TGD people AFAB may use a variety of contraceptive methods (Abern & Maguire, 2018; Bentsianov et al., 2018; Bonnington et al., 2020; Chrisler et al., 2016; Cipres et al., 2017; Jones, Wood et al., 2017; Krempasky et al., 2020; Light et al., 2018).These methods may be used explicitly for pregnancy prevention, menstrual suppression, abnormal bleeding, or other gynecological needs (Bonnington et al., 2020; Chrisler et al., 2016; Krempasky et al., 2020; Schwartz et al., 2019). Contraceptive research gaps within this population are profound. No studies have examined how the use of exogenous androgens (e.g., testosterone) may modify the efficacy or safety profile of hormonal contraceptive methods (e.g., combined estrogen and progestin hormonal contraceptives, progestin-only based contraceptives) or non-hormonal and barrier contraceptive methods (e.g., internal and external condoms, non-hormonal intrauterine devices, diaphragms, sponges, etc.).

Gender diverse individuals who currently have a penis and testicles may engage in sexual activity with individuals who have a uterus, ovaries, and tubes of any gender. Gender diverse people who have a penis and testicles can produce sperm even while on gender-affirming hormones (i.e., estrogen), and although semen parameters are diminished among those who are currently using or who have previously used gender-affirming hormones, azoospermia is not complete and sperm activity is not totally suppressed (Adeleye et al., 2019; Jindarak et al., 2018; Kent et al., 2018). Therefore, contraception needs to be considered if pregnancy is to be avoided in penis-in-vagina sexual activity between a person with a uterus, ovaries, and tubes and one with a penis and testicles, irrespective of the use of gender-affirming hormones by either partner. Currently, contraceptive methods available for use by the sperm-producing partner are primarily mechanical barriers (i.e., external condoms, internal condoms), permanent sterilization (i.e., vasectomy), and gender-affirming surgery (e.g., orchiectomy, which also results in sterilization). Contraceptive counseling that considers sperm producing, egg producing, and gestating partners (as relevant) is recommended.

Statement 16.7

We recommend providers who offer pregnancy termination services ensure procedural approaches are gender-affirming and serve transgender people and those of diverse genders.

Unplanned pregnancies and abortions have been reported among TGD individuals with a uterus (Abern & Maguire, 2018; Light et al., 2014; Light et al., 2018; Moseson, Fix et al., 2020) and documented through surveys of abortion-providing facilities (Jones et al., 2020). However, the population-based epidemiology of abortion provision and the experiences and preferences of TGD individuals AFAB undergoing abortion still represents a critical gap in research (Fix et al., 2020; Moseson, Fix et al., 2020; Moseson, Lunn et al., 2020). Nonetheless, given that pregnancy capacity exists among many TGD people and pregnancies may not always be planned or desired, access to safe, legal, and gender-affirming pregnancy medical and surgical termination services is necessary.

CHAPTER 17 Sexual Health

Sexual health has a profound impact on physical and psychological well-being, regardless of one's sex, gender, or sexual orientation. However, stigma about sex, gender and sexual orientation influences individual's opportunities to live out their sexuality and to receive appropriate sexual health care. Specifically, in most societies, cisnormativity and heteronormativity lead to the assumption that all people are cisgender and heterosexual (Bauer et al., 2009), and that this combination is superior to all other genders and sexual orientations (Nieder, Güldenring et al., 2020; Rider, Vencill et al., 2019). Hetero-cisnormativity negates the complexity of gender, sexual orientation, and sexuality and disregards diversity and fluidity. This is all the more important since sexual identities, orientations, and practices of transgender and gender diverse (TGD) people are characterized by an enormous diversity (Galupo et al., 2016; Jessen et al., 2021; Thurston & Allan, 2018; T'Sjoen et al., 2020). Likewise, a strong cross-cultural tendency toward allonormativity—the assumption that all people experience sexual attraction or interest in sexual activity—negates the diverse experiences of TGD people, especially those who locate themselves on the asexual spectrum (McInroy et al., 2021; Mollet, 2021; Rothblum et al., 2020).

The World Health Organization (WHO, 2010) emphasizes sexual health depends on respect for the sexual rights of all people, including the right to express diverse sexualities and to be treated respectfully, safely, and with freedom from discrimination and violence. Sexual health discourses have focused on agency and body autonomy, which include consent, sexual pleasure, sexual satisfaction, partnerships, and family life (Cornwall & Jolly, 2006; Lindley et al., 2021). In light of this, the WHO defines sexual health as "a state of physical, emotional, mental, and social well-being in relation to sexuality and not merely the absence of disease, dysfunction, or infirmity. Sexual health requires a positive and respectful approach to sexuality and sexual relationships as well as the possibility of having pleasurable and safe sexual experiences, free of coercion, discrimination, and violence. For sexual health to be attained and maintained, the sexual rights of all persons must be respected, protected, and fulfilled" (WHO, 2006, p. 5). This includes individuals on the asexual spectrum, who may not experience sexual attraction to others but may still choose to be sexual at times (e.g., via self-stimulation) and/or experience interest in forming and building romantic relationships (de Oliveira et al., 2021).

Scientific attention to the sexual experiences and behaviors of TGD people has grown in recent years (Gieles et al., 2022; Holmberg et al., 2019; Klein & Gorzalka, 2009; Kloer et al., 2021; Mattawanon et al., 2021; Stephenson et al., 2017; Tirapegui et al., 2020; Thurston & Allan, 2018). This expansion within the literature reflects a sex-positive framework (Harden, 2014), a framework that recognizes both the positive aspects such as sexual pleasure (Laan et al., 2021) and potential risks associated with sexuality (Goldhammer et al., 2022; Mujugira et al., 2021). Studies of TGD people's sexuality, however, often lack validated measures, an appropriate control group, or a prospective design (Holmberg et al., 2019). Additionally, most focus exclusively on sexual functioning (Kennis et al., 2022), and thus neglecting sexual satisfaction and broader operationalizations of sexual pleasure beyond functioning. The effects of current TGD-related medical treatments on sexuality are heterogeneous (Özer et al., 2022; T'Sjoen et al., 2020), and there has been little research on the sexuality of TGD adolescents (Bungener et al., 2017; Maheux et al., 2021; Ristori et al., 2021; Stübler & Becker-Hebly, 2019; Warwick et al., 2022). While sex-positive approaches to counseling and treatment for sexual difficulties experienced by TGD individuals have been proposed (Fielding, 2021; Jacobson et al., 2019; Richards, 2021), to date there is insufficient research on the effectiveness of such interventions. Focusing on the promotion of sexual health, the World Association for Sexual Health (WAS) asserts the importance of sexual pleasure and considers self-determination, consent, safety, privacy, confidence, and the ability to communicate and negotiate sexual relations as major facilitators (Kismödi et al., 2017). WAS asserts sexual pleasure is integral to sexual rights and human rights (Kismödi et al., 2017). To contribute to

Statements of Recommendations

17.1- We recommend health care professionals who provide care to transgender and gender diverse people acquire the knowledge and skills needed to address sexual health issues (relevant to their care provision).
17.2- We recommend health care professionals who provide care to transgender and gender diverse people discuss the impact of gender-affirming treatments on sexual function, pleasure, and satisfaction.
17.3- We recommend health care professionals who provide care to transgender and gender diverse people offer the possibility of including the partner(s) in sexuality-related care, if appropriate.
17.4- We recommend health care professionals counsel transgender and gender diverse people about the potential impact of stigma and trauma on sexual risk behavior, sexual avoidance, and sexual functioning.
17.5- We recommend any health care professional who offers care that may impact sexual health provide information, ask about the expectations of the transgender and gender diverse individual and assess their level of understanding of possible changes.
17.6.-We recommend health care professionals who provide care to transgender and gender diverse people counsel adolescents and adults regarding prevention of sexually transmitted infections.
17.7- We recommend health care professionals who provide care to transgender and gender diverse people follow local and World Health Organization guidelines for human immunodeficiency virus/sexual transmitted infections (HIV/STIs) screening, prevention, and treatment.
17.8- We recommend health care professionals who provide care to transgender and gender diverse people address concerns about potential interactions between antiretroviral medications and hormones.

the sexual health of TGD people, health care professionals (HCPs) need both transgender-related expertise and sensitivity (Nieder, Güldenring et al., 2020). With the goal of improving sexual health care for TGD people to an ethically-sound, evidence-based and high-quality level, HCPs must provide their health services with the same care (i.e., with transgender-related expertise), respect (i.e., with transgender-related sensitivity), and investment in sexual pleasure and sexual satisfaction as they provide for cisgender people (Holmberg et al., 2019).

In many societies, nonconforming gender expressions can elicit strong (emotional) reactions, including in HCPs. Thus, when initiating a health-related contact or establishing a therapeutic relationship, a nonjudgmental, open and welcoming manner is most likely ensured when HCPs reflect on their emotional, cognitive, and interactional reactions to the person (Nieder, Güldenring et al., 2020). In addition, transgender-related expertise refers to identifying the impact the TGD person's intersectional identities and experiences of marginalization and stigma may have had on their whole self (Rider, Vencill et al., 2019). To adequately address the specific physical, psychological, and social conditions of TGD people, HCPs must be aware these conditions are generally overlooked due to hetero-cis-normativity, lack of knowledge, and lack of skills (Rees et al., 2021). It is also important to consider cultural norms in relation to sexuality. For example, in some African cultures, the idea of sex as taboo restricts the number of acceptable terms to be used when taking a sexual history (Netshandama et al., 2017). Culturally respectful language can facilitate talking openly about one's sexual history and reduce ambiguity or shame (Duby et al., 2016). In addition, HCPs must be sensitive to the history of (mis)use of sexual identity and orientation as a gatekeeping function to exclude transgender people from gender-affirming health care (Nieder & Richter-Appelt, 2011; Richards et al., 2014). The following recommendations aim to improve sexual health care for TGD people.

All the statements in this chapter have been recommended based on a thorough review of evidence, an assessment of the benefits and harms, values and preferences of providers and patients, and resource use and feasibility. In some cases, we recognize evidence is limited and/or services may not be accessible or desirable.

Statement 17.1

We recommend health care professionals who provide care to transgender and gender diverse people acquire the knowledge and skills to address sexual health issues (relevant to their care provision).

It is important HCPs addressing the sexual health of TGD people be familiar with commonly used terminology (see Chapter 1—Terminology) and invite those seeking care to explain terms with which the provider may not be familiar. In this context, it is also important HCPs (are

prepared to) take a sexual history and offer treatment (according to their competencies) in a gender-affirming way with a sex-positive approach (Centers for Disease Control, 2020; Tomson et al., 2021). However, HCP's should apply greater importance to the terminology that the TGD person uses for their own body over more traditionally accepted or used medical terminology (Wesp, 2016). When talking about sexual practices, it is advisable to focus on body parts (e.g., "Do you have sex with people with a penis, people with a vagina, or both?"; ACON, 2022) and what role they play in their sexuality (e.g., "During Sex, do any parts of your body enter your partners body, such as their genitals, anus, or mouth?"; ACON, 2022).

Statement 17.2

We recommend health care professionals who provide care to transgender and gender diverse people discuss the impact of gender-affirming treatments on sexual function, pleasure, and satisfaction.

To achieve gender-affirming care, it is crucial HCPs providing transition-related medical interventions be sufficiently informed about the possible effects on sexual function, pleasure, and satisfaction (T'Sjoen et al., 2020). Since clinical data indicate that TGD people score significantly lower in sexual pleasure compared to cisgender individuals, this is even more important (Gieles et al., 2022). If the HCP cannot provide information about the effects of their treatment on sexual function, pleasure, and satisfaction, they are at least expected to refer the individual to someone qualified to do so. If the sexuality-related effects of their treatment are unknown, HCPs should inform their patients accordingly. As introduced above, the sexuality of TGD people often challenges heteronormative views. Nevertheless, there is a large amount of literature (e.g., Bauer, 2018; Laube et al., 2020; Hamm & Nieder, 2021; Stephenson et al., 2017) highlighting the spectrum character of sexuality that does not fit into expectations of what male and female sexuality entails (neither cis- nor transgender), let alone that of gender diverse people (e.g., nonbinary, agender, genderqueer). Thus, these aspects should be carefully considered by HCPs as cisnormativity, heteronormativity, and transition-related medical interventions, all have a strong impact on sexual health.

Sexual pleasure has been well documented as a factor in improving sexual, mental, and physical health outcomes (Anderson, 2013). Next to sexual function, HCPs providing sexual health care must address sexual pleasure and satisfaction as a key factor within sexual health. Historically sexual health care has been disease focused, and this is particularly true for research and clinical practice in working with TGD patients. Although competent sexual health care regarding HIV and STIs is necessary, integration of valuing sexual pleasure of TGD patients is also necessary. Calls for integrating sexual pleasure as a focal point in STI prevention education and interventions rest on the understanding that pleasure is a motivator of behavior (Philpott et al., 2006). TGD people are concerned about their sexual pleasure and need HCPs who are knowledgeable about the diversity of sexual practices and anatomical functioning particular to TGD health care.

Statement 17.3

We recommend health care professionals who provide care to transgender and gender diverse people offer the possibility of including the partner(s) in sexuality-related care, if appropriate.

When appropriate and relevant to clinical concerns, inclusion of a sexual and/or romantic partner(s) in sexual health care decision-making can increase TGD patients' sexual well-being and satisfaction outcomes (Kleinplatz, 2012). TGD people may choose a range of transition-related medical interventions, and these interventions may have mixed results in shifting experiences of anatomical dysphoria (Bauer & Hammond, 2015). When discussing the impact of medical interventions on sexual functioning, pleasure, and satisfaction, inclusion of partner(s) can increase knowledge of potential changes and encourage communication between partners (Dierckx et al., 2019). Because the process of transitioning is often not a completely solitary endeavor, the inclusion of sexual and/or romantic partners in transition-related health care can facilitate the process of "co-transitioning" (Lindley et al., 2020;

Siboni et al., 2022; Theron & Collier, 2013) and can also support sexual growth and adjustment both in the individual as well as in the relationship. Social and psychological barriers to sexual functioning and pleasure, including experiences of gender dysphoria, stigmatization, lack of sexual and relationship role models, and limited skills, can have negative impacts on overall sexual health (Kerckhof et al., 2019). Supportive, gender-affirming sexual communication between partners improves sexual satisfaction outcomes for TGD people (Stephenson et al., 2017; Wierckx, Elaut et al., 2011).

Inclusion of sexual and/or romantic partners offers an additional opportunity to set realistic expectations, disseminate helpful and accurate information, and facilitate gender-affirming positive communication related to sexual health. Ultimately, however, it is important to recognize individual choices related to gender health and transition are the patients to make, not a partner's decision. It is important the inclusion of partners in sexual health-related care occur only when appropriate and as desired by patients. Contraindications might include interpersonal dynamics that are abusive or violent, in which case patient safety overrides partner involvement. Finally, it is critical HCPs treat all people in an affirming and inclusive manner, including sexual and romantic partners. This means, for example, monitoring and addressing assumptions and potential biases about the gender or sexual orientation of a patient's partner(s) or a patient's relationship structure.

Statement 17.4

We recommend health care professionals counsel transgender and gender diverse people about the potential impact of stigma and trauma on sexual risk behavior, sexual avoidance, and sexual functioning.

The TGD community is disproportionately impacted by stigma, discrimination, and violence (de Vries et al., 2020; European Union Agency for Fundamental Rights, 2020; McLachlan, 2019). These experiences are often traumatic in nature (Burnes et al., 2016; Mizock & Lewis, 2008) and can create barriers to sexual health, functioning, and pleasure (Bauer & Hammond, 2015). For example, stigmatizing narratives about transgender sexualities can increase dysphoria and sexual shame, increasing potential avoidance of the sexual communication needed for safety and optimizing pleasure (Stephenson et al., 2017). Research demonstrates stigma, a history of sexual violence, and body image concerns can negatively impact sexual self-esteem and agency, for example the ability to assert what is pleasurable or to negotiate condom use (Clements-Nolle et al., 2008; Dharma et al., 2019). Additionally, gender dysphoria can be exacerbated by past trauma experiences and ongoing trauma-related symptoms (Giovanardi et al., 2018). It may be difficult for some TGD individuals to engage sexually using the genitals with which they were born, and they may choose to avoid such stimulation altogether, disrupting arousal and/or orgasmic processes (Anzani et al., 2021; Bauer & Hammond, 2015; Iantaffi & Bockting, 2011) or result in complex feelings about orgasm (Chadwick et al., 2019). HCPs providing gender-affirming counseling and interventions must be knowledgeable about the spectrum of sexual orientations and identities (including asexual identities and practices) to avoid assumptions based in heteronormative, cisnormative, allonormative modes of behavior or satisfaction while also affirming the potential impacts of stigma and trauma on sexual health and pleasure (Nieder, Güldenring et al., 2020). Some level of disconnect or dissociation may at times be present, particularly in the case of acute trauma symptoms (Colizzi et al., 2015). It is important HCPs be aware of these potential impacts on sexual health, functioning, pleasure, and satisfaction, so they may refer patients as needed to trauma-informed sexual counselors, mental health providers, or both, who may be of further assistance and may also normalize and validate TGD patients exploring multiple diverse pathways of healing and accessing sexual pleasure.

Statement 17.5

We recommend any health care professional who offers care that may impact sexual health provide information, ask about the expectation of the transgender and gender diverse individual, and assess their level of understanding of possible changes.

Transition-related care can affect sexual function, pleasure, and satisfaction, both in positive and negative ways (Holmberg et al., 2018; Kerckhof et al., 2019; Thurston & Allan, 2018; Tirapegui et al., 2020). On the positive side, gender-affirming care can help TGD people improve their sexual functioning and increase their sexual pleasure and satisfaction (Kloer et al., 2021; Özer et al., 2022; T'Sjoen et al., 2020). On the negative side, however, data indicate problematic sexual health outcomes due to hormonal and surgical treatments (Holmberg et al., 2018; Kerckhof et al., 2019, Stephenson et al., 2017; Weyers et al., 2009). Transition-related hormones may affect mood, sexual desire, the ability to have an erection and ejaculation, and genital tissue health, which in turn can impact sexual function, pleasure and sexual self-expression (Defreyne, Elaut et al., 2020; Garcia & Zaliznyak, 2020; Kerckhof et al., 2019; Klein & Gorzalka, 2009; Wierckx, Elaut et al., 2014). TGD people who wish to use their original genital anatomy for penetrative sex may benefit from medications that address sexual health side effects of hormone therapy, such as erectile dysfunction, medications for TGD persons taking estrogen or antiandrogens, and topical estrogen and/or moisturizers for TGD persons experiencing vaginal atrophy or dryness due to testosterone therapy.

Sexual desire, arousal, and function may also be affected by the use of psychotropic drugs (Montejo et al., 2015). As some TGD people are prescribed medication to treat depression (Heylens, Elaut et al., 2014), anxiety (Millet et al., 2017) or other mental health concerns (Dhejne et al., 2016), their potential side effects on sexual health should be considered.

Many gender-affirming surgeries can have significant effects on erogenous sensation, sexual desire and arousal as well as sexual function and pleasure. The impact of these changes for patients may be mixed (Holmberg et al., 2018). Chest surgeries (breast reduction, mastectomy, and breast augmentation) and body contouring surgeries, for example, may offer desired changes in form and appearance thereby reducing psychological distress that can disrupt sexual functioning but may adversely affect erogenous sensation (Bekeny et al., 2020; Claes et al., 2018; Rochlin et al., 2020). Genital surgeries in particular can potentially affect sexual function and pleasure in adverse ways, although they are likely to be experienced positively as the patient's body becomes more aligned with their gender, potentially opening new avenues for sexual pleasure and satisfaction (Hess et al., 2018; Holmberg et al., 2018; Kerckhof et al., 2019).

There are numerous examples of this in the extant literature:

- Surgery may result in a decrease, a total loss, or a possible increase in erogenous stimulation and/or experienced sensation compared with the patient's presurgery anatomy (Garcia, 2018; Sigurjónsson et al., 2017).
- A particular surgical option may be associated with specific limitations to sexual function that may manifest immediately, in the future, or at both timepoints, and which patients should consider before finalizing their choice when considering different surgical options (Frey et al., 2016; Garcia, 2018; Isaacson et al., 2017).
- Postsurgical complications can adversely affect sexual function by either decreasing the quality of sexual function (e.g., discomfort or pain with sexual activity) or by precluding satisfactory intercourse (Kerckhof et al., 2019; Schardein et al., 2019).

In general, satisfaction with any medical treatment is heavily influenced by the patient's expectations (Padilla et al., 2019). Furthermore, when patients have unrealistic expectations before treatment, they are much more likely to be dissatisfied with the outcome, their care, and with their HCP (Padilla et al., 2019). Therefore, it is important to both provide patients with adequate information about their treatment options and to understand and consider what is important to the patient with regard to outcomes (Garcia, 2021). Finally, it is important the HCP ensure patients understand the potential adverse effects of a treatment on their sexual function and pleasure so that a well-informed decision can be made. This is relevant for both meeting the standard of informed consent (i.e.,

discussion and understanding) and for providing an opportunity to offer further clarification to patients and, if desired, to their partners (Glaser et al., 2020).

Statement 17.6

We recommend health care professionals who provide care to transgender and gender diverse people counsel adolescents and adults regarding prevention of sexually transmitted infections.

The WHO (2015) recommends HCPs implement brief sexuality-related communication in primary care for all adolescents and adults. Therefore, TGD persons who are sexually active or considering sexual activity may benefit from sexuality-related communication or counseling for the purpose of HIV/STI prevention. These conversations are particularly important as TGD persons are disproportionately impacted by human immunodeficiency virus (HIV) and other sexually transmitted infections (STIs) relative to cisgender persons (Baral et al., 2013; Becasen et al., 2018; Poteat et al., 2016). However, few data are available for non-HIV STIs, such as chlamydia, gonorrhea, syphilis, viral hepatitis, and herpes simplex virus (Tomson et al., 2021). The United Nations Joint Programme on HIV/AIDS estimates transgender women are 12 times more likely than other adults to be living with HIV (UNAIDS, 2019). A meta-analysis estimated a pooled global HIV prevalence of 19% among transgender women who have sex with men (Baral et al., 2013). HIV/STI risk is concentrated among TGD subgroups at the confluence of multiple biological, psychological, interpersonal, and structural vulnerabilities. In particular, transfeminine persons who have sex with cisgender men, belong to minoritized racial/ethnic groups, live in poverty, and engage in survival sex work are at elevated HIV/STI risk (Becasen et al., 2018; Poteat et al., 2015; Poteat et al., 2016). Less is known about HIV/STI risk among transgender men or gender diverse persons AFAB. Small studies in high-income countries indicate a laboratory-confirmed HIV prevalence of 0-4% among transmasculine people (Becasen et al., 2018; Reisner & Murchison, 2016). Almost no research has been conducted with transmasculine people who have sex with cisgender men in high-HIV-prevalence countries. Despite limited epidemiologic data, transmasculine persons who have sex with cisgender men frequently report HIV/STI risk related to receptive vaginal and/or anal sex (Golub et al., 2019; Reisner et al., 2019; Scheim et al., 2017) and may be more susceptible to HIV acquisition from vaginal intercourse than (pre-menopausal) cisgender women due to hormone-related vaginal atrophy.

HCPs will need to supplement general guidelines by developing the knowledge and skills needed for discussing sexual health issues with TGD people, such as the use of gender-affirming language (see Statement 17.1 in this chapter). It is critical HCPs avoid assumptions about HIV/STI risk based solely on a patient's gender identity or anatomy. For example, many transgender people are not sexually active, and TGD persons may use prosthetics or toys for sex. To provide appropriate prevention counseling, HCPs should inquire about the specific sexual activities TGD people engage in, and the body parts (or prosthetics) involved in those activities (ACON, 2022). Well-prepared HCPs (including, but not limited to mental health providers) may also engage in in-depth counseling with their patients to address the underlying drivers of HIV/STI risk (see Statement 17.3 in this chapter).

In all cases, HCPs should be sensitive to the collective and individual histories of TGD people (e.g., stereotypes and stigma about trans sexualities and gender dysphoria) and should explain to patients the reasons for sexuality-related inquiries and the voluntary nature of such inquiries. In discussing HIV/STI prevention, HCPs should refer to the full range of prevention options including barrier methods, post-exposure prophylaxis, pre-exposure prophylaxis, and HIV treatment to prevent onwards transmission (WHO, 2021). Trans-specific considerations for pre-exposure prophylaxis are addressed in Statement 17.8.

Statement 17.7

We recommend health care professionals who provide care to transgender and gender diverse people follow local and World Health Organization guidelines for human immunodeficiency virus/sexual transmitted infections (HIV/STIs) screening, prevention, and treatment.

Like cisgender patients, TGD adolescents and adults should be offered screening for HIV/STIs in accordance with existing guidelines and based on their individual risk of HIV/STI acquisition, considering anatomy and behavior rather than gender identity alone. Where local or national guidelines are unavailable, WHO (2019a) offers global recommendations; more frequent screening is recommended for transgender people who have sex with cisgender men as a key population affected by HIV.

Gender-affirming genital surgeries and surgical techniques have implications for STI risks and screening needs, as outlined in recent guidelines from the US Centers for Disease Control (Workowski et al., 2021). For instance, transfeminine persons who have had penile inversion vaginoplasty using only penile and scrotal skin to line the vaginal canal are likely at lower risk of urogenital Chlamydia trachomatis *(C. trachomatis)* and Neisseria gonorrhoeae *(N. gonorrhoeae)*, but newer surgical techniques that employ buccal or urethral mucosa or peritoneum flaps could in theory increase susceptibility to bacterial STIs relative to the use of penile/scrotal skin alone (Van Gerwen et al., 2021). Routine STI screening of the neovagina (if exposed) is recommended for all transfeminine persons who have had vaginoplasty (Workowski et al., 2021). For transmasculine persons who have had metoidioplasty with urethral lengthening, but not vaginectomy, testing for bacterial urogenital STIs should include a cervical swab because infections may not be detected in urine (Workowski et al., 2021).

Further, it is important for HCPs to offer testing at multiple anatomical sites as STIs in transgender patients are often extragenital (Hiransuthikul et al., 2019; Pitasi et al., 2019). Consistent with WHO (2020) recommendations, self-collection of samples for STI testing should be offered as an option, particularly if patients are uncomfortable or unwilling to undergo provider-collected sampling due to gender dysphoria, trauma histories, or both. Where relevant, integration of HIV/STI testing with regular serology used to monitor hormone therapy may better facilitate access to care (Reisner, Radix et al., 2016; Scheim & Travers, 2017).

Statement 17.8

We recommend health care professionals who provide care to transgender and gender diverse people address concerns about potential interactions between antiretroviral medications and hormones.

For TGD adolescents and adults at substantial risk of HIV infection (generally defined as an ongoing serodiscordant relationship or condomless sex outside of a mutually monogamous relationship with a known HIV-negative partner; WHO, 2017), pre-exposure prophylaxis (PrEP) is an important HIV prevention option (Golub et al., 2019; Sevelius et al., 2016; WHO, 2021). To encourage uptake of PrEP, in 2021 the US Centers for Disease Control recommended all sexually active adolescents and adults be informed about PrEP and offered it if requested (CDC, 2021). For treatment among people living with HIV, transgender-specific guidelines are available in some settings (e.g., Panel on Antiretroviral Guidelines for Adults and Adolescents, 2019).

For both HIV prevention and treatment, there are antiretroviral dosing and administration considerations specific to TGD persons. For oral PrEP, only daily dosing is currently recommended for TGD persons as studies demonstrating the effectiveness of event-driven PrEP with emtricitabine/tenofovir disoproxil fumarate (TDF) have been limited to cisgender men (WHO, 2019c). In addition, while emtricitabine/tenofovir alafenamide (TAF) is a new oral PrEP option, as of early 2022 it is not recommended for people at risk of HIV acquisition through receptive vaginal sex due to a lack of evidence (CDC, 2021). Finally, long-acting injectable formulations of both PrEP and HIV treatment are increasingly available (e.g., cabotegravir for PrEP), and while they are recommended for all patients who might benefit from injectable options, indicated injection sites (i.e., the gluteal muscle) may be unsuitable for individuals who have used soft tissue fillers (Rael et al., 2020).

There is little evidence supporting the occurrence of drug-drug interactions between gender-affirming hormones and PrEP medications. A few small studies, primarily relying on self-reported PrEP use, have shown reduced PrEP drug concentrations in transgender women undergoing hormone therapy, although

concentrations remained in the protective range (Yager & Anderson, 2020). A subsequent drug-drug interaction study using directly observed PrEP therapy failed to detect an impact of hormone therapy on PrEP drug concentrations in transgender women and found transgender women and men taking hormone therapy achieved high levels of protection against HIV infection (Grant et al., 2020). Most importantly, for many TGD people, no impact of PrEP on hormone concentrations has been detected. With regard to HIV treatment, specific antiretroviral medications may impact hormone concentrations; however, these can be managed by selecting alternative agents, monitoring and adjusting hormone dosing, or both (Cirrincione et al., 2020) as detailed in guidelines from the US Department of Health and Human Services (Panel on Antiretroviral Guidelines for Adults and Adolescents, 2019). Nevertheless, concerns about drug-drug interactions, particularly interactions that may limit hormone concentrations, represent a barrier to the implementation and adherence to antiretroviral therapy for HIV prevention or treatment (Radix et al., 2020; Sevelius et al., 2016). Therefore, it is advisable for HCPs to proactively address such concerns with those who are candidates for PrEP or HIV treatment. Integration of PrEP or HIV treatment with hormone therapy may further reduce barriers to implementation and adherence (Reisner, Radix et al., 2016). Integration may be achieved through colocation or through coordination with an HIV specialist if the primary care provider does not have the necessary expertise. Some TGD persons may benefit from standalone PrEP or sexual health services that provide greater privacy and flexibility, and thus differentiated service delivery models are needed (Wilson et al., 2021).

CHAPTER 18 Mental Health

This chapter is intended to provide guidance to health care professionals (HCPs) and mental health professionals (MHPs) who offer mental health care to transgender and gender diverse (TGD) adults. It is not meant to be a substitute for chapters on the assessment or evaluation of people for hormonal or surgical interventions. Many TGD people will not require therapy or other forms of mental health care as part of their transition, while others may benefit from the support of mental health providers and systems (Dhejne et al., 2016).

Some studies have shown a higher prevalence of depression (Witcomb et al., 2018), anxiety (Bouman et al., 2017), and suicidality (Arcelus et al., 2016; Bränström & Pachankis, 2022; Davey et al., 2016; Dhejne, 2011; Herman et al., 2019) among TGD people (Jones et al., 2019; Thorne, Witcomb et al., 2019) than in the general population, particularly in those requiring medically necessary gender-affirming medical treatment (see medically necessary statement in Chapter 2—Global Applicability, Statement 2.1). However, transgender identity is not a mental illness, and these elevated rates have been linked to complex trauma, societal stigma, violence, and discrimination (Nuttbrock et al., 2014; Peterson et al., 2021). In addition, psychiatric symptoms lessen with appropriate gender-affirming medical and surgical care (Aldridge et al., 2020; Almazan and Keuroghlian; 2021; Bauer et al., 2015; Grannis et al., 2021) and with interventions that lessen discrimination and minority stress (Bauer et al., 2015; Heylens, Verroken et al., 2014; McDowell et al., 2020).

Mental health treatment needs to be provided by staff and implemented through the use of systems that respect patient autonomy and recognize gender diversity. MHPs working with transgender people should use active listening as a method to encourage exploration in individuals who are uncertain about their gender identity. Rather than impose their own narratives or preconceptions, MHPs should assist their clients in determining their own paths. While many transgender people require medical or surgical interventions or seek mental health care, others do not (Margulies et al., 2021). Therefore, findings from research involving clinical populations should not be extrapolated to the entire transgender population.

Addressing mental illness and substance use disorders is important but should not be a barrier to transition-related care. Rather, these interventions to address mental health and substance use disorders can facilitate successful outcomes from

Statements of Recommendations

18.1- We recommend mental health professionals address mental health symptoms that interfere with a person's capacity to consent to gender-affirming treatment before gender-affirming treatment is initiated.
18.2- We recommend mental health professionals offer care and support to transgender and gender diverse people to address mental health symptoms that interfere with a person's capacity to participate in essential perioperative care before gender-affirmation surgery.
18.3- We recommend when significant mental health symptoms or substance abuse exists, mental health professionals assess the potential negative impact that mental health symptoms may have on outcomes based on the nature of the specific gender-affirming surgical procedure.
18.4- We recommend health care professionals assess the need for psychosocial and practical support of transgender and gender diverse people in the perioperative period surrounding gender- affirmation surgery.
18.5- We recommend health care professionals counsel and assist transgender and gender diverse people in becoming abstinent from tobacco/nicotine prior to gender-affirmation surgery.
18.6- We recommend health care professionals maintain existing hormone treatment if a transgender and gender diverse individual requires admission to a psychiatric or medical inpatient unit, unless contraindicated.
18.7- We recommend health care professionals ensure if transgender and gender diverse people need in-patient or residential mental health, substance abuse or medical care, all staff use the correct name and pronouns (as provided by the patient), as well as provide access to bathroom and sleeping arrangements that are aligned with the person's gender identity.
18.8- We recommend mental health professionals encourage, support, and empower transgender and gender diverse people to develop and maintain social support systems, including peers, friends, and families.
18.9- We recommend health care professionals should not make it mandatory for transgender and gender diverse people to undergo psychotherapy prior to the initiation of gender-affirming treatment, while acknowledging psychotherapy may be helpful for some transgender and gender diverse people.
18.10- We recommend "reparative" and "conversion" therapy aimed at trying to change a person's gender identity and lived gender expression to become more congruent with the sex assigned at birth should not be offered.

transition-related care, which can improve quality of life (Nobili et al., 2018).

All the statements in this chapter have been recommended based on a thorough review of evidence, an assessment of the benefits and harms, values and preferences of providers and patients, and resource use and feasibility. In some cases, we recognize evidence is limited and/or services may not be accessible or desirable.

Statement 18.1

We recommend mental health professionals address mental health symptoms that interfere with a person's capacity to consent to gender-affirming treatment before gender-affirming treatment is initiated.

Because patients generally are assumed to be capable of providing consent for care, whether the presence of cognitive impairment, psychosis, or other mental illness impairs the ability to give informed consent is subject to individual examination (Applebaum, 2007). Informed consent is central to the provision of health care. The health care provider must educate the patient about the risks, benefits, and alternatives to any care that is offered so the patient can make an informed, voluntary choice (Berg et al., 2001). Both the primary care provider or endocrinologist prescribing hormones and the surgeon performing surgery must obtain informed consent. Similarly, MHPs obtain informed consent for mental health treatment and may consult on a patient's capacity to give informed consent when this is in question. Psychiatric illness and substance use disorders, in particular cognitive impairment and psychosis, may impair an individual's ability to understand the risks and benefits of the treatment (Hostiuc et al., 2018). Conversely, a patient may also have significant mental illness, yet still be able to understand the risks and benefits of a particular treatment (Carpenter et al., 2000). Multidisciplinary communication is important in challenging cases, and expert consultation should be utilized as needed (Karasic & Fraser, 2018). For many patients, difficulty understanding the risks and benefits of a particular treatment can be overcome with time and careful explanation. For some patients, treatment of the underlying condition that is interfering with the capacity to give informed consent—for example treating an underlying psychosis—will allow the patient to gain the capacity to consent to the required treatment. However, mental health symptoms such as anxiety or depressive symptoms that do not affect the capacity to give consent should not be a barrier for gender-affirming medical treatment, particularly as this treatment has been found to reduce mental health symptomatology (Aldridge et al., 2020).

Statement 18.2

We recommend mental health professionals offer care and support to transgender and gender diverse people to address mental health symptoms that interfere with a person's capacity to participate in essential perioperative care before gender-affirmation surgery.

The inability to adequately participate in perioperative care due to mental illness or substance use should not be viewed as an obstacle to needed transition care, but should be seen as an indication mental health care and social support be provided (Karasic, 2020). Mental illness and substance use disorders may impair the ability of the patient to participate in perioperative care (Barnhill, 2014). Visits to health care providers, wound care, and other aftercare procedures (e.g., dilation after vaginoplasty) may be necessary for a good outcome. A patient with a substance use disorder might have difficulty keeping necessary appointments to the primary care provider and the surgeon. A patient with psychosis or severe depression might neglect their wound or not be attentive to infection or signs of dehiscence (Lee, Marsh et al., 2016). Active mental illness is associated with a greater need for further acute medical and surgical care after the initial surgery (Wimalawansa et al., 2014).

In these cases, treatment of the mental illness or substance use disorder may assist in achieving successful outcomes. Arranging more support for the patient from family and friends or a home health care worker may help the patient participate sufficiently in perioperative care for surgery to proceed. The benefits of mental health treatments that may delay surgery should be weighed against the risks of delaying surgery and should

include an assessment of the impact on the patients' mental health delays may cause in addressing gender dysphoria (Byne et al., 2018).

Statement 18.3

We recommend when significant mental health symptoms or substance abuse exists, mental health professionals assess the potential negative impact mental health symptoms may have on outcomes based on the nature of the specific gender-affirming surgical procedure.

Gender-affirming surgical procedures vary in terms of their impact on the patient. Some procedures require a greater ability to follow preoperative planning as well as engage in peri- and postoperative care to achieve the best outcomes (Tollinche et al., 2018). Mental health symptoms can influence a patient's ability to participate in the planning and perioperative care necessary for any surgical procedure (Paredes et al., 2020). The mental health assessment can provide an opportunity to develop strategies to address the potential negative impact mental health symptoms may have on outcomes and to plan support for the patient's ability to participate in the planning and care. Gender-affirming surgical procedures have been shown to relieve symptoms of gender dysphoria and improve mental health (Owen-Smith et al., 2018; van de Grift, Elaut et al., 2017). These benefits are weighed against the risks of each procedure when the patient and provider are deciding whether to proceed with the treatment. HCPs can assist TGD people in reviewing preplanning and perioperative care instructions for each surgical procedure (Karasic, 2020). Provider and patient can collaboratively determine the necessary support or resources needed to assist with keeping appointments for perioperative care, obtaining necessary supplies, addressing financial issues, and handling other preoperative coordination and planning. In addition, issues surrounding appearance-related and functional expectations, including the impact of these various factors on gender dysphoria, can be explored.

Statement 18.4

We recommend health care professionals assess the need for psychosocial and practical support of transgender and gender diverse people in the perioperative period surrounding gender-affirmation surgery.

Regardless of specialty, all HCPs have a responsibility to support patients in accessing medically necessary care. When HCPs are working with TGD people as they prepare for gender-affirming surgical procedures, they should assess the levels of psychosocial and practical support required (Deutsch, 2016b). Assessment is the first step in recognizing where additional support may be needed and enhancing the ability to work collaboratively with the individual to successfully navigate the pre-, peri-, and postsurgical periods (Tollinche et al., 2018). In the perioperative period, it is important to help patients optimize functioning, secure stable housing, when possible, build social and family supports by assessing their unique situation, plan ways of responding to medical complications, navigate the potential impact on work/income, and overcome additional hurdles some patients may encounter, such as coping with electrolysis and tobacco cessation (Berli et al., 2017). In a complex medical system, not all patients will be able to independently navigate the procedures required to obtain care, and HCPs and peer navigators can support patients through this process (Deutsch, 2016a).

Statement 18.5

We recommend health care professionals counsel and assist transgender and gender diverse people in becoming abstinent from tobacco/nicotine prior to gender-affirmation surgery.

Transgender populations have higher rates of tobacco and nicotine use (Kidd et al., 2018). However, many are unaware of the well-documented smoking-associated health risks (Bryant et al., 2014). Tobacco consumption increases the risk of developing health problems (e.g., thrombosis) in individuals receiving gender-affirming hormone treatment, particularly estrogens (Chipkin & Kim, 2017).

Tobacco use has been associated with worse outcomes in plastic surgery, including overall complications, tissue necrosis, and the need for surgical revision (Coon et al., 2013). Smoking also increases the risk for postoperative infection (Kaoutzanis et al., 2019). Tobacco use has been shown to affect

the healing process following any surgery, including gender-related surgeries (e.g., chest reconstructive surgery, genital surgery) (Pluvy, Garrido et al., 2015). Tobacco users have a higher risk of cutaneous necrosis, delayed wound healing, and scarring disorders due to hypoxia and tissue ischemia (Pluvy, Panouilleres et al., 2015). In view of this, surgeons recommend stopping the use of tobacco/nicotine prior to gender-affirmation surgery and abstaining from smoking up to several weeks postoperatively until the wound has completely healed (Matei & Danino, 2015). Despite the risks, cessation may be difficult. Tobacco smoking and nicotine use is addictive and is also used as a coping mechanism (Matei et al., 2015). HCPs who see patients longitudinally before surgery, including mental health and primary care providers, should address the use of tobacco/nicotine with individuals in their care, and either assist TGD people in accessing smoking cessation programs or provide treatment directly (e.g., varenicline or bupropion).

Statement 18.6

We recommend health care professionals maintain existing hormone treatment if a transgender and gender diverse individual requires admission to a psychiatric or medical inpatient unit, unless contraindicated.

TGD people entering inpatient psychiatric, substance use treatment, or medical units should be maintained on their current hormone regimens. There is an absence of evidence supporting routine cessation of hormones prior to medical or psychiatric admissions. Rarely, a newly admitted patient may be diagnosed with a medical complication necessitating suspension of hormone treatment, for example an acute venous thromboembolism (Deutsch, 2016a). There is no strong evidence for routinely stopping hormone treatment prior to surgery, and the risks and benefits for each individual patient should be assessed before doing so (Boskey et al., 2018).

Hormone treatment has been shown to improve quality of life and to decrease depression and anxiety (Aldridge et al., 2020; Nguyen et al., 2018; Nobili et al., 2018; Owen-Smith et al., 2018, Rowniak et al., 2019). Access to gender-affirming medical treatment is associated with a substantial reduction in the risk of suicide attempt (Bauer et al., 2015). Halting a patient's regularly prescribed hormones denies the patient of these salutary effects, and therefore may be counter to the goals of hospitalization.

Some providers may be unaware of the low risk of harm and the high potential benefit of continuing transition-related treatment in the inpatient setting. A study of US and Canadian medical schools revealed that students received an average of 5 hours of LGBT-related course content over their entire four years of education (Obedin-Maliver et al., 2011). According to a survey of Emergency Medicine physicians, who are often responsible for making quick decisions about medications as patients are being admitted, while 88% reported caring for transgender patients, only 17.5% had received any formal training about this population (Chisolm-Straker et al., 2018). As education about transgender topics increases, more providers will become aware of the importance of maintaining transgender patients on their hormone regimens during hospitalization.

Statement 18.7

We recommend health care professionals ensure if transgender and gender diverse people need inpatient or residential mental health, substance abuse, or medical care, all staff use the correct name and pronouns (as provided by the patient), as well as provide access to bathroom and sleeping arrangements that are aligned with the person's gender identity.

Many TGD patients encounter discrimination in a wide range of health settings, including hospitals, mental health treatment settings, and drug treatment programs (Grant et al., 2011). When health systems fail to accommodate TGD individuals, they reinforce the longstanding societal exclusion many have experienced (Karasic, 2016). Experiences of discrimination in health settings lead to avoidance of needed health care due to anticipated discrimination (Kcomt et al., 2020).

The experience of discrimination experienced by TGD individuals is predictive of suicidal ideation (Rood et al., 2015; Williams et al., 2021). Gender minority stress associated with rejection and nonaffirmation has also been associated with suicidality (Testa et al., 2017). Denial of access to gender appropriate bathrooms has been

associated with increased suicidality (Seelman, 2016). However, the use of chosen names for TGD people has been associated with lower depression and suicidality (Russell et al., 2018). Structural as well as internalized transphobia must be addressed to reduce the incidence of suicide attempts in TGD people (Brumer et al., 2015). To successfully provide care, health settings must minimize the harm done to patients because of transphobia by respecting and accommodating TGD identities.

Statement 18.8

We recommend mental health professionals encourage, support, and empower transgender and gender diverse people to develop and maintain social support systems, including peers, friends, and families.

While minority stress and the direct effects of discriminatory societal discrimination can be harmful to the mental health of TGD people, strong social support can help lessen this harm (Trujillo et al., 2017). TGD children often internalize rejection from family and peers as well as the transphobia that surrounds them (Amodeo et al., 2015). Furthermore, exposure to transphobic abuse may be impactful across a person's lifespan and may be particularly acute during the adolescent years (Nuttbrock et al., 2010).

The development of affirming social support is protective of mental health. Social support can act as a buffer against the adverse mental health consequences of violence, stigma, and discrimination (Bockting et al., 2013), can assist in navigating health systems (Jackson Levin et al., 2020), and can contribute to psychological resilience in TGD people (Bariola et al., 2015; Başar and Öz, 2016). Diverse sources of social support, especially LGBTQ+peers and family, have been found to be associated with better mental health outcomes, well-being, and quality of life (Bariola et al., 2015; Başar et al., 2016; Kuper, Adams et al., 2018; Puckett et al., 2019). Social support has been proposed to facilitate the development of coping mechanisms and lead to positive emotional experiences throughout the transition process (Budge et al., 2013).

HCPs can support patients in developing social support systems that allow them to be recognized and accepted as their authentic identity and help them cope with symptoms of gender dysphoria. Interpersonal problems and lack of social support have been associated with a greater incidence of mental health difficulties in TGD people (Bouman, Davey et al., 2016; Davey et al., 2015) and have been shown to be an outcome predictor of gender-affirming medical treatment (Aldridge et al., 2020). Therefore, HCPs should encourage, support, and empower TGD people to develop and maintain social support systems. These experiences can foster the development of interpersonal skills and help with coping with societal discrimination, potentially reducing suicidality and improving mental health (Pflum et al., 2015).

Statement 18.9

We recommend health care professionals should not make it mandatory for transgender and gender diverse people to undergo psychotherapy prior to the initiation of gender-affirming treatment, while acknowledging psychotherapy may be helpful for some transgender and gender diverse people.

Psychotherapy has a long history of being used in clinical work with TGD people (Fraser, 2009b). The aims, requirements, methods and principles of psychotherapy have been an evolving component of the Standards of Care from the initial versions (Fraser, 2009a). At present, psychotherapeutic assistance and counseling with adult TGD people may be sought to address common psychological concerns related to coping with gender dysphoria and may also help some individuals with the coming-out process (Hunt, 2014). Psychological interventions, including psychotherapy, offer effective tools and provide context for the individual, such as exploring gender identity and its expression, enhancing self-acceptance and hope, and improving resilience in hostile and disabling environments (Matsuno and Israel, 2018). Psychotherapy is an established alternative therapeutic approach for addressing mental health symptoms that may be revealed during the initial assessment or later during the follow-up for gender-affirming medical interventions. Recent research shows, although mental health symptoms are reduced following gender-affirming medical treatment, levels of anxiety remain high (Aldridge et al., 2020) suggesting psychological therapy can play a role in helping

individuals suffering from anxiety symptoms following gender-affirming treatment.

In recent years, the uses and potential benefits of specific psychotherapeutic modalities have been reported (Austin et al., 2017; Budge, 2013; Budge et al., 2021; Embaye, 2006; Fraser, 2009b; Heck et al., 2015). Specific models of psychotherapy have been proposed for adult transgender and nonbinary individuals (Matsuno & Israel, 2018). However, more empiric data is needed on the comparative benefits of different psychotherapeutic models (Catelan et al., 2017). Psychotherapy can be experienced by transgender persons as a fearful as well as a beneficial experience (Applegarth & Nuttall, 2016) and presents challenges to the therapist and to alliance formation when it is associated with gatekeeping for medical interventions (Budge, 2015).

Experience suggests many transgender and nonbinary individuals decide to undergo gender-affirming medical treatment with little or no use of psychotherapy (Spanos et al., 2021). Although various modalities of psychotherapy may be beneficial for different reasons before, during, and after gender-affirming medical treatments and varying rates of desire for psychotherapy have been reported during different stages of transition (Mayer et al., 2019), a requirement for psychotherapy for initiating gender-affirming medical procedures has not been shown to be beneficial and may be a harmful barrier to care for those who do not need this type of treatment or who lack access to it.

Statement 18.10

We recommend "reparative" and "conversion" therapy aimed at trying to change a person's gender identity and lived gender expression to become more congruent with the sex assigned at birth should not be offered.

The use of "reparative" or "conversion" therapy or gender identity "change" efforts is opposed by many major medical and mental health organizations across the world, including the World Psychiatric Association, Pan American Health Organization, American Psychiatric and American Psychological Associations, Royal College of Psychiatrists, and British Psychological Society. Many states in the US have instituted bans on practicing conversion therapy with minors. Gender identity change efforts refers to interventions by MHPs or others that attempt to change gender identity or expression to be more in line with those typically associated with the person's sex assigned at birth (American Psychological Association, 2021).

Advocates of "conversion therapy" have suggested it could potentially allow a person to fit better into their social world. They also point out some clients specifically ask for help changing their gender identities or expressions and therapists should be allowed to help clients achieve their goals. However, "conversion therapy" has not been shown to be effective (APA, 2009; Przeworski et al., 2020). In addition, there are numerous potential harms. In retrospective studies, a history of having undergone conversion therapy is linked to increased levels of depression, substance abuse, suicidal thoughts, and suicide attempts, as well as lower educational attainment and less weekly income (Ryan et al., 2020; Salway et al., 2020; Turban, Beckwith et al., 2020). In 2021, the American Psychological Association resolutions states that "scientific evidence and clinical experience indicate that GICEs [gender identity change efforts] put individuals at significant risk of harm" (APA, 2021).

While there are barriers to ending gender identity "change" efforts, education about the lack of benefit and the potential harm of these practices may lead to fewer providers offering "conversion therapy" and fewer individuals and families choosing this option.

Acknowledgements

Karen A. Robinson, Professor of Medicine at Johns Hopkins University and Director of the School's Evidence-based Practice Center and her staff for conducting all systematic reviews and their assistance in the development of the recommendations that underpin the SOC-8. *Ethical considerations*: Carol Bayley, Simona Giordano, and Sharon Sytsma. *Legal perspectives*: Jennifer Levi and Phil Duran. *Reference checkers*: Taymy Caso, Oscar Dimant, Zil Goldstein, Ali Harris, Nat Thorne. *Editors*: Margueritte White, Jun Xia. *Administrative support*: Blaine Vella, Taylor O'Sullivan and Jamie Hicks. Finally, we like to thank all participants who provided comments during the public comment period and GATE (Global Action for Trans Equality), the Asia Pacific Transgender Network Foundation (APTN), The International Lesbian, Gay, Bisexual, Trans and Intersex Association (ILGA), and Transgender Europe (TGEU) for their helpful and constructive feedback on an earlier version of the SOC-8.

Conflict of Interest

Conflict of interests were reviewed as part of the selection process for committee members and at the end of the process before publication. No conflicts of interest were deemed significant or consequential.

Ethical Approval

This manuscript does not contain any studies with human participants performed by any of the authors.

Funding

This project was partly funded from a grant of the Tawani Foundation. Most of the expenses went to pay the Evidence-based Practice Center of Johns Hopkins University for their work. Editors and reference checkers were paid nominal fees. Committee members were not paid for their contributions. Some travel expenses for committee chairs were covered by the World Professional Association for Transgender Health (WPATH). WPATH staff and other internal expenses were covered by the Association's budget.

Appendix A METHODOLOGY

1. Introduction

This version of the Standards of Care (SOC-8) is based upon a more rigorous and methodological evidence-based approach than previous versions. This evidence is not only based on the published literature (direct as well as background evidence) but also on consensus-based expert opinion. Evidence-based guidelines include recommendations intended to optimize patient care and are informed by a systematic review of evidence and an assessment of the benefits and harms of alternative care options. Evidence-based research provides the basis for sound clinical practice guidelines and recommendations but must be balanced by the realities and feasibility of providing care in diverse settings. The process for development of the SOC-8 incorporated recommendations on clinical practice guideline development from the National Academies of Medicine and The World Health Organization that addressed transparency, the conflict-of-interest policy, committee composition and group process. (Institute of Medicine Committee on Standards for Developing Trustworthy Clinical Practice, 2011; World Health Organization, 2019a).

The SOC-8 revision committee was multidisciplinary and consisted of subject matter experts, health care professionals, researchers and stakeholders with diverse perspectives and geographic representation. All committee members completed conflict of interest declarations.*

A guideline methodologist assisted with the planning and development of questions, and an independent team undertook systematic reviews that were used to inform some of the statements for recommendations. Additional input to the guidelines was provided by an international advisory committee, legal experts, and feedback received during a public comment period. Recommendations in the SOC-8 are based on available evidence supporting interventions, a discussion of risks and harms, as well as feasibility and acceptability within different contexts and country settings. Consensus of the final recommendations was attained using a Delphi process that included all members of the Standards of Care Revision committee and required that recommendation statements were approved by 75% of members. Supportive and explanatory text of the evidence for the statements were written by chapter members. Drafts of the chapters were reviewed by the Chair and the Co-Chairs of the SOC Revision Committee to ensure the format was consistent, evidence was properly provided, and recommendations were consistent across chapters. An independent team checked the references used in the SOC-8 before the guidelines were fully edited by a single professional. A detailed overview of the SOC-8 Methodology is described below.

2. Difference between the methodology of the SOC-8 and previous editions

The main differences in the methodology of the SOC-8 when compared with other versions of the SOC are:

- The involvement of a larger group of professionals from around the globe;
- A transparent selection process to develop the guidelines steering committee as well as to select chapter leads and members;
- The inclusion of diverse stakeholders in the development of the SOC-8
- Management of conflicts of interest
- The use of a Delphi process to reach agreement on the recommendations among SOC-8 committee members
- The involvement of an independent body from a reputable university to help develop the methodology and undertake independent systematic literature reviews where possible
- Recommendations were graded as either "recommend" or "suggest" based upon the strength of the recommendations.
- The involvement of an independent group of clinical academics to review citations.
- The involvement of international organizations working with the transgender and gender diverse (TGD) community, members of WPATH and other professional organizations as well as the general public who provided feedback through a public comment period regarding the whole SOC-8.

3. Overview of SOC-8 development Process

The steps for updating the Standards of Care are summarized below:

1. Establishing Guideline Steering Committee including Chair, and Co-Chairs (July 19, 2017)
2. Determining chapters (scope of guidelines)
3. Selecting Chapter Members based upon expertise (March 2018)
4. Selecting the Evidence Review Team: John Hopkins University (May 2018)
5. Refining topics included in the SOC-8 and review questions for systematic reviews
6. Conducting systematic reviews (March 2019)
7. Drafting the recommendation statements
8. Voting on the recommendation statements using a Delphi process (September 2019–February 2022)
9. Grading of the recommendations statements
10. Writing the text supporting the statements
11. Independently validating the references used in the supportive text
12. Finalizing a draft SOC-8 (December 1, 2021)
13. Feedback on the statements by International Advisory Committee
14. Feedback on the entire draft of the SOC-8 during a public comment period (November 2021–January 2022)
15. Revision of Final Draft based on comments (January 2022- May 2022)
16. Approval of final Draft by Chair and Co-Chairs (June 10, 2022)
17. Approval by the WPATH Board of Directors
18. Publication of the SOC-8
19. Dissemination and translation of the SOC-8

3.1. Establishment of Guideline Steering Committee

The WPATH Guideline Steering Committee oversaw the guideline development process for all chapters of the Standards of Care. Except for the Chair (Eli Coleman) who was appointed by the WPATH board to maintain a continuity from previous SOC editions, members of the Guideline Steering Committee were selected by the WPATH Board from WPATH members applying for these positions. Job descriptions were developed for the positions of Co-Chairs, Chapter Leads, Chapter Members and Stakeholder. WPATH members were eligible to apply by completing an application form and submitting their CV. The Board of WPATH voted for the position of co-chair (one member of the board did not participate in view of conflict of interest). The chairs and co-chairs selected the chapter leads and members (as well as stakeholders) based on the application form and CVs.

The Guideline Steering Committee for Standards of Care 8th Version are:

- Eli Coleman, PhD (Chair) Professor, Director and Academic Chair, Institute for Sexual and Gender Health, Department of Family Medicine and Community Health, University of Minnesota Medical School (USA)
- Asa Radix, MD, PhD, MPH (Co-chair) Senior Director, Research and Education Callen-Lorde Community Health Center Clinical Associate Professor of Medicine New York University, USA
- Jon Arcelus, MD, PhD (Co-chair) Professor of Mental Health and Well-being Honorary Consultant in Transgender Health University of Nottingham, UK
- Karen A. Robinson, PhD (Lead, Evidence Review Team) Professor of Medicine, Epidemiology and Health Policy & Management Johns Hopkins University, USA

3.2. Determination of topics for chapters

The Guideline Steering Committee determined the chapters for inclusion in the Standards of Care by reviewing the literature and by reviewing the previous edition of the SOC. The chapters in the Standards of Care 8th Version:

1. Terminology
2. Global Applicability
3. Population estimates
4. Education*
5. Assessment of Adults
6. Adolescent
7. Children
8. Nonbinary
9. Eunuch
10. Intersex
11. Institutional environments
12. Hormone Therapy
13. Surgery and Postoperative Care
14. Voice and communication
15. Primary care
16. Reproductive Health
17. Sexual Health
18. Mental Health

* The Education Chapter was originally intended to cover both education and ethics. A decision was made to create a separate committee to write a chapter on ethics. In the course of writing the chapter, it was later determined topic of ethics was best placed external to the SOC8 and required further in-depth examination of ethical considerations relevant to transgender health.

3.3. Selection of chapter members

A call for applications to be part of the SOC-8 review committee (chapter lead or member) was sent to the WPATH membership. The Chairs of the Guideline Steering Committee appointed the members for each chapter, ensuring representation from a variety of disciplines and perspectives.

Chapter Leads and Members were required to be WPATH Full Members in good standing and content experts in transgender health, including in at least one chapter topic. Chapter Leads reported to the Guideline Steering Committee and were responsible for coordinating the participation of Chapter Members. Chapter members reported directly to the Chapter Lead.

Each chapter also included stakeholders as members who bring perspectives of transgender health advocacy or work in the community, or as a member of a family that included a transgender child, sibling, partner, parent, etc. Stakeholders were not required to be full members of WPATH.

The Chapter Members were expected to:

- Participate in the development refinement of review questions
- Read and provide comments on all materials from the Evidence Review Team
- Critically review draft documents, including the draft evidence report
- Review and assess evidence and draft recommendations
- Participate in the Delphi consensus process
- Develop the text to back up the recommendation statements
- Grade each statement to describe the strength of the recommendation
- Review and address the comments from the Chairs during the whole process
- Develop the content of the chapters
- Review comments from public comments and assist in the development of a revision of guidelines
- Provide input and participate in the dissemination of guidelines

Training and orientation for Chapter Leads and Members was provided, as needed. Training content included formulation and refinement of questions (i.e., use of PICO), reviewing the evidence, developing recommendation state-

ments, grading the evidence and the recommendations, and information about the guideline development program and process.

A total of 26 chapter-leads were appointed (some chapters required co-leads), 77 chapter members and 16 stakeholders. A total of 127 were selected. During the SOC process, 8 people left, due to personal or work-related issues. Therefore, there were 119 final authors of the SOC-8.

3.4. Selection of the evidence review team

The WPATH Board issued a request for applications to become the Evidence Review Team. For Standards of Care 8th Version the WPATH Board engaged the Evidence Review Team at Johns Hopkins University under the leadership of Karen Robinson.

- Karen A. Robinson, PhD (Lead, Evidence Review Team) Professor of Medicine, Epidemiology and Health Policy & Management Johns Hopkins University, USA

Dr Robinson also guided the steering committee in the development of the SOC-8 by providing advice and training in the development of PICO questions, statements, and the Delphi process as well as undertaking a very rigorous systematic literature review where direct evidence was available.

Conflict of interest

Members of the Guideline Steering Committee, Chapter Leads and Members, and members of the Evidence Review Team were asked to disclose any conflicts of interest. Also reported, in addition to potential financial and competing interests or conflicts, are personal or direct reporting relationships with a chair, co-chair or a WPATH Board Member or the holding of a position on the WPATH Board of Directors.

3.5. Refinement of topics and review of questions

The Evidence Review Team abstracted the recommendation statements from the prior version of the Standards of Care. With input from the Evidence Review Team, the Guideline Steering Committee and Chapter Leads determined:

- Recommendation statements that needed to be updated
- New areas requiring recommendation statements

3.6. Conduct the systematic reviews

Chapter Members developed questions to help develop recommendation statements. For the questions eligible for systematic review, the Evidence Review Team drafted review questions, specifying the Population, Interventions, Comparisons, and Outcomes (PICO elements). The Evidence Review Team undertook the systematic reviews. The Evidence Review Team presented evidence tables and other results of the systematic reviews to the members of the relevant chapter for feedback.

Protocol

A separate detailed systematic review protocol was developed for each review question or topic, as appropriate. Each protocol was registered on PROSPERO.

Literature search

The Evidence Review Team developed a search strategy appropriate for each research question including MEDLINE®, Embase™, and the Cochrane Central Register of Controlled Trials (CENTRAL). The Evidence Review Team searched additional databases as deemed appropriate for the research question. The search strategy included MeSH and text terms and was not limited by language of publication or date.

The Evidence Review Team hand searched the reference lists of all included articles and recent, relevant systematic reviews. The Evidence Review Team searched ClinicalTrials.gov for any additional relevant studies.

Searches were updated during the peer review process.

The literature included in the systematic review was mostly based on quantitative studies conducted in Europe, the US or Australia. We acknowledge a bias towards perspectives from the global north that does not pay sufficient attention to the diversity of lived experiences and perspectives within transgender and gender diverse (TGD) communities across the world. This imbalance of visibility in the literature points to a research and practice gap that needs to be addressed by researchers and practitioners in the future in order to do justice to the support needs of all TGD people independent of gender identification.

Study selection

The Evidence Review Team, with input from the Chapter Workgroup Leads, defined the eligibility criteria for each research question *a priori*.

Two reviewers from the Evidence Review Team independently screened titles and abstracts and full-text articles for eligibility. To be excluded, both reviewers needed to agree that the study met at least one exclusion criteria. Reviewers resolved differences regarding eligibility through discussion.

Data extraction

The Evidence Review Team used standardized forms to abstract data on general study characteristics, participant characteristics, interventions, and outcome measures. One reviewer abstracted the data, and a second reviewer confirmed the abstracted data.

Assessment of risk of bias

Two reviewers from the Evidence Review Team independently assessed the risk of bias for each included study. For

randomized controlled trials, the Cochrane Risk of Bias Tool was used. For observational studies, the Risk of Bias in Non-Randomized Studies—of Interventions (ROBINS-I) tool was used. Where deemed appropriate, existing recent systematic reviews were considered and evaluated using ROBIS.

Data synthesis and analysis

The Evidence Review Team created evidence tables detailing the data abstracted from the included studies. The members of the Chapter Workgroups reviewed and provided comments on the evidence tables.

Grading of the evidence

The Evidence Review Team assigned evidence grades using the GRADE methodology. The strength of the evidence was obtained using predefined critical outcomes for each question and by assessing the limitations to individual study quality/risk of bias, consistency, directness, precision, and reporting bias.

3.7. Drafting of the Recommendation Statements

Chapter Leads and Members drafted recommendation statements. The statements were crafted to be feasible, actionable, and measurable.

Evidence-based recommendation statements were based on the results of the systematic, and background literature reviews plus consensus-based expert opinions.

The Chair and Co-Chairs and Chapter Leads reviewed and approved all recommendation statements for clarity and consistency in wording. During this review and throughout the process any overlap between chapters was also addressed.

Many chapters had to work closely together to ensure consistency of their recommendations. For example, as there are now separate chapters for childhood and adolescence, to ensure consistency between both chapters, some authors were part of both chapters. For a similar reason, when applicable, a workgroup collaborated with other Chapter Workgroups on topics shared between the chapters (i.e., Assessment of Children, Assessment of Adults, Hormone Therapy, Surgery and Postoperative Care and Reproductive Health).

3.8. Approval of the recommendations using the Delphi process

Formal consensus for all statements was obtained using the Delphi process (a structured solicitation of expert judgements in three rounds). For a recommendation to be approved, a minimum of 75% of the voters had to approve the statement. A minimum of 65% of the SOC-8 members had to take part in the Delphi process for each statement. People who did not approve the statement had to provide information as to the reasons for their disapproval, so the statement could be modified (or removed) according to this feedback. Once modified, the statement was put through the Delphi process again. If after 3 rounds the statement was not approved, the statement was removed from the SOC. Every member of the SOC voted for each statement. There was a response rate between (74.79% and 94.96%) for the statements.

3.9. Grading criteria for statements

Once the statements passed the Delphi process, chapter members graded each statement using a process adapted from the Grading of Recommendations, Assessment, Development and Evaluations (GRADE) framework. This a transparent framework for developing and presenting summaries of evidence and provides a systematic approach for making clinical practice recommendations (Guyatt et al., 2011). The statements were graded based on factors such as:

- The balance of potential benefits and harms
- Confidence in that balance or quality of evidence
- Values and preferences of providers and patients
- Resource use and feasibility

The statements were classified as:

- Strong recommendations ("we recommend") are for those interventions/therapy/strategies where:
  - the evidence is of high quality
  - estimates of the effect of an intervention/therapy/strategy (i.e., there is a high degree of certainty effects will be achieved in practice)
  - there are few downsides of therapy/intervention/strategy
  - there is a high degree of acceptance among providers and patients or those for whom the recommendation applies.
- Weak recommendations ("we suggest") are for those interventions/therapy/strategies where:
  - there are weaknesses in the evidence base
  - there is a degree of doubt about the size of the effect that can be expected in practice
  - there is a need to balance the potential upsides and downsides of interventions/therapy/strategies
  - there are likely to be varying degrees of acceptance among providers and patients or those for whom the recommendation applies.

3.10. Writing of the text supporting the statements

Following the grading of the statements, the Chapter Workgroups wrote the text providing the rationale or reasoning for the recommendation. This included providing the available evidence, providing details about potential benefits and harms, describing uncertainties, and information about implementation of the recommendation, including expected barriers or challenges among others. References use APA-7 style, to support the information in the text. Links to resources are also provided, as appropriate. The text, including whether a recommendation has been described as strong or weak, was reviewed and approved by the Chair and Co-Chairs.

3.11. External validation of references used to support the statements

A group of independent clinical academics working in the field of transgender health reviewed the references used in every chapter in order to validate that the references were appropriately used to support the text. Any queries regarding the references were sent back to the chapters for review.

3.12. Finalizing a draft SOC-8

A final SOC-8 draft was made available for comments.

3.13. Distribute Standards of Care for review by international advisors

The statements of the recommendations of Standards of Care 8th were circulated among the broader Standards of Care Revision Committee and the WPATH International Advisory Group, which included the Asia Pacific Transgender Network (APTN), the Global Action for Transgender Equality (GATE), the International Lesbian, Gay, Bisexual, Transgender, Intersex Association (ILGA), and Transgender Europe (TGEU).

3.14. Public comment period

The revised draft version of the Standards of Care document was posted online for comment from the public, including WPATH members, on the WPATH website. A 6-week period was allocated for comments. A total of 1,279 people made comments on the draft with a total of 2,688 comments.

3.15. Revision of final draft based on comments

The Chapter Leads and Guideline Steering Committee considered the feedback and made any necessary revisions. All public comments were read and, where appropriate, integrated into the background text.

As part of this process, 3 new Delphi statements were developed and 2 were modified enough to require a new vote by the SOC-8 committee. This meant a new Delphi process was initiated in January 2022. The results of this Delphi process were accepted by the chapters, and the new statements were added or modified accordingly. The new supportive text was added.

All the new versions of the chapters were reviewed again by the Chair and Co-Chairs and changes or modifications were suggested. Finally, once the Chairs and the Chapter Members were satisfied with the draft, the chapter was finalized.

All new references were double checked by an independent member.

3.16. Approval of final draft by Chair and Co-Chairs

Modifications were reviewed by the Chairs and were accepted by them.

3.17. Approval by the WPATH Board of Directors

The final document was presented to the WPATH Board of Directors for approval and it was approved on the 20th of June 2022.

3.18. Publication of the SOC-8 and dissemination of the Standards of Care

The Standards of Care was disseminated in a number of venues and in a number of formats including publication in the International Journal of Transgender Health (the official scientific journal of WPATH).

4. Plan to Update

A new edition of the SOC (SOC-9) will be developed in the future, when new evidence and/or significant changes in the field necessitating a new edition is substantial.

*The development of SOC-8 was a complex process at a time of COVID-19 and political uncertainties in many parts of the world. Members of the SOC-8 worked on the SOC-8 on top of their day-to-day job, and most of the meetings took place out of their working time and during their weekends via Zoom. There were very few face-to-face meetings, most of them linked to WPATH, USPATH or EPATH conferences. Committee members of the SOC-8 were not paid as part of this process.

Appendix B GLOSSARY

CISGENDER refers to people whose current gender identity corresponds to the sex they were assigned at birth.
DETRANSITION is a term sometimes used to describe an individual's retransition to the gender stereotypically associated with their sex assigned at birth.
EUNUCH refers to an individual assigned male at birth whose testicles have been surgically removed or rendered non-functional and who identifies as a eunuch. This differs from the standard medical definition by excluding those who do not identify as eunuch.
EUNUCH-IDENTIFIED: An individual who feels their true self is best expressed by the term eunuch. Eunuch-identified individuals generally desire to have their reproductive organs surgically removed or rendered non-functional.
GENDER: Depending on the context, gender may reference gender identity, gender expression, and/or social gender role, including understandings and expectations culturally tied to people who were assigned male or female at birth. Gender identities other than those of men and women (who can be either cisgender or transgender) include transgender, nonbinary, genderqueer, gender neutral, agender, gender fluid, and "third" gender, among others; many other genders are recognized around the world.
GENDER-AFFIRMATION refers to being recognized or affirmed in a person's gender identity. It is usually conceptualized as having social, psychological, medical, and legal dimensions. Gender affirmation is used as a term in lieu of transition (as in medical gender-affirmation) or can be used as an adjective (as in gender-affirming care).
GENDER-AFFIRMATION SURGERY (GAS) is used to describe surgery to change primary and/or secondary sex characteristics to affirm a person's gender identity.
GENDER BINARY refers to the idea there are two and only two genders, men and women; the expectation that everyone must be one or the other; and that all men are males, and all women are females.
GENDER DIVERSE is a term used to describe people with gender identities and/or expressions that are different from social and cultural expectations attributed to their sex assigned at birth. This may include, among many other culturally diverse identities, people who identify as nonbinary, gender expansive, gender nonconforming, and others who do not identify as cisgender.
GENDER DYSPHORIA describes a state of distress or discomfort that may be experienced because a person's gender identity differs from that which is physically and/or socially attributed to their sex assigned at birth. Gender Dysphoria is also a diagnostic term in the DSM-5 denoting an incongruence between the sex assigned at birth and experienced gender accompanied by distress. Not all transgender and gender diverse people experience gender dysphoria.
GENDER EXPANSIVE is an adjective often used to describe people who identify or express themselves in ways that broaden the socially and culturally defined behaviors or beliefs associated with a particular sex. Gender creative is also sometimes used. The term gender variant was used in the past and is disappearing from professional usage because of negative connotations now associated with it.
GENDER EXPRESSION refers to how a person enacts or expresses their gender in everyday life and within the context of their culture and society. Expression of gender through physical appearance may include dress, hairstyle, accessories, cosmetics, hormonal and surgical interventions as well as mannerisms, speech, behavioral patterns, and names. A person's gender expression may or may not conform to a person's gender identity.
GENDER IDENTITY refers to a person's deeply felt, internal, intrinsic sense of their own gender.
GENDER INCONGRUENCE is a diagnostic term used in the ICD-11 that describes a person's marked and persistent experience of an incompatibility between that person's gender identity and the gender expected of them based on their birth-assigned sex.
INTERSEX refers to people born with sex or reproductive characteristics that do not fit binary definitions of female or male.
MISGENDER/MISGENDERING refers to when language is used that does not correctly reflect the gender with which a person identifies. This may be a pronoun (he/him/his, she/her/hers, they/them/theirs) or a form of address (sir, Mr.).
NONBINARY refers to those with gender identities outside the gender binary. People with nonbinary gender identities may identify as partially a man and partially a woman or identify as sometimes a man and sometimes a woman, or identify as a gender other than a man or a woman, or as not having a gender at all. Nonbinary people may use the pronouns they/them/theirs instead of he/him/his or she/her/hers. Some nonbinary people consider themselves to be transgender or trans; some do not because they consider transgender to be part of the gender binary. The shorthand NB or "enby" is sometimes used as a descriptor for nonbinary. Examples of nonbinary gender identities are genderqueer, gender diverse, genderfluid, demigender, bigender, and agender.
RETRANSITION refers to second or subsequent gender transition whether by social, medical, or legal means. A retransition may be from one binary or nonbinary gender to another binary or nonbinary gender. People may retransition more than once. Retransition may occur for many reasons, including evolving gender identities, health concerns, family/societal concerns, and financial issues.
SEX ASSIGNED AT BIRTH refers to a person's status as male, female, or intersex based on physical characteristics. Sex is usually assigned at birth based on appearance of the external genitalia. AFAB is an abbreviation for "assigned female at birth." AMAB is an abbreviation for "assigned male at birth."
SEXUAL ORIENTATION refers to a person's sexual identity, attractions, and behaviors in relation to people on the basis of their gender(s) and or sex characteristics and those of their partners. Sexual orientation and gender identity are distinct terms.
TRANSGENDER or trans are umbrella terms used to describe people whose gender identities and/or gender expressions are not what is typically expected for the sex to which they were assigned at birth. These words should always be used as adjectives (as in "trans people") and never as nouns (as in "transgenders") and never as verbs (as in "transgendered").

TRANSGENDER MEN or **TRANS MEN** or **MEN OF TRANS EXPERIENCE** are people who have gender identities as men and who were assigned female at birth. They may or may not have undergone any transition. FTM or Female-to-Male are older terms that are falling out of use.
TRANSGENDER WOMEN or **TRANS WOMEN** or **WOMEN OF TRANS EXPERIENCE** are people who have gender identities as women and who were assigned male at birth. They may or may not have undergone any transition. MTF or Male-to-Female are older terms that are falling out of use.
TRANSITION refers to the process whereby people usually change from the gender expression associated with their assigned sex at birth to another gender expression that better matches their gender identity. People may transition socially by using methods such as changing their name, pronoun, clothing, hair styles, and/or the ways that they move and speak. Transitioning may or may not involve hormones and/or surgeries to alter the physical body. Transition can be used to describe the process of changing one's gender expression from any gender to a different gender. People may transition more than once in their lifetimes.
TRANSPHOBIA refers to negative attitudes, beliefs, and actions concerning transgender and gender diverse people as a group. Transphobia may be enacted in discriminatory policies and practices on a structural level or in very specific and personal ways. Transphobia can also be internalized, when transgender and gender diverse people accept and reflect such prejudice about themselves or other transgender and gender diverse people. While transphobia sometimes may be a result of unintentional ignorance rather than direct hostility, its effects are never benign. Some people use the term anti-transgender bias in place of transphobia.

Appendix C GENDER-AFFIRMING HORMONAL TREATMENTS

Table 1. Expected time course of physical changes in response to gender-affirming hormone therapy

Testosterone Based Regimen		
Effect	**Onset**	**Maximum**
Skin Oiliness/acne	1–6 months	1–2 years
Facial/body hair growth	6–12 months	>5 years
Scalp hair loss	6–12 months	>5 years
Increased muscle mass/ strength	6–12 months	2–5 years
Fat redistribution	1–6 months	2–5 years
Cessation of menses	1–6 months	1–2 years
Clitoral enlargement	1–6 months	1–2 years
Vaginal atrophy	1–6 months	1–2 years
Deepening of voice	1–6 months	1–2 years
Estrogen and testosterone-lowering based regimens		
Effect	**Onset**	**Maximum**
Redistribution of body fat	3–6 months	2–5 years
Decrease in muscle mass and strength	3–6 months	1–2 years
Softening of skin/ decreased oiliness	3–6 months	Unknown
Decreased sexual desire	1–3 months	Unknown
Decreased spontaneous erections	1–3 months	3–6 months
Decreased sperm production	Unknown	2 years
Breast growth	3–6 months	2–5 years
Decreased testicular volume	3–6 months	Variable
Decreased terminal hair growth	6–12 months	> 3 years
Increased scalp hair	Variable	Variable
Voice changes	None	

Adapted from Hembree et al., 2017.

Table 2. Risks associated with gender affirming hormone therapy (bolded items are clinically significant) (Updated from SOC-7)

RISK LEVEL	Estrogen-based regimens	Testosterone-based regimens
Likely increased risk	**Venous Thromboembolism**	**Polycythemia**
	Infertility	**Infertility**
	Hyperkalemia[s]	Acne
	Hypertrigyceridemia	Androgenic Alopecia
	Weight Gain	Hypertension
		Sleep Apnea
		Weight Gain
		Decreased HDL Cholesterol and increased LDL Cholesterol
Likely increased risk with presence of additional risk factors	Cardiovascular Disease Cerebrovascular Disease Meningioma[c] Polyuria/Dehydration[s] Cholelithiasis	Cardiovascular Disease Hypertriglyceridemia
Possible increased risk	Hypertension Erectile Dysfunction	
Possible increased risk with presence of additional risk factors	Type 2 Diabetes Low Bone Mass/ Osteoporosis Hyperprolactinemia	Type 2 Diabetes Cardiovascular Disease
No increased risk or inconclusive	Breast and Prostate Cancer	Low Bone Mass/ Osteoporosis Breast, Cervical, Ovarian, Uterine Cancer

[c]cyproterone-based regimen
[s]spironolactone-based regimen

Table 3. Gender-Affirming Hormone Regimens In Transgender And Gender Diverse Youth (Adapted from the Endocrine Society Guidelines; Hembree et al., 2017)

Induction of female puberty (estrogen-based regimen) with oral 17ß-estradiol
Initiate at 5µg/kg/d and increase every 6 months by 5 µg/kg/d up to 20 µg/kg/d according to estradiol levels
Adult dose = 2-6 mg/day
In postpubertal TGD adolescents, the dose of 17ß-estradiol can be increased more rapidly:
1 mg/d for 6 months followed by 2 mg/d and up according to estradiol levels
Induction of female puberty (estrogen-based regimen) with transdermal 17ß-estradiol
Initial dose 6.25-12.5 µg/24 h (cutting 24 g patch to ¼ then ½)
Titrate up by every 6 months by 12.5 µg/24 h according to estradiol levels
Adult dose = 50-200 µg/24 hours
For alternatives once at adult dose (Table 4)
Induction of male puberty (testosterone-based regimen) with testosterone esters
25 mg/m²/2 weeks (or alternatively half this dose weekly)
Increase by 25 mg/m²/2 weeks every 6 months until adult dose and target testosterone levels are achieved. See alternatives for testosterones (Table 4)

Table 4. Hormone regimens in transgender and gender diverse adults*

Estrogen-based regimen (Transfeminine)	
Estrogen	
Oral or sublingual	
Estradiol	2.0-6.0 mg/day
Transdermal	
Estradiol transdermal patch	0.025-0.2 mg/day
Estradiol gel various	‡ daily to skin
Parenteral	
Estradiol valerate or cypionate	5-30 mg IM every 2 weeks 2-10 IM every week
Anti-Androgens	
Spironolactone	100–300 mg/day
Cyproterone acetate	10 mg/day**
GnRH agonist	3.75–7.50 mg SQ/IM monthly
GnRH agonist depot formulation	11.25/22.5 mg SQ/IM 3/6 monthly
‡ Amount applied varies to formulation and strength	
Testosterone-Based Regimen (Transmasculine)	
Transgender males	
Testosterone	
Parenteral	
Testosterone enanthate/ cypionate	50–100 IM/SQ weekly or 100–200 IM every 2 weeks
Testosterone undecanoate	1000 mg IM every 12 weeks or 750 mg IM every 10 weeks
Transdermal testosterone	
Testosterone gel	50-100 mg/day
Testosterone transdermal patch	2.5–7.5 mg/day

Doses are titrated up or down until sex steroid hormone levels are in the therapeutic range. Hormone regimens do not reflect all formulations that are available in all pharmacies throughout the world. Hormone regimens may have to be adapted to what is available in local pharmacies.
**Kuijpers et al (2021).

Table 5. Hormone monitoring of transgender and gender diverse people receiving gender-affirming hormone therapy (Adapted from the Endocrine Society Guidelines)

Transgender male or trans masculine (including gender diverse/nonbinary) individuals

1. Evaluate patient approximately every 3 months (with dose changes) in the first year and 1 to 2 times per year thereafter to monitor for appropriate physical changes in response to testosterone.
2. Measure serum total testosterone every 3 months (with dose changes) until levels are at goal
   a. For parenteral testosterone, the serum total testosterone should be measured midway between injections. The target level is 400-700 ng/dL. Alternatively, measure peak and trough peaks to ensure levels remain in the range of reference men.
   b. For parenteral testosterone undecanoate, testosterone should be measured just before injection. If the level is < 400 ng/dL, adjust the dosing interval.
   c. For transdermal testosterone, the testosterone level can be measured no sooner than after 1 week of daily application (at least 2 hours after application of product).
3. Measure hematocrit or hemoglobin concentrations at baseline and approximately 3 months (with dose changes) for the first year and then one to two times a year.

Transgender Female or trans feminine (including gender diverse/nonbinary) individuals

1. Evaluate patient approximately every 3 months (with dose changes) in the first year and one to two times per year thereafter to monitor for appropriate physical changes in response to estrogen.
   a. Serum testosterone levels should be less than 50 ng/dL.
   b. Serum estradiol should be in the range of 100-200 pg/mL.
2. For individuals receiving spironolactone, serum electrolytes, in particular potassium, and kidney function, in particular creatinine, should be monitored.
3. Follow primary care screening per primary care chapter recommendations

Appendix D SUMMARY CRITERIA FOR HORMONAL AND SURGICAL TREATMENTS FOR ADULTS AND ADOLESCENTS

The SOC-8 guidelines are intended to be flexible in order to meet the diverse health care needs of TGD people globally. While adaptable, they offer consensus-based standards derived from the best available scientific evidence for promoting optimal health care and guiding the treatment of people experiencing gender incongruence. As in all previous versions of the SOC, the criteria put forth in this document for gender affirming interventions are clinical guidelines; individual health care professionals and programs, in consultation with the TGD person, may modify them. Clinical departures from the SOC may occur due to a TGD person's unique anatomic, social, or psychological situation; an experienced health care professional's evolving method of handling a common situation; a research protocol; lack of resources in various parts of the world; or the need for specific harm-reduction strategies. These departures should be recognized as such, discussed with the TGD person, and documented. This documentation is also valuable for the accumulation of new data, which can be retrospectively examined to allow for health care—and the SOC—to evolve. This summary criteria needs to be read in conjunction with the relevant chapters (see Adult Assessment and Adolescent chapters).

SUMMARY CRITERIA FOR ADULTS

Related to the assessment process

- Health care professionals assessing transgender and gender diverse adults seeking gender-affirming treatment should liaise with professionals from different disciplines within the field of trans health for consultation and referral, if required*
- If written documentation or a letter is required to recommend gender affirming medical and surgical treatment (GAMST), only one letter of assessment from a health care professional who has competencies in the assessment of transgender and gender diverse people is needed.

Criteria for hormones

a. Gender incongruence is marked and sustained;
b. Meets diagnostic criteria for gender incongruence prior to gender-affirming hormone treatment in regions where a diagnosis is necessary to access health care;
c. Demonstrates capacity to consent for the specific gender-affirming hormone treatment;
d. Other possible causes of apparent gender incongruence have been identified and excluded;
e. Mental health and physical conditions that could negatively impact the outcome of treatment have been assessed, with risks and benefits discussed;
f. Understands the effect of gender-affirming hormone treatment on reproduction and they have explored reproductive options.

Criteria for surgery

a. Gender incongruence is marked and sustained;
b. Meets diagnostic criteria for gender incongruence prior to gender-affirming surgical intervention in regions where a diagnosis is necessary to access health care;
c. Demonstrates capacity to consent for the specific gender-affirming surgical intervention;
d. Understands the effect of gender-affirming surgical intervention on reproduction and they have explored reproductive options;
e. Other possible causes of apparent gender incongruence have been identified and excluded;
f. Mental health and physical conditions that could negatively impact the outcome of gender-affirming surgical intervention have been assessed, with risks and benefits have been discussed;
g. Stable on their gender affirming hormonal treatment regime (which may include at least 6 months of hormone treatment or a longer period if required to achieve the desired surgical result, unless hormone therapy is either not desired or is medically contraindicated).*

*These were graded as suggested criteria

SUMMARY CRITERIA FOR ADOLESCENTS

Related to the assessment process

- A comprehensive biopsychosocial assessment including relevant mental health and medical professionals;
- Involvement of parent(s)/guardian(s) in the assessment process, unless their involvement is determined to be harmful to the adolescent or not feasible;
- If written documentation or a letter is required to recommend gender-affirming medical and surgical treatment (GAMST), only one letter of assessment from a member of the multidisciplinary team is needed. This letter needs to reflect the assessment and opinion from the team that involves both medical and mental health professionals (MHPs).

Puberty blocking agents

a. Gender diversity/incongruence is marked and sustained over time;
b. Meets the diagnostic criteria of gender incongruence in situations where a diagnosis is necessary to access health care;
c. Demonstrates the emotional and cognitive maturity required to provide informed consent/assent for the treatment;
d. Mental health concerns (if any) that may interfere with diagnostic clarity, capacity to consent, and gender-affirming medical treatments have been addressed; sufficiently so that gender-affirming medical treatment can be provided optimally.
e. Informed of the reproductive effects, including the potential loss of fertility and the available options to preserve fertility;
f. Reached Tanner stage 2.

Hormonal treatments

a. Gender diversity/incongruence is marked and sustained over time;
b. Meets the diagnostic criteria of gender incongruence in situations where a diagnosis is necessary to access health care;
c. Demonstrates the emotional and cognitive maturity required to provide informed consent/assent for the treatment;
d. Mental health concerns (if any) that may interfere with diagnostic clarity, capacity to consent, and gender-affirming medical treatments have been addressed; sufficiently so that gender-affirming medical treatment can be provided optimally.
e. Informed of the reproductive effects, including the potential loss of fertility and the available options to preserve fertility;
f. Reached Tanner stage 2.

Surgery

a. Gender diversity/incongruence is marked and sustained over time;
b. Meets the diagnostic criteria of gender incongruence in situations where a diagnosis is necessary to access health care;
c. Demonstrates the emotional and cognitive maturity required to provide informed consent/assent for the treatment;
d. Mental health concerns (if any) that may interfere with diagnostic clarity, capacity to consent, and gender-affirming medical treatments have been addressed; sufficiently so that gender-affirming medical treatment can be provided optimally.
e. Informed of the reproductive effects, including the potential loss of fertility and the available options to preserve fertility;
f. At least 12 months of gender-affirming hormone therapy or longer, if required, to achieve the desired surgical result for gender-affirming procedures, including breast augmentation, orchiectomy, vaginoplasty, hysterectomy, phalloplasty, metoidioplasty, and facial surgery as part of gender-affirming treatment unless hormone therapy is either not desired or is medically contraindicated.

Appendix E GENDER-AFFIRMING SURGICAL PROCEDURES

As the field's understanding of the many facets of gender incongruence expands, and as technology develops which allows for additional treatments, it is imperative to understand this list is not intended to be exhaustive. This is particularly important given the often lengthy time periods between updates to the SOC, during which evolutions in understanding and treatment modalities may occur.

FACIAL SURGERY	
Brow	• Brow reduction • Brow augmentation • Brow lift
Hair line advancement and/or hair transplant	
Facelift/mid-face lift (following alteration of the underlying skeletal structures)	
Facelift/mid-face lift (following alteration of the underlying skeletal structures)	• Platysmaplasty
Blepharoplasty	• Lipofilling
Rhinoplasty (+/- fillers)	
Cheek	• Implant • Lipofilling
Lip	• Upper lip shortening • Lip augmentation (includes autologous and non-autologous)
Lower jaw	• Reduction of mandibular angle • Augmentation
Chin reshaping	• Osteoplastic • Alloplastic (implant-based)
Chondrolaryngoplasty	• Vocal cord surgery (see voice chapter)
BREAST/CHEST SURGERY	
Mastectomy	• Mastectomy with nipple-areola preservation/reconstruction as determined medically necessary for the specific patient • Mastectomy without nipple-areola preservation/reconstruction as determined medically necessary for the specific patient
Liposuction	
Breast reconstruction (augmentation)	• Implant and/or tissue expander • Autologous (includes flap-based and lipofilling)
GENITAL SURGERY	
Phalloplasty (with/without scrotoplasty)	• With/without urethral lengthening • With/without prosthesis (penile and/or testicular) • With/without colpectomy/colpocleisis
Metoidioplasty (with/without scrotoplasty)	• With/without urethral lengthening • With/without prosthesis (penile and/or testicular) • With/without colpectomy/colpocleisis
Vaginoplasty (inversion, peritoneal, intestinal)	• May include retention of penis and/or testicle
Vulvoplasty	• May include procedures described as "flat front"
GONADECTOMY	
Orchiectomy	
Hysterectomy and/or salpingo-oophorectomy	
BODY CONTOURING	
Liposuction	
Lipofilling	
Implants	• Pectoral, hip, gluteal, calf
Monsplasty/mons reduction	
ADDITIONAL PROCEDURES	
Hair removal: Hair removal from the face, body, and genital areas for gender affirmation or as part of a preoperative preparation process. (see Statement 15.14 regarding hair removal)	• Electrolysis • Laser epilation
Tattoo (i.e., nipple-areola)	
Uterine transplantation	
Penile transplantation	

IN THE UNITED STATES DISTRICT COURT
FOR THE NORTHERN DISTRICT OF FLORIDA
TALLAHASSEE DIVISION

AUGUST DEKKER, et al., *Plaintiffs*, v. JASON WEIDA, et al., *Defendants*.	Case No. 4:22-cv-00325-RH-MAF

EXPERT REPORT OF MICHAEL K. LAIDLAW, M.D.

Confidential Redacted Copy

Redactions are pursuant to this Court's Protective Order in this case.

I, Michael K. Laidlaw, M.D., hereby declare as follows:

1. I am over the age of eighteen and submit this expert declaration based on my personal knowledge and experience.

2. I am a board-certified endocrinologist. I received my medical degree from the University of Southern California in 2001. I completed my residency in internal medicine at Los Angeles County/University of Southern California Medical Center in 2004. I also completed a fellowship in endocrinology, diabetes and metabolism at Los Angeles County/University of Southern California Medical Center in 2006.

3. The information provided regarding my professional background are detailed in my curriculum vitae. A true and correct copy of my curriculum vitae is attached as Exhibit A.

4. In my clinical practice as an endocrinologist, I evaluate and treat patients with hormonal and/or gland disorders. Hormone and gland disorders can cause or be associated with psychiatric symptoms, such as depression, anxiety, and other psychiatric symptoms. Therefore, I frequently assess and treat patients demonstrating psychiatric symptoms and determine whether their psychiatric symptoms are being caused by a hormonal issue, gland issue, or something else.

5. I have been retained by Defendants in the above-captioned lawsuit to provide an expert opinion on the efficacy and safety of sex reassignment treatment.

6. If called to testify in this matter, I would testify truthfully and based on my expert opinion. The opinions and conclusions I express herein are based on a reasonable degree of scientific certainty.

7. I have testified as an expert witness either at trial or in deposition in the following in the past four years:

a. 2022 Testified in Court. *August Dekker, et at. V Simone Marstiller, et al.*, Case No. 4:22-cv-00325 (N.D. Fla.). Report October 2, 2022.

b. 2022 Testified at Deposition. *C.P., by and through his parents, Patricia Pritchard and Nolle Pritchard, and Patricia Pritchard v. Blue Cross Blue Shield of Illnois*, Case No. 3:20-cv-06145 (W.D. Wash.)

c. 2021 Testified in Court and Deposition. *Juliana Paoli v. Joseph Hudson, et al.,* Case No. VCU279126 (CA Superior, Tulare County)

8. A list of my publications is contained in my curriculum vitae, which is attached as Attachment A.

9. I am being compensated at an hourly rate of $450 per hour plus expenses for my time spent preparing this declaration, and to prepare for and provide testimony in this matter. I am being compensated at an hourly rate of $650 for testimony at depositions or trial. My compensation does not depend on the outcome of this litigation, the opinions I express, or the testimony I may provide.

10. My opinions contained in this report are based on: (1) my clinical experience as an endocrinologist; (2) my clinical experience evaluating individuals who have or have had gender incongruence including a detransitioner; (3) my knowledge of research and studies regarding the treatment of gender dysphoria, including for minors and adults; and (4) my review of the various declarations submitted by Plaintiffs.

11. I was provided with and reviewed the following case-specific materials: The Florida Medicaid's "Generally Accepted Professional Medical Standards Determination on the Treatment of Gender Dysphoria"; the expert declaration of Johanna Olson-Kennedy; the expert declaration of Loren Schechter; the expert declaration of Dan H. Karasic; the expert declaration of Armand H. Matheny Antommaria; the declaration of Brit Rothstein; the declaration of August Dekker; the declaration of Jane Doe; the declaration of Jade Ladue; files from Florida Medicaid.

12. In my professional opinion, treatment interventions on behalf of children and adults diagnosed with gender dysphoria must be held to the same scientific standards as other medical treatments. These interventions must be optimal, efficacious, and safe. Any treatment which alters biological development in children should be used with extreme caution. Except in the case of a fatal injury or disease, the minor will become an adult and present to the adult physician. The adult

physician must be able to have a thorough understanding of any condition which alters the biological development of children and, in the case of the endocrinologist, be knowledgeable about the long term effects of hormones on the human body, particularly when the hormones are being used in ways that alter development.

13. The following expresses my expert opinion regarding minors and adults who present with a disparity between their biological sex and internal feeling about their gender, specifically with regard to the use of social transition, medications which block normal pubertal development, the applications of hormones of the opposite sex, and surgical procedures that alter the genitalia and/or breasts for those individuals.

I. Background

A. Endocrine Disorders

14. Before discussing gender dysphoria and gender affirmative therapy from the perspective of an endocrinologist, it is helpful to discuss the background of endocrine diseases. This background demonstrates the difference in gender dysphoria, which is a psychological diagnosis, and other conditions treated by endocrinologists, which are physical diagnoses.

15. Endocrinology is the study of glands and hormones. Endocrine disorders can be divided into three main types: those that involve hormone excess,

those that involve hormone deficiency, and those that involve structural abnormalities of the glands such as cancers.

16. It is important for the endocrinologist to determine the cause of hormone gland excess or deficiency in order to devise an appropriate treatment plan. The plan will generally be to help bring the hormones back into balance and thus bring the patient back to health.

17. To give an example of hormone excess, hyperthyroidism is a term which means overactivity of the thyroid gland. In this condition excess thyroid hormone is produced by the thyroid gland. This results in various physical and psychological changes for the afflicted patient. Examples of physical changes can include tachycardia or fast heart rate, hand tremors, and weight loss. Examples of psychological symptoms include anxiety, panic attacks, and sometimes even psychosis.

18. An endocrinologist can recognize thyroid hormone excess in part by signs and symptoms, but can also confirm the diagnosis with laboratory testing that shows the thyroid hormones to be out of balance. Once this is determined and the degree of excess is known, then treatments can be given to bring these levels back into balance to benefit the patient's health and to prevent other disease effects caused by excess hormone.

19. To give another example, consider a deficiency of insulin. Insulin is a hormone which regulates blood glucose levels. If there is damage to the pancreas such that insulin levels are very low, then blood glucose levels will rise. If the glucose levels rise to a certain abnormally high level, then this is considered diabetes. In the case of type 1 diabetes, insulin levels are abnormally low and therefore blood glucose levels are abnormally high leading to a variety of signs and symptoms. For example, the patient may have extreme thirst, frequent urination, muscle wasting, and weight loss. They may often experience lethargy and weakness.

20. In this case laboratory tests of glucose and insulin levels can confirm the diagnosis. Once diabetes is confirmed, the patient is then treated with insulin to help restore glucose balance in the body and prevent long-term complications of diabetes.

21. To give an example of a structural abnormality, a patient may have a lump on the thyroid gland in the neck. This may be further examined by an imaging test such as an ultrasound. A needle biopsy can be performed so that the cells can be examined under a microscope. A trained medical professional such as a pathologist can then examine the cells to determine if they are benign or cancerous. In the case of a thyroid cancer, a surgical procedure known as a thyroidectomy may be performed to remove the diseased thyroid gland in order to treat the cancer.

22. Noteworthy in the preceding three examples is that all three disease conditions are diagnosed by physical observations. In other words, a laboratory test of a hormone, an imaging test of an organ, an examination of cells under a microscope, or all three may be employed in the diagnosis of endocrine disease.

B. Gender Dysphoria is a Psychological Diagnosis

23. Gender dysphoria, on the other hand, is not an endocrine diagnosis, it is in fact a psychological diagnosis. It is diagnosed purely by psychological methods of behavioral observation and questioning.

24. Likewise what is termed gender identity is a psychological concept. It has no correlate in the human body. In the letter to the editor I wrote with my colleagues, discussed above, we wrote in our critique of the Endocrine Society Guidelines that "There are no laboratory, imaging, or other objective tests to diagnose a 'true transgender' child" (Laidlaw et al., 2019).

25. For example, one cannot do imaging of the human brain to find the gender identity. Likewise, there is no other imaging, laboratory tests, biopsy of tissue, autopsy of the brain, genetic testing, or other biological markers that can identify the gender identity. There is no known gene that maps to gender identity or to gender dysphoria. In other words, there is no objective physical measure to identify either gender identity or gender dysphoria.

26. This is in contrast to all other endocrine disorders which have a measurable physical change in either hormone levels or gland structure which can be confirmed by physical testing. Therefore, gender dysphoria is a purely psychological phenomenon and not an endocrine disorder. But as my colleagues and I wrote in our letter to the editor, it becomes an endocrine condition through gender affirmative therapy: "Childhood gender dysphoria (GD) is not an endocrine condition, but it becomes one through iatrogenic puberty blockade (PB) and high-dose cross-sex (HDCS) hormones. The consequences of this gender-affirmative therapy (GAT) are not trivial and include potential sterility, sexual dysfunction, thromboembolic and cardiovascular disease, and malignancy" (Laidlaw et al. 2019).

27. As a practicing endocrinologist and scientist, I have made a study of GD and its treatment for two reasons: 1) I want to be sure that my colleagues and I understand the science before we treat any patients with GD; and 2) I am concerned that the medical society that claims to speak for me and other endocrinologists has abandoned scientific principles in endorsing treatments for GD that have questionable scientific support. The opinions expressed in this report are the result of my own experience, studies, education, and review of the scientific literature related to GD.

C. Gender Dysphoria and Desistance

28. GD is a persistent state of distress that stems from the feeling that one's gender identity does not align with their physical sex (American Psychiatric Association, 2013). It has been a relatively rare condition in children and adolescents. However there have been very significant increases in referrals for this condition noted around the globe.

29. For example, in the UK, "The number of referrals to GIDS [Gender Identity Development Service] has increased very significantly in recent years. In 2009, 97 children and young people were referred. In 2018 that number was 2519" (Bell v Tavistock Judgment, 2020). There is evidence that this increase may be in part due to social contagion and fueled by social media/internet use (Littman, 2018).

30. The French National Academy of Medicine wrote recently: "Parents addressing their children's questions about transgender identity or associated distress should remain vigilant regarding the addictive role of excessive engagement with social media, which is both harmful to the psychological development of young people and is responsible for a very significant part of the growing sense of gender incongruence" (SEGM, 2022).

31. In "a study of the Finnish gender identity service, '75% of adolescents [assessed] had been or were currently undergoing child and adolescent psychiatric treatment for reasons other than gender dysphoria' (Kaltiala-Heino, 2015). In fact,

'68% had their first contact with psychiatric services due to other reasons than gender identity issues.' The same study also showed that 26% percent had an autistic spectrum disorder and that a disproportionate number of females (87%) were presenting to the gender clinics compared to the past" (Laidlaw in gdworkinggroup.org, 2018).

32. Desistance is a term indicating that the child, adolescent, or adult who initially presented with gender incongruence has come to experience a realignment of their internal sense of gender and their physical body. "Children with [gender dysphoria] will outgrow this condition in 61% to 98% of cases by adulthood. There is currently no way to predict who will desist and who will remain dysphoric" (Laidlaw et al., 2019; Ristori & Steensma, 2016).

33. Because there is no physical marker to diagnose gender identity, and because it is not possible to predict which child or adolescent will desist, it is not possible to know which young person will remain transgender identified as adults. Also, because the rate of desistance is so high, gender affirmative therapy will necessarily cause serious and irreversible harm to many children and adolescents who would naturally outgrow the condition if not affirmed.

34. Dr. Olson-Kennedy states that "[t]he studies pertaining to desistance upon which the GAPMS Memo relies pertain to prepubertal youth, not adolescents. In fact, contrary to the GAPMS Memo's assertion, studies show that if gender

dysphoria is present in adolescence, it usually persists (DeVries, et al., 2011)." (Oslon-Kennedy decl, p. 22).

35. Dr. Olson-Kennedy confuses prepubertal (a medical term) with preadolescence (a psychological designation). Puberty which pertains to the phsyical development of the reproductive tract, breasts and associated secondary sex characterestics can begin as early as age 8 in girls and age 9 in boys. The studies which have examined desistance involved children aged twelve and under. For example table 1 in Ristori and Steensma 2016 shows multiple studies involving children. For the three most recent - Singh (2012), Wallien & Cohen-Kettenis (2008), and Drummond et al. (2008) - these involved age ranges from 3 to nearly 13 years old.[1] The desistance rate varied from 61 to 88%. Since the upper age was twelve (or slightly higher), this would include children in the age range of 8-12 years old many of whom were going through puberty based on their age and were therefore not Tanner stage 1 (pre-pubertal).[2] Therefore Dr. Olson-Kennedy's statement that

1 "This study provided information on the natural histories of 25 girls with gender identity disorder (GID). Standardized assessment data in childhood (mean age, 8.88 years; range, 3-12 years)" (Drummond et al., 2008).
"The mean age of the participating gender-referred children was 10.47 years (SD = 1.27; range, 8.11–12.77)" (Wallien et al., 2009).
" Standardized assessment data in childhood (mean age, 7.49 years; range, 3–12 years) and at follow-up (mean age, 20.58 years; range, 13–39 years) were used to evaluate gender identity and sexual orientation outcome. At follow-up, 17 participants (12.2%) were judged to have persistent gender dysphoria." (Singh, 2012).

2 To my knowledge the desistance literature does not examine Tanner stages of puberty as part of their studies. However one can infer based on the ages that many children had at least begun puberty (Tanner stage 2) or were at a more advanced stage of puberty.

"[t]he studies pertaining to desistance upon which the GAPMS Memo relies pertain to prepubertal youth" is incorrect.

D. Biological Sex in Contrast to Gender Identity

36. A recognition and understanding of biological sex is critical to my practice as an endocrinologist because the endocrine physiology of men and women, boys and girls, differ.

37. Biological sex is the objective physical condition of having organs and body parts which correspond to a binary sex. There are only two physical sexes, male and female. The male is identified as having organs and tissues such as the penis, testicles and scrotum. The female sex is identified by having organs and tissues such as the labia, vagina, uterus, and ovaries. Biological sex is easily identified by physical observation such that adults and even young children can identify the biological sex of a newborn baby.

38. This is in contrast to gender identity, which does not exist in any physical sense. It is a subjective identification known only once a patient makes it known. It cannot be identified by any physical means, cannot be confirmed by any outside observer, and can change over time.

39. It is also noteworthy that the physical organs described above as representing biological sex have a physical genetic correlate. In other words, it is a

well-established scientific fact that two X chromosomes identify the cells correlating to a female person, and an X and a Y chromosome correlate to a male person.

40. Sex is clearly identified in 99.98% of cases by chromosomal analysis (Sax, 2002). Sex is also clearly recognized at birth in 99.98% of cases (Id.). Therefore, sex is a clear provable objective reality that can be identified through advanced testing such as karyotyping, or simple genital identification at birth by any layperson. The other 0.02% of cases have some disorder of sexual development (DSD). DSDs do not represent an additional sex or sexes, but simply a disorder on the way to binary sex development (Chan et al., 2021).

E. Human Sexual Development

1. Embryologic development

41. Another confirmation that there are only two biological sexes comes from what is known about embryologic development and fertilization. The biologic development of the human person begins with a gamete from a female termed an ovum or egg and a gamete from a biological male which is termed sperm. The fertilization of the egg by the sperm begins the process of human biological development. The cells of the fertilized ovum then multiply and the person undergoes the incredible changes of embryologic development.

42. It is noteworthy that the male sperm comes from the biological male and the female egg comes from the biological female. There is no other third or

fourth or fifth type of gamete that exists to begin the development of the human person. This is consistent with the binary nature of human sex (Alberts et al., 2002).

43. The sex binary of the human embryo is further developed between roughly weeks 8 to 12 of human development. There are two primitive structures present within the developing embryo called the Wolffian duct and Mullerian ducts (Larsen et al., 2003). The Wolffian ducts develop into substructures of the genitalia including the vas deferens and epididymis which belong exclusively to the male sex. For the female, the Mullerian ducts go on to form the uterus, fallopian tubes, cervix and upper one third of the vagina which belong exclusively to the female sex (Id.)

44. Significantly once the male structures are developed from Wolffian ducts, the Mullerian ducts are obliterated. This means that throughout the rest of embryological development the Mullerian ducts will not form into biological female structures. Likewise, in the female, the Wolffian ducts are destroyed by week 12 and will not form male structures at any point in the future (Id.).

45. Thus we can see in very early development that the sex binary is imprinted physically not only in the chromosomes, but also on the very organs that the body produces. Additionally, the potential to develop organs of the opposite sex is eliminated. Thus, in the human being there are only two physical tracts that one may progress along, the one being male and the other being female (Wilson and Bruno, 2022).

2. Pubertal Development

46. As mentioned previously, at the time of birth an infant's sex is easily identified through observation of the genitalia. Corresponding internal structures could also be confirmed through imaging if needed.

47. In early childhood, some low level of sex hormones are produced by the sex glands. The male testes produce testosterone. The female ovaries produce primarily the hormone estrogen. These sex glands remain quiescent for the most part, producing low levels of sex hormones until the time of pubertal development.

48. Puberty is a time of development of the sex organs, body, brain and mind. There are well known changes in physical characteristics of the male such as growth of facial hair, deepening of the voice, and increasing size of the testicles and penis. Importantly the testicles will develop sperm under the influence of testosterone and become capable of ejaculation. Because of these changes, the male will become capable of fertilizing an egg. The inability to produce sperm sufficient to fertilize an egg is termed infertility.

49. For the female, pubertal development includes changes such as breast development, widening of the pelvis, and menstruation. The female will also begin the process of ovulation which is a part of the menstrual cycle and involves the release of an egg or eggs from the ovary. Once the eggs are released in a manner in which they can become fertilized by human sperm then the female is termed fertile.

The inability to release ovum that can be fertilized is infertility (Kuohong and Hornstein, 2021).

3. Tanner stages of development

50. From a medical perspective it is important to know the stage of pubertal development of the developing adolescent. This can be determined through a physical examination of the body. The female will have changes in breast characteristics and pubic hair development.

Similarly, the male will have changes in testicular size and pubic hair development. These findings can be compared to the Tanner staging system which will allow the stage of puberty to be known.

51. Tanner stages are divided into five. Stage 1 is the pre-pubertal state before pubertal development of the child begins. Stage 5 is full adult sexual maturity. Stages 2 through 4 are various phases of pubertal development (Greenspan and Gardner, 2004).

52. Awareness of the Tanner stage of the developing adolescent is also useful to assess for maturation of sex organ development leading to fertility. For girls, the first menstruation (menarche) occurs about two years after Tanner stage 2 and will typically be at Tanner stage 4 or possibly 3 (Emmanuel and Boker, 2022). The first appearance of sperm (spermarche) will typically be Tanner stages 4 (Id.).

If puberty is blocked or disrupted before reaching these critical stages, the sex glands will be locked in a premature state and incapable of fertility.

4. Biological Sex Cannot Be Changed

53. It is not possible for a person to change from one biological sex to the other, and there is no technology that allows a biological male to become a biological female or vice-versa. It is not technologically possible at this time to change sex chromosomes; these will remain in every cell throughout life. It is not technologically possible to transform sex glands from one to the other. In other words, there are no hormones or other means currently known to change an ovary into a testicle or a testicle into an ovary.

54. Furthermore, as noted earlier, several of the sex specific structures (such as the epidymis of the male or uterus of the female) are produced early in embryological development from around weeks 8 to 12. The primitive ducts which lead to these organs of the opposite sex are obliterated. There is no known way to resuscitate these ducts and continue development of opposite sex structures.

55. It is also not possible to produce gametes of the opposite sex. In other words, there is not any known way to induce the testicles to produce eggs. Nor is there any known way to induce the ovaries to produce sperm. Therefore, creating conditions for a biological female to create sperm capable of fertilizing another ovum is impossible. The induction of opposite sex fertility is impossible.

56. In fact, as I will discuss, gender affirming therapy actually leads to infertility and potential sterilization.

F. Iatrogenic Harms

57. The term iatrogenic is used in medicine to describe harms or newly created medical conditions that are the result of medications, surgeries, or even psychological treatments. In this section I will discuss the iatrogenic harms of "gender affirmative treatment," for females. Each of the four interventions which I will describe (social transition, blocking normal puberty, opposite sex hormones, and surgery) lead to iatrogenic harms to the patient. These harms will be described in detail below. I speak of these harms because it is important to understand that once a patient begins GAT it is more likely the patient will continue on to surgery (de Vries et al., 2014). Thus, GAT interrupts the natural desistence process and instead places the patient on a lifetime regimen of hormonal and surgical care. A good understanding of these harms is also critical to my practice as an endocrinologist, because if I did not understand these harms, I could not advise patients of the risks associated with GAT.

G. Gender Affirmative Therapy

58. The approaches to gender dysphoria in minors may be divided into three main types. (Zucker, 2020). One is psychosocial treatment that helps the young person align their internal sense of gender with their physical sex. Another would be

to "watch and wait" and allow time and maturity to help the young person align sex and gender through natural desistance. The third option, which is the focus of that which follows, is referred to as gender affirmative therapy.

59. Gender affirmative therapy (GAT) of adults and minors consists of psychosocial, medical, and surgical interventions that attempt to psychologically and medically alter the patient so that they come to believe they may become similar to the physical sex which aligns with their gender identity (but not their biological sex) and thereby reduce gender dysphoria. GAT consists of four main parts: 1) social transition, 2) blocking normal puberty or menstruation, 3) high dose opposite sex hormones, and 4) surgery of the genitalia and breasts.

60. The application of this medical therapy to minors[3] is a fairly new intervention and is associated with a number of harms both known and unknown. GAT suffers from a lack of a quality evidence-base, poorly performed studies, and ongoing unethical human experimentation.

3. "[T]he US Department of Health and the Food and Drug Administration reference approximate age ranges for these phases of life, which consist of the following: (1) infancy, between birth and 2 years of age; (2) childhood, from 2 to 12 years of age; and (3) adolescence, from 12 to 21 years of age.1 Additionally, *Bright Futures* guidelines from the American Academy of Pediatrics identify adolescence as 11 to 21 years of age,2 dividing the group into early (ages 11–14 years), middle (ages 15–17 years), and late (ages 18–21 years) adolescence. The American Academy of Pediatrics has previously published a statement on the age limit of pediatrics in 1988,3 which was reaffirmed in 2012 and identified the upper age limit as 21 years with a note that exceptions could be made when the pediatrician and family agree to an older age, particularly in the case of a child with special health care needs.
Recent research has begun to shed more light on the progression of mental and emotional development as children progress through the adolescent years into young adulthood. It is increasingly clear that the age of 21 years is an arbitrary demarcation line for adolescence because there is increasing evidence that brain development has not reliably reached adult levels of functioning until well into the third decade of life" (Hardin, 2017).

1. Social transition

61. The first stage of gender affirmative therapy is termed social transition. Social transition is a psychological intervention. The child may be encouraged to adopt the type of clothing and mannerisms or behaviors which are stereotypical of the opposite sex within a culture. For example, in the United States a boy might wear his hair long and wear dresses in order to socially transition. A girl may cut her hair short and wear clothes from the boys' section of a department store.

62. Social transition of the child has been noted by expert researcher in the field of child gender dysphoria, Ken Zucker, to itself be a form of iatrogenic harm (Zucker, 2020). This is because the social transition process may solidify the young person's belief that they are in fact the sex opposite of their biological sex.

63. From an endocrine point of view, it is understandable that a child having the outward appearance of the opposite sex, would believe that he or she is destined to go through puberty of the opposite sex as they have only a poor understanding of the internal structures of the body, the function of the sex glands, the role of the sex glands in fertility and so forth.

64. Therefore, it would be quite frightening for a boy who believes he is a girl to be turning into a man with all of the adult features that accompany manhood. Vice versa, the girl who has become convinced that she is a boy will be frightened by the physical changes brought on by womanhood.

65. In fact, it would appear that in the minds of the children and adolescents that they are anticipating a sort of disease state in the future by the hormone changes that will occur as a normal and natural part of human development. Until relatively recently in human history, it has not been possible to interfere with puberty through pharmaceutical means.

2. Medications which Block Pubertal Development

a. Background

66. A second stage of gender affirmative therapy may involve blocking normal pubertal development. This may be done with puberty blocking medications (PB) that act directly on the pituitary to cause the endocrine condition known as hypogonadotropic hypogonadism (HH).

67. In order to understand what is occurring in this process, it is helpful to be aware of normal hormone function during pubertal development.

There is a small pea-sized gland in the brain called the pituitary. It is sometimes referred to as the "master gland" as it controls the function of several other glands. One key function for our purposes is the control of the sex glands. There are two specific hormones produced by the pituitary referred to as luteinizing hormone (LH) and follicle stimulating hormone (FSH). These are responsible for sex hormone

production and fertility. The LH and FSH act as signals to tell the sex glands begin or continue their function.

68. In the adult male, the production of LH will cause adult levels of testosterone to be produced by the testicles. In the adult female, the production of LH will cause adult levels of estrogen to be produced by the ovaries.

69. In early childhood, prior to the beginning of puberty, the pituitary function with respect to the sex glands is quiescent. However, during pubertal development LH will signal the testicle to increase testosterone production and this carries the boy through the stages of pubertal development into manhood. Likewise for the female, the interaction of LH with the ovaries increases estrogen production and carries the girl through the stages of development into womanhood.

70. Hypogonadotropic hypogonadism is a medical condition in which the pituitary does not send the hormonal signals (LH and FSH) to the sex glands. Therefore the sex glands are unable to make their sex specific hormones of testosterone or estrogen.

71. If this condition occurs during puberty, the effect will be to stop pubertal development. This is a disease state which is diagnosed and treated by the endocrinologist.

72. Medications such as GnRH anologues (sometimes called puberty blockers) act on the pituitary gland to lower the pituitary release of LH and FSH

levels dramatically. The result is a blockage of the signaling of the pituitary to the testicles or ovaries and therefore underproduction of the sex hormones. This will stop normal menstrual function for the female and halt further pubertal development. For the male this will halt further pubertal development. If the male had already reached spermarche, then production of new sperm will stop.

b. GnRH Agonist Medication Effects Vary by Use Case

73. There are a variety of uses for GnRH agonists. The use and outcome can be very different for different applications.

74. For example, the initial development of the medication called Lupron was for the treatment of prostate cancer. The idea being that blocking pituitary hormones will block the adult male's release of testosterone from the testicles. Since testosterone will promote the growth of prostate cancer, the idea is to lower testosterone levels to a very low amount and therefore prevent the growth and spread of prostate cancer. This is a labeled use of the medication. In other words, there is FDA approval for this use.

75. Another labeled use of GnRH agonist medication is for the treatment of central precocious puberty. In the disease state of central precocious puberty, pituitary signaling is activated at an abnormally young age, say age four, to begin pubertal development. In order to halt puberty which has begun at an abnormally early time, a GnRH agonist may be used. Here the action of the medication on the

pituitary will disrupt the signaling to the sex glands, stop early sex hormone production, and therefore stop abnormal pubertal development.

76. Then, at a more normal time of pubertal development, say age 11, the medication is stopped and puberty is allowed to proceed. The end result is to restore normal sex gland function and timing of puberty. This is a labeled use for a GnRH agonist medication.

77. What about the use of GnRH anologue medications such as Lupron in gender affirmative therapy? In these cases, we have physiologically normal children who are just beginning puberty or are somewhere in the process of pubertal development. They have healthy pituitary glands and sex organs. However, a puberty blocking medication is administered to stop normal pubertal development.

78. In this case the condition of hypogonadotropic hypogonadism described above (a medical disease) is induced by medication and is an iatrogenic effect of treating the psychological condition of gender dysphoria. GnRH anologue medications have not been FDA approved for this use. The use of GnRH anolgue medication for this purpose in adolescents is experimental as there have been no randomized controlled trials for this specific use case.

c. Hypogonadotropic Hypogonadism

i. Description and Diagnosis

79. As described above, hypogonadotropic hypogonadism is a condition in which the pituitary fails to send signals to the gonads thereby preventing the testicle of the male from making testosterone or the ovary of the female from making estrogen.

80. As an endocrinologist I frequently evaluate patients to ascertain if they have the condition of hypogonadotropic hypogonadism. This is done by a laboratory evaluation. If the patient has this condition, I then determine the cause and the proper treatment.

81. The primary hormone of the pituitary which is abnormal in this condition is called luteinizing hormone or LH. In order to diagnose the condition, a laboratory test with reference ranges based on the person's sex and age is used to evaluate the blood sample.

82. For example, figure 1 shows the normal laboratory reference range for LH over the course of a month in an adult pre-menopausal female (0.5-76.3 mIU/mL) (Quest LH, 2023). A very low level of LH (red) with low estrogen levels indicates hypogonadotropic hypogonadism[4].

4 Levels will be similarly low for adolescents, though the normal reference range is different.

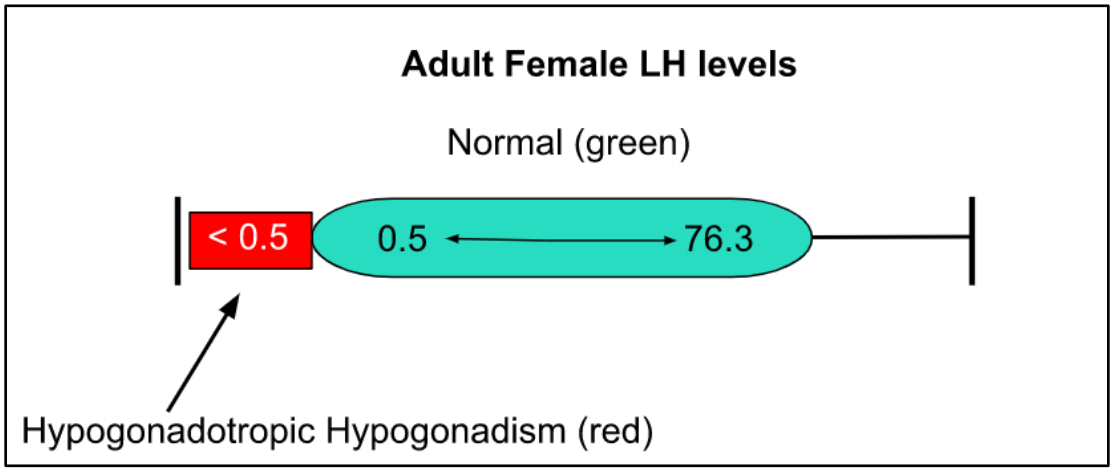

Figure 1.

83. As one can see, in hypogonadotropic hypogonadism the level of LH is below the reference range. In the female, this causes the cessation of estrogen production, and in the male it causes cessation of testosterone production. In adolescents of either sex, this will stop further pubertal development. For females in mid-puberty or beyond, this condition will also stop normal menstrual cycles and ovulation. For the male in mid-puberty or beyond, it will cause the cessation of normal sperm production.

84. As an endocrinologist, I would confirm the condition of hypogonadotropic hypogonadism based on laboratory results and then treat this medical condition.

85. What occurs to pituitary hormones and the sex hormones[5] when administering a GnRH analogue medication such as Lupron? The effect is identical

5 The primary sex hormones being estrogen for females and testosterone for males.

to figure 1. Over time, the result of the medication is to cause very low LH levels (red) leading to low sex hormone levels thereby medically inducing the condition of hypogonadotropic hypogonadism.

86. In gender affirmative therapy, the medical condition of hypogonadotropic hypogonadism is being deliberately created by the use of medications called GnRH analogues, one of which is called Lupron.

c. Adverse Health Consequences of Blocking Normal Puberty

i. Infertility

92. Confidential [redacted]

Confidential [redacted]

93. Dr. Antommaria writes that "The [Endocrine Society] guideline recommends that informed consent for pubertal blockers and gender-affirming hormones include a discussion of the implications for fertility and options for fertility preservation (Antommaria decl, p.23). However, even though procedures to preserve fertility are available, studies show that less than 5% of adolescents receiving GAT even attempt fertility preservation (FP) (Nahata, 2017). Moreover, "ovarian tissue cryopreservation is still considered experimental in most centers and testicular tissue cryopreservation remains entirely experimental. These experimental

forms of FP would be the only options in children [with puberty] blocked prior to spermarche and menarche and are high in cost and limited to specialized centers. Even with FP there is no guarantee of having a child" (Laidlaw, Cretella, et al., 2019).

94. Confidential [redacted]

95. Dr. Antommaria states that "Florida Medicaid provides coverage for the use of puberty blockers to treat central precocious puberty, but now prohibits coverage for the use of puberty blockers to treat gender dysphoria, even though the use of puberty blockers to treat both conditions has comparable risks and is supported by comparable types of evidence" (Antommaria decl, p. 24). These statements fail to recognize the very different effects of PB medication in early childhood versus during adolescence.

96. Giving puberty blockers to a four year old with central precocious puberty will obviously not impair fertility, as the four year old has not yet become fertile. The child will at a later time have the puberty blocker discontinued and then normal pubertal development can proceed. Therefore when they are no longer taking the medication, they will gain natural fertility.

iii. Negative Effects of Hypogonadotropic Hypogonadism on Bone Density

100. Puberty is a time of rapid bone development. This time period is critical in attaining what we call peak bone density or the maximum bone density that one will acquire in their lifetime (Elhakeem, 2019).

101. Confidential

7 Jazz's age is somewhere in the mid-teens during this episode.

Confidential [redacted]

102. DEXA scans are used to evaluate changes in bone density and to help evaluate risk for future fractures. In my practice I order and interpret DEXA scans for this purpose.

103. The Z-score of a DEXA scan is used to compare a patient's bone density to the same population based on age and sex. For example a person who has a bone density similar to the average of the population would be at the 50th percentile. Those who have greater relative bone density would be above the 50th percentile. Those who have lower bone density would have a Z score below the 50th percentile.

104. Puberty blockers used in adolescence to cause HH will inhibit the normal accrual of bone density. This can be evaluated by DEXA scan. In a study in the UK, 44 patients aged 12-15 with gender dysphoria were given puberty blockers and tests of bone density were done at baseline, 12 months, 24 months and 36 months (Carmichael, 2021).

105. Figure 2 shows the Z-scores of the average age matched population percentile which is 50%. It shows the average baseline (before puberty blockers) Z-score percentile for the study participants. It also shows the bone density percentile at 12, 24, and 36 months. One can see that the average baseline z score was about

32% compared to peers of similar age and sex. At 12 months this had decreased to about 15%, and by 24 months it had declined further to about 5% compared to their peers and remained at this low level.

d. The Effect of Puberty Blockers on Desistance

111. As stated earlier a very high proportion of minors diagnosed with gender dysphoria will eventually desist or come to accept their physical sex. Puberty blockers have been shown to dramatically alter natural desistance.

112. In a Dutch study that included seventy adolescents who took puberty blockers, all seventy decided to go on to hormones of the opposite sex (de Vries, et al. 2011). In a follow-up study, the overwhelming majority went on to have sex reassignment surgery by either vaginoplasty for males or hysterectomy with ovariectomy for females (de Vries, et al. 2014). These surgeries resulted in

sterilization. This is why puberty blockers, rather than being a "pause" to consider aspects of mental health, are instead a pathway towards future sterilizing surgeries[9].

3. Opposite Sex Hormones

113. The third stage of gender affirmative therapy involves using hormones of the opposite sex (also called cross sex hormones) at high doses to attempt to create secondary sex characteristics in the person's body.

a. Testosterone

114. Testosterone is an anabolic steroid of high potency. It is classified as a Schedule 3 controlled substance by the DEA: "Substances in this schedule have a potential for abuse less than substances in Schedules I or II and abuse may lead to moderate or low physical dependence or high psychological dependence" (DEA, 2022). A licensed physician with a valid DEA registration is required to prescribe testosterone.

115. I prescribe testosterone to men for testosterone deficiency. The state of testosterone deficiency can cause various problems including problems of mood, sexual function, libido, and bone density. Prescription testosterone is given to correct the abnormally low levels and bring them back into balance. The dose of testosterone must be carefully considered and monitored to avoid excess levels in the male as

9 The surgeries were consequential in another important way. One person who had a vaginoplasty died of post-surgical complications of necrotizing fasciitis which is a rapidly progressive and very severe infection of the soft tissues beneath the skin and which has a high mortality (Id.).

there are a number of serious concerns when prescribing testosterone. The use of high dose testosterone in females is experimental.

116. Regarding the potential for abuse, the labeling reads "Testosterone has been subject to abuse, typically at doses higher than recommended for the approved indication...Anabolic androgenic steroid abuse can lead to serious cardiovascular and psychiatric adverse reactions...Abuse and misuse of testosterone are seen in male and female adults and adolescents...There have been reports of misuse by men taking higher doses of legally obtained testosterone than prescribed and continuing testosterone despite adverse events or against medical advice." (Actavis Pharma, 2018)

117. Adverse events with respect to the nervous system include: "Increased or decreased libido, headache, anxiety, depression, and generalized paresthesia." (Actavis Pharm, 2018)

118. With regard to ultimate height, "[t]he following adverse reactions have been reported in male and female adolescents: premature closure of bony epiphyses with termination of growth" (Actavis Pharma, Inc., 2018). What this means is that testosterone applied to the adolescent will cause premature closure of the growth plates, stopping further gains in height in the growing individual, and ultimately making the person shorter than they otherwise would have been.

119. With respect to the cardiovascular system of men using ordinary doses, "Long-term clinical safety trials have not been conducted to assess the cardiovascular outcomes of testosterone replacement therapy in men" (Actavis Pharma, 2018). No clinical safety trials have been performed for women or adolescent girls to my knowledge.

120. "There have been postmarketing reports of venous thromboembolic events [blood clots], including deep vein thrombosis (DVT) [blood clot of the extremity such as the lef] and pulmonary embolism (PE) [blood clot of the lung which may be deadly], in patients using testosterone products, such as testosterone cypionate" (Actavis Pharma, 2018).

121. A very recently published study of adverse drug reactions (ADRs) as part of gender affirming hormone therapies in France states that "[o]ur data show a previously unreported, non-negligible proportion of cases indicating cardiovascular ADRs in transgender men younger than 40 years… In transgender men taking testosterone enanthate, all reported ADRs were cardiovascular events, with pulmonary embolism in 50% of cases" (Yelehe et al., 2022).

122. There are also serious concerns regarding liver dysfunction: "Prolonged use of high doses of androgens ... has been associated with development of hepatic adenomas [benign tumors], hepatocellular carcinoma [cancer], and peliosis hepatis

[generation of blood-filled cavities in the liver that may rupture] —all potentially life-threatening complications" (Actavis Pharma, 2018).

123. In GAT, what is termed "cross sex hormones" is the use of hormones of the opposite sex to attempt to create secondary sex characteristics. To do so, very high doses of these hormones are administered. When hormone levels climb above normal levels they are termed supraphysiologic.

i. Hyperandrogenism

124. Hyperandrogenism is a medical condition of elevated blood androgens such as testosterone. As an endocrinologist I frequently evaluate patients to determine if they have the condition of hyperandrogenism. Hyperandrogenism in the female or male is harmful and can lead to various maladies.

125. In order to diagnose hyperandrogenism, a laboratory blood test of testosterone is done. In hyperandrogenism, one will find testosterone levels elevated above the reference range.

126. For example for females aged 18 or older, the normal reference range is 2-45 ng/dL (Quest testosterone, 2023).[10] However, in female disease conditions these levels can be much higher. Levels above this normal reference range are considered hyperandrogenism (figure 3).

10 For females aged 11-17 the reference range is <= 40 and below this age group, the range is even lower.

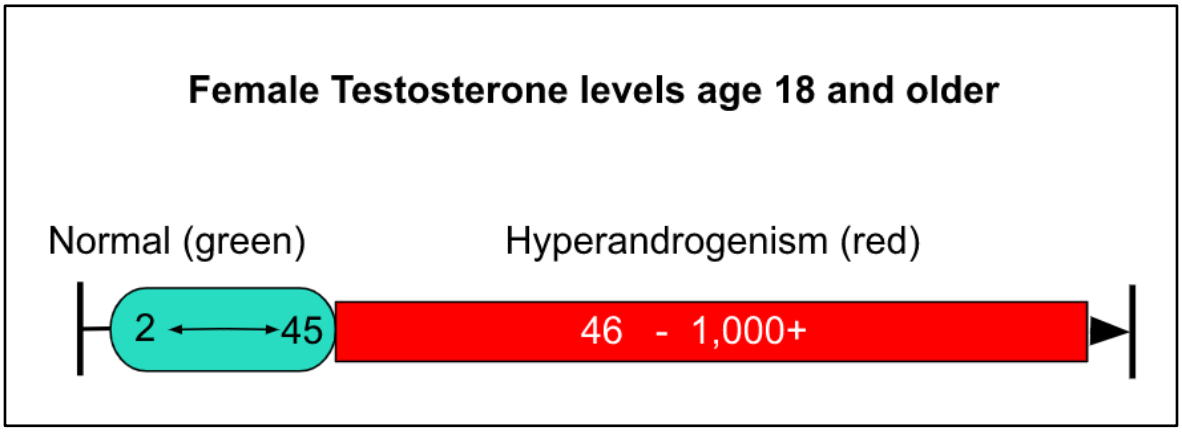

Figure 3

127. For example, in polycystic ovarian syndrome levels may range from 50 to 150 ng/dL.

128. I frequently diagnose and treat the hyperandrogen condition called polycystic ovarian syndrome (PCOS). These patients have elevated testosterone levels. These levels are mildly to moderately elevated and may range from 50-150. Hyperandrogenism found in PCOS has been associated with insulin resistance (Dunaif, 1989), metabolic syndrome (Apridonidze, 2005) and diabetes (Joham, 2014).

129. I also evaluate patients to rule out rare androgen producing tumors that generate very high levels of testosterone. These rare endocrine tumors can cause severely elevated testosterone levels in the 300-1000 range. Once the cause of a hyperandrogen condition is identified, treatments may be put in place to help bring the testosterone levels down to the normal reference range.

130. Recommendations from the Endocrine Society's clinical guidelines related to GAT are to ultimately raise female levels of testosterone to 320 to 1000 ng/dL[11] which is on the same order as dangerous endocrine tumors for women as described above (Hembree, 2017). A simple calculation shows this level for the adult may be anywhere from 6 to 100 times higher than native female testosterone levels. In doing so they are inducing severe hyperandrogenism. These extraordinarily high levels of testosterone are associated with multiple risks to the physical and mental health of the patient.

131. The following chart shows testosterone levels in the normal adult female range (blue), PCOS (graycrine tumors, and gender affirmative therapy as part of female to male (FtM) transition (figure 4).

11 In the Endocrine Society's Guidelines there is no grading of evidence for the rationale of using such high supraphysiologic doses of opposite sex hormones for the female or male. There seems to be an underlying assumption that because the person believes to be the opposite sex then they acquire the sex specific laboratory ranges of the opposite sex. "The root cause of this flaw in thinking about diagnostic ranges was exemplified in a response letter by Rosenthal et al claiming that gender identity determines the ideal physiologic range of cross-sex hormone levels (5). Thus, a psychological construct, the 'gender identity', is imagined to affect physical reality and change a person's sex-specific laboratory reference ranges. This is clearly not the case, otherwise there would be no serious complications of high-dose androgen treatment in transgender males" (Laidlaw et al., 2021).

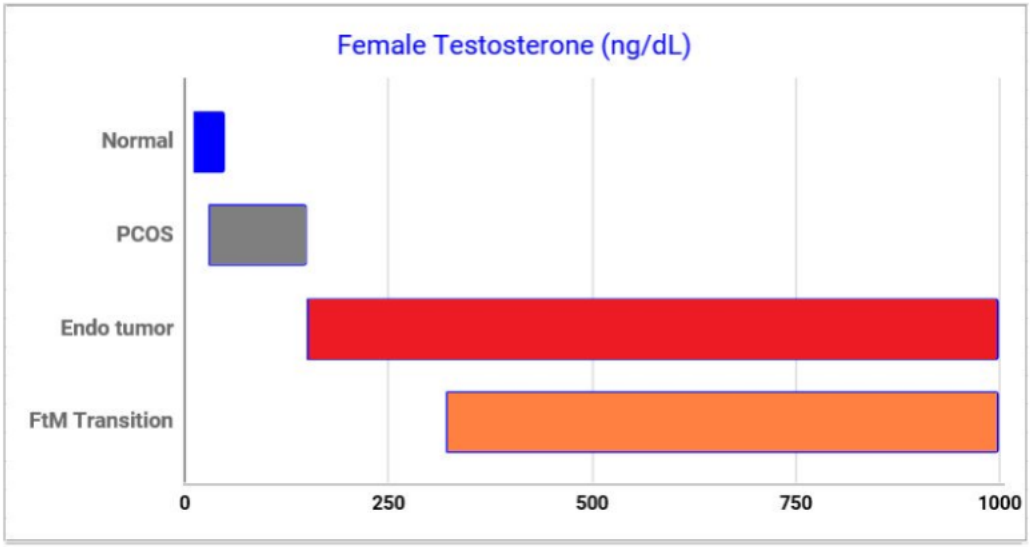

Image by Michael K Laidlaw. MD. Approximate total testosterone in ng/dL based on laboratory, etc. FtM transition from 2017 Endo Society Guidelines on Gender Dysphoria. With PCOS testosterone levels may be as high as 150. With endocrine tumors testosterone may be in the 150-1000 range. The recommendations of the Endocrine Society/WPATH are to bring levels into the 300-1000 range which is 6-100 times higher than normal endogenous adult female levels.

13 See II.D. Medical Concerns Regarding August Dekker
14See II.A. Medical Concerns Regarding K.F.

iii. Medical Problems Related to Hyperandrogenism

137. With respect to cardiovascular risk "Studies of transgender males taking testosterone have shown up to a nearly 5-fold increased risk of myocardial infarction relative to females not receiving testosterone" (Laidlaw et al.,2021; Alzahrani et al., 2019). I would expect Brit Rothstein and August Dekker to be at increased risk of cardiovascular disease due to hyperandrogenism.

138. Permanent physical effects of testosterone therapy involve irreversible changes to the vocal cords. Abnormal amounts of hair growth which may occur on the face, chest, abdomen, back and other areas is known as hirsutism. Should the female eventually regret her decision to take testosterone, this body hair can be very difficult to remove. Male pattern balding of the scalp may also occur. I would expect these changes to occur to the plaintiffs taking testosterone to induce hyperandrogenism. Common sense suggests that changes of voice and hair growth could be psychologically troubling should a patient decide to detranstition and attempt to reintegrate into society as female.

139. Changes to the genitourinary system due to hyperandrogenism include polycystic ovaries, clitoromegaly and atrophy of the lining of the uterus and vagina (Hembree, 2017). The breasts have been shown to have an increase in fibrous breast tissue and a decrease in normal glandular tissue (Grynberg et al., 2010). Potential cancer risks from high dose testosterone include ovarian and breast cancer

(Hembree, 2017). I would expect some or all of these effects and risks to occur to the plaintiffs taking testosterone to induce hyperandrogenism.

140. According to research anabolic steroid abuse[15] has been shown to predispose individuals towards mood disorders, psychosis, and psychiatric disorders. The "most prominent psychiatric features associated with AAS [anabolic androgenic steroids, i.e. testosterone] abuse are manic-like presentations defined by irritability, aggressiveness, euphoria, grandiose beliefs, hyperactivity, and reckless or dangerous behavior. Other psychiatric presentations include the development of acute psychoses, exacerbation of tics and depression, and the development of acute confusional/delirious states" (Hall, 2005). Moreover, "[s]tudies... of medium steroid use (between 300 and 1000 mg/week of any AAS) and high use (more than 1000 mg/week of any AAS) have demonstrated that 23% of subjects using these doses of steroids met the DSM-III-R criteria for a major mood syndrome (mania, hypomania, and major depression) and that 3.4% — 12% developed psychotic symptoms" (Hall, 2005).

141. Confidential [redacted]

15Anabolic steroid abuse involves the deliberate creation of hyperandrogenism in the body as a result of high doses of testosterone or other androgens.

Confidential

iv. Erythrocytosis as a Result of Hyperandrogenism

142. I regularly monitor patients who are receiving testosterone to evaluate for erythrocytosis. Erythrocytosis is a condition of high red blood cell counts. Prolonged hyperandrogenism such as occurs with the use of testosterone at supraphysiologic levels can cause erythrocytosis.

143. Males and females have different reference ranges for red blood cells (measured as hematocrit). For example the normal range of hematocrit for females over age 18 is 35.0-45.0% and males 38.5-50.0% (Quest Hematocrit, 2023). Levels above this range signify erythrocytosis (see figure 5).

16 See II.A. Medical Concerns Regarding K.F.
17 See II.B. Medical Concerns Regarding Brit Rothstein

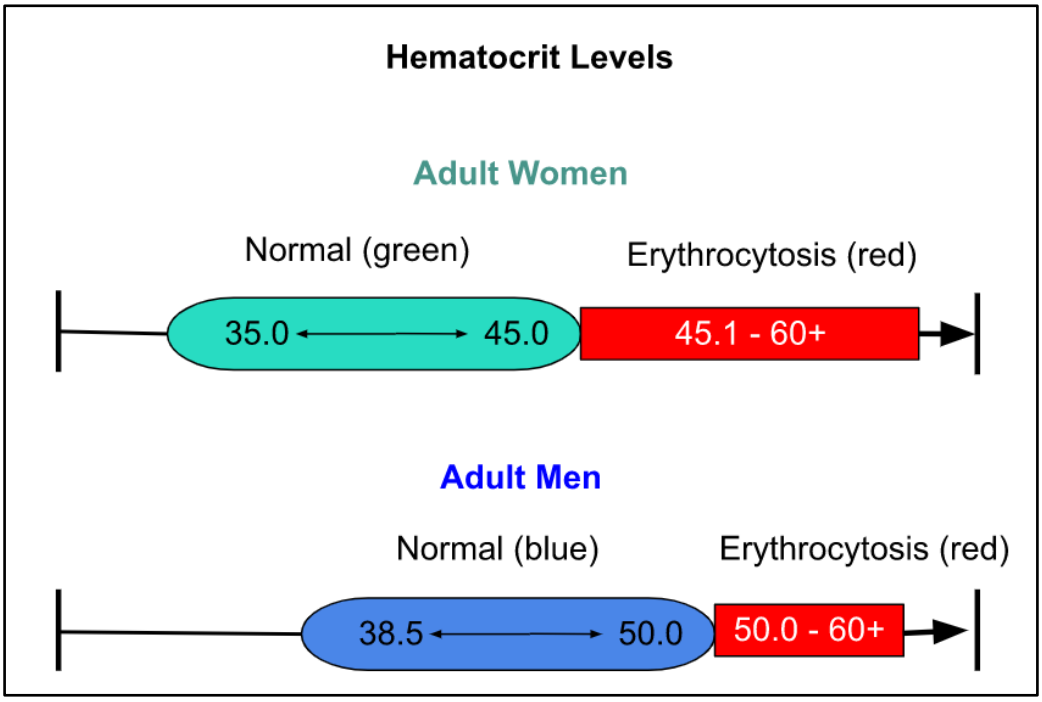

Figure 5.

144. As one can see, there is an overlap in the ranges of males and females such that levels between 45.1 and 50 are considered normal for the male. However for the female these levels are considered erythroctotic. Levels above 50 for the male are considered erythrocytosis and for the female severe erythrocytosis.

145. The Madsen study was a "20-year follow-up study in [1,073] adult trans men who started testosterone therapy and had monitoring of hematocrit at our center" (Madsen, 2021). In this study, 24% of trans men had hematocrit levels 50% at some time which would be considered severe erythrocytosis. Unfortunately, they did not examine the hematocrit range of 45-50. However one would presume that this would occur in at least the same percentage or higher as those who had developed severe erythrocytosis.

146. Any level of erythrocytosis in young women has been shown to be an independent risk factor for cardiovascular disease, coronary heart disease and death due to both (Gagnon, 1994).

Confidential [redacted]

b. Estrogen

149. Estrogen is the primary sex hormone of the female. Prescription estrogen may be used if a woman has low estrogen levels due to premature failure of her ovaries. Estrogen is prescribed to bring these levels back into a normal range for the patient's age. Another labeled use of estrogen is to treat menopausal symptoms. The use of estrogen to treat pediatric age males is experimental.

i. Hyperestrogenism

150. Hyperestogenemia is a condition of elevated blood estrogens such as estradiol. I regularly evaluate patients for hyperestrogenemia in my practice. Hyperestrogenemia in the male is harmful and can lead to various maladies.

151. In order to diagnose hyperestrogenemia, a laboratory blood test of estrogen is performed. In hyperestrogenemia, one will find estrogen levels elevated above the reference range.

152. For example, in an adult male the normal estrogen reference range is 60-190 pg/mL (Quest Estrogen, 2023). Levels above this range are consistent with hyperestrogenemia. See figure 6.

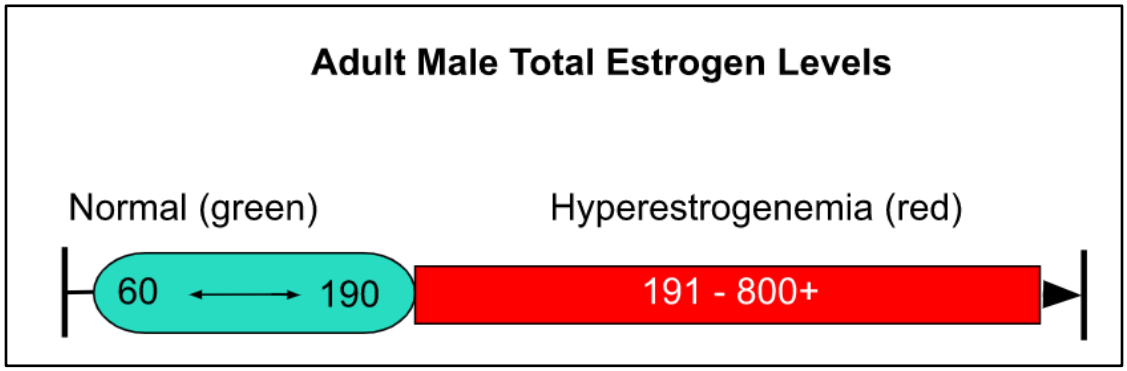

Figure 6.

153. There are medical conditions which can result in hyperestrogenemia. For example, "[t]he concentration of estrogen in cirrhotic patients is thought to increase by fourfold compared to individuals without cirrhosis" (Pagadala, 2023). Certain rare tumors for example of the adrenal gland can result in estrogen levels 3 to 10 fold higher than normal (Cavlan, 2010).

154. In gender affirmative therapy, the medical condition of hyperestrogenemia is being deliberately, medically induced by the off-label use of high doses of estrogen. Endocrine Society guidelines recommend raising estradiol levels to 2 to 43 times above the normal range.[18] The high doses are used in an attempt to primarily affect an increase of male breast tissue development known as gynecomastia. Gynecomastia is the abnormal growth of breast tissue in the male. I evaluate and treat patients with gynceomastia. I have prescribed medication and have referred patients for surgery for this condition.

18 Estradiol is a type of estrogen. Endocrine Society Guidelines recommend raising estradiol levels to 100-200 pg/mL (Hembree, 2017). The normal adult male estradiol range is 7.7-42.6 pg/mL (Labcorp Estadiol, 2023).

155. Other changes of secondary sex characteristics may develop because of hyperestrogenemia such as softening of the skin and changes in fat deposition and muscle development.

156. Long-term consequences of hyperestrogenemia include increased risk of myocardial infarction and death due to cardiovascular disease (Irwig, 2018). Also "[t]here is strong evidence that estrogen therapy for trans women increases their risk for venous thromboembolism[19] over 5 fold" (Irwig, 2018).

157. Breast cancer is a relatively uncommon problem of the male. However the risk of a male developing breast cancer has been shown to be 46 times higher with high dose estrogen (Christel et al., 2019).

158. Sexual dysfunction, including decreased sexual desire and decreased spontaneous erections, is another adverse effect of hyperestrogenemia (Hembree, 2017).

159. Confidential [redacted]

19 Venous thromboembolism is a blood clot that develops in a deep vein and "can cause serious illness, disability, and in some cases, death" (CDC, 2022).

4. Surgeries

160. The fourth stage of gender affirmative therapy is surgical alterations of the body of various kinds in an attempt to somehow mimic features of the opposite sex.

161. As an endocrinologist, I refer patients for surgeries for endocrine conditions. I have to be aware of the indications for surgery, the risks and benefits of surgery, and long term comorbidities that may arise from surgeries.

162. Individual surgical procedures can be a complex topic. It is helpful to first step back and consider conceptually what any surgery can and cannot accomplish.

163. In its basic form surgery is subtractive. In other words, a portion of tissue, an organ or organs are removed in order to restore health. For example, a diseased gallbladder may be surgically removed to help the patient get back to wellness. An infected appendix may be surgically removed to prevent worsening infection or even death. In both of these cases an unhealthy body part is surgically removed in order to restore health.

164. In some cases a diseased tissue or organ is removed so that a foreign replacement part may be substituted for an unhealthy organ or tissue. For example, a diseased heart valve may be replaced with a pig valve or a prosthetic heart valve. Another example is a failed liver may be replaced by liver transplant.

165. Though modern surgical techniques and procedures are astounding, there are very noteworthy limitations. Importantly, surgery cannot de novo create new organs. If a person's kidneys fail, the surgeon has no scientific method for creating a new set of kidneys that can be implanted or grown within the patient. This conceptual background is helpful when considering various gender affirming surgeries.

166. There are a variety of gender affirming surgeries for females. These may include mastectomies, metoidioplasty, and phalloplasty.

a. Mastectomy

167. Mastectomies are the surgical removal of the breasts. The procedure is used in GAT in an attempt to make the chest appear more masculine. The surgery results in a permanent loss of the ability to breastfeed and significant scarring of 7 to 10 inches. The scars are prone to widening and thickening due to the stresses of breathing and arm movement. Other potential complications include the loss of normal nipple sensation and difficulties with wound healing (American Cancer Society, 2022).

168. It is important to note that this operation cannot be reversed. The female will never regain healthy breasts capable of producing milk to feed a child (Mayo Clinic, Top Surgery, 2022).

169. Another important consideration is that compared to the removal of an unhealthy gallbladder or appendix, in the case of gender dysphoria the breasts are perfectly healthy and there is no organic disease process such as a cancer warranting their removal. The future woman who later desists is left with regret about what happened to her at an age before she could provide true informed consent. Functioning breasts cannot be created by a surgeon and restored to a patient in case of regret. She is left with permanent injury and loss of function with respect to her breasts.

b. GAT Surgeries on the Male

170. GAT surgeries for the male include removal of the testicles alone to permanently lower testosterone levels. This is by nature a sterilizing procedure. Further surgeries may be done in an attempt to create a pseudo-vagina which is called vaginoplasty. In this procedure, the penis is surgically opened and the erectile tissue is removed. The skin is then closed and inverted into a newly created cavity in order to simulate a vagina. A dilator must be placed in the new cavity for some time so that it does not naturally close.

171. Potential surgical complications may include urethral strictures, infection, prolapse, fistulas and injury to the sensory nerves with partial or complete loss of erotic sensation (Mayo Clinic, Feminizing Surgery, 2022).

c. GAT Surgeries of the Female Pelvis and Genitalia

172. Other types of surgery for females include those of the genitalia and reproductive tract. For example, the ovaries, uterus, fallopian tubes, cervix and the vagina may be surgically removed. Removal of the ovaries results in sterilization.

173. Importantly, removing female body parts does not produce a male. Rather, the female has had sex specific organs permanently destroyed with no hope of replacement, while remaining biologically female.

174. There have also been attempts to create a pseudo-penis. This procedure is known as phalloplasty. It is not possible to de novo create a new human penis. Instead, a roll of skin and subcutaneous tissue is removed from one area of the body, say the thigh or the forearm, and transplanted to the pelvis. An attempt is made to extend the urethra or urinary tract for urination through the structure. This transplanted tissue lacks the structures inherent in the male penis which allow for erection, therefore erectile devices such as rods or inflatable devices are placed within the tube of transplanted tissue in order to simulate erection (Hembree, 2017). The labia may also be expanded to create a simulated scrotum containing prosthetic objects to provide the appearance of testicles.

175. Complications may include urinary stricture, problems with blood supply to the transplanted roll of tissue, large scarring to the forearm or thigh, infections including peritonitis, and possible injury to the sensory nerve of the

clitoris (Mayo Clinic, Masculinizing Surgery, 2022). A recent systematic review and meta-analysis of 1731 patients who underwent phalloplasty found very high rates of complications (76.5%) including a urethral fistula rate of 34.1% and urethral stricture rate of 25.4% (Wang, 2022).

H. Life Threatening Physical Medical Conditions Versus Suicidal Ideation

176. Any child or adolescent who has suicidal ideation or has attempted suicide should receive immediate, appropriate psychiatric care. Psychologists and psychiatrists are trained in the recognition and treatment of suicidal ideation and prevention of suicide. A child or adolescent with gender dysphoria who also has suicidal ideation should not be treated any differently. They require compassionate care and a full psychological evaluation of comorbidities such as depression, anxiety, and self-harming behaviors.

177. However, suicidal ideation or attempts are categorically different than other life-threatening situations, such as a rapidly expanding brain tumor or a severe infection. In these situations, a medication or a surgery is used to stop the progression of an organic physical condition. In contrast, the danger to the self with suicidal ideation relates to a condition of the mind.

178. Gender affirmative therapy does not treat any life-threatening physical condition. In fact, it creates a number of new medical conditions as described above. It is also not an appropriate treatment for suicidal ideation. Neither puberty blocking

medications, nor testosterone, nor estrogen have been FDA approved for suicide prevention. Moreover, as noted above, the hormone imbalances generated by the medications used in GAT actually increase psychological conditions that lead to suicidal ideation and completed suicide.

I. Informed Consent

179. Any person who is to take a medication, undergo a surgical procedure, or have a psychological intervention should understand the risks and benefits before proceeding. A discussion of these risks and benefits should be provided by medical professionals and then the person of sufficient intellectual capacity and maturity can consent to the treatment.

180. Naturally difficulties arise when a minor is involved in the process of medical decision-making. Their intellect, emotions, and judgment are not fully developed and they are not capable of fully appreciating permanent, life altering changes such as described above. Therefore, they cannot provide informed consent. They may sometimes "assent" to a procedure or medication with a parent or guardian making the final decision.

181. With respect to GAT, in my opinion, it is not possible for the parent or guardian to make a true informed consent decision for the child because of the poor quality of evidence of benefit, the known risks of harm, and the many unknown long-term risks of harm which could only truly be known after years and decades of

gender affirmative therapy. A parent or guardian cannot consent to dubious treatments which result in irreversible changes to their child's body, infertility, sexual dysfunction, and in many cases eventual sterilization.

182. Because this age group is still undergoing brain development and they are immature with respect to intellect, emotion, judgment, and self-control, in my professional opinion there is a significant chance a young person may later regret the irreversible bodily changes that result from hormones or from removing an organ or organs that will no longer function and cannot be replaced.

183. I would also note that adolescents are more prone to high-risk behavior and less likely to fathom the risks and consequences of these decisions (Steinberg, 2008).

J. The WPATH and The Endocrine Society

184. According to their declarations, the experts Dr. Johanna Olson-Kennedy, Dr. Loren Schechter, and Dr. Dan H. Karasic are members of WPATH. Dr. Schechter was "co-lead author of the surgical and postoperative care chapter" for SOC 8 (Schechter decl, p 4). Dr. Karasic was a lead author of the Mental Health chapter for SOC 8 (Karasic decl, p. 3).

185. WPATH's Standards of Care 7 were produced over a decade ago in 2011. They were prepared within their advocacy organization and are purported to be a "professional consensus about the psychiatric, psychological, medical, and

surgical management of gender dysphoria" (WPATH, 2022). However, the "professional consensus" exists only within the confines of its organization. Furthermore, their Standards of Care 7, unlike the Endocrine Society's guidelines, do not have a grading system for either the strength of their recommendations or the quality of the evidence presented.

186. While the Endocrine Society has issued "Endocrine Treatment of Gender-Dysphoric / Gender-Incongruent Persons: An Endocrine Society Clinical Practice Guideline," these are only "guidelines." The Endocrine Society's guidelines (ESG) specifically state that their "guidelines cannot guarantee any specific outcome, nor do they establish a standard of care" (Hembree at al, 2017, p. 3895).

187. With respect to the makeup of authors of the ESG, nine out of ten authors were members of WPATH or worked on WPATH's scientific committees. Seven of those nine had at some time been in WPATH leadership including the WPATH presidency and board of directors (File: WPATH - Endocrine Society 2017 guidelines.pdf).

188. In the Endocrine Society's guidelines, the quality of evidence for the treatment of adolescents is rated "very low-quality evidence" and "low quality evidence". "The quality of evidence for [puberty blocking agents] is noted to be low. In fact, all of the evidence in the guidelines with regard to treating

children/adolescents by [gender affirmative therapy] is low to very low because of the absence of proper studies" (Laidlaw et al., 2019).

189. Unlike some other recommendations for adolescent GAT, the Endocrine Society's guidelines do not include any grading of the quality of evidence specifically for their justification of laboratory ranges of testosterone or estrogen or for adolescent mastectomy or other surgeries.

190. Endocrinologists W. Malone and P. Hruz and colleagues have written critically of the Endocrine Society's (ES) guidelines: "Unlike standards of care, which should be authoritative, unbiased consensus positions designed to produce optimal outcomes, practice guidelines are suggestions or recommendations to improve care that, depending on their sponsor, may be biased. In addition, the ES claim of effectiveness of these interventions is at odds with several systematic reviews, including a recent Cochrane review of evidence (5), and a now corrected population-based study that found no evidence that hormones or surgery improve long-term psychological well-being (6). Lastly, the claim of relative safety of these interventions ignores the growing body of evidence of adverse effects on bone growth, cardiovascular health, and fertility, as well as transition regret" (Malone et al., 2021).

191. In June of 2022, the Endocrine Society published "Enhancing the Trustworthiness of the Endocrine Society's Clinical Practice Guidelines"

(McCartney et al., 2022). They wrote "In an effort to enhance the trustworthiness of its clinical practice guidelines, the Endocrine Society has recently adopted new policies and more rigorous methodologies for its guideline program." (Id.) They relate that in 2019, the ECRI Guidelines Trust "asked the Society for permission to include its guidelines in the ECRI Guidelines Trust database". However, after an evaluation by ECRI, the guideline related to osteoporosis "was the only guideline for which all recommendations were based on verifiable systematic evidence review with explicit descriptions of search strategy, study selection, and evidence summaries" (Id.). Therefore we can conclude that with regard to the recommendations from the ESG 2017 on Gender Dysphoria/Gender Incongruence not all recommendations were "based on verifiable systematic evidence review with explicit descriptions of search strategy, study selection, and evidence summaries". Furthermore, these ESG 2017 were highly subject to conflicts of interest. As related earlier, nine out of the 10 authors were members or worked on the scientific committees of the advocacy group WPATH. Additionally, the ESG 2017 document was endorsed by WPATH. The "Enhancing Trustworthiness" article recommends the opposite composition of authors for guidelines: "A majority (>50%) of non-Chair GDP members must be free of relevant C/DOI [conflict/duality of interest]" (McCartney et al., 2022).

192. WPATH Standards of Care 8 (SOC 8) were just published Sep. 6, 2022 (Coleman et al., 2022) . In a correction to the SOC 8, all guidelines for minimum age of surgery were removed, meaning a minor of any age could be referred for any of the GAT surgeries listed previously (Correction IJTH, 2022). All guidelines for minimum age of oppposite sex hormones were also removed.

193. The correction reads: "On page S258, the following text was removed: 'The following are suggested minimal ages when considering the factors unique to the adolescent treatment time frame for gender-affirming medical and surgical treatment for adolescents, who fulfil all of the other criteria listed above.

– Hormonal treatment: 14 years
– Chest masculinization: 15 years
– Breast augmentation, Facial Surgery: 16 years
– Metoidioplasty, Orchiectomy, Vaginoplasty,
– Hysterectomy, Fronto-orbital remodeling: 17 years
– Phalloplasty: 18 years'" (WPATH SOC 8 Correction, p. S261).

194. Of great concern is that the minimum age recommendations were retracted, it appears, in contradiction to the recommendation of their own expert consensus:

"On page S66, the following text was removed:
'Age recommendations for irreversible surgical procedures were determined by a review of existing literature and the expert consensus of mental health providers, medical providers, and surgeons highly experienced in providing care to TGD adolescents.'" (WPATH SOC 8 Correction, p. S260).

195. Additionally, a chapter regarding eunuchs was inserted into SOC 8 that gives recommendations for how to induce hypogonadism in men who have the

eunuch "gender identity"[20] by either orchiectomy [testicle removal] or chemical castration such as with GnRH analogues (Coleman et al., 2022)[21].

196. The SOC8 also used an aberrant form of the GRADE approach for systematic reviews that removed the grading of quality of evidence (which should be categorized as very low, low, moderate, and high quality).[22] Instead any recommendation of "recommend" is automatically assigned as high quality of evidence. SOC 8 also failed to provide evidence profile tables which should include "an explicit judgment of each factor that determines the quality of evidence for each outcome" (Guyatt et al., 2021).

20 The notion that there is a "eunuch gender identity" further invalidates the gender identity as a serious biological property of human beings: "Many eunuch individuals see their status as eunuch as their distinct gender identity with no other gender or transgender affiliation" (Coleman et al., 2022, p. S88).

21 "Treatment options for eunuchs to consider include:
• Hormone suppression to explore the effects of androgen deficiency for eunuch individuals wishing to become asexual, nonsexual,
or androgynous;
• Orchiectomy [testicle removal] to stop testicular production
of testosterone;
• Orchiectomy with or without penectomy to
alter their body to match their self-image;
• Orchiectomy followed by hormone replacement with testosterone or estrogen. " (Id.)

22 From SOC 8 "The [recommendation] statements were classified as:
• Strong recommendations ("we recommend") are for
those interventions/therapy/strategies where:
• the evidence is of high quality" (Id., p. S250).

197. Such a modification of GRADE is explicitly recommended against in the referenced GRADE document[23] and in so doing, in my opinion, invalidates all of the SOC 8 recommendations as being evidence-based.

198. For at least the reasons above, in my professional opinion WPATH SOC 8 represents a grave and immediate danger to minors, young adults, and adults and should not be followed by any physician, mental health care provider, or other medical professional.

K. Harms of off-label treatments in GAT

199. Dr. Antommaria makes a faulty comparison between migraine headaches and gender dysphoria (Antommaria decl, p. 7). First, migraine headaches are a neurological condition with a potential vascular component and not a condition of the mind, nor found as a psychological diagnosis in the DSM-5. Second the treament of migraine headaches with a medication such as sumitriptan or similar are labled indications for the condition unlike GnRH agonists and opposite sex hormones in GAT (FDA.gov sumitriptan). Third, the side effects of medications like sumitriptan do not alter or block normal human development such as the case with puberty blocking medication, or cause permanent alterations of the body such as

23From the GRADE guidelines: "Some organizations have used modified versions of the GRADE approach. We recommend against such modifications because the elements of the GRADE process are interlinked because modifications may confuse some users of evidence summaries and guidelines, and because such changes compromise the goal of a single system with which clinicians, policy makers, and patients can become familiar" (Guyatt et al., 2011).

with sex hormones, or lead to the permanent loss of healthy functioning organs such as occurs with surgeries which alter sex as a part of GAT.

200. Dr. Olson-Kennedy also draws a faulty comparison when she compares the off-label use of antibiotics or anti-histamines to blocking normal puberty, administering high-dose opposite sex hormones, or the permanent removal of healthy organs as part of GAT (Olson-Kennedy decl, p. 38). The health consequences are categorically different and the lifelong potential for permanent injury are extremely high in GAT.

L. The Lack of Evidence of Effectiveness of GAT

201. There is much additional evidence that questions the long-term benefits of opposite sex hormones and gender reassignment surgery and in fact suggests serious harms.

1. Sweden's Long-term study of 30 years of data by Dhejne

202. The most comprehensive study of its kind is from Sweden in 2011. The authors examined data over a 30-year time period (Dhejne, 2011). The Dhejne team made extensive use of numerous Swedish database registries and examined data from 324 patients in Sweden over 30 years who had taken opposite sex hormones and had undergone sex reassignment surgery. They used population controls matched by birth year, birth sex, and reassigned sex. When followed out beyond ten years, the sex-reassigned group had nineteen times the rate of completed suicides

and nearly three times the rate of all-cause mortality and inpatient psychiatric care compared to the general population of Sweden.

2. The Branstrom and Pachankis Retraction

203. Other published studies of GAT have been shown to have serious errors. For example, a major correction was issued by the American Journal of Psychiatry. The authors and editors of a 2020 study, titled "Reduction in mental health treatment utilization among transgender individuals after gender-affirming surgeries: a total population study" (Bränström study, 2020) retracted their original primary conclusion. Letters to the editor by twelve authors including myself led to a reanalysis of the data and a corrected conclusion stating that in fact the data showed no improvement in mental health for transgender identified individuals after surgical treatment nor was there improvement with opposite sex hormones ("Correction", 2020; Van Mol et al., 2020).

204. The initial reports of this study claimed that the authors found treatment benefits with surgery, and this was shared widely in the media. For example, ABC News posted an article titled "Transgender surgery linked with better long-term mental health, study shows" (Weitzer, 2019). An NBC news/Reuters headline reads "Sex-reassignment surgery yields long-term mental health benefits, study finds" (Reuters, 2019).

205. However, after twelve authors from around the world including our team investigated the study in detail, a number of serious errors were exposed leading to a retraction (Kalin, 2020; Anckarsäter et al., 2020).

206. In our letter to the editor which I co-wrote with former Chairman of Psychiatry at Johns Hopkins Medical School, Paul McHugh, MD, we noted key missing evidence in the original Branstrom report when compared to the previous body of knowledge yielded from the Swedish Dhejne study. We wrote that "[t]he study supports only weak conclusions about psychiatric medication usage and nothing decisive about suicidality. In overlooking so much available data, this study lacks the evidence to support its pro gender-affirmation surgery conclusion" (Van Mol, Laidlaw, et al., 2020).

207. In another letter, Professor Mikael Landen writes that "the authors miss the one conclusion that can be drawn: that the perioperative transition period seems to be associated with high risk for suicide attempt. Future research should use properly designed observational studies to answer the important question as to whether gender-affirming treatment affects psychiatric outcomes" (Landen, 2020).

208. In another letter to the editor, psychiatrist David Curtis noted that "[t]he study confirms the strong association between psychiatric morbidity and the experience of incongruity between gender identity and biological sex. However, the Branstrom study does not demonstrate that either hormonal treatment or surgery has

any effect on this morbidity. It seems that the main message of this article is that the incidence of mental health problems and suicide attempts is especially high in the year after the completion of gender-affirming surgery" (Curtis, 2020).

209. In yet another critical letter, Dr. Agnes Wold states that "[w]hether these factors involve a causal relationship (i.e., that surgery actually worsens the poor mental health in individuals with gender dysphoria) cannot be determined from such a study. Nevertheless, the data presented in the article do not support the conclusion that such surgery is beneficial to mental health in individuals with gender dysphoria" (Wold, 2020).

3. Flawed studies based on the problematic 2015 US Transgender Survey

210. A 2021 study by Almazan and Keurghlian attempted to address mental health outcomes in relation to surgery as a part of GAT (Almazan & Keurghlian, 2021). This was not a randomized controlled study nor a prospective observational study. Rather the study relied upon the 2015 US Transgender Survey (USTS), which has been severely criticized for its serious limitations and weaknesses.

211. D'Angelo et al. have written about the 2015 USTS survey as part of the criticism of another flawed study in the journal Pediatrics by Jack Turban in 2020 titled "Pubertal Suppression for Transgender Youth and Risk of Suicidal Ideation" (Turban, 2020). They write in their critique of the USTS that it is "a convenience

sampling, a methodology which generates low-quality, unreliable data." (Bornstein, Jager, & Putnick, 2013). Specifically, the participants were recruited through transgender advocacy organizations and subjects were asked to 'pledge' to promote the survey among friends and family. This recruiting method yielded a large but highly skewed sample...Their analysis is compromised by serious methodological flaws, including the use of a biased data sample, reliance on survey questions with poor validity, and the omission of a key control variable, namely subjects' baseline mental health status." They also state that "[s]tigmatizing non-'affirmative' psychotherapy for GD [gender dysphoria] as 'conversion' will reduce access to treatment alternatives for patients seeking non-biomedical solutions to their distress" (D'Angelo et al., 2021).

4. Mastectomy Surgery for Minors

212. Any serious look at long-term effects at surgical treatment would follow subjects out at least ten years. For example, an article was published recently examining patients who had mild calcium disorders due to a gland called the parathyroid. They compared a group of patients who had surgical removal of the parathyroid to a control group who had not. They examined data ten years after surgery was completed and concluded that parathyroid surgery in this group "did not appear to reduce morbidity or mortality" in that patient group (Pretorius, 2022).

213. To my knowledge there exists no comparable studies of minors with gender dysphoria comparing those who had mastectomy surgery to a control group who had not. There are also no known studies of minors followed for 10 years or more to determine the long-term risks and benefits of mastectomy for gender dysphoria.

214. Good quality studies specifically showing that mastectomy surgery is safe, effective, and optimal for treating minors with gender dysphoria do not exist. For example, there is a study titled "Chest Reconstruction and Chest Dysphoria in Transmasculine Minors and Young Adults Comparisons of Nonsurgical and Postsurgical Cohorts" (Olson-Kennedy, 2018). The study authors conclude that "[c]hest dysphoria was high among presurgical transmasculine youth, and surgical intervention positively affected both minors and young adults." However, there are a number of problems with this study. First, the term "chest dysphoria" is a creation of the study authors and is not found as a diagnosis or even referenced in the DSM-5. Second the "chest dysphoria scale" is a measuring tool created by the authors, but which the authors state "is not yet validated." (*Id*., p. 435) Third, the mastectomies were performed on girls as young as 13 and 14 years old and who thereby lacked the maturity and capacity of good judgment for truly informed consent for this life altering procedure. For this reason, in my professional opinion, the research and surgeries performed were flawed and unethical.

215. There exists another poorly designed study which suffers from similar methodological and ethical problems as the Olson-Kennedy study. A 2021 study published in Pediatrics examined females aged 13-21 recruited from a gender clinic. Thirty young females had mastectomy procedures and sixteen had not. The average age at surgery was 16.4 years (Mehringer, 2021). The follow up time after surgery was only 19 months and no data is provided or analyzed about key psychiatric information such as comorbid psychological illnesses, self-harming behaviors, psychiatric hospitalizations, psychiatric medication use, or suicide attempts.

216. Information returned from the study surveys were all qualitative and included responses such as "[My chest dysphoria] made me feel like shit, honestly. It made me suicidal. I would have breakdowns". Another respondent stated, "I've been suicidal quite a few times over just looking at myself in the mirror and seeing [my chest]. That's not something that I should have been born with" (Mehringer, 2021). The omission of psychiatric data is a major flaw in the study and also irresponsible given the obviously dangerous psychological states that some of these young people were in.

217. Since such a high proportion of subjects were using testosterone (83%), some of the responses could be attributed to adverse effects of testosterone. For example, as related earlier, high dose testosterone can manifest in irritability and

aggressiveness. One study subject responded, “I get tingly and stuff and it kind of makes me want to punch something" (Mehringer, 2022).

218. The testosterone labeling also indicates nausea and depression as adverse reactions which are described by another study subject “There’s a feeling of hopelessness, of desperation, of—almost makes me feel physically sick" (Actavis Pharma, Inc., 2018; Mehringer, 2022).

219. The study appears to have been designed, at least in part, to justify insurance companies paying for mastectomy procedure for minors with GD, even though they have provided no long-term statistical evidence of benefit: "These findings...underscore the importance of insurance coverage not being restricted by age" (Mehrniger, 2021). This also appears to be part of the aim of the flawed Olson-Kennedy study which stated “changes in clinical practice and in insurance plans’ requirements for youth with gender dysphoria who are seeking surgery seem essential” (Olson-Kennedy, 2018). So these two studies, rather than being a thorough examination of the psychological and physical risks and benefits of mastectomy surgery over the long-term appear instead to exist, at least in part, to validate the need for insurance companies to insure the costs of these dubious procedures for minors.

5. Centers for Medicare and Medicaid Services

220. The Centers for Medicare and Medicaid Services ("CMS") has found "inconclusive" clinical evidence regarding gender reassignment surgery. Specifically, the CMS Decision Memo for Gender Dysphoria and Gender Reassignment Surgery (CAG-00446N) (June 19, 2019) states: "The Centers for Medicare & Medicaid Services (CMS) is not issuing a National Coverage Determination (NCD) at this time on gender reassignment surgery for Medicare beneficiaries with gender dysphoria because the clinical evidence is inconclusive for the Medicare population."

221. Dr. Schecter states: "The result of CMS's review of the evidence is not applicable to other population groups" (Schecter decl, p. 39). However it does not make the converse true as Dr. Schecter seems to imply. In other words, the CMS review does not therefore mean that there is conclusive evidence of benefit and lack of harm for the under 65 population. On the contrary, evidence of benefit is lacking and the risks and harms due to GAT are very high as I have described.

6. Nations and States Question and Reverse Course on GAT

222. Also noteworthy is that other nations are questioning and reversing course regarding gender affirmative therapy. For example in the *Bell v. Tavistock* Judgment in the UK, regarding puberty blockers in GAT, they concluded that "there is real uncertainty over the short and long-term consequences of the treatment with

very limited evidence as to its efficacy, or indeed quite what it is seeking to achieve. This means it is, in our view, properly described as experimental treatment" (*Bell v. Tavistock* Judgment, 2020).

223. The case was appealed and although the medical decision making was returned to clinicians (rather than the courts), it was noted that great pains should be taken to ensure that the child and parents are properly informed before embarking on such treatments. In its conclusion the appeals court stated that "[c]linicians will inevitably take great care before recommending treatment to a child and be astute to ensure that the consent obtained from both child and parents is properly informed by the advantages and disadvantages of the proposed course of treatment and in the light of evolving research and understanding of the implications and long-term consequences of such treatment. Great care is needed to ensure that the necessary consents are properly obtained " (*Bell v. Tavistock* Appeal, Judgment, 2021).

224. In the bulletin of the Royal College of Psychiatrists in 2021, in a reevaluation of the evidence, Griffin and co-authors write, "As there is evidence that many psychiatric disorders persist despite positive affirmation and medical transition, it is puzzling why transition would come to be seen as a key goal rather than other outcomes, such as improved quality of life and reduced morbidity. When the phenomena related to identity disorders and the evidence base are uncertain, it might be wiser for the profession to admit the uncertainties. Taking a supportive,

exploratory approach with gender-questioning patients should not be considered conversion therapy" (Griffin et al., 2021).

225. In 2020, Finland recognized that "[r]esearch data on the treatment of dysphoria due to gender identity conflicts in minors is limited," and recommended prioritizing psychotherapy for gender dysphoria and mental health comorbidities over medical gender affirmation (Council for Choices in Healthcare in Finland, 2020). Additionally, "[s]urgical treatments are not part of the treatment methods for dysphoria caused by gender-related conflicts in minors".

226. In 2021, Sweden's largest adolescent gender clinic announced that it would no longer prescribe puberty blockers or cross-sex hormones to youth under 18 years outside clinical trials (SEGM, 2021). "In December 2019, the SBU (Swedish Agency for Health Technology Assessment and Assessment of Social Services) published an overview of the knowledge base which showed a lack of evidence for both the long-term consequences of the treatments, and the reasons for the large influx of patients in recent years. These treatments are potentially fraught with extensive and irreversible adverse consequences such as cardiovascular disease, osteoporosis, infertility, increased cancer risk, and thrombosis. This makes it challenging to assess the risk / benefit for the individual patient, and even more challenging for the minors or their guardians to be in a position of an informed stance regarding these treatments" (Gauffen and Norgren, 2021).

227. Dr Hilary Cass "was appointed by NHS England and NHS Improvement to chair the Independent Review of Gender Identity Services for children and young people in late 2020" (The Cass Review website, 2022). In her interim report dated February 2022, it states that "[e]vidence on the appropriate management of children and young people with gender incongruence and dysphoria is inconclusive both nationally and internationally" (Cass, 2022).

M. Assessment of the patient with gender dysphoria

228. In light of the very serious medical concerns and potential harms of gender affirmative therapy, there are several criteria that I believe would be important to fulfill before applying the GAT model to a patient.

a. Minors should be evaluated to determine if they will follow the natural pattern of desistance which 50 to 98% of pediatric age children will follow[24].

b. Patients, parents and guardians should be made aware of other options for treatment of gender dysphoria including active psychosocial treatment or watching and waiting with support in order to help with natural desistance.

c. The patient should be provided an assessment by a qualified psychologist or psychiatrist who does not follow the WPATH GAT model. If

24 From the DSM-5: "Rates of persistence of gender dysphoria from childhood into adolescence or adulthood vary…In natal males, persistence has ranged from 2.2% to 30%. In natal females, persistence has ranged from 12% to 50%" (American Psychiatric Association, 2013).

underlying psychological conditions are diagnosed then these should be adequately evaluated and treated before proceeding to hormones and surgery.

d. If a medicalized approach with hormones such as testosterone or medications to stop menstruation is being considered then a clear description of the risks and benefits needs to be conveyed to the patient and if a minor also the parent or guardian. It needs to be verified that they fully understand these risks.

e. If surgical procedures such as mastectomy, hysterectomy, ovariectomy, orchiectomy, or vaginoplasty are being considered then clear descriptions of the risks and benefits need to be conveyed to the patient, and if a minor, the parent or guardian.

229. However, even if a minor and their parents or guardian are made fully aware of the risks and benefits of hormones and surgeries, in my opinion, the minor does not have adequate maturity and judgment to make permanent changes to their body that may result in infertility/sterility and the permanent loss of organs such as breasts whose functions will not be fully utilized (such as breastfeeding) until adulthood.

III. Conclusion

306. The gender affirmative therapy model suffers from serious deficiencies in logic and lacks scientific foundation. The deep error hidden in this model is that one cannot in fact change sex. One cannot acquire the deep characteristics of

29 There are serious concerns regarding liver dysfunction with testosterone: "Prolonged use of high doses of androgens ... has been associated with development of hepatic adenomas [benign tumors], hepatocellular carcinoma [cancer], and peliosis hepatis [generation of blood-filled cavities in the liver that may rupture] —all potentially life-threatening complications" (Actavis Pharma, 2018).

biological sex in order to gain the complete sexual and reproductive functions of the opposite sex. This is not technologically possible.

307. Children and adolescents are of such immature minds that they are likely to believe that it is possible. In fact they may come to believe that their inherent, biologically necessary puberty is "terrifying" or needs to be stopped. Social transition serves to convince the child or adolescent that they can be the opposite sex. Puberty blockers sustain this state of mind by retaining a childlike state with respect to the genitalia and body habitus. High dose opposite sex hormones then cause medical conditions such as hirsutism and irreversible damage to the vocal cords in females and gynecomastia in males. These conditions serve to convince the young person that they are going through puberty of the opposite sex when in fact they are not developing sexually and are infertile.

308. There are known risks for both adults and minors, some of which I have described above, including cardiovascular disease, cancer, deficiencies in ultimate bone density, harms to sexual function, infertility, and for some permanent sterility. The child or adolescent cannot consent to these harms when they are not mature enough to fully comprehend what they mean. Long-term studies regarding the treatment effects specifically for minors with hormones and surgeries, using randomized controlled studies or even proper observational studies do not exist. The

two adult plaintiffs and the two plaintiffs' children have comorbidities which make GAT particularly dangerous.

309. WPATH's newly released SOC 8 represents a grave and immediate danger to minors, young adults, and adults and should not be followed by any physician, mental health care provider, or other medical professional.

310. For the reasons set forth above, in my professional opinion as an endocrinologist, no child or adolescent should receive puberty blockers to block normal puberty, nor should they receive supraphysiologic doses of opposite sex hormones to attempt to alter secondary sex characteristics, nor should they have surgeries to remove or alter the breasts, genitalia or reproductive tracts as part of GAT. The child cannot consent or assent to these procedures. The parent or guardian also cannot consent to the life altering changes resulting from GAT. There exists insufficient evidence of benefit for adults, but serious concerns for risk of harm.

311. Finally, the June 2022 AHCA GAPMS report states: "Following a review of available literature, clinical guidelines, and coverage by other insurers and nations, Florida Medicaid has determined that the research supporting sex reassignment treatment is insufficient to demonstrate efficacy and safety" (FL Medicaid GAPMS, 2022). I strongly agree with that statement.

I declare, pursuant to 28 U.S.C. § 1746, under penalty of perjury that the foregoing is true and correct. Executed this 17th day of February, 2023.

EMPLOYMENT

2006-Present	Michael K Laidlaw, MD Inc. Private Practice – Endocrinology, Diabetes, and Metabolism. Rocklin, CA

EDUCATION

2004-2006	Endocrinology and Metabolism Fellowship - Los Angeles County/University of Southern California Keck School of Medicine
2001-2004	Internal Medicine Residency - Los Angeles County/University of Southern California Keck School of Medicine
1997-2001	University of Southern California Keck School of Medicine Doctor of Medicine Degree May 2001
1990-1997	San Jose State University Bachelor of Science Degree in Biology with a concentration in Molecular Biology, Cum Laude

LICENSURE

California Medical License – Physician and Surgeon: # A81060: Nov 6, 2002. Exp 5/31/2024.

PROFESSIONAL AFFILIATIONS

Endocrine Society 2006-2022
American Board of Internal Medicine - Endocrinology, Diabetes, and Metabolism – 2006
American Board of Internal Medicine - Internal Medicine - 2005
National Board of Physicians and Surgeons - Endocrinology, Diabetes, & Metabolism 2018-2024
National Board of Physicians and Surgeons - Internal Medicine 2018-2024

HONORS AND RECOGNITION

2010	Endocrine Society Harold Vigersky Practicing Physician Travel Award
2004-2005	Vice President - Joint Council of Interns and Residents
2002-2004	Council Member – Joint Council of Interns and Residents
1996, 1997	Dean's Scholar, San Jose State University
1995	Golden Key National Honor Society

IN THE UNITED STATES DISTRICT COURT
FOR THE NORTHERN DISTRICT OF FLORIDA
TALLAHASSEE DIVISION

AUGUST DEKKER, et al., *Plaintiffs*, v. JASON WEIDA, et al., *Defendants*.	Case No. 4:22-cv-00325-RH-MAF

EXPERT REPORT OF KRISTOPHER KALIEBE, M.D.

Introduction

Pursuant to 28 U.S.C. 1746, I declare:

1. I have been asked by the defendants to discuss my membership in professional associations, and the relevant guidelines and policies concerning gender dysphoria in those associations. I have been asked to provide a review of the evidence base for treatments of gender dysphoria. I also have been asked to opine on the influence of activism and suppression of open inquiry which has distorted academic dialogue and made published research and expert recommendations untrustworthy with regard to gender dysphoria.

2. This report is entirely my own work product, and no one was consulted for this this report.

3. If called to testify in this matter, I will testify truthfully based on my personal experience and knowledge.

4. I am being compensated at an hourly rate of $400 per hour for my time preparing this declaration. My compensation does not depend on the outcome of this litigation, the opinions I express, or the testimony I may provide.

Here I provide a summary of my major points:

a. While historical reports of gender dysphoria exist, it has been rare until the last two decades.

b. There is no consensus in the field regarding the treatment of gender dysphoria, nor is there an evidence-base sufficient to lead to any confident recommendations.

c. Multiple reviews of the evidence base regarding treatment of gender dysphoria indicate that the evidence for affirmative treatment is low-quality.

d. Small numbers of advocate physicians within medical organizations have been able to leverage moralized claims and low quality evidence in order to promote affirmative care for gender dysphoria.

e. Significant evidence points to a spread of ideology combined with technologically induced contagion effects leading the recent increase in gender dysphoria.

f. As American medical professional organizations have already endorsed the concept of affirmative care as evidence-based and ethical, they are no longer neutral with regards to the science and have instead entered into advocacy roles.

g. Much of the slogans and assumptions associated with affirmative care for gender dysphoria are conjecture, opinion or misinformation presenting as established fact.

h. Due to the highly politicized and ideological nature of the issue of gender dysphoria, there is limited rigorous scholarly dialogue within American professional medical organizations and medical journals.

Background

6. I am an associate professor at the University of South Florida in Tampa Florida. I am Board Certified in Psychiatry, Child and Adolescent Psychiatry and Forensic Psychiatry. My clinical work has been primarily in University based clinics, Federally Qualified Health Centers and juvenile corrections.

7. I was awarded my medical degree in 1999, and subsequently completed general psychiatry, child and adolescent psychiatry and forensic psychiatry training. This training includes education in human biology, human sexuality, development, brain functioning, normal development and psychopathology. Gender dysphoria and gender dysphoria treatment were part of my professional training.

8. From 2005 to 2016 I was Assistant Professor at Louisiana State University Health Science Center – New Orleans. I was the program director of the LSU Child Psychiatry Fellowship for 2 years. Since 2016 I have been Associate Professor at the University of South Florida where my clinical roles which mainly include working with juvenile corrections, supporting primary care physicians through the Florida Medicaid Psychiatric Medication hotline and in a university child and adolescent psychiatry clinic. I cover at Tampa General Hospital and recently added an adult psychiatry resident clinic to my schedule. I also practice forensic psychiatry including child and adult cases, both within criminal and civil court.

9. As a supervising physician at the University of South Florida's Silver Child Development Center my role is to function as a clinical supervisor and instructor. Child psychiatry residents and general psychiatry residents serve as the primary patient evaluators and clinicians. I evaluate new patients directly, and after see patients directly as needed. I oversee the resident's work products and function as the physician of record. Within this clinic I evaluate and treat patients with gender dysphoria.

10. In addition to these direct clinical experiences, part of my scope of duties within the Silver Child Development Center is training residents regarding the treatment of patients, including patients with gender dysphoria.

11. Within the juvenile justice system I also evaluate and treat patients with gender dysphoria. I further have been consulted to provide a second opinion and coordinate care regarding a patient with gender dysphoria in the Louisiana juvenile correctional system.

12. In addition to direct clinical care, I am routinely consulted by colleagues. Within my work at the Florida Medicaid Psychiatric Hotline I have collaborated in the care of patients with gender dysphoria. My colleague consultation includes providing my opinion regarding would a youth be competent to consent as requested by an endocrinologist regarding a youth considering puberty blockers on

a path toward sex hormone treatment and potential surgeries. I have been consulted regarding psychotherapeutic approaches to young adult patients who detransitioned.

13. I have extensive teaching experience including medical students, general psychiatry residents, child and adolescent psychiatry fellows and forensic psychiatry fellows. I have years of extensive positive feedback from medical students and psychiatrist residents.

14. My approach to the practice of medicine includes utilizing and appreciating the amazing progress modern medicine has made. I practice and support conventional medicine, I have strongly advocated for the expansion of Federally Qualified Health Centers, along with improved collaboration of mental health with primary care (Kaliebe 2016, Kaliebe 2017).

15. My support of, and attempts to improve conventional medicine, is balanced by a healthy degree of caution. The history of medicine is filled with examples of the harms which can come with unproven, unnecessary, aggressive or counterproductive interventions. As such, I've presented twice at the Preventing Overdiagnosis conference.

16. I am involved with Integrative Medicine, focused mainly on the role of mind-body medicine, mindfulness, nutrition and exercise, along with how modern medicine has adopted approaches which underemphasize and at times neglect the basics of health. Another academic interest of mine is the tradeoffs and stress of

moving to primarily electronics based communications, especially on young people. (Kaliebe 2002, Gerwin 2018) I have a longstanding interest in how technology and the media intersect with society and culture, including the impacts of social media, recent increases in tribalism and the spread of misinformation.

17. With Paul Weigle, I co-edited the Child and Adolescent Psychiatric Clinics of North America *Youth Internet Habits and Mental Health* edition in 2018 with 16 chapters by invited experts on digital and mental health related issues. (Kaliebe 2018)

18. I am a member of the American Academy of Psychiatry and the American Psychiatric Association. I have been most active within the American Academy of Child and Adolescent Psychiatry (AACAP). I was awarded status as a Distinguished Fellow at AACAP in 2016. I first presented regarding the media at the 2004 AACAP annual conference, and have now presented at the annual conference 25 times. I served as co-chair of the Media Committee from 2013-2021. I served as the Liaison from AACAP to the American Academy of Pediatrics from 2016-2022. I was an author on their practice guidelines for telepsychiatry. I have also served AACAP in the state affiliates, for the Louisiana Council for Child Psychiatry I was secretary / treasurer for 4 years and served as president for 2 years.

19. I have a longstanding interest in psychotherapy. I have additional training in Cognitive Behavioral Therapy and trauma-focused therapies. I have been

providing psychotherapy and teaching psychotherapy to psychiatry trainees throughout my career. I currently routinely supervise psychiatry residents regarding psychotherapy with the USF residency program. I created and taught a Cognitive Behavioral Therapy practicum for LSU residents from 2007 to 2016. I was a member of the Association for Behavioral and Cognitive Therapies from 2004 to 2016.

20. I have been on the Best Doctors list annually since 2007.

21. I also practice and teach forensic psychiatry and have testified in deposition or trial in the following cases over the past four years:

a. Civil Testimony, retained by the defense:

i. In the Interest of RW, LL, AP Minor Children January 28, 2020 Circuit Court of the 13th judicial circuit, Juvenile Division, Judge Lisa Campbell, Tampa FL

b. Civil Testimony, court appointed:

i. February 28, 2020, Jeffrey Spivey, petitioner/father and Teresa Spivey N/K/A Teresa Cartwright, respondent/mother Case No.: 2016 DR0471's, Circuit Court of the 12th judicial circuit in and for Manatee County Florida. Judge Kevin Bruning

c. Civil Testimony, court appointed:

i. Re: The Marriage of Robyn Cohen McCarthy and John McCarthy November 1, 2019 11th Judicial Circuit, Family Division, Dade County, Judge Jason Dimitris, Miami FL

d. Criminal Testimony, retained by the defense:

i. The State of Florida v. Bill Paul Marquardt December 19, 2019 5th Judicial Circuit, Sumner County, Florida, Judge William Hallman III, Bushnell Florida

ii. The State of Florida v. Bill Paul Marquardt August 24, 2022 5th Judicial Circuit, Sumner County, Florida, Judge Mary P. Hatcher Bushnell Florida

e. Civil Depositions, retained by the defense:

i. Z.M.L., a minor, through her parents and guardians, -vs- D.R. Horton, Inc., a foreign corporation authorized to do business in Florida, United States District Court, Middle Division of Florida, Tampa, May 6, 2021

ii. THE ESTATE of JEAN LINDOR, deceased minor, by and through the Personal Representative of the Estate, JAMES LACROIX and NOUSE ANDREE LACROIX, individually, Plaintiffs, v. BOS TRANSPORT, LLC, a Florida Limited Liability Company, and ORESTES ZAMORA FLEITES, individually, December 5th, 2022

f. Civil Depositions, retained by the plaintiff:

i. Carlton Collins, individually, and on behalf of his minor son, Connor Samuel Collins v. David R. Wallace, Sr., M.D. Louisiana's 14th judicial district, Civil Suit: 2019 – 4128 – D, March 4th, 2022

g. Criminal Deposition, retained by the defense:

i. State of Florida v. Justin Mitchell Pennell, 2020CF000159FAXWS, 6th Judicial Circuit of the State of Florida in and for Pasco County, March 11, 2022Since 2016

22. A list of my publications is attached to this report as Exhibit "A".

The abrupt rise in transgender and non-binary identification

23. The discussion regarding transgender care is in the context of an unexplained and remarkable rise in patients reporting gender dysphoria. During my medical school experience and 3 residencies, I never encountered a patient reporting symptoms of gender dysphoria. For eleven years, from 2005 to 2016, I had a busy psychiatry clinic with about 80% minors and 20% adult patients without a single patient expressing gender dysphoria.

24. During those eleven years, none of the hundreds of medical students or residents I supervised presented cases to me describing patients with gender dysphoria. None of my social work or psychologist colleagues ever asked for consultation or advice regarding how to clinically approach patients with gender dysphoria. Within the last year, on a single day, I have treated three adolescent patients diagnosed with gender dysphoria.

25. My experience is consistent with statistics indicating an abrupt rise in gender dysphoria and presentations to medical clinics for related services. When a new patient population emerges, it creates challenges for physicians to respond. In medicine, typically when such an abrupt change in patient populations occur, the subsequent scholarly literature would typically discuss and debate underlying causes of this phenomenon.

26. Never before has there been large cohorts of individuals seeking medical services to alter their secondary sex characteristics. There had been decades of extremely rare treatment which was at the time acknowledged as compassionate but experimental care. Yet the current patients expressing gender dysphoria represent primarily a new and distinct patient population, not a population which has historically existed.

27. As a psychiatrist, I have encountered many patients who are uncomfortable with their bodies. This discomfort and dissatisfaction is often comingled with anxiety and depression, along with various diagnoses which involve bodily discomfort including eating disorders or Body Dysmorphic Disorder.

28. I have observed bodily discomfort more often in females, and especially as girls enter puberty, which is consistent with the epidemiological literature. Puberty introduces significant challenges and risks to females as they receive more attention from males, including adult males, along with increased competition from peers. Puberty now comes much younger than for our ancestors, creating a greater mismatch between brain and body maturity.

29. While the exact number is unknown it can be said that the incidence of gender dysphoria in youth was previously rare. The American Psychiatric Association's Diagnostic and Statistical Manual of Mental Disorders published in 2013 rated in adults at 2-14 per 100000 (American Psychiatric Association p454).

Referrals at the Tavistock clinic in England increased over 50 fold in just a decade from 2009 to 2019. (Tavistock & Portman, NAHS Foundation Trust, 2020).

30. Similar increases have been reported across much of the economically advanced countries in the world, many showing over 1000% rise in gender dysphoria over the last decades (Marianowicz-Szczygiel 2022). This phenomenon requires some explanation and any complex phenomenon likely has a multifactorial line of causation. Yet multiple lines of evidence point to direct social influences and online and social media contagion as a major contributors to this increase in gender dysphoria. Biological factors causing the increase of gender dysphoria, such as endocrine disrupting chemicals, are plausible but have not been explored in the scholarly literature.

31. The involvement of social spread is supported by Lisa Littman's work (Littman 2018). It is supported by the timing of the massive increase in gender dysphoria coinciding with the rise in social media and associated "influencers". It is supported by the largest rise in gender dysphoria occurring in vulnerable adolescent females. This is precisely the same population most susceptible to online contagions such as "functional" rapid onset tics disorders, suicidal behavior, non-suicidal self-harm and increase self-reported Dissociative Identity Disorder.

32. The influence of culture, medical theories and ideology on symptom production is long-standing and well known. Shorter detailed numerous examples

of how culture intersects with psychiatric illness from the Victorian to modern era (Shorter 1993). For a discussion of how psychopathology can spread among psychiatric disorders, see Horesh et al's recent article (Horesh 2022).

33. Humans evolved as a sexually dimorphic, ultra-social and cultural species. Culture has co-mingled with our evolution, because unlike other animals, learning from others enables our very survival. Humans acquire a considerable portion of our behaviors and viewpoints "by tapping into a large body of non-genetic information that has been filtered and accumulated over generations. This process, termed cumulative cultural evolution, creates a storehouse in the form of strategies, attentional biases, motivations, tastes, and cognitive heuristics that are necessary for us to accomplish even the basics of survival". (p 210 Henrich 2021).

34. Thus humans can't explain the rationale for much of our routines, habits and customs because they have been shaped over time, some for thousands of year, some more recently. This raises the possibility there is time tested wisdom in many of our cultural adaptations. Cumulative culture constantly changes, but the recent rate of change has been exponentially faster due to the explosion of technologies. The modern world is thus experiencing perhaps the largest generation gap in history. Today's children and adolescents are exposed to so much more than out grandparents.

35. In ancient evolutionary environments, copying others aided survival via the transmission of acquired knowledge about what areas are safe, how to make shelters or weapons, what berries or mushrooms are safe to eat, and what type of social behavior is acceptable within a group. Humans' brains are particularly adapted with exceptional abilities to notice and copy the behavior of others.

36. Transmission of culture occurs in part via humans naturally mimicking what we observe in others. Yet these same instincts that develop helpful behavioral norms also enable social contagions that co-mingle with mental and behavioral disorders. Long-standing scholarly consensus exists confirming that direct social contagion not only affects health such as cardiac disease (Christakis. 2013), but interacts with technology enabled spread of mental health problems. (Haltigan 2023)

37. This can be seen in relation to suicide contagion (Yıldız,2019), non-suicidal self-injury (Jarvi, 2013), contagion related to eating disorders such as anorexia (Allison 2014). Since the Covid 19 pandemic, there has been an explosive increase of young people displaying features of Dissociative Identity Disorder and movements similar to those seen in Tic Disorders such as Tourette's (Pringsheim 2021). A google scholar review shows a dozen articles linking rapid onset tic disorders to social media. Similar to other examples of social contagion, these sudden onset tic presentations tend to be comorbid with pre-existing mental illnesses and adolescent girls show themselves to be the most susceptible.

38. The phenomenon labeled Mass Social Media Induced Illness (Giedinghagen, 2022) shows us that at scale, users of social media can develop technology facilitated psychosomatic illness. Psychiatrists have seen an abrupt rise in patients presenting with a self-diagnosis (Rettew 2022).

39. Consistent with all this evidence, the spread of beliefs about gender identity, such that all individuals should consider and question their gender identity, appears quite plausibly capable of significantly increasing the incidence of gender dysphoria. This is especially true as traditional sources of knowledge about the world such as families, school, local culture and religion have been replaced by what children observe on electronic screens. Youth even form complex reciprocal relationships with their avatars (Szolin 2023).

40. In their February 25, 2022 press release "Medicine and gender transidentity in children and adolescents" the French National Academy of Medicine notes "Whatever the mechanisms involved in the adolescent – overuse of social networks, greater social acceptability, or example in the entourage - this epidemic-like phenomenon results in the appearance of cases or even clusters in the immediate surroundings". It continues "The vigilance of parents in response to their children's questions on transidentity or their malaise, underlining the addictive character of excessive consultation of social networks which is both harmful to the psychological development of young people and responsible, for a very important part, of the

growing sense of gender incongruence." Thus the French National Academy of Medicine has concluded that the "epidemic-like" rise in gender dysphoria is tied to social media.

41. Psychiatrists also believe social media has significantly contributed to the rise in gender dysphoria. Yet most child and adolescent psychiatrists admit to me they will not speak publicly on this subject due to how sensitive the topic is, and also fears of hostilities from activists along with condemnation and retribution from others within their universities or organizations.

42. My personal conversations align with recent polling. While I was on stage presenting at the October 2022 American Academy of Child and Adolescent Psychiatry annual conference, as part of the presentation, the audience was anonymously polled on a number of topics. When polled: *How often do you see teens who seem to be influenced by social media in regards to their sexual and/or gender identity?* 80 of 97 (82%) indicated social media was an influence s*omewhat often* or *very often*. To my knowledge, this is the first data confirming that the vast majority of a group of child and adolescent psychiatrists acknowledge social contagion is a major contributor to the rise in gender dysphoria.

43. A similar poll was conducted at the January 18, 2023, meeting of the Child & Adolescent Psychiatry Society of Greater Washington, all attendees were physician members. For the question *How often do you see teens who seem to be*

influenced by social media in regards to their sexual and/or gender identity? Of the 34 respondents, 47% indicated *Occasionally* and 35% indicated *Often*. So again 82% of these child and adolescent psychiatrists reported they see their patients gender identity is influenced by social media.

44. It is plausible and probable that ideological and social factors underlie the increase in gender dysphoria. This does not rule out other factors. Concern, open discussion and scholarly exploration of this data does not constitute bias, discrimination or transphobia. This area requires thoughtful analysis and further study.

Review of the Evidence Base for Treatments of Gender Dysphoria

45. Neither Gender dysphoria (GD) itself, nor what is the best psychotherapeutic or medical approach is well understood. My review of the research concludes that the evidence base for gender dysphoria treatments is mixed and generally low quality. Below I provide detail to this assessment.

46. The administration of sex hormones and performing of surgeries are medical interventions with substantial risks, and as these interventions target otherwise healthy tissue, a high degree of evidence is expected before such a life altering intervention. Until recently cross sex hormone and surgeries for gender dysphoria have been exceedingly rare, thus there exists nominal long term data. It is especially challenging to evaluate this evidence base due to changing definitions and

epidemiology. It is my opinion that insufficient data is available to make confident proclamation regarding the risks and benefits of treatments of gender dysphoria.

47. I have reviewed Drs. Brignardello-Peterson and Wiercioch's 2022 *Effects of gender affirming therapies in people with gender dysphoria: Evaluation of the best available evidence*. This report was compiled for the Florida Agency for Health Care Administration. This report utilized GRADE: Grading of recommendations, assessment, development, and evaluations. This is the most widely used method for appraising studies to be included in systematic reviews and guidelines. (Goldet 2013). Their review revealed that the quality of evidence supporting treatments is generally low. The conclusions rendered fit the data and are logically sound.

48. Drs. Brignardello-Peterson and Wiercioch's review is consistent with the Endocrine Society's own grading in their 2017 Clinical Practice Guidelines. The Endocrine Society also utilizes the GRADE system (Hembree 2017). In fact, the Endocrine Society 2017 Clinical Practice Guidelines only grade as moderate or high quality recommendations for assessment or education. All recommendations regarding treatment are graded as supported by very low-quality or low quality evidence.

49. Similar to the state of Florida, countries across the globe have responded to concerns about medical practice for gender dysphoria by conducting

reviews. After the reviews, each country changed their approach. Many of these countries, due in part to their smaller and better organized medical systems, have offered more comprehensive and structured treatment regimens for gender dysphoria. In addition, these treatment options in Nordic countries have been in place longer than they have been typically more available in the United States.

50. In Sweden, the National Board of Health and Welfare (NBHW) was commissioned by the Swedish government to update guidelines via its *Care of Children and Adolescents with Gender Dysphoria*. After this systematic review was published in 2022 by the Swedish Agency for Health Technology Assessment and Assessment of Social Services, Sweden's NBHW recommended a move away from cross sex hormones. The authors conclude that risks currently outweighs the possible benefits and most patients will need psychotherapy and supports rather than medical care. The Swedish National Board of Health and Welfare reported the 3 main factors:

a. A lack of reliable scientific evidence concerning the safety and efficacy of treatments.

b. Increasing concerns about de-transition.

c. Uncertainty brought about by the extreme rise in those seeking care, especially females.

51. They further conclude that "Evidence for non-binary gender identity is lacking." and the evidence is limited for adults. They further report "Gender dysphoria rather than gender identity should determine access to care". The authors conclude the "For adolescent with gender incongruence NBHW deems that the risks of puberty suppressing treatment with GnRH -analogues and gender affirming hormonal treatment currently outweighs the possible benefits. Treatment should be offered only in exceptional cases."

52. Sweden has made these changes within a context of longstanding access to care for gender dysphoria and much of the available data regarding longer term outcomes. A 2011 article reviewed sex-reassigned patients in Sweden from 1973 to 2003 and showed increased risk for suicide attempts and inpatient psychiatric care. (Dhejne 2011). A recent article, initially published claiming positive mental health results, after Letters to the Editors, caused a correction (Bränström 2020). This article reviewed patients diagnosed with gender incongruence between 2005 and 2015. The reanalysis and multiple Letters to the Editor in the end led even the authors to conclude that the methodological shortcomings preclude any statement on the suitability of surgery in persons seeking treatment for gender noncongruence. The peer review issues exemplified by these events will be discussed later in this report.

53. Finland is another Nordic country with an organized medical system and longstanding availability of care for gender dysphoria. Finland's recent Recommendation of the Council for Choices in Health Care in Finland (PALKO / COHERE Finland) *Medical Treatment Methods for Dysphoria Related to Gender Variance In Minors* concluded "The first-line treatment for gender dysphoria is psychosocial support and, as necessary, psychotherapy and treatment of possible comorbid psychiatric disorders." The authors further report cross sex identification "even in extreme cases, generally disappears during puberty. In some cases it persists or intensifies."

54. The authors state "A lack of recognition of comorbid psychiatric disorders common among gender-dysphoric adolescents can also be detrimental. Since reduction of psychiatric symptoms cannot be achieved with hormonal and surgical interventions, it is not a valid justification for gender reassignment. A young person's identity and personality development must be stable so that they can genuinely face and discuss their gender dysphoria, the significance of their own feelings, and the need for various treatment options." They conclude: "In light of available evidence, gender reassignment of minors is an experimental practice. Based on studies examining gender identity in minors, hormonal interventions may be considered before reaching adulthood in those with firmly established transgender identities, but it must be done with a great deal of caution, and no

irreversible treatment should be initiated. Information about the potential harms of hormone therapies is accumulating slowly and is not systematically reported."

55. In their 2021 Position statement, *Recognizing and addressing the mental health needs of people experiencing Gender Dysphoria / Gender Incongruence*, the Royal Australian and New Zealand College of Psychiatrists (RANZCP) provides an overview of Gender Dysphoria and highlights the importance of respecting an individual's gender identity.

56. This position statement indicates that "Comprehensive Assessment is critical." "Evidence and professional opinion is divided whether an affirmative approach should be taken in relation to treatment of transgender children or whether other options are more appropriate." They further reflect that "There is a paucity of quality evidence on the outcomes of those presenting with Gender Dysphoria."

57. The 2022 press release of the French National Academy of Medicine, *Medicine and gender transidentity in children and adolescents*, reporting that on the epidemic like increase and that "This primarily social problem is based, in part, on a questioning of an excessively dichotomous vision of gender identity by some young people." "Therefore, faced with a request for care for this reason, it is essential to provide, first of all, a medical and psychological support to these children or adolescents, but also to their parents, especially since there is no test to distinguish a "structural" gender dysphoria from transient dysphoria in adolescence.

Moreover, the risk of over-diagnosis is real, as shown by the increasing number of transgender young adults wishing to "detransition". It is therefore advisable to extend as much as possible the psychological support phase."

58. They further report "However, a great medical caution must be taken in children and adolescents, given the vulnerability, particularly psychological, of this population and the many undesirable effects, and even serious complications, that some of the available therapies can cause."

59. Similarly, The National Health Service of England commissioned the Cass Review to evaluate the safety and effectiveness of gender dysphoria care. The systematic review commissioned in the UK found the evidence for puberty blockers and cross-sex hormones to be of "very low certainty."

60. "The key limitation to identifying the effectiveness and safety of gender-affirming hormones for children and adolescents with gender dysphoria is the lack of reliable comparative studies. All the studies included in the evidence review are uncontrolled observational studies, which are subject to bias and confounding and were of very low certainty using modified GRADE. A fundamental limitation of all the uncontrolled studies included in this review is that any changes in scores from baseline to follow-up could be attributed to a regression-to-the-mean. " The authors further noted that the studies have relatively short follow-up and studies with a longer follow-up are needed to determine the long-

term effect of gender-affirming hormones for children and adolescents with gender dysphoria.

61. The World Professional Association for Transgender Health (WPATH) is an international, multidisciplinary, professional association whose reports themselves to have a "mission is to promote evidence-based care, education, research, public policy, and respect in transgender health." WPATH has created their Stands of Care (SOC) documents which shares some features equivalent to what a medical organization would call a clinical practice guideline. These documents are referred to as the Standards of Care (SOC), the 2011 edition as SOC -7 and the 2022 version as SOC-8. The authors of SOC-8 state: "The overall goal of SOC-8 is to provide health care professionals (HCPs) with clinical guidance to assist TGD people in accessing safe and effective pathways to achieving lasting personal comfort with their gendered selves with the aim of optimizing their overall physical health, psychological well-being, and self-fulfillment."

62. Due to its recent release, a thorough systematic review of WPATH SOC-8 is not available. Dahlen et al provided a systematic review and quality assessment of international clinical practice guidelines for gender minority/trans people which included the review of WPATH SOC-7. They note that WPATH SOC7 "contains no list of key recommendations nor auditable quality standards." Among the principal findings was that WPATH SOC 7 cannot be considered 'gold

standard'. The WPATH review scored poorly on editorial independence, applicability, and rigor of development. The review scored better on scope, stakeholder involvement and clarity of presentation. The reviewers noted that WPATH and other international clinical practice guidelines tended to prioritize stakeholder involvement rather than methodological rigor.

63. Among the implications were that "Clinicians should be made aware that gender minority/trans health CPGs outside of HIV-related topics are linked to a weak evidence base" and that "Organizations producing guidelines and aspiring to higher-level quality could use more robust methods, handling of competing interests and quality assessment."

64. The Mayo Clinic Proceedings article, *Clinical Practice Guidelines: a Primer on Development and Dissemination*, (Murad 2017) highlights that "trustworthy clinical practice guidelines require a systematic review to select the best available evidence and should explicitly evaluate the quality of evidence". The authors' criteria for trustworthy guidelines include:

a. "Be based on explicit and transparent process that minimizes distortions, biases and conflicts of interest"

b. "Provide a clear explanation of the logical relationships between alternative care options and health outcomes"

c. "Provide ratings of the quality of evidence and the strength of the recommendations"

65. Despite the well-known methodological weakness to SOC 7, WPATHS created SOC 8 in a similar manner, again disregarding the conventions expected to create a trustworthy clinical practice guideline.

66. While SOC 8 is a large document and it is beyond the scope of this report to review completely, I must note 4 major concerns as a mental health professional.

a. SOC 8 makes no analysis of privileging gender affirmation over body affirmation. For clinicians and psychotherapist these trade-offs are fundamental concerns.

b. SOC 8 suggests consumer-driven medical and surgical interventions and deems these medically necessary without adequate supporting evidence.

c. SOC 8 normalizes self-mutilation via inclusion of "Eunichs" as just another non-binary category without any suggestion that these individual require mental health assessment prior to any consideration of chemical or surgical procedures.

d. SOC 8 downplays concerns related to de-transitioning.

67. Four final thoughts regarding the limited evidence for treatments for gender dysphoria. Firstly, advocates of gender affirming treatments point to short-term improvements observed in some studies. It is possible that much of these improvements are placebo effects. Placebo effects are positive changes based on expectations. Placebo effects are routinely seen in other treatments, such as pills for depression. Vulnerable youth expressing gender dysphoria may be especially susceptible to believe in remedies celebrated by online influencers or advocate physicians. The enthusiastic claims of effectiveness of gender affirming treatments in the press, by medical societies and expressed by advocates at high prestige institutions, would be expected to enhance placebo effects (Clayton 2022). This creation of false expectations has significant potential to cause harm.

68. The second concern is many proponents of early transition of youth with gender dysphoria point to what is known as the "Dutch Protocol". Yet a recent reviews display that while some call published reports regarding results of the Dutch Protocol reliable research, this "research", is in fact severely flawed (Biggs 2022). This is because the Dutch protocol selected out patients to assure only the most successful outcomes. The clinicians flipped the questionnaire, leaving it unclear if gender dysphoria was resolved. Lastly, concomitant psychotherapy confounds whether effects were from psychotherapy or the hormones and surgeries. Added to this, is that clinics in the United States do not follow the rigor of the

original studies, and as such the result are unlikely to be generalizable (Abbruzzese 2022).

69. The third problem regards Informed Consent. It is a concern of clinicians, as I have been asked about it by colleagues. It is curious that there has been minimal dialogue exploring the unanswered questions related to informed consent in medical journals. These matters are disputed in other journals (Latham 2022, Levine 2022). Medical organizations have come out strongly for affirmative care, supporting the opinion that minors have the emotional and cognitive development to be responsible for whatever consequence their teenage selves make. Yet when the question was mandatory life in prison in Miller V. Alabama, The American Academy of Child and Adolescent Psychiatry (with the American Medical Association) Amicus Curiae (2012. P2-3) claims: "Scientists have found that adolescents as a group, even at later stages of adolescence, are more likely than adults to engage in risky, impulsive, and sensation-seeking behavior. This is, in part, because they overvalue short-term benefits and rewards, and are less capable of controlling their impulses making them susceptible to acting in a reflexive rather than a planned voluntary manner. Adolescents are also more emotionally volatile and susceptible to stress and peer influences. In short, the average adolescent cannot be expected to act with the same control or foresight as a mature adult." It is thus my opinion that The American Academy of Child and Adolescent Psychiatry is so

politicized it cannot keep track of its own claims in Amicus Briefs which contradict each other. Unless this organization is willing to backpedal on its well substantiated and well documented arguments in the Miller v Alabama case, how can it basically argue the opposite when it comes to consent for irreversible treatment within the context of low quality evidence and significant risk of harm?

70. The fourth concern is most grave. A recent article in the New England Journal of Medicine tracked 315 youths undergoing 2 years of gender affirming hormones (Chen 2023). Within 315 hormone treated youth there were 2 completed suicides. Curiously, this remarkably high suicide rate is not explored in the article. By comparison, a recent review tracked the Gender Identity Development Service in England, Wales and Northern Ireland from 2010 to 2020 (Biggs 2022). This found 4 completed suicides of 15032 transgender patients over 10 years. As Gender Identity Development Service in these locations were overwhelmed with patients, only a small fraction were receiving gender affirming hormones. If these are compared the American hormone treatment group, it would be akin to a waitlist control. Thus the most recent research shows a much higher than expected rate of suicide in the condition of affirmative hormone treatment.

Lack of consensus regarding treatment of gender dysphoria

71. With rapidly growing cohorts of patients expressing novel symptoms clusters in an new area of medicine where a limited evidence base exist, differences

of opinion regarding clinical care for gender dysphoria are expected. It would be remarkable if there was uniformity of opinion. Furthermore, gender care is politicized, and opinions tend to cluster in a manner consistent with an influence of political ideology (Regnerus 2022).

72. Within this context of low quality evidence and divergent opinions, there are bound to be calls for reasonable clinical safeguards. There are also serious reservations regarding the effectiveness and concerns about the risks from affirmative treatment for Gender Dysphoria (Clayton 2022, Biggs 2022).

73. Much of the push for affirmative treatment for gender dysphoria treatment has come from professional organizations such as the Endocrine Society, American Academy of Pediatrics and the American Psychiatric Association and the American Academy of Child and Adolescent Psychiatry. Medical professional organizations are large bureaucracies which serve many functions. They are important components of our medical system and usually provide great services for the profession and the public.

74. Just as other parts of society, professional medical organizations are susceptible to tribal influences and politicization. Their influence and credibility can be misused in a harmful manner. I have directly observed, that over the last decade, but particularly the last 5 years these organizations have prioritized a politicized and narrow vision of social justice advocacy. While this has arisen from

good intentions, it has contributed to the creation and spread of misinformation regarding treatment of gender dysphoria. I will explain how this occurred.

75. I have directly observed that within these organizations, the members most enthusiastic about a certain type of medicine self-selected into "special interest groups" or committees. For instance, the psychopharmacology committee is filled with supporters of using psychopharmacology and the psychotherapy committee is populated by members enthusiastic about psychotherapy. Committees on gender and sexuality have been no exception. By participating in a committee, a small group of people can establish themselves as content experts within their organization.

76. Using committees as content experts usually works well, as it did during my eight years as co-chair within AACAP's media committee. ACCAP leadership utilized our input to make decisions about policy statements, clinical recommendations, public education or relevant legislation.

77. Over the recent years that gender clinics started to spread across America, gender medicine enthusiasts self-selected into these clinics and also into gender relevant committees. Most physicians are wary of the very concept that it can be beneficial to give cross sex hormones to still developing minors. Thus those who venture into medicalized gender care are already a select few who bring to this work certain viewpoints and aspirations. Just as with the psychopharmacology or

psychotherapy committee members, gender committee members have strong personal and professional investment in the success of their favored type of treatment. This created a well-intentioned but homogenous group of gender medicine supporters.

78. Without the knowledge of most members of a professional organization, as few as the dozen members in a committee can steer these organization's leadership to advocate for treatments or policy positions. Once medical organizations have come out with policy statements, clinical practice guidelines and press releases advocating strongly for a position, they have difficulty accepting they may have misstated evidence, advocated for unwise policy or otherwise caused harm.

79. For example, the highly influential 2018 Policy Statement from the American Academy of Pediatrics (AAP) (Rafferty 2018) contained many citation errors, overstatements and unfortunately mischaracterized the longstanding and well-regarded clinical approach of watchful waiting (Cantor 2020). This policy statement has been particularly detrimental to the scholarly exchange of ideas related to gender dysphoria treatments, as it used the prestige and trustworthiness of the AAP to privilege the concept of affirmative care and denigrate other treatment. It also increased momentum to enshrine social transition and access to

medical treatments in minors, whether or not these are prudent or evidence based approaches.

80. Medical and psychiatric journals editors are surely aware of their affiliated professional organization's policy statements and political advocacy. Since the Endocrine Society, American Academy of Pediatrics, American Psychiatric Association and American Academy of Child and Adolescent Psychiatry have been all openly involved in political advocacy in support of gender affirming care, in reality their journal are no longer are scientifically neutral. This politicization is reflected in the editors' actions as medical and psychiatric journals have recently attempted to consolidate favorable opinion toward gender affirming treatments for gender dysphoria rather than promoting open scholarly debate.

81. This is not just my theory, Michael Norko, the editor of the Journal of the American Academy of Psychiatry and the Law emailed to me in June 2022: "The Journal is an instrument of AAPL, and it is my responsibility as Editor to lead it in a direction that supports the efforts and goals of the parent organization."

82. Not surprisingly, skeptical voices have been difficult to find within any of the journals of the Endocrine Society, American Academy of Pediatrics, American Psychiatric Association or American Academy of Child and Adolescent Psychiatry. In fact, I have not found a single skeptical or even ideologically balanced article in any of these journals. Journal editors have a wide discretion to

choose what topics are covered in their journals by choosing what articles are sent for review, commentaries, clinical perspective, vetting Letters to the Editor guiding what is included in the book review column and setting policies.

83. The medical journal I follow most closely, The Journal of the American Academy of Child and Adolescent Psychiatry has only published articles seeking conformity of thought with gender ideology and affirmative care, and has not allowed actual scholarly dialogue to be voiced. Please see the commentaries (Dixon 20202), clinical perspectives (Turban 2017, Turban 2018), and book reviews (Suto 2021, Chilton 2021, Kim 2021).

84. The 2017 Turban article provided the perspectives of transgender and gender nonconforming youth and reading that viewpoint can certainly be valuable for clinicians. Yet most striking was the youth's ideological assertions, misunderstanding of the evidence and pleas for their physicians to believe suppositions such as ""Sexuality and gender are two different things. TOTALLY separate." and "Puberty blockers and cross-sex hormones can save my life." It also contained a pressure to join the movement: "Let me know that you are on my team." These youth somehow have gotten the impression there is no doubt regarding the safety and efficacy of hormones and surgery. They also have the belief that changing society is the solution to their mental health challenges: "If I am depressed or anxious, it's likely not because I have issues with my gender identity,

but because everyone else does." More striking was that that authors expressed agreement with the youths' ideology. The authors conclude: "Likely due to a combination of minority stress and dysphoria related to being 'trapped in the wrong body,' these young people are disproportionately burdened by depression, anxiety, and suicide attempts." The evidence actually points to youth who are depressed, anxious and suicidal are more like express gender dysphoria (Kaltiala 2020).

85. The Journal of the American Academy of Child and Adolescent Psychiatry even published a Commentary filled with misinformation which pressured researchers to adopt progressive gender theories to "become allies" (Dixon 2022). It is curious but revealing that the participants seemed uninterested in core unanswered questions such as why individuals experience themselves as nonbinary or transgender. Conversely, the youth and authors used the commentary to push researchers to adopt ideology and allyship. These pressures on scholars are antithetical to the scientific method and have been a corrupting force in much recent research and academic dialogue regarding sex and gender. This politicized, low quality scholarship has minimal credibility and is a prime example of how medical journals have prioritized advocacy and ideology over trustworthy science. With two child and adolescent psychiatric colleagues, in response to Dixon et al, we wrote a Letter to the Editor of the Journal of the American Academy of Child and

Adolescent Psychiatry. The journal editor refused to even send this letter out for review.

86. Not only are the articles one sided, the peer review process regarding gender medicine within medical journals has become dysfunctional. Many recent examples show how prominent medical journals ignore significant weakness in methods, allow erroneous conclusions and overstatement of the strength of the evidence when articles support affirmative care or related concepts (Bigg 2020, Deangelo 2021, Kalin 2020, Giovanelli R. 2022). As mentioned earlier, the Journal of the American Psychiatric Association published a study with an erroneous positive conclusion regarding gender surgeries in Sweden, prompting a flurry of letters to the editors and later revision (Bränström 2020).

87. In 2018 Lisa Littman published an article which revealed aspects of the rapid spread of gender dysphoria in adolescents. After this research was peer reviewed and published, the journal PLOS ONE had a re-editing of the publication with a commentary added. This showed a disregard for the typical rules of scientific discourse, and should be noted was not a corrections, as there was no finding of error, misconduct or faulty methods. As confirmed by the PLOS ONE re-review, Dr. Littman's research methods were unremarkable and comparable to other mental health research, and this was not a correction as claimed by activists. Various journals also published articles deriding Dr. Littman's work and she was personally

harassed by activists. Brown University also did not make any effort to defend her Dr. Littman from attacks on her freedom to pursue science. This antagonism of Dr. Littman was not about her methods, but rather that her data indicated that Gender Dysphoria was spreading in a pattern consistent with social influence. Dr. Littman's other heresy was revealing how many parents perceive the gender affirming approach is dysfunctional. (Littman 2018)

88. Similar dynamics are in place even in newsletters. A colleague related a difficult experience with editors of the American Academy of Psychiatry and the Law Newsletter. The editors would not permit him to describe in his article the actual problematic behaviors of youth who declared themselves to be transgender on his inpatient unit. This silencing of actual clinical situations undermine the exchange of ideas on how to best provide clinical care.

89. Thankfully, journals outside of medicine have not allied themselves to one viewpoint and are willing to embrace open scholarly dialogue (Abbruzzesse 2023, D' Angelo 2021).

The breakdown of scholarly dialogue

90. Open inquiry is the ability to ask questions and share ideas without risk of censure. It is fundamental to medical research and scientific progress. Within medicine the ability for constructive disagreement and the expression of divergent

opinions has withered with regards to questions of biological sex, gender and gender medicine.

91. Political and social pressures are not new to this line of research and clinical care and do not come from only one political pole or fraction of society. Yet especially within the last decade, academia, including academic medicine has become more tribal, moralizing and more likely to attempt to silence divergent opinions (Bindewald 2021).

92. I witnessed these dynamics personally at the American Psychiatric Association 2022 annual conference. At the Clinical Perspective *The Management of Adolescent Onset Transgender Identity: Should "Best Practices" Change* on May 24th 2022, the was a preamble. In a procedure I've never before seen at a conference, the representatives from American Psychiatric Association who were monitoring the event were asked by leadership to read a statement prior to presentation indicating the content of the presentation clashed with official proclamations of the organization. During this Clinical Perspectives four speakers presented convincing data and opined that they questioned the evidence based and logic supporting current affirmative psychotherapy and medicalized practice regarding the treatment of transgender youth. Most of the audience respectfully sat while enjoying the thoughtful presentation. Yet a small crowd in the audience was disruptive. There were many interruptions of the presentation by a member of the

crowd who repeatedly provided his input. During the question-and-answer session, a series "questions" were rather hostile ad-hominem statements towards the presenters. Only a tiny fraction of the questions actually responded to any of the evidence or viewpoints presented. I have never previously observed any comparable unprofessional behavior or hostility toward presenters in any medical or psychiatric conference.

93. Similarly, in 2018 Lisa Littman, MD presented her research data at American Academy of Child and Adolescent Psychiatry conference and received personal enmity which caused a colleague to remark he has never seen a presenter at a conference treated with such hostility. I did not attend live but later watched the presentation online and also heard the many demeaning and unprofessional comments directed toward Dr. Littman.

94. Members of APA and AACAP who attend meetings and observe scholars being condemned will certainly think twice before voicing their concerns. This polarization and moralization can create a "spiral of silence": an appearance of agreement because a small moralizing group dominates the discussion (Noelle-Neumann 1974). This is consistent with my experience as I have been told by a range of child psychiatrists, from very senior AACAP "life members" to residents in training that they are unwilling to openly express their viewpoint, but they do not see data or logic supporting gender affirming treatments.

95. The 2022 American Academy of Child and Adolescent Psychiatry conference featured at least 6 presentations related to gender dysphoria or transgender patients, none presenting new research. Yet a research Symposium was rejected which was to include a prominent international researcher, Dr. Littman, a clinician experienced in treating gender dysphoria and was to feature detransitioners. The AACAP program committee co-chair James McGough later indicated via a May 28th 2022 email this highly unusual rejection was in part due to "concerns" about the methods employed in several of the presentations and that detransitioners would be involved. It defies logic that the only time methods are an issue is when the results of the research raises questions about affirmative care. Furthermore, I am aware of a number of presentations which have been accepted with the condition of making a small adjustment. The detransitioners as discussants could have easily been replaced as their only role would be to ask questions after the research is presented.

96. Dr. McGough indicates he took these concerns seriously. He referred concerned parties to "Aron Janssen co-chair the AACAP committee charged with taking the lead on trans issues." Dr. McGough also noted that "Aron is also on the program committee". A program committee member "taking the lead on trans issues" would give Dr. Janssen significant power to support or suppress presentations. I have seen Dr. Janssen present twice and spoken with him. Though

we disagree, he is a thoughtful person and means well. Yet those concerned with free exchange of scholarly ideas should notice the words he chose in his 2021 "Perspectives" article (Janssen 2021) whereas he characterized legislative and political endeavors to limit medical care as "malicious changes" that "provide fodder to perpetuate discrimination, fear and exclusion." He specifically states: "It is our ethical responsibility to respond to this assault".

97. Dr. Janssen characterizes those arguing against gender affirmative care as making "an effort to oppress". This all makes clear he does not want open rigorous scholarly exchange that would raise substantial questions about the ethics and efficacy of gender affirming care. It is further my assessment that across medical organizations and medical journals those who are "taking the lead on trans issues" share Dr. Janssen perspective.

98. For those not familiar with the proceedings of medical conferences, research symposiums are eagerly sought out by the medical societies. The same program chair has commented to me personally that research symposiums are by far the easiest type of presentation to be accepted. For this same conference I also submitted, with two other physicians, for a Special Interest Group presentation which was to feature data on de-transitioning. This proposal obviously provided data which raised questions about affirmative care, it was also not accepted.

99. Despite unclear evidence and significant disagreement among psychiatrists regarding the treatment of gender dysphoria, medical professional organizations have enthusiastically conducted a public campaign to portray these treatments as evidence based. The organizations' political activism has important ramifications and creates a false impression that gender affirming treatment rests on strong and settled science. Two recent press releases provide examples. The September 28th 2022 American Academy of Pediatrics (AAP) press release regarding the State of Oklahoma condemnation of any limits on gender affirming health care. Defending scope of practice is typical for medical associations. Yet the press release frames these limits as discrimination based on gender identity, a moralized characterization of restrictions on care.

100. American Academy of Pediatrics' opposition to Oklahoma's limits on moral grounds (discrimination) fails to acknowledge ethical concerns regarding treatment of children with gender dysphoria including large scale potentially irreversible damage to minors. This is an example of two competing moral frameworks which both express valid concerns. As such, a more appropriate perspective from a medical organization would be a call for reasoned dialogue to evaluate the moral claims on each side, examine the logic and data behind these moral frameworks and treatments. It is not immoral to seek to find more cautious ways to care for and support those with gender dysphoria, or to seek a higher level

of evidence before allowing minors to make permanent decisions regarding altering their bodies.

101. Curiously, the AAP statement invokes parental rights, but without clarifying if the AAP supports the very likely majority, who do not want hormonal or surgical treatment for their child's gender dysphoria. This AAP statement misses an opportunity to show respect for those who disagree, which is an indication of how politicized the AAP organization has become.

102. The American Academy of Child and Adolescent Psychiatry (AACAP) made a number of similar statements regarding limits on care such as the March 1, 2022 statement which characterized actions in Texas as "attacks" which endanger young people. The statement curiously claims "Gender affirming care is informed by long-standing standards of care and by evidence-based clinical studies". How longstanding are we talking about, because gender dysphoria was previously so rare I went over 20 years from medical school through over the first decade of my career without a single patient reporting gender dysphoria. The first gender clinic in the United States just opened in 2007. It is reasonable for AACAP to defend scope of practice, oppose criminalization of physicians and call out inappropriate use of child protective services. Yet a medical professional organization overstating evidence and using divisive rhetoric reveals serious ideological and political influence which undermines it's own legitimacy.

103. Even more revealing is the American Academy of Child and Adolescent Psychiatry's (AACAP) March 18th, 2022 press release reveals their leadership's strident position by remarking on an education bill, outside psychiatrists' area of expertise. AACAP's statement used politicized derogatory phrasing by calling Florida's legislation the "Don't Say Gay or Trans" bill. The press release quotes the current president of AACAP who demonizes supporters of the bill as unconscionable and implies these supporters "target and harm" LGBTQ+ youth". The American Academy of Child and Adolescent Psychiatry's leadership moralizes the debate, uses polarizing language and does not engage in forthright discussion which must include skepticism, not just affirmation.

104. It should be noted the national organization offered my regional AACAP branch (in the Tampa area) the opportunity to sign on to "BRIEF OF AMICI CURIAE AMERICAN ACADEMY OF PEDIATRICS AND ADDITIONAL NATIONAL AND STATE MEDICAL AND MENTAL HEALTH ORGANIZATIONS IN SUPPORT OF PLAINTIFFS' MOTION FOR PRELIMINARY INJUNCTION". The Tampa regional organization refused to sign on.

105. While I have little direct experience with the Endocrine Society, my assessment is that many endocrinologists, and perhaps most, also believe their professional organization is also too strongly influenced by activist physicians.

Similar to AACAP and AAP, they take a polarized position and misstate the strength of the evidence regarding gender affirming care. In particular, the April 20th 2022 press release "Endocrine Society Opposes Florida Department of Health Policy on Gender Dysphoria Treatment for Children and Adolescents" reveals overstatements of the strength of evidence and the false appearance of consensus in the medical community. This statement mischaracterizes puberty delaying medication as a "safe, reversible and conservative approach." This statement claims that attempts to restrict care are based on politics, rather than acknowledging legitimate concerns. It is interesting that they cite the Endocrine Society's own clinical practice guidelines. As noted previously, the Endocrine Society's own guidelines themselves graded the supporting evidence as low or very low quality for their clinical recommendations.

106. These organizations portrayal of affirmative treatments for gender dysphoria as both effective and virtuous has had a chilling effect on scholarly dialogue regarding gender dysphoria in the medical community. This framework brands those who disagree regarding the evidence base as morally inferior and biased. Through mechanisms I will describe below, moralization has been counter-productive to developing trustworthy science and has contributed to the spread of misinformation regarding treatment approaches to gender dysphoria.

107. Prudent physicians generally avoid being part of a partisan and moralized debate, and do not want to be harassed by gender activists (Evans 2021). When anonymously polled, as cited above, physicians are free to provide their actual opinion and show their skepticism. Supporters of affirmative care could survey physicians to specifically test their hypothesis of broad based support. Why have they not conducted such a survey?

108. As mentioned earlier, the highly politicized dialogue regarding the issue of transgender care (Evans 2021) mirrors a larger phenomenon within the academic community. On many complex and divisive issues within academia, there has been a push from the progressive left demanding conformity of opinion with a narrow, highly moralized viewpoints (Bindewald 2021). The example of gender dysphoria shows that academic medicine has not been immune to this same phenomenon.

109. Pressures to make affirmative therapies the only treatment for gender dysphoria essentially push all parties involved to adopt a simple clear framework for gender dysphoria treatment. Yet simple and clear does not represent the reality or the evidence base. All- or-nothing rhetoric can be an effective technique to rally support around a cause. Yet the treatment of gender dysphoria has complex ethical, legal, social and clinical trade-offs.

110. This moralized framing of affirmative treatments for gender dysphoria encourages a cognitive shortcut known as attribution substitution. Attribution substitution is the process whereby a simple, related moral judgement is substituted for various conceptually complex decisions. This common cognitive bias causes humans to intuitively believe viewpoints which appear virtuous, especially ideas which seem widely held within their social group. Affirmative care does sound compassionate and supportive, and these minor semantic can have a surprising influence.

111. For comparison, the Covid-19 pandemic provided a clear parallel of how moralizing medical issues can lead to misinformation and poor decision making. Individuals' tribal associations were shown to often influence their viewpoint of lockdowns, masks and vaccines more than data. (Kerr 2021, Jiang 2021). Call for conformity meant that dissenting physicians, even academic titans like John Ioannidis, Jay Bhattacharya, and Scott Atlas were treated badly both online and within the medical community. These pressures against voicing skepticism distorted the professional dialogue. Respectful conflict of opinion and impersonal rigorous exchange would have likely reduced harms, such as education loss and mental health deterioration associated with prolonged American school closures during the pandemic (Dooley 2022).

112. Ideological homogeneity and group identity are risk factors for developing irrational beliefs and spreading misinformation. (Su 2022, Sun 2022, Macy 2018). This directly relates to attitudes about transgenderism and gender dysphoria treatments where ideological dogma has distorted scientific exploration. Those who dare to question the dogma are treated as heretics.

113. These dynamics are understandable. Many times within psychiatry and medicine we as practitioners face enormous suffering. Gender non-conforming patients do at times face harassment and discrimination. Patients expressing gender dysphoria have high rates of depression, anxiety and self-harm. All physicians and mental health professionals want to help. Those who started gender clinics hoped to relieve suffering. Yet in medicine false hope can cause suffering.

114. All humans, including physicians, tend to find arguments in favor of conclusions we want to believe, and this bias in known as motivated reasoning (Peters 2020). Supporters of gender affirming treatment want to believe they have found an ethical and evidence based solution. This motivated reasoning explains the strong divergence between the enthusiastic support for gender affirming treatments and the relatively weak evidence base.

115. Once a group, such as a gender committee, endorses a statement of belief, such as “gender affirmative care is life-saving”, the other psychiatrists in their professional organization who have not reviewed the facts tend not to question

it. Psychiatrists face a rapidly expanding evidence base across disorders, and we depend on specialization to lead us toward progress in our varied patient populations.

116. Especially if the "experts" assert a strong moral claim regarding a clinical approach, other members would assume it is based on strong evidence. This creates a group process whereas the leadership responds to show support and loyalty, and others tend to follow. Support of this moral claim becomes a marker of virtue and raises status within the group. Those who are skeptical tend to self-censor (a Spiral of Silence) rather than taking a risk of being called unethical. These dynamics, especially leaderships' endorsement, make opinions appear like facts within the group. Members of this group they never hear counter arguments or disconfirming data and become ever more confident.

117. Within such moralized environments education and intelligence offer limited protection from irrational beliefs. In fact, sophisticated language skills enable virtuosity in creating and promoting false narratives. These dynamics have happened many times before in medicine and it is my assessment this has occurred again with regards to affirmative treatments of gender dysphoria.

118. Contrary to popular belief, humans' emotional programing drives much of our cognitive processes. That is, we tend to create beliefs that go along with what we feel, rather than the other way around. This usually works well, but also causes

serious problems. In cognitive therapy it is known as "emotional reasoning". Emotional reasoning helps explain opinion cascades, partisanship and group-think.

119. Our highly social nature and limited rationality demand that, in medicine and science, we create conditions which foster trustworthy data and minimize the creation and spread of misinformation. Recently, as shown, medical organizations and journals have prioritized advocacy, putting them at risk for producing and officially sanctifying misinformation.

120. A prescription for open exchange and deliberate consideration regarding gender dysphoria treatments should aspire to:

a. Solicit a diversity of perspectives.

b. Discuss the argument, rather than the person making the argument.

c. Clarify the methods, source of data and its limitations.

d. Use precise language rather than broad ideologies.

e. Discuss potential sources of bias, including those related to group affiliation.

f. Quickly acknowledge and correct mistakes.

121. This framework would depersonalize the search for truth and esteem empirical dialogue. Yet conflict is required to help us create a trustworthy scholarly dialogue regarding gender dysphoria. This has not occurred and as such claim that there is an evidence base supporting gender affirming treatments is not credible.

122. Complex ethical issues regarding treatment of gender dysphoria deserve attention. Yet pressures to accept affirmation treatment as being the most virtuous and only effective approach discourages good faith scholarly dialogue. Furthermore, the characterization of those who oppose gender affirming care as transphobic or hateful has been used to justify silencing scholars whose data or logic does not support the gender affirming approach. This occurred with Lisa Littman. Former sex researchers have left the field due to the harassment and intellectual bullying they had received (Soh 2021).

123. Thus we are in the curious situation where in private, but not in public, most psychiatrists will acknowledge their doubts regarding affirmative care. My personal interactions with many thoughtful well regarded psychiatrists display a full range of views. Most child and adolescent psychiatrists consider automatic affirmation inappropriate, even though many are willing to use affirmative approaches selectively. (Evans 2021). Most psychiatrists are willing to admit we don't have enough research to really know how to proceed.

124. Within medicine and academia we need to create space to allow input from those who hold the opinion that logic and the evidence base do not support medical interventions for gender dysphoria. We require a frank discussion of the moral issues involved, including moral hazards associated with medical treatments

for gender dysphoria. Currently, I see no evidence any of this scholarly dialogue happening.

125. Beyond hormones and surgeries, thus the costs and benefits of gender self-identification have not gone through academic inquiry with open rigorous academic review. Social affirmation can be considered a psychosocial treatment, and the recent push for adoption of social affirmation is an attempt at a grand social experiment. This is most concerning as it pertains to children. Statements of physician advocates and medical organizations are used to justify social affirmation, yet social affirmation of children seems more driven by ideology than thoughtful reflection. Throughout human history societies have grouped children by biological sex rather than gender identity. In fact, children naturally group themselves by biological sex (Maccoby 1998). Grouping children by biological sex requires tradeoffs but works well. As it has been standard practice throughout the world there has never been the need for literature to defend this practice. Yet abandoning this convention for the experiment of childhood gender self-identification appears imprudent on many grounds, not least of which is that it will likely be psychologically destabilizing for children and adolescents.

126. Social affirmation for children is portrayed as ethical, but to what degree it is ethical depends on how it will affect children's lives. No substantial evidence guides this movement to rewire a basic element of society. There is a

longstanding forensic psychiatric literature showing that children are suggestible (Ceci 2000). It is easy to see the widespread suggestions of the existence of multiple genders and each child should declare their gender will increase confusion and cross sex identification. This should be expected to increase the incidence of, and persistence of, gender dysphoria. It is thus reasonable to expect social affirmation can cause harm, especially for emotionally vulnerable and neurocognitively impaired youth.

127. Social affirmation of children's and adolescents' self-declared gender requires more research and discussion before the risks and benefits are fully explored(Zucker 2020). Until more is known, and more rigorous scholarly dialogue takes place, society and academic medicine should avoid pushing such a large scale social experiment.

Psychotherapy

128. Patients presenting with gender dysphoria have real symptoms, typically with other comorbid mental health disorders. These patients require validation and support. I recommend their mental health treatment start with psychosocial supports and psychotherapy (Schwartz 2021). In psychiatry, we typically refer to other providers such as social workers, psychologists and licensed clinical therapists who tend to provide the bulk of psychotherapy. Despite this, as

noted in my background, I have extensive experience with psychotherapy, and additional training beyond the majority of psychiatrists.

129. Quality psychotherapy includes the process of exploring patient life history, emotions, coping style and thought patterns. This includes validating how patients feel, but it also includes teaching patients to not be guided solely by their feelings. Psychotherapy involves getting patients to recognize their own thought patterns, disturbed emotions, and, when appropriate, includes challenging irrational, self-defeating and harmful beliefs.

130. There is not an evidence base to support strictly "affirmative" psychotherapy for gender dysphoria, where therapists actively agree with a patient's self-assessment. Automatically agreeing with patient viewpoints is a radical departure from traditional mental health treatments and psychotherapy. Psychiatrists do not "affirm" hopelessness in depression, delusions in schizophrenia or distorted body image in anorexia or body dysmorphic disorder. The similarities between body dysmorphic disorder and gender dysphoria, and the contrast in how they are approached, provide significant evidence of how ideological and political forces have influenced medical practice (Kohls 2022).

131. Is it, for example, sensible, compassionate or good medical practice to, for instance, soon after a sexual assault, to automatically agree with a teen's new

self-assigned gender label? What about when a 9 year old girl spontaneously says "I feel like I am a boy", do we immediately ask what boy name to call her(him)?

132. In psychotherapy with a patient with gender dysphoria, the therapist would not advise a patient to change a gender identity, but also should not "agree" that a patient is the opposite sex. It is surely reasonable and compassionate for a psychotherapist to prefer a patient no longer to suffer with gender dysphoria. It would be inappropriate for a mental health professional to prefer gender dysphoria to continue. Yet the false binary of affirmative psychotherapy versus conversion therapy for gender dysphoria is being used to push therapists from any consideration that acceptance of one's biological sex or resolution of gender dysphoria is a positive event.

133. This categorizing of quality psychotherapy as conversion therapy is a serious misunderstanding of the complexities of ethical and effective psychotherapy (Schwartz 2021, D' Angelo 2021). The term "conversion therapy" is often misused by the supporters of affirmative care as an attempt to devalue and pathologize approaches other than purely affirming a patient's gender self-identification (Griffin 2021, Evans 2020). The only conversation therapy which has ever been researched is the attempt to change, or convert, sexual orientation.

134. Sexual orientation, with rare exception, appears to arise from in utero or early life biological factors. Thus conversion therapy for sexual orientation is

ineffective, hostile and pathologizing to same sex attracted individuals. Decades ago conversation therapy was rejected by modern medicine and mental health. Conversion therapy is a historical reality within the United States, but accusations of conversation therapy have been used as a technique to change the discussion from a question of nuanced mental health care to all-or-nothing thinking regarding affirmation. During my entire career I have never once encountered a single mental health professional that has practiced conversion therapy for sexual orientation. Nor has a single patient ever described to me that they endured conversion therapy.

135. Gender identity is distinct from sexual orientation. Gender identity is often described as fluid, and as this implies, often changes over time, particularly in young people. This gender fluidity is also why it is inappropriate to affirm a declared gender identity in a child. Psychotherapists need space to ask questions about gender identity. Exploring gender identity is not conversion therapy.

136. Time-tested and widely effective psychotherapy approaches include supportive therapy or cognitive behavioral therapy. Cognitive behavioral therapy has proven effective for virtually every mental health condition it has been researched for, including the full range of anxiety disorders, depressive and mood disorders, disturbed anger, sleep disturbance and trauma reactions including Post Traumatic Stress Disorder. Due to the high levels of comorbidity of psychiatric disorders in patients with gender dysphoria, cognitive behavioral therapy could be

extremely helpful as the same approach and techniques have proven effective with so many problems including anxiety, depression and in reducing self-harm.

137. Any psychotherapy should aim to help individuals gain a deeper understanding of themselves, develop coping skills and provide a neutral, unbiased process. Beyond standard psychotherapies, more specific and nuanced approaches for gender dysphoria exist, such as Exploratory Therapy (https://genderexploratory.com/). This "talking therapy" allows time for exploration of mental health concerns without pushing an ideological or political agenda.

138. Advocates of affirmative treatment dismissal of other approaches can be especially harmful in the cases of gender dysphoria presenting in the context of severe pre-existing psychiatric illness. Psychotherapy could led to the resolution of these comorbid illnesses. I can provide three examples.

139. Trauma: There is longstanding psychiatric literature showing that exposure to sexual trauma can lead to changes in gender expression (Cosentino 1993), and this has also been revealed by recent research on detransitioners. (Littman 2021). A recent review on Dissociative Identity Disorder and co-occurring Gender Dysphoria showed frequent childhood sexual abuse (Soldati 2022).

140. A core feature of Post-Traumatic Stress Disorder (PTSD) is avoidance. Repeatedly patients have described to me their physical and emotional distress when they are exposed to trauma reminders. Thus, they frequently have difficulty engaging in psychotherapy for PTSD. Even if they participate, they often actively avoid discussing their trauma. This is unfortunate as trauma focused therapies such as Trauma Focused Cognitive Behavioral Therapy have an excellent evidence base.

141. The massive rise in expressions of gender dysphoria has been most pronounced in adolescent females. This is a population where assessment for, and treatment of trauma, should be a top priority. Furthermore, based on the link between sexual abuse and gender dysphoria seen in detransitioners, assessment and treatment of trauma symptoms should be prioritized. It is possible that for many patients the delivery of trauma based psychotherapy may cause the desistence of gender dysphoria, which in some cases could be considered a co-occurring disorder related to the trauma.

142. Another feature which links gender dysphoria to trauma is the well-known phenomenon of traumatized individuals feeling "cut off" or disconnected from their bodies (Van der Kolk, 1994). Van der Kolk and other prominent PTSD experts recommend mind-body techniques and experiential moving meditations such as yoga to help the body process trauma. These techniques help ground people in the physical world, mindfully experience their bodies and increase positive

physical sensations. While only small studies exist, yoga is being used with success in many settings including prisons and substance abuse facilities. Yoga and other somatic therapies should be studied as a component of comprehensive treatment for gender dysphoria.

Autism

143. Autism Spectrum Disorders are neurodevelopment disorders. People with Autism Spectrum Disorder by definition have problems with social communication and interaction along with restricted or repetitive behaviors or interests. People with Autism Spectrum Disorders are consistently shown to be at increased risk for developing gender dysphoria (Cooper 2022). One review found gender dysphoria to be over 4 times as likely in patients with Autism Spectrum Disorders (Hisle-Gorman et al., 2019). Another review found compared to typically developing control, autistic adults who endorsed the wish to be the opposite sex were found to have more mental health challenges, bullying, suicidal ideation and worse quality of life. They also had worse autism symptoms and more co-morbid disorders than autistic adults who did not report the wish to be the opposite sex.

144. Autistic people experiencing gender dysphoria are a complex patient cohort. There is limited evidence of how best to help and support this specific populations. Due to the neurocognitive limitations in patients with Autism Spectrum Disorders they may be more suggestible. Autistic patients struggle

socially and often spend large amounts of time online. Due to their rigid and obsessive thought patterns, if they develop gender dysphoria they can become fixated and preoccupied with receiving hormonal or surgical procedures, whether or not they understand the risks. Patients with Autism Spectrum Disorder can be incredibly insistent, single minded and determined. They also may have limited insight and minimal ability to anticipate the negative consequences of obtaining the object of their obsessions. Until more is known about the specific outcome related to this vulnerable population, caution with any clinical approach is warranted. Again, special psychotherapy approaches would likely be helpful in this population, but as of yet none have been studied.

Borderline Personality Disorder

145. Personality Disorders are enduring patterns of inner experience and behavior which deviates from expected and causes distress and impairment in functioning. The epidemiology of personality disorders in individuals with gender dysphoria is unknown and estimates vary (Furlong 2022). Many estimates have the population extremely increased, such as 50% of adults, but others show smaller increases. One review of emergency room visits of transgender patients diagnosed personality disorders at 4%, versus matched community sample of 1%. The hospitalized sample was at 5% versus 2% in controls (Lam 2021). Little scholarly

guidance exists regarding specific approaches related to the various personality disorders with comorbid gender dysphoria.

146. In Borderline Personality Disorder there is, by definition, an unstable sense of self, and this leads to frequent personality changes. This typically means sudden shifts in employment, relationship, sexual identity, frequent moves and changes in types of friends. Patients with Borderline Personality Disorder often have early life trauma and find many social environments invalidating. Patients with Borderline Personality Disorder have high levels of emotional dysregulation, self-harm and substance use. This population is extremely difficult to treat.

147. With an unstable sense of self being a feature of the disorder, this patient population seems an especially poor candidate for affirming treatments, especially irreversible treatments. There are two psychotherapeutic approaches which have shown significant success, the most established is Dialectical Behavioral Therapy (Gillespie 2022), but Mentalization Base Therapy (Vogt 2019) also has significant evidence as a successful approach.

148. Especially for a young person developing signs of Borderline Personality Disorder, starting these proven approaches as early as possible is their best chance of avoiding a life course which is full of emptiness, struggle and suffering. Again, in this patient population, a focus on gender affirming treatments as the solution to this constellation of serious mental health problems is extremely

problematic, and appears likely to cause harm if it delays access to evidenced based treatments.

Conclusion

149. It is scientific and medical consensus that patients with gender dysphoria typically also have a mix of anxiety, depression, self-harm, personality disorders, neurodevelopmental disorders and trauma related symptoms. Yet these mental health problems generally pre-date or co-occur with the development of gender dysphoria.

150. There is not a scientific or medical consensus that comorbid mental health disorders are due to "untreated" gender dysphoria. This claim does not match the data. These co-occurring mental health problems pre-date and are, for the most part, not caused by the gender dysphoria.

151. As reported in the Finnish review (PALKO / COHERE Finland 2020): "A lack of recognition of comorbid psychiatric disorders common among gender-dysphoric adolescents can also be detrimental. Since reduction of psychiatric symptoms cannot be achieved with hormonal and surgical interventions, it is not a valid justification for gender reassignment." The Finnish experience shows that "treating" the gender dysphoria with affirmative medications and surgeries does not resolve the patients' mental health disorders (Kaltiala 2020).

152. Claims of medical necessity for hormones and surgeries for minors can be refuted by the fact that all cohorts of previous children and adolescent throughout human history have never "needed" these procedures. The burden of proof is on those who proposed hormones and surgeries for minors to conduct long term studies and show these practices to be safe and effective. These are currently experimental approaches which seem highly intertwined with ideology. As detransitioners become more visible and relate their stories, it is clear that this ideology has distorted the practice of medicine, leading to harm.

153. The medical system has a long history of spurts of overdiagnosis and overtreatment. Many of our interventions such as frontal lobotomies were celebrated at the time. Eventually society sees the harm, pushes back and the medical profession eventually reforms.

154. Harmful and unnecessary interventions are especially likely to occur when patient desires are combined with financial incentives and the best of intentions. The American opiate epidemic was ushered in by "expert" physicians who proposed physicians need more compassion because "pain is the 5th vital sign" (Mandell 2016, Adams 2016). Too much compassion can cause harm.

155. Psychiatrist Anna Lembke, in her 2016 *Drug Dealer, MD: How Doctors Were Duped, Patients Got Hooked, and Why It's So Hard to Stop* discusses how susceptible to manipulations physicians can be. "Doctors are by and large

pleasers. They make it through the complex maze of schooling all the way to medical school by figuring out early what people want and providing it." (Lembke 2016 P 104) In this way, physicians tend to go along with patient narratives and over-treat.

156. Conditions resting on entirely subjective assessments like level of pain or gender identity have the most potential for harmful overtreatment. In both cases, patients can easily find out what symptoms to report to obtain the treatment they desire. In the current political climate, physicians feel the pressure to not be assailed as a "gatekeepers", even when logic and data tell them outside social pressures should not distort medical care.

157. Dr. Lembke discusses the modern phenomenon of illness as identity: "Illness identities offer a chance for community." "The adoption of illness identities is driven by the breakdown of traditional social roles. Illness provides a way to define the self in a rapidly changing and increasingly fragmented world. Furthermore, ill persons today are lionized as heroes because they fight a battle against overwhelming physical forces. In a world where the struggle for basic survival (food, clothing, shelter) has become largely irrelevant for most Americans, the ill person is among the last great warriors." (Lemke 2016 P 98)

158. What Lembke points out is critical to the debate regarding gender dysphoria treatments. Community is so important for all of us, but especially

adolescents. There is significant evidence that a lack of socialization, and social struggles are factors which put adolescents at risk for gender dysphoria.

159. Depression and anxiety in adolescents often relate to social struggles and these generally predate the emergence of gender dysphoria. Autism is primarily a social disorder. Many child psychiatrists have expressed to me their experience that patients expressing a transgender or non-binary orientation have tended to struggle socially prior to declaring this orientation.

160. Sweden, England and Finland have all reviewed the evidence and pressed pause. These are countries with medical systems that have better tracking, more organized care and compassionate attitudes toward gender non-conforming persons. As the Finish review stated (PALKO / COHERE Finland 2020): "The first-line treatment for gender dysphoria is psychosocial support and, as necessary, psychotherapy and treatment of possible comorbid psychiatric disorders."

161. After reviews, all countries concluded that restricting care and emphasizing psychotherapy rather than hormones and surgery is the compassionate course. Affirmative treatments are not, in fact, medically necessary. This is true when it comes to the most grave concern of all, suicide. Based on long term data in Sweden, Gender Affirming treatment have not been shown to be life-saving. We do not have convening data that affirmative treatments reduce suicidality, and based

on recent data, we should be especially concerned that it could increase it(Chen 2023).

162. When claims are made that there exists a scientific and medical consensus supporting gender affirming care for gender dysphoria, this rests on the assertions of a small group of physicians who are already personally invested in this type of care. Those already providing hormones and surgeries have extremely powerful reasons to want to believe affirmative care is effective, and thus they are biased. I know psychiatrists involved in this type of care and they are smart, compassionate physicians. I have no doubt they have received significant positive feedback from patients and families. This is consistent with multiple studies showing short term benefit in mood and social dysphoria from affirming treatment.

163. Yet when the enthusiasm for affirming procedures is this celebratory, it is also clear that the detransitioners and other patients with less optimal outcomes will not return to these affirmative providers. We need controlled studies because gender clinics staff's personal experience is thus potentially biased toward the good responders they continue to see, without clear tracking of the rest. Short term positives responses can also be explained by placebo effects, especially under the current conditions where most gender clinics offer multidisciplinary teams providing support and therapy along with hormones and medical procedures.

164. For these many reasons the "gender experts" are not neutral observers. This is why long term controlled studies are needed. Just over two decades ago a previous group of "experts" minimized the risks of opiates when they proposed pain as the 5th vital sign. This turned out to be a large scale social disaster instigated in large part by the medical community. When aligned with economic and ideological forces, a small group of physicians can wield disproportionate influence. The modern medical system does make serious mistakes at scale. We should be taking a cautious approach and encouraging rigorous open scholarly dialogue where physicians who doubt the merits of affirmative gender care can speak freely without being attacked as immoral.

165. Gender roles will always exist, as humans are a sexually dimorphic species. Gender roles are not problems to be solved, but we do need to acknowledge the trade-offs. Much of the ideological and political activism is a reaction against a perception that gender roles are too rigid or stifling. Many young people want more ability to express themselves as they please, and it is agreed that we need to create space for all in our society. Yet the recent overall rise in depression, anxiety and self-harm supports that we are not meeting the needs of our youth. Yet in the debate regarding treatments for gender dysphoria, the medical system should still apply rules of evidence and proceed with caution.

I declare, pursuant to 28 U.S.C. s. 1746, under penalty of perjury that the foregoing is true and correct. Executed this 17th day of February, 2023.

IN THE UNITED STATES DISTRICT COURT
FOR THE NORTHERN DISTRICT OF FLORIDA
TALLAHASSEE DIVISION

AUGUST DEKKER, et al.,

Plaintiffs,

v.

JASON WEIDA, et al.,

Defendants.

Case No. 4:22-cv-00325-RH-MAF

REBUTTAL EXPERT REPORT OF QUENTIN VAN METER, M.D.

I, Quentin Van Meter, M.D., declare that the facts contained herein are true and correct to the best of my knowledge and belief, and that the opinions expressed herein represent my own.

Introduction

1. I have been asked by counsel for the Defendants to respond to the expert report of Dr. Johanna Olson-Kennedy.

2. I received my B.A. in Science from the College of William and Mary and my M.D. from the Medical College of Virginia, Virginia Commonwealth University. I am currently a pediatric endocrinologist in private practice in Atlanta, Georgia. I am the President of Van Meter Pediatric Endocrinology, P.C. I am on the clinical faculties of Emory University School of Medicine and Morehouse College of Medicine, in the role of adjunct Associate Professor of Pediatrics. I am board certified in Pediatrics and Pediatric Endocrinology. I have been licensed to practice medicine in Georgia since 1991. I have been previously licensed to practice medicine in California, Louisiana, and Maryland.

3. I did my Pediatric Endocrine fellowship at Johns Hopkins Hospital from 1978-1980. The faculty present at that time had carried on the tradition of excellence established by Lawson Wilkins, M.D. Because of the reputation of the endocrine program as a center for exceptional care for children with disorders of sexual differentiation, I had well-above average exposure to such patients. As a Pediatric Fellow, I was also exposed to adults with Gender Identity Disorder, then called Trans-Sexuality, and received training from John Money, Ph.D., in his

Psycho-hormonal Division. Over the past 44 years, I have closely followed the topic of incongruent gender in children, adolescents, and adults, but I am focusing this report on working with children and adolescents.

4. The bases for my opinions expressed in this report are my review of Dr. Olson-Kennedy's report dated February 16, 2023, my professional experience as a pediatric endocrinologist, and my knowledge of the pertinent scientific literature, including those publications listed in the attached bibliography.

5. A list of my publications is included in my curriculum vitae, which is attached as Exhibit "A" hereto.

6. Over the past four years, I have testified at trial and/or deposition in the following cases:

- 2019: Multiple Plaintiffs v. State of Ohio Bureau of Records, Columbus, Ohio, deposed.
- 2020: Loughman v. Loughman, Harris County, Texas, deposed, court testimony.
- 2021: Spahr v. Spahr, St Louis County, Missouri, court testimony.
- 2021: Laura Cauthen v. James Cauthen, Cobb County, Georgia, court testimony.

7. I am being compensated at an hourly rate for actual time devoted, at the rate of $350 per hour including report drafting, travel, testimony, and consultation. My compensation does not depend on the outcome of this litigation, the opinions I express, or the testimony I provide.

Response to Dr. Olson-Kennedy

8. In paragraph 1 on page 8 of her report, Dr. Olson-Kennedy wrongly states that gender identity "has a strong biological basis." To the contrary, there is no biologic basis for gender identity.[1] Genetic markers have been evaluated but there is no statistical significance between genomic sequences in trans-identified individuals compared to the sequences of non-trans humans of the same sex.[2,3] MRI studies on human adults do not show an identifiable female or male brain.[4] A study purporting to show a female configuration of the brain in trans female patients was marred by the small sample size and inability to reproduce the findings[5] and the differences reported can be explained by neuroplasticity.[6]

9. The term gender has crept into the vernacular as a replacement for the word sex. Gender originally was a linguistic term describing nouns as either masculine or feminine in a number of languages. It was actually John Money who introduced the term gender identity as the internal sexed self in 1955.[6] This contradicts this statement in paragraph 1 of Dr. Olson-Kennedy's opinion, suggesting that it was coined by Robert J. Stoller some 9 years later. Dr. Olson-Kennedy states that gender identity and gender are the same, when that is not the case if sex and gender are used interchangeably.

10. Contrary to the suggestion in paragraph 8 of the report, there is absolutely no spectrum to biologic sex. Sex is binary. Individuals with disorders of sexual differentiation are not a third sex.[8] Mosaicism can occur in varying degrees, but the patient remains either male or female, not both. In my clinical

experience over 42 years of practice, none of my hundreds of DSD patients have experienced any gender identity confusion. The same Endocrine Society whose guidelines say "biologic sex" is a term that should not be used subsequently published a statement that biologic sex is a necessary determinant of human propensity for disease, and that it is necessary to understand the response to therapeutic interventions.[9]

11. In paragraph 10 on page 12 of her report, Dr. Olson-Kennedy refers to the World Professional Association of Transgender Health's (WPATH's) Standards of Care version 8 (SOC 8). However, "SOC 8" are not indeed standards of care, by definition, since there is clearly no consensus of opinion For example, Drs. Kenneth Zucker and Paul McHugh are internationally recognized experts in the field of human sexuality and yet their contrary viewpoints were not discussed or included in "SOC 8".

12. As Dr. Olson-Kennedy notes in paragraphs 11 and 12, the WPATH "SOC 7" served as the template for the recommendations of the Endocrine Society, the Pediatric Endocrine Society, the UCSF guidelines and the position statement of the American Academy of Pediatrics. However, she fails to note that all of the recommendations were essentially the product of authors in leadshipe positions within WPATH. The recommendations are not uniformly supported by members of those other organizations. The American Academy of Pediatrics' 67,000 members were not consulted. The Endocrine Society sent their standards out for comment to membership before approval, but they did not

acknowledge the input or make any changes based on our objections. The Pediatric Endocrine Society requested input from membership with a warning that suggestions like those we made to the Endocrine Society would not be considered. The leadership of the American Academy of Pediatrics called to question the wisdom of that organization's 2018 policy statement.[10]

13. The vast amount of publications which exist, including the DSM-V[1] and the Handbook of Human Sexuality published by the American Psychological Association indicate gender identity is fluid and can change.[11] There are over 11 published studies which clearly prove that desistance occurs in children who have been allowed to proceed uninterrupted through natural puberty ranging 50-98 percent of the time.[1,12,13,14,15,16,17,18,19,20,21] In-depth mental health evaluation of the patient, the family, and those in close contact with the patient and subsequent counseling to resolve pathology is truly beneficial and most often effective.[22]

14. In paragraph 14 on pages 13-14 of her report, Dr. Olson-Kennedy incorrectly suggests that my report attached to the GAPMS determination somehow endorsed what she calls "conversion," "redirection," and "corrective" therapy. Nowhere in my report do I state that I endorse conversion or redirection therapy. Those are her terms, not mine. Instead, I outline the use of extensive in-depth evaluation of the mental health of the patient, parents, and siblings and assessment of the adverse childhood events to which the patient was exposed. The term conversion therapy is used pejoratively to suggest that allowing the patient to examine their underlying mental health issues is somehow converting

a male or female patient, when recommended counseling is indeed just addressing the mental health morbidities to facilitate healing the patient.

15. In paragraph 16 of her report, Dr. Olson-Kennedy expands on a topic never mentioned by me and refers to "people like me" who advocate "redirection" therapy. But my report never mentions "redirection" therapy. She refers to my statement on the recommended use of counseling as unethical and ineffective. In doing so, she refuses to acknowledge the consequential body of literature in peer-reviewed journals which shows the beneficial outcomes that result from counseling.[22,23,24,25,26] She also stands against her own referenced documents (Endocrine Society Guidelines and WPATH SOC 7) which state that first and foremost, mental health evaluations and counseling must be done before any social, medical, or surgical interventions are considered. The American Academy of Pediatrics' policy statement does clearly state that any kind of counseling is unethical, but it came under fire for that.[27,28]

16. In paragraph 17 on pages 15-16 of her report, Dr. Olson-Kennedy's version of wait-and-see suggests that once puberty starts, medical intervention follows immediately, whereas wait-and-see has been used by others to describe waiting until *completion* of puberty at the age of consent, since by that time the vast majority of patients have desisted.

17. In paragraphs 18, 19, and 20 on pages 16-18 of her report, Dr. Olson-Kennedyattempts to make her treatment plans sound compassionate and other treatment plans sound barbaric. She is wrong in stating that there is no goal to

affirm any specific outcome. Why would anyone socially transition a child if their goal were not to follow on with medical, and then surgical transition. The director of the transgender clinic in Columbus, Ohio stated, under oath, that she was unaware of any patients who dropped out from that pathway.[29] Dr. Olson-Kennedy's statement that there is no data to support the automaticity of the intervention cascade is true because there is no transparency of full data from any of the transgender care centers. Her theory that social affirmation in pre-pubertal patients does not lead to medical and surgical interventions during puberty is false.[13]

18. Dr. Olson-Kennedy's claim in paragraph 21 on page 18 of her report that treatment is individualized is not substantiated by data from each transgender center, again with a complete lack of transparency.

19. Dr. Olson-Kennedy refuses to recognize that patients with gender dysphoria have undercurrent mental health issues. Patients referred to me with the diagnosis of gender dysphoria have undercurrent depression and/or anxiety that historically preceded the gender dysphoria. The published literature suggests that a conservative estimate for undercurrent mental health issues is 70%. Data are hard to extract because there is no uniformity or transparency to the protocols used in the transgender clinics in the United States. The recent published data from the NIH study clearly point that out. Each of the four study centers had different consent forms and the study design was an observation of the response to interventions at four independent sites.[30] This was the explanation used to

explain why there was no central uniform design or accountability to an Institutional Review Board (IRB).

20. GnRH super-agonists (puberty blockers) interrupt signaling to the gonads and thereby suppress the innate gonadal steroid production. The "Dutch protocol" (cited in paragraph 24 on page 20 of Dr. Olson-Kennedy's report) started pubertal suppression in Tanner stage III (average age 14 years), but never before age 12 (which is the average age of onset of menstruation in females). This intervention is suggested to be used as a "pause" at the very onset of puberty (stage II) by the Endocrine Society Guidelines.[13] However, the pause in U.S. transgender clinics is often for as little as a month.[31] Delayed puberty is a reason why adolescents seek endocrine consultation because of the social consequences that surround delay. It is the most common reason we see adolescent boys for evaluation of short stature.

21. In paragraph 24 on page 20 of her report, Dr. Olson-Kennedy refers to the use of GnRH super-agonist therapy in the FDA-approved indication for precocious puberty and cites the safety data and the reversible nature of such treatment. That is comparing apples to oranges. Stopping puberty in the adolescent age range and then overlapping cross-sex hormones in supraphysiologic dosing is a completely different circumstance. It is an open-ended experiment involving minors with no competent oversight or control. The release of data from Australian and European centers has shown no diminution of gender dysphoria and worsening of mental health, causing their governments

to intervene and stop such therapy[32,33,34,35,36,37,38]. As for using age as a criteria for any intervention, the most recent version of guidelines from WPATH ("SOC 8") eliminates use of age as a determinant of when to intervene socially, medically or surgically.[39]

22. As to paragraphs 25-32 on pages 21-24 of Dr. Olson-Kennedy's report, the "growing body of evidence" of purported benefits of pubertal suppression in regard to the mental health of the adolescents comes from studies of what is called convenience sampling. This describes using survey data obtained by advertising through advocacy sites such as the Trevor Project or the U.S. Transgender Survey to anyone with an interest in the survey subject matter. This inherently biases the nature of the survey participants. People who experienced significant regret or who died as a result of their efforts to transition are not likely to respond. Those who do respond provide answers that cannot be verified. These data bases show potential correlation at best, but prove no direct causation.[40] Unlike blocking precocious puberty, blocking puberty during the adolescent time frame causes irreversible loss of calcium accretion to the skeleton and affects the development of the brain and the gonads.[41] Without knowing if these latter two issues are reversible if the patient chooses to cease suppression of puberty later on, continued use is, once again, an uncontrolled experiment involving minors who cannot ethically consent. The "dark places of despair" she describes are just buried deeper as a result of the false sense of security. The frontal lobe of the teen brain is unable to see the folly of short term gains that

result in long-term losses.[38] Blocking puberty does indeed change the landscape: it leads the patients to cross-sex hormones 100% of the time in the Dutch transgender clinics.[43] The N.I.C.E. review highlighted a clear lack of scientific proof of any benefit from suppressing natural puberty during adolescence, and the UK banned the general use of puberty blockers due to documented worsening of mental health.[44]

23. Beginning with paragraph 32 on page 24 of her report, Dr. Olson-Kennedy discusses cross-sex hormones. Cross-sex hormones are indeed used to transform the appearance of the body to look like the opposite sex. Again, the fact that 100% of children who have puberty blocked also go on the cross-sex hormones points out clearly that the "case-by-case" assessment is really not that at all. The adolescent cannot really consent to a process that induces life-long medical morbidity, including sterilization. The only full population study that has been published indicated that medical intervention did not reduce mental health morbidity after extended periods of time.[45] It is clearly not surprising that there is initial euphoria in females treated with testosterone. There is an increase in physical and emotional energy and a sense of reaching a goal as the physical changes begin to occur. But those who detransition are left with these subsequently unwanted and irreversible physical changes. What starts out as euphoric energy can easily turn into extreme anxiety. The clear risk of cancers, strokes, and heart disease among other pathologies, not to mention infertility, is

widely known. An adolescent minor cannot fully understand or consent to the long-term problems caused by seeking short term "gains."

24. The study referenced in paragraph 39 of Dr. Olson-Kennedy's report included two years of data and is flawed by the death of three patients by suicide.[30] Any independent review board would have halted the study in its tracks with such serious adverse events as death of study participants, especially with a study population already suffering from depression and anxiety. It is also flawed because regret and detransition is known to occur much later than two years after interventions begin. The only truly valid data from long-term studies comes from the two population studies which showed no improvement in mental health over the long run.[45,46]

25. Dr. Olson-Kennedy's opinions about surgical intervention in paragraphs 44 to 46 on pages 28-29 of her report are belied the Branstrom and Djheine studies, which clearly demonstrated that when followed for long-enough periods of time, surgical intervention did not improve mental health.[45,46,47]

26. The "SOC 8" referenced in paragraph 47 on page 30 of her report clearly states that its recommendations are merely guidelines. They are not true standards of care in the legal sense.

27. In paragraph 48 on page 32 of her report, Dr. Olson-Kennedy states that gender-affirming medical interventions are recognized as "medically necessary" by many major medical organizations. However, the guidelines were written by special interest groups within medical organizations, mostly members

of WPATH (8 of the 9 authors of the 2017 revision), reflecting the opinion of WPATH and not the whole of the membership of those organizations. Contrary opinions are suppressed or ignored.[11] Good science involves evolution of thought which considers all data, not just selected, affirming data.

28. In paragraph 40 on page 27 of her report, Dr. Olson-Kennedy simply dismisses the influence of social media. In my experience, patients were convinced they had gender dysphoria because of the online influence to which they were exposed. A Google search that I performed identified 482,000,000 entries on the subject. Troubled adolescents, struggling for acceptance by peers or for some sense of celebrity have existed forever, but social media now presents them with a one-size-fits-all solution which offers acceptance and celebrity instantly. Before the advent of social media, transgender teens turned to parental support and counseling, which resolved their gender identity confusion 60-98% of the time.[22]

29. At least half of my patients were recruited by transgender or non-binary individuals. There is no published data because, once again, there is no transparency about data collection protocols in the transgender centers in the U.S. The studies Dr. Olson-Kennedy cites to "prove" a biologic basis are limited by small numbers and no ability to prove causation.

30. In paragraph 52 on page 32 of Dr. Olson-Kennedy's report, the actual data reported by Zucker, collected before any exposure to medical or social

interventions, showed desistance if the patients were followed through completion of puberty.[22]

31. In paragraph 54 on pages 33-34 of her report, Dr. Olson-Kennedy attempts to draw a distinction between Gender Identity Disorder and Gender Dysphoria to discredit certain studies cited in the GAPMS report. Like Gender Dysphoria, Gender Identity Disorder was based on mental health morbidity as a key part of the diagnostic criteria. Failing to recognize this, Dr. Olson-Kennedy wrongly suggests that these patients did not suffer from gender dysphoria. The name change was just that—a name change.

32. In paragraphs 57 on pages 34-35 and paragraph 64 on page 38 of Dr. Olson-Kennedy's report, she mentions a subset of patients who do not present until adolescence, but then turns around in paragraph 58 and denies that Dr. Lisa Littman's cohort of studied patients could possibly exist and be called, instead, adolescent-onset patients. In fact, upwards of 80% of children presenting with gender incongruence are female (compared to 30% ten years ago) and that of those, the majority are teenagers with no history of gender incongruence in young childhood. Although she dismisses Littman's 2019 study[48,49], the data that Littman collected was not retracted in the accepted revision of her article—the conclusions were the same, but the terminology was revised.

33. In paragraph 65 on page 39 of her report, Dr. Olson-Kennedy explains that the increased incidence of gender incongruence is due to the increased social acceptance from reduction of social stigma. The overwhelming

increase in the number of patients presenting to Tavistock is what caused the NHS to take a deeper look at what caused the rise, and lessening social stigma was clearly shown not to be the cause.[50] What makes data collection nearly impossible in the U.S. is the utter lack of transparency about what goes on behind closed doors. The magnitude of increase in incidence can only be truly ascertained by opening the files of the transgender treatment centers at which time data can be obtained by independent monitors.

34. In paragraph 70 on page 42 of her report, Dr. Olson-Kennedy recognizes the need for longitudinal studies, which have been called for by the original and revised version of the Endocrine Society Guidelines.[13] More importantly, such studies should be rigorous and have a control group. She incorrectly assumes that any random controlled trial is blinded, which clearly is not possible or necessary. She expresses dismay about the probable dropout potential, but does not mention the high dropout rates in the Dutch protocol study which is the foundation upon which transgender clinic protocols are ostensibly built.[51] There has been recent criticism by one of the authors or the Dutch protocol that what he gleaned from having a glimpse inside the U.S. clinics was that his protocol was not actually being followed.[52] Dismissing the need for a randomized control group based on the theory that patients in the control arm will die from suicide is insupportable, since there is published evidence that counseling alone is highly effective in resolving gender dysphoria.[22] It is also obvious that no IRB would even consider allowing a treatment arm in a study that

would include reported complications such as sterility and decreased sexual function, let alone increased risk of heart disease, stroke, and cancer.[53]

35. In response to paragraphs 87-89 on pages 49-50 of Dr. Olson-Kennedy's report, evidence-based medicine is practiced when all sides of a medical issue are researched, and the results graded independently. Evidence-based medicine supports standards of care. It is abused when only some evidence is used, and especially when that evidence is indirect opposition to existing evidence and subsequently published evidence. The GRADE system interprets data to determine the degree to which the recommendations are evidence-based medical practices. The Endocrine Society Guidelines in both iterations failed miserably. SOC7 failed the evidence-based test entirely.[54]

36. Dr. Olson-Kennedy's discussion in paragraphs 91 to 93 on pages 50-51 of her report regarding off-label use of medication compares apples to oranges. There are medications which are used off label because of published studies showing benefit and clear lack of harm, but there is no desire for the manufacturer to apply for FDA approval due to the complexity and cost of doing so, especially when there is no future compensatory return on investment. Puberty blockers were studied for safety and efficacy and their ability to prevent progression of secondary sex characteristics and stall bone maturation in patients with precocious puberty. The drugs passed muster in their ability to do such and were therefore approved by the FDA, with a proviso that the study patients be followed longitudinally indefinitely to monitor for any signals of harm. One such signal

was announced recently and has been added to the product insert of puberty blocking medications used for treatment of precocious puberty.[55] The manufacturers of puberty blockers have not engaged in clinical research studies about the safety and efficacy of puberty blockers in gender incongruent children and adolescents despite the fact that they would profit if these drugs were FDA-approved for such.

37. In response to paragraph 96 on pages 53-54 of Dr. Olson-Kennedy's report, it is a bit self-serving that WPATH recommends multidisciplinary staffing for transgender clinics, all of whom follow its recommended guidelines. It is clear from the history of the Tavistock Clinic that if you do not follow the WPATH protocol or if you call out the harm the WPATH protocol generates, you are not considered to be a part of "the team."[56]

38. In response to paragraphs 99 to 100 on pages 54-55 of Dr. Olson-Kennedy's report, the "growing body of evidence" of purported benefits of pubertal suppression in regard to the mental health of the adolescents comes from studies of convenience sampling involving the retrospective memories of those who chose to answer the surveys. These data bases have been used repeatedly by the authors who cherry pick the recalled memories of participants in an attempt to prove a point. The surveys failed to verify the mental health status of the participants at any point in time by independent examination. They show no direct causation.[57,58,59,60,61] Heretofore, no reputable editor would accept such studies for publication in peer-reviewed journals.

39. Paragraphs 104 to 105 on pages 56-57 of Dr. Olson-Kennedy's report provide another case of apples vs. oranges: the studies of young people with precocious puberty show full recovery of function after two years off therapy. Dr. Olson-Kennedy mentions not using the puberty blockers for longer than two years, thereby admitting the relentless continuum of puberty blockers followed by cross-sex hormones in the U.S. gender clinics—once again proving the pause theory to be mythical. The precocious puberty patients are not in adolescence, which is when calcium accretion is critical.

40. In response to paragraph 108 on page 59 of Dr. Olson-Kennedy's report, supraphysiologic levels of hormones are always prone to cause severe side effects, regardless of whether the patient is experiencing gender dysphoria or not. That proves that they are never appropriate.

41. In response to paragraph 112 on page 60 of her report, Dr. Olson-Kennedy completely ignores the phenomenal published experience of Kenneth Zucker's behavioral interventions because they do not fit the narrative reflected in her report. In fact, desistance has been documented with behavioral health interventions in Canada and Europe since the 1980s. [1,12,13,14,15,16,17,18,19,20,21]

I declare under penalty of perjury, pursuant to 28 U.S.C. § 1746, that the foregoing is true and correct.

Executed this 10th day of March 2023.

TALLAHASSEE DIVISION

AUGUST DEKKER, et al.,

Plaintiffs,

v. Case No. 4:22-cv-00325-RH-MAF

JASON WEIDA, et al.,

Defendants.
_____/

EXPERT REPORT OF SOPHIE SCOTT, PH.D.

Pursuant to 28 U.S.C. 1746, I declare:

1. I have been retained by counsel for Defendants as an expert witness in connection with the above-captioned litigation. I have actual knowledge of the matters stated in this report. My professional background, experience, and publications are detailed in my curriculum vitae. A true and accurate copy of my curriculum vitae, which includes a list of my publications, is attached as Exhibit A to this report.

2. I have testified as an expert witness in the following cases, at trial or in deposition in the last four years: Bell v Mrs A vs Tavistock and Portman Trust, Case No: CO/60/2020, December 2020.

3. I am being compensated at an hourly rate for actual time devoted, at the rate of $400 per hour including report drafting, testimony, and consultation. My compensation does not depend on the outcome of this litigation, the opinions I express, or the testimony I provide.

4. The opinions expressed in this report are based on my training and experience as a neuroscientist, my reading and my assessment of the relevant neuroscientific literature on brain development, and the potential effects of gonadotropin-releasing hormone (GnRH) agonists (the most common form of what are often called puberty blockers) on the developing brain.

5. If called to testify in this matter, I would testify truthfully and based on my expert opinion. The opinions and conclusions I express herein are based on a reasonable degree of scientific certainty.

Introduction

6. I am the Director of University College London's (UCL's) Institute of Cognitive Neuroscience. I have published over 130 peer reviewed scientific papers, including papers in Nature, Science, and the Proceedings of the Academy of Natural Sciences. I am a fellow of the Academy of Medical Sciences, and of the British Academy. Since my PhD was awarded in 1994, I have been working in cognitive neuroscience, a scientific field that examines the relationships between human behaviour to the human brain, and how these can be affected by age, disease and individual differences. *See* Attached Curriculum Vitae.

7. As a neuroscientist I am very familiar with the existence of variations of sexual preference, and the existence of variations in gender identity. I think that the anecdotal evidence we have suggests that transition may, for some younger people, be an effective treatment for gender dysphoria, and that the medical approaches taken to achieve this may therefore be appropriate. Thus is it entirely possible that the use of puberty blockers is appropriate in some exceptional cases of gender dysphoria in prepubescent and adolescent individuals. My concern is that we do not yet have enough evidence about the best ways to identify the individuals for whom they are appropriate: we have not identified any biological markers or other characteristics to identify individuals for whom GnRH antagonists might provide effective; we do not have any reliable studies that show which young gender dysphoric individuals will remain gender dysphoric after adolescence; and we thus do not yet know who might benefit from

this highly medicalised and largely non-reversible treatment. I am also very concerned that the implications of the effects of puberty blockers on the developing brain and body are not well understood. In both of these areas much more research is needed.

8. All cultures recognise the onset of adolescence as the start of the entry into the adult world: it is a journey into that world, and a journey that takes place over several years. In 2005 the US supreme court, influenced partly by this emerging neuroscience research, increased the minimum age for capital punishment to be the same as that for voting and serving on juries. Around the world, many such limitations on the responsibility for teenagers for their own actions are in place – alongside laws which mean that teenagers could not engaging in risky behaviours that could place them or others at risk or having to live with long terms consequences (e.g. ages for driving, drinking alcohol, age of consent, getting a tattoo). Much of this reflects a lay understanding of what neuroscience is now confirming – there is variation from child to child, but teenage brains on the whole are structurally and functionally different from adult brains, and this affects both their engaging with risky behaviour, and their understanding of the implications of risky behaviour.

9. The human brain is formed of approximately 89 billion brain cells, or neurones, most of which are grown during gestation (Bayer et al. 1993; Rakic 1995). Following birth, there is a further period of extended brain development. Directly after birth, the brain grows rapidly, quadrupling in size

between birth and age 6, when it is roughly 90% the size of an adult brain. However the pattern of growth is underpinned by some complex changes that are occurring. These are:

- Synaptic pruning
- Myelination of different brain networks
- Differential growth of specific functional and anatomical areas.

10. Before I go into this in detail it's important to note that brain cells, or neurones, are formed of a cell body, with a long projection (an axon) and branch-like shorter projections (dendrites) from the cell body or from the far end of the axon. The axons can be thought of as ways the neurone can connect to more distant neurones, while the dendrites connect to nearby neurones. These connections are called synapses. Changes in the brain – associated with learning and development - occur largely through the connections between neurones, which can be through the strengthening of existing connections, or through the development of new dendritic connections. The axons are coated in a slim fatty sheath, called myelin: this enables the electrical discharges that enable transfer of information in the brain to be propagated rapidly along the length of the axon. Myelination is a process that increases the speed and efficiently of neural function. Neurones are highly organised in the brain, with the cell bodies forming structure layers on the surface of the brain (the cortex), as well as in sub cortical nuclei of cell bodies: the axons form tracts of connections between cortical areas, to and from sub cortical areas, and between the two hemispheres of the brain.

These tracts look white, due to the fatty myelin sheaths: this leads to the name 'white matter' for these tracts or connective networks. In contrast, the unmyelinated neuronal cell bodies look grey, hence the term 'grey matter'.

11. At birth and in early infancy, many dendritic connections exist and are created between neurones: this is known as *synaptic exuberance*. In the early years of life these are rapidly pruned, at first quickly, then more slowly. During adolescence a more adult profile of synaptic connections starts to appear: this appears most slowly in prefrontal fields compared to sensory and is still not established fully at age 18yrs (Huttenlocher and Dabholkar, 1997). The relationship between synaptic exuberance and pruning and their implications for the developing brain and experience are still being explored, but in terms of brain connectivity, the adult pattern is not yet established at 18: development continues into the early 20s.

12. Myelination in the human brain begins in visual brain areas a couple of months before birth and continues in other sensory brain areas over the first year. This process continues in other cortical and subcortical systems into the middle of the third decade. This has been expressly linked to the development of cognitive skills in children and adolescents, as myelination greatly improves the speed of condition of neurones, and hence their efficiency. Myelination proceeds in a roughly caudal to rostral direction in the brain, which means form back to front. This means that it is frontal and prefrontal fields that are those continuing to be myelinated into the mid 20s: this has been confirmed by more recent studies

looking at fractional anisotopy in the brain (Lebel et al., 2008). At 18yrs old, the connections to the frontal lobes are not myelinated like a mature adult brain, and this is likely to affect frontal lobe functions.

13. Throughout childhood, the brain grows and changes: this involves a non-linear pattern of change in the proportion of white and grey matter, which may partly involve changes in myelination (see above) and also the loss of cells through cell death (Sowell et al. 2004). A recent study looking at this pattern into adolescence found that "First, we found evidence for continued development of both intracranial volume (ICV) and whole brain volume (WBV) through adolescence, albeit following distinct trajectories. Second, our results indicate that CGMV is at its highest in childhood, decreasing steadily through the second decade with deceleration in the third decade, while CWMV increases until mid-to-late adolescence before decelerating" (Mills et al, 2016). This indicates that considerable changes are still happening in the structure of the adolescent brain. In terms of specific brain areas, while the cortex continues to thin through adolescence, the decreases are most marked in the parietal lobes and least marked (or growth is seen) in temporal and prefrontal fields (Tamnes et al, 2017).

Implications

14. The pattern of maturation of the brain in adolescence suggests a particular issue with frontal lobe functions – the frontal and temporal lobes are showing a different pattern of change (in terms of movement towards adult profiles) compared to more caudal fields, and the frontal lobes are the last to be

fully myelinated. The frontal lobes are associated with complex cognitive control processes, so called 'meta-cognitive processes' that enable us to plan our behaviour, control our responses, to be able to adapt our behaviour to different contexts and requirements, and to anticipate the implications and consequences of behaviour. The absence of mature frontal lobe connectivity and functions has been linked to increased impulsivity and risk-taking in adolescence, and to their greater susceptibility to peer opinions and behaviour (Blakemore and Robbins, Nature Neuroscience, 2012). Functional imaging studies – addressing how brains function under different task requirement – have shown that while adults recruit frontal lobe networks during decision making tasks, teenagers are more likely to recruit 'limbic networks" i.e. sub cortical networks linked more to emotional processing and reward processing: the implication is that the differential integrity of frontal lobe connectivity leads to teenagers making different, more risky decisions than adults, and relying on different brain networks to do so. This is backed up by behavioural studies showing that when decision making is 'hot' (i.e. more emotional), under 18yr olds make less rational decisions than when the responses are being made in a colder, less emotional context.

15. Puberty blockers (specifically, gonadotrophin-releasing hormone agonists) work by preventing the release of gonadotrophin-releasing hormone from the hypothalamus. Gonadotrophin releasing hormones have many effects, including stimulating the gonads (testes and ovaries) to produce testosterone and oestrogen. In childhood, the level of Gonadotrophin releasing hormones is very

low, but an increase in this prompts the onset of puberty, with the release of testosterone and oestrogen; these in turn have masculinising or feminising effects on the bodies and the brain. As puberty is associated with very marked changes in the structure of the brain (as outlined above) the use of puberty blockers may have serious consequences for the development of the human brain. We know from studies on sheep (Nuruddin et al, 2013) that treatment around the onset of puberty with gonadotrophin-releasing hormone agonists is associated with significant differences in the size of the amygdala (found to be larger in treated animals) and this was linked to some differences in emotional reactions. The male treated sheep showed greater approach responses and more risk taking behaviours, while the treated female sheep showed higher levels of anxiety and greater avoidance behaviour (Wojniusz et al, 2011). A behavioural study of natal girls who were treated for precocious (early) puberty with Gonadotrophin releasing hormone agonists (Wojniusz 2016) found that they also showed significant greater emotional reactivity on one of the tests used, relative to the control group. The treated girls also showed significantly lower heart rates than the untreated control group. In a commentary on this article (Hayes, 2017) it was pointed out that there were also notably lower scores on IQ measures and sub scales in the group of girls who were treated with Gonadotrophin releasing hormone agonists. He points out that “their reassuring statement in the abstract that girls undergoing GnRHa treatment for CPP and controls “showed very similar scores with regard to cognitive performance” and their conclusion that

"GnRHa treated girls do not differ in their cognitive functioning ... from the same age peers" (Wojniusz et al., 2016) may be overly optimistic. These statements minimize the fairly substantial difference found in IQ scores" (Hayes, 2017). Hayes also points to an older study that found a significant drop in IQ associated with taking triptorelin acetate to treat precocious puberty (Mul et al, 2001). Note that in all of these cases, in humans and other mammals, we cannot say if the results are due to direct effects of the Gonadotrophin releasing hormones on the brain, heart and behaviour, or if they are secondary to this (e.g. due to the altered levels of testosterone or oestrogen, or changes in the heart rate itself). All the papers I can find suggest that we need much more data on the long-term brain effects of Gonadotrophin releasing hormones when administered around puberty, the effects this can have on behaviour, and the extent to which any of this is altered if the treatment with Gonadotrophin releasing hormones is stopped.

16. I am very concerned that the current treatment regime is exposing young people to significant risk of harm. The greater susceptibility to peer pressure in those under 18 may make them especially vulnerable to risk taking, and this may well be enhanced by social media, where actions can be encouraged without any responsibility for outcomes. We need more research to be able to determine the potential for puberty blockers to be effective in alleviating some aspects of gender dysphoria, and to be able to differentiate those who might be helped by this treatment from those who will not. Furthermore, given the risks of puberty blocking treatment, and the fact that these will have irreversible, lifelong

effects, it is very possible for an adolescent to be unable to fully grasp the implications of puberty-blocking treatment, even if the risks are well explained. All the evidence we have suggests that the complex, emotionally charged decisions required to engage with this treatment are not yet acquired as a skill at this age, both in terms of brain maturation and in terms of behaviour.

I declare, pursuant to 28 USC § 1746, under penalty of perjury that the foregoing is true and correct. Executed on February 16th, 2023.

/s/ Sophie Scott
Sophie Scott, Ph.D.

Exhibit "A"

PROF SOPHIE KERTTU SCOTT CBE, FMEDSCI, FBA

Date of Birth: 16-11-1966
Address: Institute of Cognitive Neuroscience, UCL, 17 Queen Square, London, WC1N 3AR
email: sophie.scott@ucl.ac.uk

CURRENT POSITION

2019 – Director, Institute of Cognitive Neuroscience, University College London

EDUCATION/QUALIFICATIONS

1994 University College London, PhD in Cognitive Science
1990 Polytechnic of Central London, BSc (Hons) 2:1, Psychology

PROFESSIONAL HISTORY

1993-1998 MRC Applied Psychology Unit, Cambridge, Senior Scientific Officer
1998-2001 Research Fellow, Institute of Cognitive Neuroscience, UCL.
2001-2005 Wellcome Career Development Fellow, Dept. Psychology, UCL
2004 - Group Leader, Speech Communication Lab
2006- Professor of Cognitive Neuroscience, UCL
2005-2016 Wellcome Trust Senior Fellow, Institute of Cognitive Neuroscience
2013-2019Deputy Director, Institute of Cognitive Neuroscience, UCL
2019 – Director, Institute of Cognitive Neuroscience, University College London
I took maternity leave between June 2006-June 2007.

PRIZES AND RECOGNITION

2022 Awarded an Honorary degree by the University of Westminster
2021 awarded the Michael Faraday prize by the Royal Society
2020 appointed Commander of the Most Excellent Order of the British Empire for services to Neuroscience
2019 Royal Literature Society "Reading Matters" prize, for "The Neuromantics", my podcast with poet and writer Dr Will Eaves
2017 presented the Royal Institution Christmas Lectures
2017 Royal Society Summer Science Exhibition, "What's in a Voice?"
2016 elected as a Fellow of the British Academy
2016-2018 UCL TEDx License holder

2015 spoke at the annual TED conference, Vancouver (talk has been viewed over 4.4 million times on TED.com).
2015 gave Prize Lecture at the Physiology Society meeting, Cardiff.
2014 included in Who's Who
2013 won UCL Provosts' Award for Public Engagement (grade 8 and above category).
2012 Royal Society Summer Science Exhibition, "LOL: Science and Art of Laughter"
2012 Elected as Fellow of the Academy of Medical Sciences
2003 Royal Society Summer Science Exhibition, "Science of Speaking"

SUPERVISION OF GRADUATE STUDENTS

Since 2002, 14 PhD students supervised at UCL, and 35 MSc students at UCL, 2 at City University and one at the University of Reading

EDITORIAL WORK

2015 – associate editor for *The Psychologist* (British Psychological Society monthly journal).
2009 – 2014 Editorial Board of *Cognitive Neuroscience*
2010 – 2013 Section Editor, Language, *Neuropsychologia*
2008 – 2015 Associate Editor of *Brain and Language*
2004 –2009 Associate Editor of the *Quarterly Journal of Experimental Psychology*

MANAGEMENT AND FACILITATION

2020 - PALS Director for EDI
2015 – member, PALS Academic Careers and Diversity Committee
2015-2019– chair of ICN Public Activities Committee
2014 – 2019 deputizing for Prof Neil Burgess (ICN Director) at Faculty of Brain Sciences' Faculty Executive Committee meetings
2004 – representing the Speech Communication Group at the ICN Group Leader's committee

JUDGING AND COMMITTEES

2022 - member of ILCB advisory board
2019- Chair of Board of Trustees, Told By An Idiot theatre company (https://www.toldbyanidiot.org/about/)
2017- 2022 member of the Royal Society Dorothy Hodgkin Fellowship Committee
2015- associate Editor of the Psychologist and Digest Policy Advisory Committee, British Psychological Society

2015 Judge, Comment Awards
2015, 2018 Judge, Philip Leverhulme Prize
2014 Judge, Wellcome science writing prize
2013- Trustee, Jericho House theatre company (registered charity number 1131984)

EXTERNAL EXAMINING

2009-2012 External Examiner, BSc Psychology, University of Sussex
2009-2013 External Examiner, MSc Cognitive Neuroscience, University of York
2015-2019 External Examiner, BSc Psychology, University of Reading

TEACHING

2011-2014 Course convener, "Theories and Paradigms in Cognitive Neuroscience" UCL MSc in Cognitive Neuroscience.
2015- Module Convener, "Science Communication for Cognitive Neuroscientists" UCL MSc/MRes in Cognitive Neuroscience.
2023- Module Convener, "Power, Inclusion, Exclusion and Working with local communities".

GRANTS

Wellcome Trust Hub award development funding, for 'Talking Funny', £13000 over 18 months
Wellcome Trust Public engagement award, for "What's in a Voice" exhibit at the Royal Society Summer Science Exhibition, £20,000 over 12 months.
Wellcome Trust People Award for public engagement activities: for LOL event at the Royal Society, awarded 2012, amount £19,000 over 12 months.
Wellcome Trust Senior Fellowship, awarded April 2010 "Neurobiology of speech communication - cognition, plasticity, and social interactions" total amount awarded £1,184, 506, over 60 months.
Wellcome Trust Senior Fellowship, awarded May 2004 'the Neurobiology of Speech Perception – Cognitive and Clinical Links'. Total amount awarded £800,270, over 60 months.
Wellcome Trust RCDF grant, from April 2001-April 2005, 'the Neurobiology of speech perception'. Total amount awarded £358,376, over 48 months.
Marie Curie Incoming Scientist Fellowship, awarded November 2004, sponsoring Narly Golestani, £100,914 over 24 months.
ESRC grant awarded for new post doctoral researchers, sponsoring Charlotte Jacquemot, awarded May 2004, £30,919 awarded over 12 months.
ESRC grant awarded for new post doctoral researchers, sponsoring Patti Adank, awarded May 2005, £31,591 awarded over 12 months

ESRC +3 studentship award, awarded May 2004 (supervising Carolyn McGettigan)
British Academy meetings award, for the John Morton Festschrift, £2000
Experimental Psychology Society research seminar award, for the John Morton Festschrift, £3000
British Association for the Advancement of Science award for Key events in National Science and Engineering Week, 2008, £1000

ACADEMIC SUPERVISION

2001 -2004 Supervised Charvy Narain, the research assistant on my Wellcome RCDF award. Charvy was awarded a PhD in 2003 and took a job as an editor at Nature Neuroscience: she is now a Scientific Outreach Manager at the University of Oxford.
2002 -2006 supervised Disa Sauter, a research student in the Dept. Psychology at UCL. Disa passed her PhD viva without corrections in December 2006, and currently holds her a lecturer position at the University of Amsterdam..
2004 -2005 Supervised Dr. Charlotte Jacquemot, a post-doctoral fellow. Charlotte has been awarded a permanent CNRS position in France, which she began in 2006
2004 - 2012 supervised Carolyn McGettigan, a research student in the Dept of Human Communication Sciences. Carolyn passed her PhD viva without corrections in March 2008, was employed as a post-doctoral fellow on my Wellcome SRF grant until 2012 when she left to take up a lectureship at RHUL. She is now a Professor at UCL.
2005 -2006 supervised Dr. Patti Adank, a post-doctoral fellow. Patti is now a Professor at UCL.
2005 -2008 Supervised Dr Frank Eisner as a post-doctoral fellow on my Wellcome SRF award. Since January 2009, Frank held post-doc position at the Max-Planck-Institute for Psycholinguistics in Nijmegen, and is now a researcher at the Centre for Cognition of the Donders Institute for Brain, Cognition and Behaviour.
2005 -2007 Supervised Dr. Jonas Obleser as a post-doctoral fellow on my Wellcome SRF award. Since April 2007, Jonas has held a Junior Staff Scientist position at the Max Planck Institute for Human Cognitive and Brain Sciences, Leipzig, Germany, where ran his own research group: he is now a Professor at the Department of Psychology, University of Lübeck.
2005-2007 supervised Dr. Narly Golestani, a post-doctoral fellow, who now heads the Brain and Language Lab at the Cognitive Science Hub of the

University of Vienna, Austria, and at the Department of Psychology at the University of Geneva, Switzerland.2008 -2009 – supervised Nicholas Abreu, who has a Fulbright Scholarship to work in the UK for a year. Nicholas started medical school at Harvard in September 2009.
2009 - 2013 Dr Zarinah Agnew appointed as a post-doctoral fellow on my Wellcome SRF grant. Zarinah now works at UCSF as a post-doc in John Houde's lab.
2010 -2015 supervised Pradheep Shanmugalingam as an ESRC funded PhD student. Pradheep is now training in simultaneous translation.
2012 - 2015 supervising Kyle Jasmin as a PhD student on the UCL/NIH program (NIH supervisor Alex Martin). Kyle joined my lab as a post-doctoral fellow and then was awarded a a Leverhulme research fellowship at Birkbeck: he is now a lecturer at Royal Holloway UL.
2012 -2013 Nadine Lavan joined my lab as an RA for 12 months. Nadine left to take up a PhD place at RHUL: she now holds a Wellcome Fellowship at QMUL.
2013 - Supervising Sophie Meekings as an ESRC funded PhD student. Sophie was awarded a BA fellowship at Newcastle University, and was awarded a Dorothy Hodgkin fellowship in 2021, held at University of York.
2013 - Supervising Sinead Chen as a PhD student funded by a grant from the Taiwanese Government. Sinead now works for a policy think tank in Taiwan.
2013 -2015 Samuel Evans joined my lab as a post-doc on my Wellcome SRF grant. Now a lecturer at the University of Westminster
2013 – 2014 Dana Boebinger joined my lab as an RA. Dana left in August 2014 to start a PhD at Harvard, she is now a post do at the University of Rochester.
2015 – 2016 César Lima joined my lab as a senior post-doctoral fellow on my Wellcome SRF grant. César Lima is Assistant Professor of Psychology at Iscte - University Institute of Lisbon since 2017.
2017- Qing Cai joined my lab as a PhD student with funding from the Chinese government from 2018.
2017- Alexis Deighton McIntyre joined my lab as a PhD student with a UCL Graduate School studentship. In October 2021 she joined the MRC CBU as a postdoctoral researcher.
2018-Addison Billings joined my lab as a PhD student
2019 - Efe Caswell Niven joined my lab as a PhD student

IN THE UNITED STATES DISTRICT COURT
FOR THE NORTHERN DISTRICT OF FLORIDA
TALLAHASSEE DIVISION

AUGUST DEKKER, et al., *Plaintiffs*, v. JASON WEIDA, et al., *Defendants*.	Case No. 4:22-cv-00325-RH-MAF

EXPERT DECLARATION OF
PATRICK W. LAPPERT, M.D.

I, Patrick Lappert, M.D., pursuant to 28 USC 1746, declare as follows:

1. I am over the age of eighteen and submit this expert declaration based on my personal knowledge.

2. I have been retained by counsel for the defendants in the above captioned lawsuit to provide an expert opinion concerning the nature of gender surgery. That opinion will be based primarily in my own experience as a physician and surgeon. It will also be based in an evaluation of the scientific publications that Plaintiffs have provided to the court in support of their complaint. It will additionally include an examination the world literature on the subject, as well as an examination of the massive public controversies that have led to near complete reversal of public health policy in multiple European states who have turned away from the social, medical, and surgical transitioning of minors.

3. I am a retired plastic surgeon, as well as a retired senior medical officer in the United States Navy. I have been a physician for 40 years. I completed my undergraduate education at the University of California, Santa Barbara. While there I had significant experience in university level research having been invited to be an undergraduate research assistant, working in the laboratory of Dr. Philip C. Laris. It gave me experience in the evaluation of research publications. We were involved in the collaborative work of elucidating the electrodynamic and stoichiometric quantification of the sodium and potassium pump, located in every living cell. I

completed my undergraduate degree in four years, and went directly to medical school.

4. I completed my preliminary medical training while on active duty in the US Navy. I attended the Uniformed Services University of the Health Sciences, F. Edward Hebert School of Medicine, graduating as Doctor of Medicine in 1983.

5. I completed a surgical internship at the Oakland Naval Hospital, followed by Aerospace Medicine/ Flight Surgeon Training at the Naval Aerospace Medical Institute, Naval Air Station Pensacola.

6. I then served for 2 1/2 years with a deploying, front-line Marine Corps fighter squadron, serving in the dual functions of medical department head, and squadron Radar Intercept Officer flying in the F-4 Phantom. I was deployed to Asia and the Western Pacific. I provided medical care to squadron personnel while deployed in Japan, Korea, and the Philippines.

7. I completed my General Surgery residency at the Oakland Naval Hospital- University of California, Davis/ East Bay Consortium. Following residency, I was retained there as a staff surgeon, and was responsible for the training of surgical residents. I was awarded the inaugural "Resident's Choice" award given to the attending surgeon deemed most effective by the residents in training, and presented by Claude Organ, MD, past President, American College of Surgeons.

8. I trained in Plastic and Reconstructive Surgery at the University of Tennessee, Memphis, graduating in 1994. During that training I traveled to Peru and provided craniofacial surgical care for indigent Peruvian children. This included the publication of a case report of surgical management of a very late post traumatic ectopic frontal sinus mucocele.

9. I received Board Certification in General Surgery from the American Board of Surgery in 1992. I received Board Certification in Plastic and Reconstructive Surgery in 1997 from the American Board of Plastic Surgery. I re-certified in Plastic and Reconstructive Surgery in 2008.

10. I served as a staff plastic surgeon at Naval Hospital Portsmouth, Virginia. 1994-2002. I became Department Chairman in 1998, and served in that office until my retirement. We had 5 staff plastic surgeons, and 10 Enlisted and civilian members. I established the Wound Care Center, providing specialized wound care services to a global catchment area. For example, our department was responsible for the limb and pelvic reconstruction of some of the sailors wounded when the USS Cole was attacked while at anchor at Aden in Yemen. I also established and chaired the multi-disciplinary Cleft Palate, Craniofacial Board. We provided comprehensive services for congenital pediatric deformities to a global catchment area.

11. Following selection to the rank of Captain, USN, I was selected to serve as Specialty Leader, Plastic and Reconstructive Surgery for the office of the Surgeon General, USN. In addition to being responsible for the selection and training of surgical residents, I was also responsible for Navy Medical Department policy concerning coverage for services, and medical evaluation and evacuation policy. I was responsible for the resolution of issues concerning what conditions constitute a requirement for immediate care in military hospitals, what may be purchased from civilian medical organizations and provided to eligible members on a delayed (elective) basis, and what is to be considered cosmetic surgery and therefore not an obligation of the government. I served in that position until my retirement. While serving as Department Chairman, I co-authored a textbook chapter on the management of combat injuries with the Chairman of Plastic Surgery at Harvard University, Dr. Eloff Ericksson. During that time I also published the first case report in the world literature detailing the use of endoscopic technique for reduction and plate fixation of a fronto-facial fracture.

12. I retired from the Navy after 24 years of continuous active duty. I was invited to join a surgical group in Scottsbluff Nebraska, primarily to provide comprehensive reconstructive surgery for women suffering breast cancer. I also provided reconstructive services to a very large regional catchment served by the Level II trauma center at Regional West Medical Center (RWMC). I established and

chaired the Cleft Palate/ Craniofacial multi-specialty clinic at RWMC. I also established comprehensive wound care services for the many rural community hospitals in the western prairie including Nebraska, Eastern Wyoming, southwest South Dakota and northeast Colorado.

13. For reasons pertaining to the education of our six children, I moved my practice to Northern Alabama in 2005. I have been a solo practitioner here for the last 17 years. I was brought here by a local hospital that wanted to offer comprehensive breast reconstruction to women affected by breast cancer. I also started a comprehensive wound care center. I have also had a very active practice in aesthetic/ cosmetic surgery. I maintained my own surgical suite for in-office facial rejuvenation procedures as well as minimally invasive body contouring procedures. I was an early adopter of advanced techniques in autologous fat grafting for facial re-contouring as well as for the resolution of radiation burn wounds of the skin. I continued to serve in the training of medical students in my office practice.

14. Although I maintain a practice in wound consultation, skin care, and laser services, I retired from my surgical practice in 2020, after having practiced as a plastic and reconstructive surgeon for 30 years. I was an Active Member in good standing of the American Society of Plastic Surgery for all but the last two years in practice. With only two years remaining in my practice, I elected to forgo a third certification by the American Board of Plastic Surgery. The certification was no

longer necessary for maintaining my hospital credentials, and I saw it as an unjustifiable expense for a solo practitioner planning retirement. When my board certification lapsed, my membership in the American Society of Plastic Surgery lapsed as a result.

15. As can be gleaned from this summary, I have a meaningful breadth of experience, not only in the advanced surgical care of trauma, cancer, head/ neck disease, as well as cranial and facial birth defects. Many of those procedures require the use of the most advanced sensate, microvascular flaps, including composite and pre-fabricated flaps. These are all the same techniques employed by today's gender surgeons. As regards surgery of the breast, I co-authored a ground-breaking article regarding pre-operative plastic surgical planning in the care of women suffering from breast cancer. It is among the most frequently cited papers in the field of breast reconstruction.[1]

16. Since 2014 I have made a concerted effort to examine the medical literature as it pertains to the care of self-identified transgender persons including children and adults. I have had an eight year long running discussion on these issues with Family Practitioners, Pediatricians, Pediatric and Adult Psychologists and

[1] Toth, B.A. and Lappert, P. (1991) Modified Skin Incisions for Mastectomy: The Need for Plastic Surgical Input in Pre-Operative Planning. Plastic and Reconstructive Surgery, 87, 1048-1053. http://dx.doi.org/10.1097/00006534-199106000-00006

Psychiatrists, Pediatric Endocrinologists, as well as PhDs who specialize in the evaluation of the validity of scientific publications. During that time I have made many public presentations to teachers, counselors, pastors, and administrators on the subject of transgender, and the medical-scientific evidence that informs that care.

17. I have offered testimony, both written and in person on this issue to state legislators, state health benefits management agencies, as well as to State Attorneys General.

18. I have also had experience in making judgments concerning distinctions between reconstructive surgery and cosmetic surgery. I gained this experience while serving in senior leadership for a government medical care system in which I had no financial stake. I have no financial interests in the matter in question, and the professional opinion that I offer is not influenced by my sources of income nor by my position in any organization that financially benefits from medical services that are discussed in this opinion.

19. My peer-reviewed publications include: Lappert PW. Peritoneal Fluid in Human Acute Pancreatitis. Surgery. 1987 Sep; 102(3):553-4; Toth B, Lappert P. Modified Skin Incisions for Mastectomy: The Need for Plastic Surgical Input in Preoperative Planning. J Plastic and Reconstructive Surgery. 1991; 87 (6): 1048-53; Lappert P. Patch Esophagoplasty. J Plastic and Reconstructive Surgery. 1993; 91 (5): 967-8; Smoot E C III, Bowen D G, Lappert P, Ruiz J A. Delayed development

of an ectopic frontal sinus mucocele after pediatric cranial trauma. J Craniofacial Surg. 1995;6(4):327–331; Lappert PW. Scarless Fetal Skin Repair: "Unborn Patients" and "Fetal Material". J Plastic and Reconstructive Surgery. 1996 Nov; 98(6): 1125; Lappert PW, Lee JW. Treatment of an isolated outer table frontal sinus fracture using endoscopic reduction and fixation. Plastic and Reconstructive Surgery 1998; 102(5): 1642-5. I have also published the following medical textbooks: Wound Management in the Military. Lappert PW, Weiss DD, Eriksson E. Plastic Surgery: Indications, Operations, and Outcomes, Vol. 1; 53-63. Mosby. St. Louis, MO 2000.

20. Over the past four years, I have testified at trial and/or deposition in the following cases: *Brandt v. Rutlege*, Case No. 4:21-CV-00450-JM (E.D. Ark.) and *Kadel v. Folwell*, Case No. 1:19CV272 (M.D.N.C.). I have also submitted an expert report in *Siefert v. Hamilton County Job and Family Services,* Case No. 1:17-CV-511 (S.D.Ohio).

21. For my services as an expert witness, I am being compensated at an hourly rate of $400 for preparation of my written testimony as well for deposition and hearing. Additionally my travel expenses will be reimbursed. My compensation is not dependent upon the substance of my opinion nor upon the outcome of the litigation.

22. If called to testify in this matter I will do so truthfully, and to the best of my ability.

23. The Plaintiffs make the claim that "gender affirmation care" including "gender affirming (or confirming) surgery" should be paid for by the State of Florida because such care has scientifically proven efficacy, and safety. Furthermore they claim that there is such an abundance of scientific support for these treatments that they must be understood to be the standard of care, and that there is no controversy in the matter. As shall be seen in this report, the claims made by the plaintiffs are not supported in the science. This will be seen in the examination of those scientific documents which they cite in support of what will be seen to be experimental treatments on children.

24. In recent years professional medical societies have been making a concerted effort to strengthen the scientific basis upon which their particular specialties stand. This effort is commonly given the name "evidence based medicine". It is a systematic effort to categorize the quality of prognostic and therapeutic studies so that physicians reading these publications can distinguish what is vague and speculative from what is a matter of high likelihood, or grave certainty. Tools for making such distinctions have been developed that categorize clinical or experimental findings on the basis of how that data was obtained, the reliability of the test instruments used, the variability of the results, the sample size, and the

likelihood of bias among other factors. For the purposes of this response, I will use the tool developed by the American Society of Plastic Surgery[2]. For prognostic studies, the categorization of evidence is divided into Levels I- V, with Level I being the most rigorous and having the highest likelihood of scientific certainty, and Level V having the least rigor, and having very little certainty. Here are the definitions of those levels according to the American Society of Plastic Surgery:

Level I: High quality prospective cohorts study with adequate power or systematic review of these studies.

Level II: Lesser quality prospective cohort, retrospective cohort study, untreated controls from an RCT (randomized control study), or systematic review of these studies.

Level III: Case- control study or systematic review of these studies.

Level IV: Case series

Level V: Expert opinion; case report or clinical example; or evidence based on physiology, bench research or "first principles".

25. For therapeutic studies, the ASPS categorization is similar, but with a few helpful distinctions:

[2] The Levels of Evidence and their role in Evidence-Based Medicine Patricia B. Burns, MPH,1 Rod J. Rohrich, MD,2 and Kevin C. Chung, MD, MS3 Plast Reconstr Surg. 2011 Jul; 128(1): 305–310. http://www.plasticsurgery.org/Medical_Professionals/Health_Policy_and_Advocacy/Health_Policy_Resources/Evidence-based_GuidelinesPractice_Parameters/Description_and_Development_of_Evidence-based_Practice_Guidelines/ASPS_Evidence_Rating_Scales.html.

Level	Type of Evidence
1A	Systematic review (with homogeneity) of RCTs
1B	Individual RCT (with narrow confidence intervals)
1C	All or none study
2A	Systematic review (with homogeneity) of cohort studies
2B	Individual Cohort study (including low quality RCT, e.g. <80% follow-up)
2C	"Outcomes" research; Ecological studies
3A	Systematic review (with homogeneity) of case-control studies
3B	Individual Case-control study
4	Case series (and poor quality cohort and case-control study
5	Expert opinion without explicit critical appraisal or based on physiology bench research or "first principles"

26. These distinctions are very important to physicians who seek to understand the weight of the evidence presented in support of a change in therapeutic care. Sometimes such scientific findings can be so compelling regarding an issue, that professional societies will publish clinical guidelines that strongly suggest conformity to a new treatment plan based in that evidence. Occasionally the evidence will be of such certainty, on a matter that is so grave, that professional

societies and even public law will assert that there exists a standard of care based in this evidence that if ignored has a high probability of injury or harm to the patient. That is what is implied when the phrase "standard of care" is used.

27. To that end, the ASPS document provides a grading system for Practice Recommendations that helps in the decision making. It is a synthesis of the breadth of scientific data that addresses the issue in question. In the case of Grade A there is an accompanying "Strong recommendation", versus Grade D where the evidence is so lacking in empirical value that the proposed treatment can only be offered as an option if at all, depending upon the strength of existing or alternative treatments, and the particular issues of a particular patient.

28. To summarize, it can be said that Level-V evidence is anecdotal, and in the world of surgery it is typified by the phrase "expert opinion". Such evidence is not to be dismissed since it is the known starting point for much meaningful research and discovery. A surgeon with great experience and unassailable credentials will observe something peculiar. He will form a hypothesis about its cause or treatment. Hopefully he will publish his single case report, and share his thoughts with the wider surgical community. Perhaps one of his residents will start a hunt for other cases. Perhaps surgeons who read his paper will report similar cases. Eventually it might lead the surgeon to apply his new principal to a series of cases. The series may already be there in his own case files. If he publishes his series of cases, that would

constitute an improvement to Level-IV evidence. Even then, it would be considered "poor" evidence because it suffers from the fact that it is a small collection of cases, from a single surgeon, and perhaps no one has yet replicated his observations. Additionally it may suffer from "selection bias" (as when the patient decides if he will receive long term follow up), lack of proper controls (which help us to separate out what is the result of our treatment, and what is within the range of normal variation in the population), inadequate study duration (if you claim a long term improvement in survival, you have to follow the patients long-term).

29. An example from the history of surgery will serve to illustrate how Level-IV and V evidence, when widely encouraged and applied through expert opinion, can result in grave missteps. For over 100 years, ulcer disease of the stomach was considered a surgical problem. This very debilitating disease did not appear to be manageable through medical means. Laboratory study of the stomach had already demonstrated that acid production in the stomach is regulated by particular nerves. That finding suggested that if those nerves are cut, acid production will decline, and the ulcer will heal. It was also determined that the surgery must include some form of "drainage procedure" because cutting the nerves would also impair the muscular contracture of the stomach. Through the course of the decades many of the greatest surgeons gave their names to the elegant techniques for selectively cutting the nerves, or draining the stomach in ways that hopefully would

not result in a "gastric cripple" (an all too common outcome). Long hospitalizations, and many months spent accommodating to the reordering of their digestive tract was expected. There is a syndrome of bad effects from these surgeries that most people adapt to but some never do. Nonetheless, untreated peptic ulcer disease was often deadly, either from peritoneal sepsis, or bleeding to death. Because of the gravity of ulcer disease, it was ethically sound to risk "post gastrectomy syndrome" if it meant saving a life.[3] By the 1980s, level II and I studies had demonstrated that peptic ulcer disease is actually a bacterial infection that can be treated with antibiotics and an acid-reducing medication. This had been very seriously suspected for at least 30 years. However, poorly designed studies published by the greatest academic surgeons of the day had utterly suppressed the bacterial explanation in favor of the surgical solution. A very well-reasoned 2014 paper by Seselja and Strasser[4] shows the heuristic pitfalls that can result in unintended harms to patients when surgical decision making is driven by expert opinions that aren't well supported by quality scientific evidence.

30. Generations of surgeons will follow what is taught to them by the academic surgeons. These are esteemed mentors who are responsible for training the

[3] History and evolution of peptic ulcer surgery; John B.BlalockJr.MD1; The American Journal of Surgery Volume 141, Issue 3, March 1981, Pages 317-322

[4] Dunja Šešelja 1, Christian Straßer; Heuristic reevaluation of the bacterial hypothesis of peptic ulcer disease in the 1950s; Acta Biotheor 2014 Dec;62(4):429-54.

next generation of surgeons. That is how it has always been. However today, medical science has advanced in crucial ways through the application of the "science of science". We understand better now how to examine the evidence. We are less likely to make needless errors of judgement because we are better able to analyze the data particularly with regard to its reliability. This is indispensable when studying biological systems that, in every measurable trait, demonstrate great variability. It is particularly essential when examining and caring for the human person, because you have the added dimension of their subjective interior life.

31. In the professional literature that supports gender-affirmation care, the word "transgender" is defined on the basis of a subjective conflict within the patient's internal sense of themselves. It affirms this interior subjective division on the basis of an idea that sex is somehow "assigned" at birth, rather than scientifically discovered through tissue sampling, in utero ultrasound, or simple inspection at birth. In 99.98% of cases, simple inspection correctly detects the sex of the subject. Furthermore, this test can be administered by untrained personnel. His use of the term "assigned" implies that there can be errors of "assignment". Such an assertion demands not only that we examine the result, but we must also look at the consistency of the data. It is well understood that consistency of the data is one of the hallmarks of good evidence. Any test that can be correct 99.98% of the time regardless of who administers the test is perhaps unequaled in scientific medicine.

32. Gender, on the other hand, as it relates to sex, is a very different matter. While there are some aspects of gender that are more fixedly related to the sex, there are large areas of gender that are learned within the milieu of the local culture, and find their origins in family life. There is no objective, repeatable test, with known error rates, that can be used to detect "gender". Gender, as the term is used in the world of medicine and surgery is not objectively measurable. Such traits as hair length, occupation, preference for violent sport, clothing selection, among others, may have vague gender associations, but are so variable from culture to culture as to be useless for our purposes. This is because "gender" is one of the many expressions of the interior life of the person. It is a mercurial thing because it is not entirely fixed to that part of the patient that is a reliable object for examination and treatment. That difficulty with diagnosis and prognosis is further complicated by the fact that variability in gender presentation doesn't just occur within any particular human grouping, it is also known to vary within the span of the life of a single patient.((Zucker, K. J. (2018). The myth of persistence: response to "A critical commentary on follow-up studies and 'desistance 'theories about transgender and gender nonconforming children" by Temple Newhook et al. International Journal of Transgenderism, 19(2), 231–245. Published online May 29, 2018. http://doi.org/10.1080/15532739.2018.1468293)

33. The claim is made that hormone therapy and gender confirmation surgeries can help alleviate gender dysphoria, and that these treatments have been shown to be an effective treatment for gender dysphoria. In support of this claim, a further claim will be made that there is a prevailing consensus of the medical community that these treatments are medically necessary, and are safe and effective treatments for gender dysphoria. We will examine the efficacy, and safety by examining the papers offered in support of these claims. We will examine the world literature more broadly in order to evaluate the claim of a "prevailing consensus". The claim of consensus insists on an absence of important controversy surrounding the use of social, medical, and surgical gender affirmation, particularly with regard to the young. That examination will show that there are startling and permanent differences in outcomes between "affirmation-care" as proposed by the plaintiffs, and the historically proven approach that begins in proven psychological care, and results in resolution nearly 90% of the time.

34. In virtually every instant when the claim of the efficacy and safety of gender-affirmation is made, the WPATH "Standards of Care" will be cited in support. This document is the product of the World Professional Association of Transgender Health. It has had 8 iterations. This document has been, and continues to be produced through a process of consensus-seeking within working committees of experts. As we have seen in our discussion about the grading of scientific

evidence, expert opinion is the most rudimentary level of evidence. It is the starting point of scientific investigation, not the end. As any medical subject is investigated over time, the expert opinion becomes better supported by well developed and monitored scientific processes. In short, expert consensus is only as valuable as the scientific evidence that can be reviewed and evaluated which supports the opinion. If the evidence hasn't progressed very far beyond the category of expert opinion, then we are speaking about evidence that is neither sufficiently developed so as to drive either clinical decision making, nor fiduciary decision making when public or invested resources are involved.

35. It will be recalled that the use of the words "standards of care" imply that a particular treatment or clinical principle, if not employed, would have an unacceptable probability of harm to the patient. The term "standard of care" addresses issues of duty, negligence, harm, and causation. It is a legal term that is applied when evaluating the malpractice of medicine. In its Introduction to the WPATH standards, the authors acknowledge that their document is meant to be a guideline only, and subject to individual and local adaptation, and that it is not binding in any way. On page 2 of v.7 in bold face it states "The Standards of Care are flexible clinical guidelines". This calls into question the motivation for the use of the phrase "standards of care" in all of its publications and statements.

36. If the WPATH document is actually a collection of clinical guidelines, then we must examine how such guidelines are developed. In the International Journal of Quality in Healthcare (2016) Kredo et al.[5] offer a helpful examination of that process. They point out that in the past they were just consensus statements offered by experts in the field. They were "'systematically developed statements to assist practitioner and patient decisions about appropriate health care for specific clinical circumstances." With the push toward evidence based medicine, it was realized that guidelines required more scientific rigor, so in 2011 the definition was changed to, "statements that include recommendations intended to optimize patient care that are informed by a systematic review of evidence and an assessment of the benefits and harms of alternative care options'". In order to have real value, clinical practice guidelines must therefore do two things: Use high quality scientific data to evaluate risks, and beneficial results while presenting alternative approaches for the practitioner and patient to consider.

37. With respect to the particular questions at issue in this case, "high quality scientific data to evaluate risks, and results while presenting alternative approaches for the practitioner and patient to consider", should be evidenced in the complaint, and its supporting documents.

[5] Guide to clinical practice guidelines: the current state of play; Kredo et al. Int J Qual Health Care. 2016 Feb; 28(1): 122–128.Published online 2016 Jan 21. doi: 10.1093/intqhc/mzv115

38. Among the scientific publications frequently cited in support of the efficacy and safety of hormonal treatment of transgender persons is a paper by Hembree et al.[6] which is itself a clinical practice guideline promulgated by the Endocrine Society (hereafter ES). Since this paper is a product of the Endocrine Society, it must be understood by reconstructive surgeons given that the referral path of children into the surgical treatment arm is universally through the prior evaluation by an endocrinologist. This guideline was produced in order to update an earlier guideline from 2009. It was produced using GRADE consensus methodology, and is the product of 9 experts who formed the committee. The GRADE methodology cautions its users that "inconsistency of result across multiple studies", "indirectness of evidence", "imprecision in measurement", and "publication bias" are to be watched for in its application; essentially that doctors must watch out for sloppy measurement, and bias in the working group. The scientific evidence used to support the Endocrine Society's special treatment guidelines for gender dysphoric/ gender incongruent persons appears to be of low to very low quality, since the clinical recommendations were so equivocal. It was published in 2017 and includes the statement:

[6] Wylie C Hembree, et al. Endocrine Treatment of Gender-Dysphoric/Gender-Incongruent Persons: An Endocrine Society Clinical Practice Guideline, *The Journal of Clinical Endocrinology & Metabolism*, Volume 102, Issue 11, 1 November 2017, Pages 3869–3903, https://doi.org/10.1210/jc.2017-01658

"guidelines cannot guarantee any specific outcome, nor do they establish a standard of care": "The guidelines should not be considered inclusive of all proper approaches or methods, or exclusive of others. The guidelines cannot guarantee any specific outcome, nor do they establish a standard of care. The guidelines are not intended to dictate the treatment of a particular patient." P. 3895.

39. As was discussed earlier, this language of uncertainty when included in a clinical practice guideline is what we would expect with low quality evidence. This is what the ASPS would call a Grade D result that rests on level IV-V evidence, and is therefore not useful in directing clinical decision making. This consensus process described by Hembree et al. would likely appear very similar to the decision making that drove peptic ulcer surgery in opposition to evidence that it is a bacterial disease. Academic physicians of the highest calibre were making recommendations to their fellow practitioners, as they are now, based upon anecdotal experience and low level evidence.

40. Just 2 years later, in 2019, the ES , along with an international panel of endocrinology societies, concluded "**the only evidence-based indication for testosterone therapy for women is for the treatment of HSDD** [Hypoactive sexual desire disorder]," and that "There are **insufficient data to support the use of testosterone for the treatment of any other symptom or clinical condition,** or

for disease prevention." Also, "The **safety of long-term testosterone therapy has not been established."**[7]

41. It is somewhat alarming to note that these findings are entirely consistent with a consensus statement from 5 years earlier in 2014 (8). In the span of just 5 years, the Endocrine Society consensus has swung from "no other indication for androgen in women" to something akin to, "it is crucial that androgens be given to women who are gender dysphoric", and then back to "no other indication for androgen". This kind of consensus oscillation is what you would expect when there is such scant scientific basis for the decision making.

42. Leading experts in the nascent field of "gender-affirmation surgery" will cite the ES guidelines as the "criteria for initiation of surgical treatment", and that such surgery is "often necessary and effective". Additional citation of other specialty consensus statements, developed by similar methodology, includes the American Pediatric Society, and the American Psychiatric Association. These

(8)- Margaret E. Wierman, et al. Androgen Therapy in Women: A Reappraisal: An Endocrine Society Clinical Practice Guideline, *The Journal of Clinical Endocrinology & Metabolism*, Volume 99, Issue 10, 1 October 2014, Pages 3489–3510, https://doi.org/10.1210/jc.2014-2260

consensus statements are also important for reconstructive surgeons to be familiar with since it is in these areas of practice that the initial diagnosis of gender dysphoria is made, a diagnosis which constitutes the foundation for referral to surgery. The surgeon must understand the strength of the scientific support of the diagnosis given that in some instances breast surgery, and in all instances genital surgery is an irreversible mutilation of the child resulting in permanent losses to essential human functions.

43. Surgeries that are used in gender-affirmation care are described by plaintiffs experts as being "reconstructive". They include surgeries of the face, the chest, and the genitals. It is crucial to understand the meaning of the term reconstructive surgery, and contrast it with the term "aesthetic surgery". It is precisely this distinction that distinguishes medical necessity, which in turn is the basis for evaluating claims of obligation on the part of the State or any other 3rd party payor, to pay for these procedures. This is an area where I have some experience, having served the office of the Surgeon General, USN as specialty leader for reconstructive surgery. Making determinations of coverage for any agency is essentially about rightly answering this as the first question: "Is this reconstructive, or is this cosmetic?"

44. Reconstructive surgery is the restoration of form and function for a person who has suffered a loss through genetic, in utero developmental accident,

trauma, infection, or surgery for infectious events or cancer. It begins with the most comprehensive knowledge available concerning the nature and function of the injured part, and seeks to optimize function as the primary goal, while seeking to restore the natural form. Both form and function are understood objectively, and both have subjective effects. Restoration of form and function in a combat injured leg has measurable effects on mobility, range of motion, strength, and capacity for work. Subjectively, the impact is profound as well, but it is not the central purpose of the operation.

45. In contrast, aesthetic surgery begins in the subjective life of the patient. The patient presents seeking an opinion concerning the aesthetics of a particular feature, such as the nose. They will express a dislike of the feature. Their hope is that by modifying its appearance, they will improve their interior subjective life. What the patient is seeking is a normal human objective: to improve the aesthetics of things, for ourselves and for the people around us. When the surgeon is planning and performing the operation on the nose, there is great objective precision; however, all of it is placed in the service of the subjective life of the patient. It is of no use for the surgeon to impress himself with a technically perfect result if the patient loathes it. The surgeon additionally has the grave duty of managing the risk for the patient and weighing it against the potential benefit. The patient must not be submitted for a surgery which entails a significant risk of loss if the surgery is being

performed only to achieve an aesthetic outcome. If there is a certainty of loss, then there is a certainty of error. To give a young woman a perfect nose, and in the process destroy her ability to breath through it would be a terrible error of surgical decision making. It is axiomatic in plastic surgery that we are to avoid a predictable sacrificing of function in the pursuit of cosmetic improvement.

46. All of the world's literature in the area of gender affirmation medicine and surgery begins in the subjective life of the patient. In the past the associated diagnostic terms directed us to consider the subtle processes at work in the mind of the patient that cause obsessive thinking, and compulsive behaviors that center on how the world views their sexed appearance. More recently the condition has been "de-pathologised" and now the preferred term of "gender dysphoria" has come into use. This new language has hidden away virtually all of the issues of the interior emotional life of the patient, and left us only with the vaguest descriptions of the patient's condition: "dysphoria", "unhappy". Simple though the term is, it is still entirely in the subjective life of the patient. There is nothing found in the term "gender dysphoria" that points to a lost or otherwise damaged body structure in need of reconstruction. No functional or physical loss is described or even suggested by the term "gender dysphoria". It is a fundamental characteristic of a cosmetic surgery patient that the presenting complaints are only subjective, and in the course of the complete evaluation of the patient, no functional or structural defect is found.

47. A further reason for the crucial importance of clarity in separating what is reconstructive from what is cosmetic is the part that this distinction plays in surgical planning, and informed consent processes. Planning for a reconstructive operation includes an assessment of the size and severity of the wound, or the dimensions and tissue types of the missing part. This determination guides the selection of tissue from other body areas that can be employed in the reconstruction. At the same time the surgeon must understand the scope of the harm that will be caused by harvesting that tissue to complete the reconstruction. That harm is given the name "donor defect", and it forms an important part in the risk/ benefit calculation. For example if I were to reconstruct a man's jaw that was shot away in combat, one of my first options would be to use a portion of bone from the leg. I can transpose that bone to the face, attach the blood supply, then cut and form the bone segment to replace what was lost. One of the important considerations is to prevent loss of function of the leg (donor defect). The operation is in part designed around that consideration because we seek to limit (entirely if possible) the magnitude of the functional loss caused by the donor defect. The only reason that we accept any loss at all is because of the grave nature of the original wound. We accept some small degree of loss if by doing the operation we restore the functions lost in the wounding event. Furthermore, whatever function is lost because of the donor defect is considered a complication had there been any way to avoid it.

48. In contrast cosmetic surgeries, because they begin with an otherwise fully intact person, they do not begin with any assessment of any loss from any of the wounding processes described above. The only measurable findings in cosmetic surgery are those of aesthetic proportion, and which being aesthetic find their importance in the subjective life of the observer. In the case of the cosmetic operation, any functional loss caused by surgery is considered an avoidable complication since the surgery neither anticipates nor yields any functional improvement except in the subjective life of the patient. This is why measures of success in cosmetic surgery are always made using subjective "quality of life" questionnaires.

49. As we examine the particular surgeries used in gender affirmation we will see that there is a very troubling abandonment of these first principles of reconstructive surgery. The first troubling example is "chest masculinization" surgery in female to male presentation patients. This surgery actually begins with the known expectation that the surgery will produce a loss of two essential human functions, namely: sexual arousal, and breast feeding. Both functions are permanently and irretrievably lost, and that loss is one of the expected results or the surgery. This step is then followed by the cosmetic shaping of the chest through the use of liposuctioning in an effort to further masculinize the appearance of the chest. This surgery is now being routinely performed on minor girls, and version 8 of the

WPATH "standards of care", which is presented as authoritative by proponents of gender affirmation, actually recommends mastectomy in girls as young as 15 years of age. This surgery does not involve the restoration of form and function, and is therefore not reconstructive. It is an operation that begins in the subjective life of the patient and aims at a result that also resides entirely within the subjective life of the patient. It is thus by definition an aesthetic (cosmetic) surgery. Because it includes the 100% likelihood of a massive functional loss, it must be considered unsupportable as a matter of policy.

50. Similarly, genital surgery procedures cannot be considered reconstructive because they do not meet the definition of reconstructive surgery. They begin with an obsessive concern or anxiety in the subjective life of an otherwise normal, healthy person. They involve the planned destruction of an essential human function, and they are not restoring a form that is missing due to trauma, genetic accident, in utero event, or disease. The surgery seeks to create counterfeit structures that never could have existed in the patient, except as an artifact of surgery. I have done many reconstructive surgeries involving the entire genital area in patients with military injuries and infectious illnesses. If the injury is so devastating as to require a counterfeit structure, and that is all that can be offered, then there is no question as to how the surgeon must proceed. In contrast, gender affirmation surgery only produces counterfeit structures that are created to serve the

subjective life of the patient. Because these surgeries are cosmetic, and because they are 100% certain to produce grave functional losses, they must not be supported as a matter of public policy, and never be paid for using public funds.

51. In spite of these clear distinctions between reconstructive and cosmetic surgery, proponents of gender affirmation surgery will claim that such procedures are medically necessary. This language of medical necessity is found in the WPATH "standards of care". It should be remembered that the WPATH standard of medical necessity is not supported in reliable scientific evidence, but only on rudimentary, low level, expert opinion/ consensus statement data, which is no support at all. The use of the term "medical necessity" is language that is used by medical insurance programs, both private and public to establish insurance coverage in the case of particular procedures. Benefits of insurance programs can vary from policy to policy, but when the term "medically necessary" is used, it implies that failure to cover the care is likely to cause harm to the beneficiary. For this reason, insurance programs, including state Medicaid programs routinely examine the efficacy of treatments in the management of medical conditions, and develop policies of coverage or exclusion if benefit has not been demonstrated, or if a less hazardous or less expensive process of care can be offered to the beneficiary.

52. There are circumstances in which the exact same surgery may be considered reconstructive in one patient, but cosmetic in another. It is important to

be familiar with this problem since advocates of gender affirmation surgery will use the similarity as the basis for claiming that it should be a covered benefit, and that failure to include surgery in the insurance coverage is evidence of legal prejudice against a particular class of patients. For example, the claim will be made that removal of breast tissue from a female seeking to present as a male is the same as removing breast tissue from a male who suffers from the condition of gynecomastia (female breast tissue on a male chest). Or they will offer the analogy that mastectomy (complete removal of the breast) in a healthy female who seeks to present as male is the same as prophylactic mastectomy in a female who has inherited a high lifetime risk of breast cancer. Both females are at present healthy, both females get mastectomy. Gender affirmation advocates will ask, why one is a covered benefit, and the other excluded?

53. One of the essential mechanisms that third-party payors (including state Medicaid agencies) have for distinguishing reconstructive surgery from cosmetic surgery is found in the laboratory examination of tissue removed during surgery. This tissue examination by the pathology department is required by insurance programs in order to confirm that the operation performed was reconstructive (covered benefit) and not cosmetic (excluded from coverage). Two operations may be outwardly identical even while one is reconstructive and the other cosmetic. An excellent example is breast reduction surgery. This surgery may be reconstructive

if it is performed on patients who suffer from chronic neck, back, and shoulder pain caused by the orthopedic effects of their heavy breasts. The same, technically identical operation, might be done for purely cosmetic reasons. In the case of reconstruction, the patient has an objectively diagnosable condition that causes lost time from work, frequent covered visits to physical therapy, or to pain clinics, chiropractors and radiologists. There is abundant actuarial data, based upon the highest levels of scientific support, that a breast reduction of sufficient weight (based upon the anthropometric measurement of the patient) has a very high probability of resolving the chronic pain. High quality medical literature that addresses this issue, and its importance to insurance plans, is typically very precise in its data gathering and actuarial interpretation.[8] However, pain cannot really be measured. Pain is reported by the patient. Nonetheless, health insurance plans are able to distinguish cosmetic breast lift from reconstructive breast reduction based upon the measured and reported weights of the breast tissue that is submitted to pathology during surgery. An objective, repeatable medical test, with known error rates is used to confirm the diagnosis, ensure correct care for the patient, and separate cosmetic

[8] Accuracy of Predicted Resection Weights in Breast Reduction Surgery: Kung, Theodore A. MD;
Plastic and Reconstructive Surgery - Global Open: June 2018 - Volume 6 - Issue 6 - p e1830

surgery from reconstructive surgery in the interest of preserving medical resources and preventing fraud.

54. No such process exists in the case of mastectomy for chest masculinization of self-identified transgender females seeking to present as males. There is no physical, biochemical, hormonal or tissue pathology, that can be demonstrated to localize the patient's condition in her healthy breasts. It is the young woman's subjective sense of revulsion when she looks at herself that has caused her to believe that mastectomy might make her feel better.

55. In spite of this glaring lack of objective, scientifically validated methodologies for making the diagnosis, or for proving benefit of care, advocates for gender affirmation care will cite many papers, published in peer reviewed professional journals, that claim sufficient improvement in the subjective life of the patient that lifelong morbidity and suicide are avoided. Close examination of this literature will show the very low quality of evidence that is offered, even after many years of affirmation care. Before reviewing the literature supporting gender affirmation, we must understand what it means when an article is reported as "peer reviewed".

56. Peer review is the very important process by which highly educated and trained experts review scientific medical papers for publication. They are examined in order to ensure that the corpus of medical literature is protected from imprecise,

substantively erroneous, or conceptually flawed publications. It is an essential part of the historic, magisterial process in medicine. In fact, it is so much a part of the life-long learning process of doctors that any reputable training program will have a robust "journal club" in which doctors at every level of training take turns at publicly "peer reviewing" an article and leading a lively discussion of its value. A good doctor is constantly peer reviewing. It is an essential element of good medical care because it keeps the doctor in contact with the finest practitioner in their particular field, and thus improving care.

57. Establishing that an article is peer-reviewed is a basic and essential practice. You might read a medical paper with level-III evidence of high quality, or a paper that is level-V evidence of low or questionable quality, both of which undergo peer review, and are published. The level-III will likely drive decision making, and possibly a recommendation as high as "standard of care", while the poor-evidence paper suggests research, or perhaps the consideration of an alternative approach, if that approach does not put the patient in any significant risk. Papers that have very low-quality evidence, such as single case reports, or case collections by a single practitioner, or collected from several practitioners at a single medical center, will be published by peer reviewed medical journals. These papers are not offered to guide clinical decision making. They are offered in the service of advancing the understand of complex problems, and suggesting areas of research

that might lead to higher quality evidence, and thus to future improvements in the quality of care. So, the label "peer reviewed" says absolutely nothing about the value of the evidence for either clinical decision making, or larger issues of practice guidelines, and policies of medical coverage or exclusion by healthcare agencies like state Medicaid programs.

58. A 2019 publication by Miller et al.[9] is typical of a single-surgeon, case collection paper published in a peer reviewed medical journal. It reports a collection of cases that claims to show complete satisfaction on the part of the patients (that 100% would do it again). Upon examination of Dr. Miller's paper we see that it is a report of a single surgeon, and is a retrospective review of his cases. It begins with a chart review of only 34 patients, only 12 of whom responded to the quality-of-life questionnaire. This means 74% of the study patients dropped out (patient self-selection bias, with dropout rate greater than 20% being unacceptably high for publication in most journals). All of the data is based in subjective reporting by the patients, rather than objective findings such as substance abuse rates, psychiatric hospitalization rates, suicide attempt etc.. Published reports which use purely subjective evaluations such as satisfaction surveys, or quality of life surveys etc. are characteristic of the cosmetic surgery literature, not the reconstructive surgery

[9] Miller, TJ, et al. Breast Augmentation in Male-to-Female Transgender Patients: Technical Considerations and Outcomes, 21 JPRAS Open 63-74 (2019)

literature. He reports that "every patient surveyed at 1 year" reported that "their life had changed for the better". This statement is again reporting only subjective data, this time following a meaninglessly short follow-up of a very small group that has been biased by self-selection. The overall study is little better from the standpoint of the duration of the study because the final follow-up was only 4 to 7 years. This paper presents level-IV and level-V (low to very low quality) evidence, and is possibly useful in suggesting further research, particularly since the author is a subject matter expert. It is not useful for clinical decision making. Neither can it be presented as evidence for anything more than a cautiously worded practice guideline (as in the ES guideline concerning the use of cross-sex hormones presented above), and certainly can never be used in support of a "standard of care".

59. A 2006 paper by Newfield et al.[10] is an example of a paper that was published in a peer reviewed journal, and perhaps ought not to have been. This paper asserts that mastectomy and chest masculinization in transgender biological females "increases self-esteem and improves body image" while providing the patient with "some security and safety for those who remove their shirts in public areas such as gyms or beaches". This assertion is made by the authors in the paper's preamble, and is an assertion frequently quoted when the paper is cited in evidence to support

[10] Newfield, N, et al., Female to-Male Transgender Quality of Life, 15 Quality of Life Research 1447- 1457 (2006)

gender affirmation surgery. In reading the entirety of the paper one finds that it does not demonstrate this claim at all. The assertion is a personal editorial opinion expressed by the authors in support of transgender surgery. The assertion is never verified in the objective data on post-surgical patients.

60. The paper is a report of an anonymous survey. It claims to provide meaningful information about the effect of female to male transitioning medicine and surgery without even verifying that the subjects who responded to the survey have in fact undergone medical and surgical gender transition. Subjects were recruited **"via online promotion and printed materials, including flyers and postcards that were distributed to San Francisco Bay Area community centers, cafes, stores, and health clinics that serve the transgender community."** In terms of self-selection bias (patient determines who is followed by the study) it is hard to imagine a more problematic patient selection process. The researchers even admit that they were unable to determine how many surveys may have been submitted multiple times by the same study respondent. They write: "Although this procedure *helped* (italics mine)prevent duplicate submissions by the same participant, we could not employ more sophisticated computerized systems due to administrative and financial constraints".

61. All of the demographic information contained in the study was self-reported but not verified, including age, sex, health status, history of hormonal

therapy, and history of gender surgery. The study uses a quality-of-life survey with 36 questions in 8 areas of interest, producing only self-reported subjective information. Even the claim of simple benefit is poorly support, as is reflected in the conclusion to the paper. The authors write, **"The 376 US FTM transgender participants analyzed in this sample had diminished mental-health related QOL compared with the general US population, as measured by the SF36v2. These findings are consistent when compared against specific age and sex norms."** This statement demonstrates the lack of value in the study. The study participants demonstrated a quality of life that is statistically significantly lower than the age/ sex comparison cohort, and the authors can only speculate as to the cause. There is no way to tell if treatment helped, had no effect, or harmed the patients because there was no information available about the anonymous subjects. This is because the anonymous test subjects hadn't received pre-treatment evaluation using the same or comparable test instrument. This study which is frequently offered in support of the claim of efficacy is of the lowest evidentiary value, may be useful for suggesting future research, but is of no value in directing clinical decision making, or meaningful allocation of public resources in the service of public health.

62. Another peer reviewed article, presently cited in filings by advocates in cases pending before federal courts, is from 2013 by Weigert et al.[11] which makes the claim that there is a statistically significant improvement in "psychosocial well-being" following cosmetic breast augmentation in biological males who are presenting as women. This paper is very simple to analyze and classify as not helpful in clinical-therapeutic decision making, or for establishing coverage/ exclusion criteria for public health agencies. At the bottom of the published article is written, "Clinical question/level of evidence: Therapeutic, IV." As was discussed above, this paper is at the same alarmingly low level, because it is a single-center sampling of a small cohort of patients, and relies on subjective, self-reporting through questionnaire, over a short study duration. Patient collection was made between 2008- 2012. The paper was published in 2013. If the peer review process followed the usual timeline, it is likely that there are a significant number of patients in the study who were followed for less than a year. The authors, in the abstract are only able to report the pre-surgery, and the 4th month post-surgery as assured time points. This is remarkably short follow up even for a cosmetic breast augmentation study group. The article is perhaps useful in suggesting inquiry into why their cohort

[11] Weiger, R, Frison,E., Sessiecq, Q., et al.; Patient Satisfaction with Breasts and Psychosocial, Sexual, and Physical Well-Being after Breast Augmentation in Male to Female Transexuals. Plastic and Reoncstructive Surgery, 132(6), 1421-1429. doi:10.1097/01.prs.0000434415.70711.49 (2013)

reported no improvement in physical well-being, given the known association between emotional health and physical health. There is nothing in the article to support even a guardedly worded clinical guideline suggestion.

63. Another citation in legal claims presently before federal courts and offered in support of gender surgery is another peer-reviewed study by Horbach et al. published in 2015.[12] This is a review of transgender surgical literature published between 1995 and encompassing nearly 20 years. It yielded 26 papers that satisfied the search criteria, and includes 1,461 patients. The paper claims that "transgender women (biological males presenting as women) who had vaginoplasty found that study participants' mean improvement in quality of life after surgery was 7.9 on a scale of one to ten". In the conclusion of the paper the authors write, "

"Sexual function and patient satisfaction were overall acceptable, but many different outcome measures were used. QoL was only reported in one study. Comparison between techniques was difficult due to the lack of standardization."

64. Of the merely 26 studies out of a sampling that spanned 20 years, only one paper was found to have used a standardized metric, one that only measures subjective, patient reported information, and the rest could not even be compared to each other. The authors write,

[12] Horbach, SER, Bouman, M, Smit, JM et al.Outcome of Vaginoplasty in Male-to-Female Transgenders: A Systematic Review of Surgical Techniques ; J Sex Med2015 Jun;12(6):1499-512. doi: 10.1111/jsm.12868.55.

"The available literature is heterogeneous in patient groups, surgical procedure, outcome measurement tools, and follow-up. Standardized protocols and prospective study designs are mandatory for correct interpretation and comparability of data."

65. This result is startlingly reminiscent of a paper offered by Tolstrup et al. published in 2020 (&&). It is a comprehensive literature review on the subject of breast surgery in transgender patients, including both male to female, and female to male presentation. It is a scoping review that yielded 849 papers of which 47 papers met the inclusion criteria based upon title, abstract, and full text. In the study results, the authors report that,

"The summary of outcome domains and classifications showed that there are large variations in outcome evaluation between studies. Although several studies reported on similar outcome categories, there was a high level of heterogeneity of domains and classifications of outcomes." The authors then conclude by explaining that "Evaluation of outcomes in gender-confirming chest surgery showed large variations in reporting, and further streamlining of reporting is therefore required to be able to compare surgical outcomes between studies."

66. **Tolstrup's review of the literature[13] show us that the general level of evidence for the efficacy of gender affirmation breast surgery is in the category of "early experimental" evidence.** None of the articles examined rates of psychiatric hospitalization, substance abuse, self-harm behaviors, or suicide. This tells us that the most compelling reason offered for performing these surgeries

[13] Tolstrup A[1], Zetner D[1], Rosenberg J[1] Measures in Gender-Confirming Chest Surgery: A Systematic Scoping Review. **Aesthetic Plastic Surgery**, 29 Oct 2019, 44(1):219-228 DOI: 10.1007/s00266-019-01523-1

(psychological distress and suicide risk) isn't even evaluated by the researchers, and can support no claims of efficacy in the world transgender surgery literature.

67. Professionally speaking, these are very disappointing findings from the comprehensive examination of the transgender surgery literature. To have a surgical sub-specialty working diligently, and guided by professionals at the highest levels of academic expertise, that has only produced case-series reports, retrospective case collections, and fruitless 20 year literature reviews, and still only have level-IV and V evidence to show for its work is alarming. It shows that the sub-specialty has not developed uniform descriptive language, standardized reporting nor test instruments that might raise the value of expert opinion to a level that could make reliable recommendations that might help in surgical decision making, rightly inform the consent process, or guide decision making by officials entrusted with the care of public and private medical resources. It would cause me to make a sober review of the medical and surgical principles that are guiding this work.

The Question of Consent in Gender-Affirmation

68. It is firmly established in high quality research[14] (that persons with gender dysphoria have a greater than 30% likelihood of being on the autism

[14] Kaltiala-Heino R, Sumia M, Työläjärvi M, Lindberg N. Two Years of Gender identity service for Minors: overrepresentation of natal girls with severe problems in adolescent development.

spectrum, and a nearly 40% probability of a diagnosis of depression or major anxiety disorder. The proponents of gender surgery will rightly point to the high probability of self-harming behavior, including suicide attempts and completed suicide among self-identified transgender persons.

69. However, as is known by all surgeons, it is considered imprudent to obtain consent from patients suffering from psychological conditions that provoke the patient to acts of self-harm, or to suicidal ideation. These psychological disturbances are known to impair the patient's capacity for understanding the information they are hearing from the surgeon, interpreting that information, and reasoning from that information. If those capacities are impaired by psychological disturbances sufficient to consider suicide, then meaningful consent is not actually possible. Certainly in the case of conditions that constitute a threat to life and limb in a patient with decreased competence, consent may be obtained with the assistance of family, guardian, or in particularly urgent cases a group of professionals who agree on the grave necessity to proceed with surgery.

70. The problem however is that none of the surgeries, on the list of commonly performed gender affirmation surgeries, can be described as emergency operations performed to save the life of the patient. They are all elective because

---

Child and Adolescent Psychiatry and Mental Health (2015) 9:9.)

they are scheduled when convenient and after the patient is deemed fully ready. Furthermore, an ever-growing percentage of patients submitted for gender surgeries are minors who by definition are not competent to consent. The claim is made that these surgeries are in fact "lifesaving". This is a claim that is not supported in high quality scientific evidence. In fact, high quality evidence, which I will present below, shows that while self-harm and suicide rates are improved in the very short term for some sub-groupings of patients, in the long-term these problems remain if not worsen.

71. Documents like the WPATH v.8 speak of the need to have these psychological disturbances "well-controlled" prior to surgery. This must be taken to mean that self-harming or suicidal thoughts must be well controlled before one can proceed with surgery. If that is the case, then the main reason for the consenting the child for surgery has been successfully treated medically, and the patient no longer requires the surgery. That would be very felicitous news to the child's parents.

72. What is more troubling is that the co-morbid conditions of autism spectrum disorder, clinical depression, and major anxiety disorder are never examined as the possible causes of the gender identity disturbance. These are conditions that, if treated, might improve or even resolve the gender problem. To the contrary, these serious problems are viewed as mere impediments to gender surgery that must be "reasonably well-controlled" so that surgery may proceed. This is

consistent with the regnant WPATH model that there is a single explanation that the child's condition is caused by a disconnection between biological reality and subjective identity which has an as-yet undiscovered cause, and has only a single solution: the social, medical, and surgical affirmation of the child's gender discordance.

73. Such a single cause/ single solution assumption would seem to be unlikely, given the massive range and the recent complete reversal in the demographics of transgenderism. What used to be a condition that was nearly exclusively found in little boys, and resolved nearly 90% of the time[15], is now predominantly a condition affecting young women, and at a rate that has risen between 4000 and 5000% in the course of the last decade.

74. The claim is often made that gender affirmation surgery is not cosmetic, because it is based in a "medical diagnosis" that can be found listed in the Diagnostic and Statistical Manual. This is a document produced by the American Psychiatric Association. It is essentially a dictionary of terminologies recommended in descriptions of psychiatric conditions. This publication used to include the terms "body dysmorphic disorder", and "gender identity disorder" among others used to describe self-identified transgender person. Changes to the language found in the

[15] Irreversible Damage: The Transgender Craze Seducing Our Daughters; Abigail Shreier, (2020)

DSM are based upon expert consensus methodologies described above, which are the lowest form of scientific evidence. The consensus in not obtained by polling the membership of the Society, but within a small group of provider- advocates. Conditions that were once in the category of paraphillias are now considered normal and not listed. It is in this committee that the decision was made to "depathologize" gender discordance. The difficulty is that without a medical diagnosis, you cannot generate billing for medical services. This is why the term "gender dysphoria" was chosen. No high quality scientific evidence was presented and reviewed by the committee in making the changes.

75. This methodology by the DSM committee has made the document essentially useless in making either a diagnosis, establishing principles of care, or estimating likely resolution of psychiatric medical problems. This appears to be why the National Institute of Mental Health, which has been the original source of funding for the DSM publicly its support for the DSM project just weeks before the present iteration was published in 2013. The fact that gender affirmation physicians and surgeons cite the DSM as a source document for diagnostic criteria is further proof that the condition exists in the subjective life of the patient, and therefore surgery performed to address the subjective condition is by definition cosmetic surgery.

76. Diagnostic and pre-operative selection for of patients for surgery is through a process that begins in psychology, continues with psychological support, and concludes with certification by psychological services that the patient is ready for surgical modification. At no point is there described any medical diagnostic process of history-taking, physical examination, laboratory evaluation, or radiographic examination that is used to confirm a surgical diagnosis. The entire process is in psychological services which is operating on the premise that the anxious child has made a correct diagnosis. The indication for surgery begins in the subjective life of the patient. Surgery is offered to the patient with the assurance that it is likely to improve the subjective life of the patient, and is therefore by definition cosmetic surgery.

On the Safety of Gender Affirmation Surgery

77. A discussion of surgical safety must include anticipated losses which are either expected, or even remotely possible. In order to examine the comparable issues in transgender versus reconstructive surgery our effort is simplified by comparing identical operations. I will describe two operations which use the identical techniques, and even the same tissue source so that we can better compare gender affirmation surgery, with actual reconstructive surgery.

78. On several occasions I have performed the reconstructive operation called "Sensate radial-forearm microvascular free flap hypopharyngeal

reconstruction". I performed this surgery in order to reconstruct the tongue and throat of patients who had suffered a grievous wound of the mouth and throat when he underwent removal of an aggressive cancer. The defects caused by that wounding needed to be replaced with thin, pliant, abrasion and fluid resistant tissue. It needed to provide the patient with sensation in the reconstructed area so that they can feel the food and liquids in their mouth, and manipulate the food so as to swallow it. We selected an area of skin on the inside of the forearm that has regular and robust blood flow, is thin and durable, and has an easily dissected sensory nerve that can be attached to the nerves in the wound. The forearm flap satisfied all the requirements. An operation of this complexity, duration, and technical requirements has many issues, big and small, that can diminish or destroy the result.

79. The throat reconstruction operation is in almost every way identical to the second most commonly performed female to male (FtM) gender affirmation surgery of the genital. It is called the "Sensate radial forearm microvascular free flap phalloplasty". In that operation, the identical flap is raised and transferred. It too must be resistant to abrasion, be water tight, pliant, sensate, and of correct volume. Through a process of incision, plication and suturing, a tubular phallus is constructed within which is a skin lined tube which will serve as the urethra. The suture closures in both flaps is where most things go wrong because the skin edges that define the suture line can lose their blood supply to varying degrees. In the phalloplasty, when

this happens, the patient suffers from delayed healing, urine leakage, varying degrees tissue death, and scarring. All of those problems can happen with either the throat flap, or the phallus flap. When the phallus flap fails, the patient suffers due to varying degrees of tissue loss, chronic urinary leakage, or urinary obstruction due to scarring that can cause kidney injury if left un-treated. When the throat flap fails, bacteria laden saliva will leak into the neck where it can cause fulminant infections, or erode into a major artery and cause the patient to bleed to death in a matter of moments. A singularly terrible event.

80. In the case of the throat operation, if the removal of the cancer had not been performed, there was a known and significant probability that the cancer would have eroded into the tissues of the neck and caused a fulminant infection, or eroded into a large blood vessel, as described above. In contrast, if the phallus flap operation, had not been performed, the patient would have remained fully functional in every human capacity, though suffering from an inner subjective disturbance called gender dysphoria, which has not yet been adequately treated.

81. Both operations involve the use of a highly complex surgical techniques to remedy a wound. In the case of the cancer operation the wound was the result of a cancer that would have ended in a terrible death. In the case of the phallus operation the surgeon is creating multiple physical wounds in a healthy child (castration, loss of pelvic organs of reproduction, de-gloving injury of the forearm, skin graft donor

site injury), with their associated risks of complications. The surgery is performed in attempt to remedy a subjective, patient-reported sense of their identity.

82. Clearly the pre-operative condition of the cancer patient is far more grievous than the condition of the young person who is suffering from gender dysphoria. The cancer patient would likely be more than willing to endure significant loss, such as voice, or teeth, or the sense of smell. And yet, if I were discussing surgical risk pre-operatively with my patient who has the throat cancer, and told him that there was a certainty that in the course of the operation he would lose all of his reproductive organs, he would be justified in asking why he was being subjected to such an unsafe operation. The patient wouldn't be even slightly interested in any further discussion of operative risks. The question of safety addresses itself to the question of potential losses caused by surgery. Transgender surgery of the genital apparatus predictably causes grievous loss that dwarfs such complications as infection, local tissue loss, urinary leakage or scarring. Such surgery can justly be considered universally unsafe in all cases, and particularly grievous when visited upon the young.

83. One of the peer reviewed article presented in support of masculinizing chest surgery, and found in numerous expert opinions submitted in pending federal

cases. It is a 2017 paper, published in the peer reviewed journal JAMA Pediatrics[16]. it claims to support the conclusion that "surgical intervention (mastectomy, or chest masculinization) positively affected both minors and adults". This paper is perhaps the most alarming of all the citations presently offered and deserves a detailed examination.

84. The principle author, Dr. Olson-Kennedy is also an academic expert in her capacity as Associate Professor of Clinical Pediatrics, Keck School of Medicine of USC, and Medical Director of The Center for Transyouth Health and Development in Los Angeles. She holds professional membership in The Society for Pediatric Research, the World Professional Association for Transgender Health(WPATH), and the Society for Adolescent Health and Medicine. If any gender affirmation expert would be in a position to offer high quality, evidence-based publications, it would certainly be Dr. Olson -Kennedy.

85. In their summary of findings, the authors report that "chest dysphoria" is common among "trans males" (natal females seeking to present as males), and that the dysphoria is decreased by surgery. They claim that regret for surgery is "rare". It is a retrospective review of children treated at a single center. The article

[16] Olson-Kennedy,J., Warus, . et al. Chest Reconstruction and Chest Dysphoria in Transmasculine Minors and Young Adults: Comparisons of Nonsurgical and Postsurgical Cohorts; JAMA Pediatr2018 May 1;172(5):431-436. doi: 10.1001/jamapediatrics.2017.5440.

reports breast removal surgery on at least one girl aged 13 years. The average age was 19. Children were entered into the study through recruitment from among patients visiting the clinic, and by telephone over a six-month period. The authors found that patients recruited from among visitors to the clinic (convenience sampling) yielded an abundance of non-operated patients, so they were forced to reach out to all the known post-surgical patients by phone. 26% of the clinic's post-surgical patients could not be reached for various reasons including no working phone, or failure to respond to multiple messages. A 26% drop-out rate is never questioned by the authors. Were they lost to follow up because of dissatisfaction, psychiatric hospitalization, or suicide? This problem is called "self-selection bias", and is evidence of careless study design. Of the remaining 74% of patients, only 72% of them (only 53% of the study patients) completed the survey. This is a second example of self-selection bias. Why would some post-surgical patients who had been successfully contacted, not complete the survey? The authors do not ask the question.

86. In the study, dysphoria was measured using "a novel measure" (an unproven test instrument) which was a series of subjective questions about happiness. Among the designers of this novel test instrument were some of the adolescent patients themselves. Their flawed methodology included the use of an entirely unvalidated test instrument, with no known error rates, or proven predictive

power, **that was in part designed by the minors and young adults who were the subject of the study.** Furthermore, the post-surgical patients were given the survey at varying time intervals post-surgery. The longest interval between surgery and the satisfaction survey was 5 years, but children less than a year post surgery were included in their flawed sample, and yet the authors claim evidence of "negligible regret." This is a remarkable claim given that long term, longitudinal population studies show that there is a dramatic rise in post-surgical problems such as depression, hospitalization, substance abuse, and suicide beginning at around year 7 post surgery (Dhejne cited below). Surely Dr. Olson-Kennedy is familiar with the international literature on transgender outcomes?

87. Having promised in the introduction to her paper that "chest dysphoria" is reduced by surgery, at the conclusion they confess the fact that the study design and execution produced very low-quality data that is not useful for patient selection, or prediction of outcomes. They even confess that the study does not address the efficacy of surgery in improving outcomes regarding the single most compelling reason for performing the operation: mitigation of depression and suicide. The authors write:

"An additional limitation of the study was the small sample size. The nonsurgical cohort was a convenience sample, recruited from those with appointments during the data collection period. There could be unknown imbalances between the nonsurgical and postsurgical cohorts that could have confounded the study findings.

Finally, the Chest Dysphoria Scale is not yet validated, and may not represent distress or correlate with validated measures of quality of life, depression, anxiety, or functioning."

88. This paper is a typical example of a publications which are used to support transgender medicine and surgery, written by board certified transgender expert physicians who practice in our nation's largest pediatric gender clinics, and was published in peer-reviewed medical journals. The article is essentially useless in making any clinical decisions regarding who should be offered surgery, what the likelihood is that they will benefit from it, or the likelihood that they will regret their decision. Most importantly, it cannot even vaguely estimate if the risk of hospitalization, incarceration, or suicide will be reduced. For the same reason that the paper is not useful in clinical decision making, it is likewise not meaningful in decision-making by persons responsible the just management of public and private medical resources.

On the Experimental Nature of Transgender Surgery

89. One of the important usages of the term "experimental" in the world of medical care is in the domain of insurance services, both public and private. Leadership in these agencies is charged with the responsibility of managing medical resources in a way that both preserves resources, while at the same time applying those resources to the patient as correctly as medical science and their own actuarial information will allow. Whenever a novel therapy is proposed for a given condition,

insurance services will examine the medical and actuarial data to see if the proposed therapy is likely to yield a result that serves those two purposes (health of the patient, and financial soundness of the insurance process). Typically, in the early years of a new treatment there is resistance on the part of the payors because early on (as discussed in detail above) all that the proponents are able to present is low-level scientific papers that present anecdotal case collections without controls, or multiple studies that can not be compared due to methodological variation or are methodologically questionable due to unvalidated test instruments. History has shown, and the fact remains, that good surgery demands good evidence, particularly when permanent damage to the client is a possible result.

90. Nonetheless, if the insurance agency reviewer see evidence that a new approach may be helpful, they prudently insist that therapies of known value be tried to their reasonable limit first , and that they be found to have failed in solving the patient's condition. Only the will consideration be given to the new treatment.

91. This dynamic process between the patient, the physicians, and the insurance industry has many problems, but good, well validated scientific evidence is not one of those problems. In fact well validated science is typically the best remedy for those problems. Sometime the good science is from the doctors, and sometimes the good science comes from the actuaries. In both cases the patient benefits.

92. From the perspective of the case in question, this sense of the term "experimental surgery" may be the most important. How did the affirmation care scientific model and its associated social, medical and surgical treatments enter into the mainstream of the medical community? Did it follow this same process of gradual acceptance in both the medical and insurance communities through a process of steadily improving evidence levels? Was it used on a careful trial basis after having exhausted treatment by established methods? The answer is that it did so, but only in part.

93. The historically validated treatment model for what is today called gender dysphoria is what is called "watchful waiting". On hearing the name one is tempted to think of this as a resignation to inaction. It is not. It is a psychotherapeutic process that is rooted first in an examination of the cognitive processes of the child, and seeing how the child has responded to the reality of their life. For this reason, in order to be effective, it must include family therapy. The goal is to keep the anxious and confused child in loving contact with reality, while seeking to understand and remedy the subjective dynamic that is provoking the condition of distress. It is essentially the same process used in helping persons who suffer other obsessive-compulsive issues, like eating disorders. Psychological research, having high level evidence, has shown that over the course of time this approach results in over 80%

resolution of the cross-sex self-identification during adolescence, and nearly 92% by young adulthood.(Zucker et al.).

94. This watchful-waiting approach is likely the reason why gender discordance used to be a rare diagnosis. The vast majority of people with the condition resolved the issues, and went on to live their lives without the need for life-long medications, without destructive surgeries, without the loss of their sexual faculties, and without the loss of fertility. What has happened, however, is that the dynamic between patient, physician, and insurance services has been severely disrupted.

95. The science based medical and actuarial management of this condition has been separated from the evidence, and now rests entirely on the opinions of academic experts who have managed to influence the decision makers in their favor. In large part, they have accomplished this by never speaking about watchful waiting except to dismiss it as folly. This process of silence and dismissal is exactly what ulcer surgeons did to the proponents of the scientifically correct infection model of ulcer disease.

96. Silence and dismissal about watchful waiting is not the only reason for the 5,000% increase in the diagnosis of transgender over the past decade. Surgeons who were seeking to achieve the best results for their transgender patients came to realize that most of the difficulty with good cosmetic results was that young men

seeking to present as women tend to appear too masculine, and young women seeking to present as men tend to appear too feminine. They reasoned that if their masculine or feminine development had been arrested early, they would achieve better results. It was reasonable, in light of their treatment model, to think that a better cosmetic result would mean a better resolution of the gender incongruence. Thus the idea was born that the earlier the child was transitioned, the better the cosmetic surgical result, and thus the better psychological result, which is the goal.

97. This theoretical improvement in outcomes for transgender persons through early transition was certainly an idea worth investigating. Because the lifelong effects of the approach might include some really bad outcomes for the children, and because the actual outcomes were unknown at the time, it would have been prudent, and scientifically consistent to categorize this from the above described insurance industry perspective, as experimental. It would have required that the patients exhaust the fully established and proven treatment model of watchful waiting. If that treatment failed to resolve the issue, then on a trial basis, and supervised under very strenuous human experimentation oversight, the affirmation model could be tried.

98. In order for any highly supervised experimental approach to pass ethical standards in human experimentation there would have to have been a previously established diagnostic and patient selection process of very high

specificity. If the proven and established method of watchful waiting is yielding 92% resolution, then what the ethically minded surgeon is really supposed to be doing is trying to find that 8% of children who would have failed watchful waiting, and select them out for surgery earlier in their life. Then studying the result on a very long-term and comprehensive basis, he would have been able to provide high-value evidence that his hypothesis about the successful early management of transgenderism is a safe and valid option for his patient. This was not done. Instead, the routine social and medical transitioning of children began, which includes puberty blockade, and cross-sex hormones in children and youth.

99. Instead of seeking the historically small cohort of children who would have carried the condition into adulthood and treating them, physicians and surgeons are treating all of those children now. Instead of seeking the scientific methodology with which to make a correct diagnosis so as to increase the likelihood that you are operating on the right person, the transgender treatment model is essentially turning all affected children into "the right person". By the time the youth or young adult person arrives in the surgeon's office the process has been locked into place.

100. It would seem that the best course of action for those who serve the insurance industry, including state Medicaid, is to return this process to the time tested dynamic model of patient, physician, and insurance plan discussed above.

Because the affirmation model rests upon such low-quality evidence, it seems justifiable to suspend financial support until such time as testing and patient selection processes are improved to acceptable levels of reliability. Given the serious, lifelong consequences of mis-diagnosis, and the misapplication of surgery, levels of patient selection reliability would have to be quite high.

101. A review of the European literature on this topic is instructful. The American literature used in support of the claim of benefit is of low reliability. We make this assertion based on the fact that to date all scientific citations offered in support of gender affirmation medicine and surgery is that they report studies of short duration. Follow up durations of less than 3 years are common. Some, as we have seen are as short as 4 months. This fact helps us to understand why proponents of the affirmation model are enthusiastic. Medical services in a number of European countries utilize centralized medical databases which employ uniform language, and report care over the life of the citizen.

102. The Swedish medical establishment maintains an excellent and centralized data base of all episodes of care for beneficiaries. It uses uniform language, and captures treatment events at all levels, from school clinics, to psychiatric hospitals, to prison infirmaries, to public clinics. The database can be analyzed for such things as emergency room visits, drug addiction treatment, hospitalization for suicide, psychiatric admissions for self-harming event etc.

103. In 2011, Dhejne et al.[17] published a population based, longitudinal cohort study of that database that sought to examine the lifetime hazard ratio of such things as substance abuse, incarceration for violent behavior, psychiatric hospitalization, and completed suicide. This is level-III evidence of high order given the methodology employed and the proven reliability of the database. It examined persons who have fully completed the gender affirmation process and compares them to age and sex matched controls in the Swedish population. It did not use anonymous surveys, or other faulty convenience sampling. It found the post-transition patients by finding the associated episodes of care, such as when hormone therapy prescriptions began, or admission for gender surgery occurred. The data set spans 30 years. What it shows is that fully transitioned subjects showed a relative risk of suicide roughly equal to the age/ sex matched controls, but the effect appears to last for just a few years. The trend line for death from any cause begins a sharp drop at approximately 10 years and continues to drop massively over the subsequent 15 years. When the researchers looked at the aggregate life-time relative risk of suicide, persons who fully transitioned were over 19 times more likely to have killed themselves when compared to age and sex matched controls. If you only look at the subgroup of biological females who transitioned to male-presentation, the risk of

[17] Dhejne,C., Lichtenstein, P., et al. Long-term follow-up of transsexual persons undergoing sex reassignment surgery: cohort study in Sweden; PLoS One2011 Feb 22;6(2):e16885. doi: 10.1371/journal.pone.0016885.

suicide is 40 times higher than the control group. Results such as these, because they are obtained using tested and reliable methodology, are able to help meaningfully in clinical and administrative decision making, and in several European countries it has.

104. Over the past several years, the medical systems in Great Britain, Sweden, Finland, and France[18][19][20] have stepped away from early medical and surgical transitioning of the young. The Tavistock-Portman Institute in London, which was the sole provider of these services to children in Great Britain was closed

[18] **NHS Amendments to service specifications for Gender Identity Development Service** (GIDS) for children and adolescents, **effective 01 Dec 2020**. https://www.england.nhs.uk/wp-content/uploads/2020/12/Amendment-to-Gender-Identity-Development-Service-Specification-for-Children-and-Adolescents.pdf

[19] **Sweden's Karolinska Hospital** (affectingAstrid Lindgren Children's Hospital's pediatric gender services) issues a **policy change effective April 1, 2021**:

- "…hormonal treatments (*i.e., puberty blocking and cross-sex hormones, see above*) will not be initiated in gender dysphoric patients under the age of 16."
- "For patients between ages 16 and 18, it is hereby decided that treatment may only occur within the clinical trial settings approved by the EPM (*Ethical Review Agency/Swedish Institutional Review Board*)."
- "These changes shall not affect the continued psychological and psychiatric care within BUP (*Public Child and Adolescent Psychiatry*) for patients under 18 years of age." "The patient must receive comprehensive information about potential risks of the treatment…"
- Cited UK High Court Decision, NHS policy change in light of it, and that in "2019, the SBU (*Swedish Agency for Health Technology Assessment and Assessment of Social Services*) published an overview of the knowledge base which showed a lack of evidence for both the long-term consequences of the treatments, and the reasons for the large influx of patients in recent years."[19]
- "These treatments are potentially fraught with extensive and irreversible adverse consequences such as cardiovascular disease, osteoporosis, infertility, increased cancer risk, and thrombosis."

Karolinska Policyförändring K2021-3343 March 2021 (Swedish).pdf
Karolinska Policy Change K2021-3343 March 2021 (English, unofficial translation).pdf

[20] **Finland rejects routine "affirmation" pathway for minors with GD. From Finnish Health Authority, *Council for Choices in Health Care in Finland (COHERE Finland)* 2020:**

recently following the public declaration by a review committee that the Institute was "unsafe for children". Similarly, the Karolinska Institute in Stockholm reversed its policy by suspending the medical and surgical transitioning of the young in favor or psychological support and treatment. Similar changes in treatment guidelines for self-identified transgender youth have been published in Finland, and are currently being developed in Italy.

105. Based upon these developments in Europe, it is very troubling to read assessments or declarations by leaders in the field of transgender surgery which assert that these treatments are mainstream and beyond controversy, or that they are part of a core curriculum of surgical training, or that an oral board examiner might fail a candidate surgeon if their answers reveal a reticence to join the mainstream as defined by gender affirmation advocates. The world literature demonstrates emphatically that early medical and surgical transitioning is in fact so controversial that medical leadership in multiple countries has put a stop to it.

106. In summary, transgender surgery is based in a treatment model of affirmation that lacks scientific support based in quality evidence. The scientific support offered by the leaders in the field is entirely composed of small studies, single provider /single center studies that are lacking in control cohorts, and are often rendered uninterpretable due to haphazard case-collections such as the solicitation of study participants without methodology to confirm that the patient is a treatment

subject. All of the studies cited in expert filings by gender affirmation practitioners have short follow-up, and most studies suffer from massive self-selection bias and high drop-out rates. The studies often employ untested assessment methodologies, and all of the literature cited by experts report only subjective data, which is typical of papers that address outcomes in cosmetic surgery.

107. Transgender surgery is, by definition, cosmetic surgery. The move towards surgery begins in the subjective life of the patient, is conducted with the aim of improving the subjective life of the patient, and outcomes are measured in subjective terms based in satisfaction surveys. Transgender surgery violates fundamental principle of cosmetic surgery, because it predictably destroys essential functions of the human person. It is not reconstructive surgery because the patient is physically healthy before the surgery, and has no definable deficit that can be objectively characterized to be the cause of the presenting complaint. There is no objective test to confirm the diagnosis of transgender, and no way to correctly select patients for surgery from among the young. The enterprise of gender affirmation medicine and surgery is based entirely in a consensus of expert opinion of low reliability because it is supported by unreliable scientific evidence.

I declare, pursuant to 28 USC § 1746, under penalty of perjury that the foregoing is true and correct. Executed this 16th day of February, 2023.

Dr. Patrick W. Lappert, M.D.

Curriculum Vitae- Patrick W. Lappert, MD

Education and Training :

— Bachelor of Arts in Biological Sciences at the University of California, Santa Barbara, 1979. Research in cell membrane physiology with Dr. Philip C. Laris, studying stoichiometry of the sodium: potassium ATPase pump.

— M.D., Doctor of Medicine degree at the Uniformed Services University of the Health Sciences, 1983 at Bethesda, Md.

— General Surgery Residency at the Naval Hospital Oakland/ UC Davis East Bay Consortium, 1987-1991

— Chief Resident, Department of Surgery, Naval Hospital Oakland, 1990-1991.

— Plastic Surgery Residency at the University of Tennessee- Memphis, 1992-1994.

Board Certifications in Medicine :

— Board Certified in Surgery — American Board of Surgery, 1992-2002

— Board Certified in Plastic Surgery — American Board of Plastic Surgery, 1997-2018

Medical Staff Appointments :

— Staff General Surgeon at the Naval Hospital Oakland, CA 1991-1992

— Associate Professor of Surgery, UC Davis-East Bay, 1991-1992.

— Plastic and Reconstructive Surgeon, Naval Medical Center, Portsmouth, VA 1994-2002

— Chairman, Department of Plastic and Reconstructive Surgery, Naval Hospital Portsmouth, VA 1996-2002.

— Clinical Assistant Professor, Department of Surgery, Uniformed Services University of the Health Sciences, 1995-2002

— Founding Director, Pediatric Cleft Palate and Craniofacial Deformities Clinic, Naval Hospital Portsmouth, VA 1996-20002

— Founding Director, Wound Care Center, Naval Hospital Portsmouth, VA 1995-2002.

— Staff Plastic Surgeon in Nebraska, and Alabama.

U.S.N. Surgeon General Service:

— Specialty Leader, Plastic and Reconstructive Surgery, Office of the Surgeon General-USN, 1997-2002

Faculty Appointments:

— Teaching Faculty at Eastern Virginia Medical School, Division of Plastic Surgery, 1995-2002

Military Service :

— Aviation Officer Candidate, Naval Aviation Schools Command, NAS Pensacola, 1978

— Commissioned an Ensign, MC, USNR 1979 and Commissioned as a Lieutenant, MC, USN 1983 .

— Designated Naval Flight Surgeon, Naval Aerospace Medical Institute, 1985

— Flight Surgeon, Marine Fighter/ Attack Squadron-451

— Radar Intercept Officer in the Marine F-4S Phantom, accumulating 235 flight hours, and trained for qualification as an Air Combat Tactics Instructor.

— Deployed to the Western Pacific as UDP forward deployed fighter squadron in Korea, Japan, and the Philippines.

— Service in the US Navy for 24 years

— Service in the US Marine Corp. for 3 years.

— Retired with the rank of Captain, USN in 2002

Military Awards:

— Navy Commendation Medal - For service with Marine Fighter/Attack Squadron - 451

— Meritorious Unit Citation- 3rd award

— Humanitarian Service Medal - For service in the aftermath of the Loma Prieta earthquake.

Operations and Clinical Experience - Consultations and Discussions : As a physician and surgeon, I have treated many thousands of patients in 7 states and 4 foreign nations. My practice has included Primary Care, Family Medicine, Aerospace Medicine, General Surgery, Reconstructive Surgery for combat injured, cancer reconstructive surgeries including extensive experience with microvascular surgery, Pediatric Congenital Deformity, and the care of chronic wounds. I have practiced in rural medicine, urban trauma centers, military field hospitals, university teaching hospitals, and as a solo private practitioner. In my private practice I have had occasion to treat many self-identified transgender patients for skin pathologies related to their use of high dose sex steroids, laser therapies for management of facial hair both in transitioners and detransitioners. I have performed breast reversal surgeries for detransitioning patients. My practice is rated as "LGBTQ friendly" on social media. I have consulted with families with children who are experiencing gender discordance. I have given many presentations to professional meetings of educators and counselors on the subject of transgender, and the present state of the science and treatment. I have discussed the scientific issues relevant to the case with many physicians and experts over a number of years and also discussed related issues with parents and others.

Endocrine Treatment of Gender-Dysphoric/ Gender-Incongruent Persons: An Endocrine Society* Clinical Practice Guideline

Objective: To update the "Endocrine Treatment of Transsexual Persons: An Endocrine Society Clinical Practice Guideline," published by the Endocrine Society in 2009.

Participants: The participants include an Endocrine Society–appointed task force of nine experts, a methodologist, and a medical writer.

Evidence: This evidence-based guideline was developed using the Grading of Recommendations, Assessment, Development, and Evaluation approach to describe the strength of recommendations and the quality of evidence. The task force commissioned two systematic reviews and used the best available evidence from other published systematic reviews and individual studies.

Consensus Process: Group meetings, conference calls, and e-mail communications enabled consensus. Endocrine Society committees, members and cosponsoring organizations reviewed and commented on preliminary drafts of the guidelines.

Conclusion: Gender affirmation is multidisciplinary treatment in which endocrinologists play an important role. Gender-dysphoric/gender-incongruent persons seek and/or are referred to endocrinologists to develop the physical characteristics of the affirmed gender. They require a safe and effective hormone regimen that will (1) suppress endogenous sex hormone secretion determined by the person's genetic/gonadal sex and (2) maintain sex hormone levels within the normal range for the person's affirmed gender. Hormone treatment is not recommended for prepubertal gender-dysphoric/gender-incongruent persons. Those clinicians who recommend gender-affirming endocrine treatments—appropriately trained diagnosing clinicians (required), a mental health provider for adolescents (required) and mental health

Abbreviations: BMD, bone mineral density; DSD, disorder/difference of sex development; DSM, Diagnostic and Statistical Manual of Mental Disorders; GD, gender dysphoria; GnRH, gonadotropin-releasing hormone; ICD, International Statistical Classification of Diseases and Related Health Problems; MHP, mental health professional; VTE, venous thromboembolism.

professional for adults (recommended)—should be knowledgeable about the diagnostic criteria and criteria for gender-affirming treatment, have sufficient training and experience in assessing psychopathology, and be willing to participate in the ongoing care throughout the endocrine transition. We recommend treating gender-dysphoric/gender-incongruent adolescents who have entered puberty at Tanner Stage G2/B2 by suppression with gonadotropin-releasing hormone agonists. Clinicians may add gender-affirming hormones after a multidisciplinary team has confirmed the persistence of gender dysphoria/gender incongruence and sufficient mental capacity to give informed consent to this partially irreversible treatment. Most adolescents have this capacity by age 16 years old. We recognize that there may be compelling reasons to initiate sex hormone treatment prior to age 16 years, although there is minimal published experience treating prior to 13.5 to 14 years of age. For the care of peripubertal youths and older adolescents, we recommend that an expert multidisciplinary team comprised of medical professionals and mental health professionals manage this treatment. The treating physician must confirm the criteria for treatment used by the referring mental health practitioner and collaborate with them in decisions about gender-affirming surgery in older adolescents. For adult gender-dysphoric/gender-incongruent persons, the treating clinicians (collectively) should have expertise in transgender-specific diagnostic criteria, mental health, primary care, hormone treatment, and surgery, as needed by the patient. We suggest maintaining physiologic levels of gender-appropriate hormones and monitoring for known risks and complications. When high doses of sex steroids are required to suppress endogenous sex steroids and/or in advanced age, clinicians may consider surgically removing natal gonads along with reducing sex steroid treatment. Clinicians should monitor both transgender males (female to male) and transgender females (male to female) for reproductive organ cancer risk when surgical removal is incomplete. Additionally, clinicians should persistently monitor adverse effects of sex steroids. For gender-affirming surgeries in adults, the treating physician must collaborate with and confirm the criteria for treatment used by the referring physician. Clinicians should avoid harming individuals (via hormone treatment) who have conditions other than gender dysphoria/gender incongruence and who may not benefit from the physical changes associated with this treatment. (***J Clin Endocrinol Metab*** **102: 3869–3903, 2017)**

Summary of Recommendations

1.0 Evaluation of youth and adults

1.1. We advise that only trained mental health professionals (MHPs) who meet the following criteria should diagnose gender dysphoria (GD)/gender incongruence in adults: (1) competence in using the Diagnostic and Statistical Manual of Mental Disorders (DSM) and/or the International Statistical Classification of Diseases and Related Health Problems (ICD) for diagnostic purposes, (2) the ability to diagnose GD/gender incongruence and make a distinction between GD/gender incongruence and conditions that have similar features (*e.g.*, body dysmorphic disorder), (3) training in diagnosing psychiatric conditions, (4) the ability to undertake or refer for appropriate treatment, (5) the ability to psychosocially assess the person's understanding, mental health, and social conditions that can impact gender-affirming hormone therapy, and (6) a practice of regularly attending relevant professional meetings. (Ungraded Good Practice Statement)

1.2. We advise that only MHPs who meet the following criteria should diagnose GD/gender incongruence in children and adolescents: (1) training in child and adolescent developmental psychology and psychopathology, (2) competence in using the DSM and/or the ICD for diagnostic purposes, (3) the ability to make a distinction between GD/gender incongruence and conditions that have similar features (*e.g.*, body dysmorphic disorder), (4) training in diagnosing psychiatric conditions, (5) the ability to undertake or refer for appropriate treatment, (6) the ability to psychosocially assess the person's understanding and social conditions that can impact gender-affirming hormone therapy, (7) a practice of regularly attending relevant professional meetings, and (8) knowledge of the criteria for puberty blocking and gender-affirming hormone treatment in adolescents. (Ungraded Good Practice Statement)

1.3. We advise that decisions regarding the social transition of prepubertal youths with GD/gender incongruence are made with the assistance of an MHP or another experienced professional. (Ungraded Good Practice Statement).

doi: 10.1210/jc.2017-01658

1.4. We recommend against puberty blocking and gender-affirming hormone treatment in prepubertal children with GD/gender incongruence. (1 |⊕⊕◯◯)

1.5. We recommend that clinicians inform and counsel all individuals seeking gender-affirming medical treatment regarding options for fertility preservation prior to initiating puberty suppression in adolescents and prior to treating with hormonal therapy of the affirmed gender in both adolescents and adults. (1 |⊕⊕⊕◯)

2.0 Treatment of adolescents

2.1. We suggest that adolescents who meet diagnostic criteria for GD/gender incongruence, fulfill criteria for treatment, and are requesting treatment should initially undergo treatment to suppress pubertal development. (2 |⊕⊕◯◯)

2.2. We suggest that clinicians begin pubertal hormone suppression after girls and boys first exhibit physical changes of puberty. (2 |⊕⊕◯◯)

2.3. We recommend that, where indicated, GnRH analogues are used to suppress pubertal hormones. (1 |⊕⊕◯◯)

2.4. In adolescents who request sex hormone treatment (given this is a partly irreversible treatment), we recommend initiating treatment using a gradually increasing dose schedule after a multidisciplinary team of medical and MHPs has confirmed the persistence of GD/gender incongruence and sufficient mental capacity to give informed consent, which most adolescents have by age 16 years. (1 |⊕⊕◯◯).

2.5. We recognize that there may be compelling reasons to initiate sex hormone treatment prior to the age of 16 years in some adolescents with GD/gender incongruence, even though there are minimal published studies of gender-affirming hormone treatments administered before age 13.5 to 14 years. As with the care of adolescents ≥16 years of age, we recommend that an expert multidisciplinary team of medical and MHPs manage this treatment. (1 |⊕◯◯◯)

2.6. We suggest monitoring clinical pubertal development every 3 to 6 months and laboratory parameters every 6 to 12 months during sex hormone treatment. (2 |⊕⊕◯◯)

3.0 Hormonal therapy for transgender adults

3.1. We recommend that clinicians confirm the diagnostic criteria of GD/gender incongruence and the criteria for the endocrine phase of gender transition before beginning treatment. (1 |⊕⊕⊕◯)

3.2. We recommend that clinicians evaluate and address medical conditions that can be exacerbated by hormone depletion and treatment with sex hormones of the affirmed gender before beginning treatment. (1 |⊕⊕⊕◯)

3.3. We suggest that clinicians measure hormone levels during treatment to ensure that endogenous sex steroids are suppressed and administered sex steroids are maintained in the normal physiologic range for the affirmed gender. (2 |⊕⊕◯◯)

3.4. We suggest that endocrinologists provide education to transgender individuals undergoing treatment about the onset and time course of physical changes induced by sex hormone treatment. (2 |⊕◯◯◯)

4.0 Adverse outcome prevention and long-term care

4.1. We suggest regular clinical evaluation for physical changes and potential adverse changes in response to sex steroid hormones and laboratory monitoring of sex steroid hormone levels every 3 months during the first year of hormone therapy for transgender males and females and then once or twice yearly. (2 |⊕⊕◯◯)

4.2. We suggest periodically monitoring prolactin levels in transgender females treated with estrogens. (2 |⊕⊕◯◯)

4.3. We suggest that clinicians evaluate transgender persons treated with hormones for cardiovascular risk factors using fasting lipid profiles, diabetes screening, and/or other diagnostic tools. (2 |⊕⊕◯◯)

4.4. We recommend that clinicians obtain bone mineral density (BMD) measurements when risk factors for osteoporosis exist, specifically in those who stop sex hormone therapy after gonadectomy. (1 |⊕⊕◯◯)

4.5. We suggest that transgender females with no known increased risk of breast cancer follow breast-screening guidelines recommended for non-transgender females. (2 |⊕⊕◯◯)

4.6. We suggest that transgender females treated with estrogens follow individualized screening according to personal risk for prostatic disease and prostate cancer. (2 |⊕◯◯◯)

4.7. We advise that clinicians determine the medical necessity of including a total hysterectomy and oophorectomy as part of gender-affirming surgery. (Ungraded Good Practice Statement)

5.0 Surgery for sex reassignment and gender confirmation

5.1. We recommend that a patient pursue genital gender-affirming surgery only after the MHP and the clinician responsible for endocrine transition therapy both agree that surgery is medically necessary and would benefit the patient's overall health and/or well-being. (1 ⊕⊕◯◯)

5.2. We advise that clinicians approve genital gender-affirming surgery only after completion of at least 1 year of consistent and compliant hormone treatment, unless hormone therapy is not desired or medically contraindicated. (Ungraded Good Practice Statement)

5.3. We advise that the clinician responsible for endocrine treatment and the primary care provider ensure appropriate medical clearance of transgender individuals for genital gender-affirming surgery and collaborate with the surgeon regarding hormone use during and after surgery. (Ungraded Good Practice Statement)

5.4. We recommend that clinicians refer hormone-treated transgender individuals for genital surgery when: (1) the individual has had a satisfactory social role change, (2) the individual is satisfied about the hormonal effects, and (3) the individual desires definitive surgical changes. (1 ⊕◯◯◯)

5.5. We suggest that clinicians delay gender-affirming genital surgery involving gonadectomy and/or hysterectomy until the patient is at least 18 years old or legal age of majority in his or her country. (2 ⊕⊕◯◯).

5.6. We suggest that clinicians determine the timing of breast surgery for transgender males based upon the physical and mental health status of the individual. There is insufficient evidence to recommend a specific age requirement. (2 ⊕◯◯◯)

Changes Since the Previous Guideline

Both the current guideline and the one published in 2009 contain similar sections. Listed here are the sections contained in the current guideline and the corresponding number of recommendations: Introduction, Evaluation of Youth and Adults (5), Treatment of Adolescents (6), Hormonal Therapy for Transgender Adults (4), Adverse Outcomes Prevention and Long-term Care (7), and Surgery for Sex Reassignment and Gender Confirmation (6). The current introduction updates the diagnostic classification of "gender dysphoria/gender incongruence." It also reviews the development of "gender identity" and summarizes its natural development. The section on clinical evaluation of both youth and adults, defines in detail the professional qualifications required of those who diagnose and treat both adolescents and adults. We advise that decisions regarding the social transition of prepubertal youth are made with the assistance of a mental health professional or similarly experienced professional. We recommend against puberty blocking followed by gender-affirming hormone treatment of prepubertal children. Clinicians should inform pubertal children, adolescents, and adults seeking gender-confirming treatment of their options for fertility preservation. Prior to treatment, clinicians should evaluate the presence of medical conditions that may be worsened by hormone depletion and/or treatment. A multidisciplinary team, preferably composed of medical and mental health professionals, should monitor treatments. Clinicians evaluating transgender adults for endocrine treatment should confirm the diagnosis of persistent gender dysphoria/gender incongruence. Physicians should educate transgender persons regarding the time course of steroid-induced physical changes. Treatment should include periodic monitoring of hormone levels and metabolic parameters, as well as assessments of bone density and the impact upon prostate, gonads, and uterus. We also make recommendations for transgender persons who plan genital gender-affirming surgery.

Method of Development of Evidence-Based Clinical Practice Guidelines

The Clinical Guidelines Subcommittee (CGS) of the Endocrine Society deemed the diagnosis and treatment of individuals with GD/gender incongruence a priority area for revision and appointed a task force to formulate evidence-based recommendations. The task force followed the approach recommended by the Grading of Recommendations, Assessment, Development, and Evaluation group, an international group with expertise in the development and implementation of evidence-based guidelines (1). A detailed description of the grading scheme has been published elsewhere (2). The task force used the best available research evidence to develop the recommendations. The task force also used consistent language and graphical descriptions of both the strength of a recommendation and the quality of evidence. In terms of the strength of the recommendation, strong recommendations use the phrase "we recommend" and the number 1, and weak recommendations use the phrase "we suggest" and the number 2. Cross-filled circles indicate the quality of the evidence, such that ⊕◯◯◯ denotes very low–quality evidence; ⊕⊕◯◯, low quality; ⊕⊕⊕◯, moderate quality; and ⊕⊕⊕⊕, high quality. The task force has confidence that persons who receive care according to the strong recommendations will derive, on average, more benefit than harm. Weak recommendations require more careful consideration of the person's circumstances, values, and preferences to determine the best course of action. Linked to each recommendation is a description of the evidence and the

doi: 10.1210/jc.2017-01658

values that the task force considered in making the recommendation. In some instances, there are remarks in which the task force offers technical suggestions for testing conditions, dosing, and monitoring. These technical comments reflect the best available evidence applied to a typical person being treated. Often this evidence comes from the unsystematic observations of the task force and their preferences; therefore, one should consider these remarks as suggestions.

In this guideline, the task force made several statements to emphasize the importance of shared decision-making, general preventive care measures, and basic principles of the treatment of transgender persons. They labeled these "Ungraded Good Practice Statement." Direct evidence for these statements was either unavailable or not systematically appraised and considered out of the scope of this guideline. The intention of these statements is to draw attention to these principles.

The Endocrine Society maintains a rigorous conflict-of-interest review process for developing clinical practice guidelines. All task force members must declare any potential conflicts of interest by completing a conflict-of-interest form. The CGS reviews all conflicts of interest before the Society's Council approves the members to participate on the task force and periodically during the development of the guideline. All others participating in the guideline's development must also disclose any conflicts of interest in the matter under study, and most of these participants must be without any conflicts of interest. The CGS and the task force have reviewed all disclosures for this guideline and resolved or managed all identified conflicts of interest.

Conflicts of interest are defined as remuneration in any amount from commercial interests; grants; research support; consulting fees; salary; ownership interests [*e.g.*, stocks and stock options (excluding diversified mutual funds)]; honoraria and other payments for participation in speakers' bureaus, advisory boards, or boards of directors; and all other financial benefits. Completed forms are available through the Endocrine Society office.

The Endocrine Society provided the funding for this guideline; the task force received no funding or remuneration from commercial or other entities.

Commissioned Systematic Review

The task force commissioned two systematic reviews to support this guideline. The first one aimed to summarize the available evidence on the effect of sex steroid use in transgender individuals on lipids and cardiovascular outcomes. The review identified 29 eligible studies at moderate risk of bias. In transgender males (female to male), sex steroid therapy was associated with a statistically significant increase in serum triglycerides and low-density lipoprotein cholesterol levels. High-density lipoprotein cholesterol levels decreased significantly across all follow-up time periods. In transgender females (male to female), serum triglycerides were significantly higher without any changes in other parameters. Few myocardial infarction, stroke, venous thromboembolism (VTE), and death events were reported. These events were more frequent in transgender females. However, the quality of the evidence was low. The second review summarized the available evidence regarding the effect of sex steroids on bone health in transgender individuals and identified 13 studies. In transgender males, there was no statistically significant difference in the lumbar spine, femoral neck, or total hip BMD at 12 and 24 months compared with baseline values before initiating masculinizing hormone therapy. In transgender females, there was a statistically significant increase in lumbar spine BMD at 12 months and 24 months compared with baseline values before initiation of feminizing hormone therapy. There was minimal information on fracture rates. The quality of evidence was also low.

Introduction

Throughout recorded history (in the absence of an endocrine disorder) some men and women have experienced confusion and anguish resulting from rigid, forced conformity to sexual dimorphism. In modern history, there have been numerous ongoing biological, psychological, cultural, political, and sociological debates over various aspects of gender variance. The 20th century marked the emergence of a social awakening for men and women with the belief that they are "trapped" in the wrong body (3). Magnus Hirschfeld and Harry Benjamin, among others, pioneered the medical responses to those who sought relief from and a resolution to their profound discomfort. Although the term transsexual became widely known after Benjamin wrote "The Transsexual Phenomenon" (4), it was Hirschfeld who coined the term "transsexual" in 1923 to describe people who want to live a life that corresponds with their experienced gender vs their designated gender (5). Magnus Hirschfeld (6) and others (4, 7) have described other types of trans phenomena besides transsexualism. These early researchers proposed that the gender identity of these people was located somewhere along a unidimensional continuum. This continuum ranged from all male through "something in between" to all female. Yet such a classification does not take into account that people may have gender identities outside this continuum. For instance, some experience themselves as having both a male and female gender identity, whereas others completely renounce any gender classification (8, 9). There are also reports of individuals experiencing a continuous and rapid involuntary alternation between a male and female identity (10) or men who do not experience themselves as men but do not want to live as women (11, 12). In some countries, (*e.g.*, Nepal, Bangladesh, and Australia), these nonmale or nonfemale genders are officially recognized (13). Specific treatment protocols, however, have not yet been developed for these groups.

Instead of the term transsexualism, the current classification system of the American Psychiatric Association uses the term gender dysphoria in its diagnosis of persons who are not satisfied with their designated gender (14). The current version of the World Health Organization's ICD-10 still uses the term transsexualism when diagnosing adolescents and adults. However, for the ICD-11, the World Health Organization has proposed using the term "gender incongruence" (15).

Treating persons with GD/gender incongruence (15) was previously limited to relatively ineffective elixirs or creams. However, more effective endocrinology-based treatments became possible with the availability of testosterone in 1935 and diethylstilbestrol in 1938. Reports of individuals with GD/gender incongruence who were treated with hormones and gender-affirming surgery appeared in the press during the second half of the 20th century. The Harry Benjamin International Gender Dysphoria Association was founded in September 1979 and is now called the World Professional Association for Transgender Health (WPATH). WPATH published its first Standards of Care in 1979. These standards have since been regularly updated, providing guidance for treating persons with GD/gender incongruence (16).

Prior to 1975, few peer-reviewed articles were published concerning endocrine treatment of transgender persons. Since then, more than two thousand articles about various aspects of transgender care have appeared.

It is the purpose of this guideline to make detailed recommendations and suggestions, based on existing medical literature and clinical experience, that will enable treating physicians to maximize benefit and minimize risk when caring for individuals diagnosed with GD/gender incongruence.

In the future, we need more rigorous evaluations of the effectiveness and safety of endocrine and surgical protocols. Specifically, endocrine treatment protocols for GD/gender incongruence should include the careful assessment of the following: (1) the effects of prolonged delay of puberty in adolescents on bone health, gonadal function, and the brain (including effects on cognitive, emotional, social, and sexual development); (2) the effects of treatment in adults on sex hormone levels; (3) the requirement for and the effects of progestins and other agents used to suppress endogenous sex steroids during treatment; and (4) the risks and benefits of gender-affirming hormone treatment in older transgender people.

To successfully establish and enact these protocols, a commitment of mental health and endocrine investigators is required to collaborate in long-term, large-scale studies across countries that use the same diagnostic and inclusion criteria, medications, assay methods, and response assessment tools (*e.g.*, the European Network for the Investigation of Gender Incongruence) (17, 18).

Terminology and its use vary and continue to evolve. Table 1 contains the definitions of terms as they are used throughout this guideline.

Biological Determinants of Gender Identity Development

One's self-awareness as male or female changes gradually during infant life and childhood. This process of cognitive and affective learning evolves with interactions with parents, peers, and environment. A fairly accurate timetable exists outlining the steps in this process (19). Normative psychological literature, however, does not address if and when gender identity becomes crystallized and what factors contribute to the development of a gender identity that is not congruent with the gender of rearing. Results of studies from a variety of biomedical disciplines—genetic, endocrine, and neuroanatomic—support the concept that gender identity and/or gender expression (20) likely reflect a complex interplay of biological, environmental, and cultural factors (21, 22).

With respect to endocrine considerations, studies have failed to find differences in circulating levels of sex steroids between transgender and nontransgender individuals (23). However, studies in individuals with a disorder/difference of sex development (DSD) have informed our understanding of the role that hormones may play in gender identity outcome, even though most persons with GD/gender incongruence do not have a DSD. For example, although most 46,XX adult individuals with virilizing congenital adrenal hyperplasia caused by mutations in *CYP21A2* reported a female gender identity, the prevalence of GD/gender incongruence was much greater in this group than in the general population without a DSD. This supports the concept that there is a role for prenatal/postnatal androgens in gender development (24–26), although some studies indicate that prenatal androgens are more likely to affect gender behavior and sexual orientation rather than gender identity *per se* (27, 28).

Researchers have made similar observations regarding the potential role of androgens in the development of gender identity in other individuals with DSD. For example, a review of two groups of 46,XY persons, each with androgen synthesis deficiencies and female raised, reported transgender male (female-to-male) gender role changes in 56% to 63% and 39% to 64% of patients, respectively (29). Also, in 46,XY female-raised individuals with cloacal

doi: 10.1210/jc.2017-01658

Table 1. Definitions of Terms Used in This Guideline

Biological sex, biological male or female: These terms refer to physical aspects of maleness and femaleness. As these may not be in line with each other (*e.g.*, a person with XY chromosomes may have female-appearing genitalia), the terms biological sex and biological male or female are imprecise and should be avoided.
Cisgender: This means not transgender. An alternative way to describe individuals who are not transgender is "non-transgender people."
Gender-affirming (hormone) treatment: See "gender reassignment"
Gender dysphoria: This is the distress and unease experienced if gender identity and designated gender are not completely congruent (see Table 2). In 2013, the American Psychiatric Association released the fifth edition of the DSM-5, which replaced "gender identity disorder" with "gender dysphoria" and changed the criteria for diagnosis.
Gender expression: This refers to external manifestations of gender, expressed through one's name, pronouns, clothing, haircut, behavior, voice, or body characteristics. Typically, transgender people seek to make their gender expression align with their gender identity, rather than their designated gender.
Gender identity/experienced gender: This refers to one's internal, deeply held sense of gender. For transgender people, their gender identity does not match their sex designated at birth. Most people have a gender identity of man or woman (or boy or girl). For some people, their gender identity does not fit neatly into one of those two choices. Unlike gender expression (see below), gender identity is not visible to others.
Gender identity disorder: This is the term used for GD/gender incongruence in previous versions of DSM (see "gender dysphoria"). The ICD-10 still uses the term for diagnosing child diagnoses, but the upcoming ICD-11 has proposed using "gender incongruence of childhood."
Gender incongruence: This is an umbrella term used when the gender identity and/or gender expression differs from what is typically associated with the designated gender. Gender incongruence is also the proposed name of the gender identity–related diagnoses in ICD-11. Not all individuals with gender incongruence have gender dysphoria or seek treatment.
Gender variance: See "gender incongruence"
Gender reassignment: This refers to the treatment procedure for those who want to adapt their bodies to the experienced gender by means of hormones and/or surgery. This is also called gender-confirming or gender-affirming treatment.
Gender-reassignment surgery (gender-confirming/gender-affirming surgery): These terms refer only to the surgical part of gender-confirming/gender-affirming treatment.
Gender role: This refers to behaviors, attitudes, and personality traits that a society (in a given culture and historical period) designates as masculine or feminine and/or that society associates with or considers typical of the social role of men or women.
Sex designated at birth: This refers to sex assigned at birth, usually based on genital anatomy.
Sex: This refers to attributes that characterize biological maleness or femaleness. The best known attributes include the sex-determining genes, the sex chromosomes, the H-Y antigen, the gonads, sex hormones, internal and external genitalia, and secondary sex characteristics.
Sexual orientation: This term describes an individual's enduring physical and emotional attraction to another person. Gender identity and sexual orientation are not the same. Irrespective of their gender identity, transgender people may be attracted to women (gynephilic), attracted to men (androphilic), bisexual, asexual, or queer.
Transgender: This is an umbrella term for people whose gender identity and/or gender expression differs from what is typically associated with their sex designated at birth. Not all transgender individuals seek treatment.
Transgender male (also: trans man, female-to-male, transgender male): This refers to individuals assigned female at birth but who identify and live as men.
Transgender woman (also: trans woman, male-to female, transgender female): This refers to individuals assigned male at birth but who identify and live as women.
Transition: This refers to the process during which transgender persons change their physical, social, and/or legal characteristics consistent with the affirmed gender identity. Prepubertal children may choose to transition socially.
Transsexual: This is an older term that originated in the medical and psychological communities to refer to individuals who have permanently transitioned through medical interventions or desired to do so.

exstrophy and penile agenesis, the occurrence of transgender male changes was significantly more prevalent than in the general population (30, 31). However, the fact that a high percentage of individuals with the same conditions did not change gender suggests that cultural factors may play a role as well.

With respect to genetics and gender identity, several studies have suggested heritability of GD/gender incongruence (32, 33). In particular, a study by Heylens *et al.* (33) demonstrated a 39.1% concordance rate for gender identity disorder (based on the DSM-IV criteria) in 23 monozygotic twin pairs but no concordance in 21 same-sex dizygotic or seven opposite-sex twin pairs. Although numerous investigators have sought to identify specific genes associated with GD/gender incongruence, such studies have been inconsistent and without strong statistical significance (34–38).

Studies focusing on brain structure suggest that the brain phenotypes of people with GD/gender incongruence differ in various ways from control males and females, but that there is not a complete sex reversal in brain structures (39).

In summary, although there is much that is still unknown with respect to gender identity and its expression, compelling studies support the concept that biologic factors, in addition to environmental factors, contribute to this fundamental aspect of human development.

Natural History of Children With GD/Gender Incongruence

With current knowledge, we cannot predict the psychosexual outcome for any specific child. Prospective follow-up studies show that childhood GD/gender incongruence does not invariably persist into adolescence and adulthood (so-called "desisters"). Combining all outcome studies to date, the GD/gender incongruence of a minority of prepubertal children appears to persist in adolescence (20, 40). In adolescence, a significant number of these desisters identify as homosexual or bisexual. It may be that children who only showed some gender nonconforming characteristics have been included in the follow-up studies, because the DSM-IV text revision criteria for a diagnosis were rather broad. However, the persistence of GD/gender incongruence into adolescence is more likely if it had been extreme in childhood (41, 42). With the newer, stricter criteria of the DSM-5 (Table 2), persistence rates may well be different in future studies.

1.0 Evaluation of Youth and Adults

Gender-affirming treatment is a multidisciplinary effort. After evaluation, education, and diagnosis, treatment may include mental health care, hormone therapy, and/or surgical therapy. Together with an MHP, hormone-prescribing clinicians should examine the psychosocial impact of the potential changes on people's lives, including mental health, friends, family, jobs, and their role in society. Transgender individuals should be encouraged to experience living in the new gender role and assess whether this improves their quality of life. Although the focus of this guideline is gender-affirming hormone therapy, collaboration with appropriate professionals responsible for each aspect of treatment maximizes a successful outcome.

Diagnostic assessment and mental health care

GD/gender incongruence may be accompanied with psychological or psychiatric problems (43–51). It is therefore necessary that clinicians who prescribe hormones and are involved in diagnosis and psychosocial assessment meet the following criteria: (1) are competent in using the DSM and/or the ICD for diagnostic purposes, (2) are able to diagnose GD/gender incongruence and make a distinction between GD/gender incongruence and conditions that have similar features (*e.g.*, body dysmorphic disorder), (3) are trained in diagnosing psychiatric conditions, (4) undertake or refer for appropriate treatment, (5) are able to do a psychosocial assessment of the patient's understanding, mental health, and social conditions that can impact gender-affirming hormone therapy, and (6) regularly attend relevant professional meetings.

Because of the psychological vulnerability of many individuals with GD/gender incongruence, it is important that mental health care is available before, during, and sometimes also after transitioning. For children and adolescents, an MHP who has training/experience in child and adolescent gender development (as well as child and adolescent psychopathology) should make the diagnosis, because assessing GD/gender incongruence in children and adolescents is often extremely complex.

During assessment, the clinician obtains information from the individual seeking gender-affirming treatment. In the case

Table 2. DSM-5 Criteria for Gender Dysphoria in Adolescents and Adults

A. A marked incongruence between one's experienced/expressed gender and natal gender of at least 6 mo in duration, as manifested by at least two of the following:
   1. A marked incongruence between one's experienced/expressed gender and primary and/or secondary sex characteristics (or in young adolescents, the anticipated secondary sex characteristics)
   2. A strong desire to be rid of one's primary and/or secondary sex characteristics because of a marked incongruence with one's experienced/expressed gender (or in young adolescents, a desire to prevent the development of the anticipated secondary sex characteristics)
   3. A strong desire for the primary and/or secondary sex characteristics of the other gender
   4. A strong desire to be of the other gender (or some alternative gender different from one's designated gender)
   5. A strong desire to be treated as the other gender (or some alternative gender different from one's designated gender)
   6. A strong conviction that one has the typical feelings and reactions of the other gender (or some alternative gender different from one's designated gender)

B. The condition is associated with clinically significant distress or impairment in social, occupational, or other important areas of functioning.

Specify if:
   1. The condition exists with a disorder of sex development.
   2. The condition is posttransitional, in that the individual has transitioned to full-time living in the desired gender (with or without legalization of gender change) and has undergone (or is preparing to have) at least one sex-related medical procedure or treatment regimen—namely, regular sex hormone treatment or gender reassignment surgery confirming the desired gender (*e.g.*, penectomy, vaginoplasty in natal males; mastectomy or phalloplasty in natal females).

Reference: American Psychiatric Association (14).

of adolescents, the clinician also obtains information from the parents or guardians regarding various aspects of the child's general and psychosexual development and current functioning. On the basis of this information, the clinician:

- decides whether the individual fulfills criteria for treatment (see Tables 2 and 3) for GD/gender incongruence (DSM-5) or transsexualism (DSM-5 and/or ICD-10);
- informs the individual about the possibilities and limitations of various kinds of treatment (hormonal/surgical and nonhormonal), and if medical treatment is desired, provides correct information to prevent unrealistically high expectations;
- assesses whether medical interventions may result in unfavorable psychological and social outcomes.

In cases in which severe psychopathology, circumstances, or both seriously interfere with the diagnostic work or make satisfactory treatment unlikely, clinicians should assist the adolescent in managing these other issues. Literature on postoperative regret suggests that besides poor quality of surgery, severe psychiatric comorbidity and lack of support may interfere with positive outcomes (52–56).

For adolescents, the diagnostic procedure usually includes a complete psychodiagnostic assessment (57) and an assessment of the decision-making capability of the youth. An evaluation to assess the family's ability to endure stress, give support, and deal with the complexities of the adolescent's situation should be part of the diagnostic phase (58).

Social transitioning

A change in gender expression and role (which may involve living part time or full time in another gender role that is consistent with one's gender identity) may test the person's resolve, the capacity to function in the affirmed gender, and the adequacy of social, economic, and psychological supports. It assists both the individual and the clinician in their judgments about how to proceed (16). During social transitioning, the person's feelings about the social transformation (including coping with the responses of others) is a major focus of the counseling. The optimal timing for social transitioning may differ between individuals. Sometimes people wait until they start gender-affirming hormone treatment to make social transitioning easier, but individuals increasingly start social transitioning long before they receive medically supervised, gender-affirming hormone treatment.

Criteria

Adolescents and adults seeking gender-affirming hormone treatment and surgery should satisfy certain criteria before proceeding (16). Criteria for gender-affirming hormone therapy for adults are in Table 4, and criteria for gender-affirming hormone therapy for adolescents are in Table 5. Follow-up studies in adults meeting these criteria indicate a high satisfaction rate with treatment (59). However, the quality of evidence is usually low. A few follow-up studies on adolescents who fulfilled these criteria also indicated good treatment results (60–63).

Recommendations for Those Involved in the Gender-Affirming Hormone Treatment of Individuals With GD/Gender Incongruence

1.1. We advise that only trained MHPs who meet the following criteria should diagnose GD/gender incongruence in adults: (1) competence in using the DSM and/or the ICD for diagnostic purposes, (2) the ability to diagnose GD/gender incongruence and make a distinction between GD/gender incongruence and conditions that have similar features (*e.g.*, body dysmorphic disorder), (3) training in diagnosing psychiatric conditions, (4) the ability to undertake or refer for appropriate treatment, (5) the ability to psychosocially assess the person's understanding, mental health, and social conditions that can impact gender-affirming hormone therapy, and (6) a practice of regularly attending relevant professional meetings. (Ungraded Good Practice Statement)

1.2. We advise that only MHPs who meet the following criteria should diagnose GD/gender incongruence in children and adolescents: (1) training in child and adolescent developmental psychology and psychopathology, (2) competence in using the DSM and/or ICD for diagnostic

Table 3. ICD-10 Criteria for Transsexualism

Transsexualism (F64.0) has three criteria:
1. The desire to live and be accepted as a member of the opposite sex, usually accompanied by the wish to make his or her body as congruent as possible with the preferred sex through surgery and hormone treatments.
2. The transsexual identity has been present persistently for at least 2 y.
3. The disorder is not a symptom of another mental disorder or a genetic, DSD, or chromosomal abnormality.

Table 4. Criteria for Gender-Affirming Hormone Therapy for Adults

1. Persistent, well-documented gender dysphoria/gender incongruence
2. The capacity to make a fully informed decision and to consent for treatment
3. The age of majority in a given country (if younger, follow the criteria for adolescents)
4. Mental health concerns, if present, must be reasonably well controlled

Reproduced from World Professional Association for Transgender Health (16).

purposes, (3) the ability to make a distinction between GD/gender incongruence and conditions that have similar features (*e.g.*, body dysmorphic disorder), (4) training in diagnosing psychiatric conditions, (5) the ability to undertake or refer for appropriate treatment, (6) the ability to psychosocially assess the person's understanding and social conditions that can impact gender-affirming hormone therapy, (7) a practice of regularly attending relevant professional meetings, and (8) knowledge of the criteria for puberty blocking and gender-affirming hormone treatment in adolescents. (Ungraded Good Practice Statement)

Evidence

Individuals with gender identity issues may have psychological or psychiatric problems (43–48, 50, 51, 64, 65). It is therefore necessary that clinicians making the diagnosis are able to make a distinction between GD/gender incongruence and conditions that have similar features. Examples of conditions with similar features are body dysmorphic disorder, body identity integrity disorder (a condition in which individuals have a sense that their anatomical configuration as an able-bodied person is somehow wrong or inappropriate) (66), or certain forms of eunuchism (in which a person is preoccupied with or engages in castration and/or penectomy for

Table 5. Criteria for Gender-Affirming Hormone Therapy for Adolescents

Adolescents are eligible for GnRH agonist treatment if:

1. A qualified MHP has confirmed that:
   - the adolescent has demonstrated a long-lasting and intense pattern of gender nonconformity or gender dysphoria (whether suppressed or expressed),
   - gender dysphoria worsened with the onset of puberty,
   - any coexisting psychological, medical, or social problems that could interfere with treatment (*e.g.*, that may compromise treatment adherence) have been addressed, such that the adolescent's situation and functioning are stable enough to start treatment,
   - the adolescent has sufficient mental capacity to give informed consent to this (reversible) treatment,
2. And the adolescent:
   - has been informed of the effects and side effects of treatment (including potential loss of fertility if the individual subsequently continues with sex hormone treatment) and options to preserve fertility,
   - has given informed consent and (particularly when the adolescent has not reached the age of legal medical consent, depending on applicable legislation) the parents or other caretakers or guardians have consented to the treatment and are involved in supporting the adolescent throughout the treatment process,
3. And a pediatric endocrinologist or other clinician experienced in pubertal assessment
   - agrees with the indication for GnRH agonist treatment,
   - has confirmed that puberty has started in the adolescent (Tanner stage ≥G2/B2),
   - has confirmed that there are no medical contraindications to GnRH agonist treatment.

Adolescents are eligible for subsequent sex hormone treatment if:

1. A qualified MHP has confirmed:
   - the persistence of gender dysphoria,
   - any coexisting psychological, medical, or social problems that could interfere with treatment (*e.g.*, that may compromise treatment adherence) have been addressed, such that the adolescent's situation and functioning are stable enough to start sex hormone treatment,
   - the adolescent has sufficient mental capacity (which most adolescents have by age 16 years) to estimate the consequences of this (partly) irreversible treatment, weigh the benefits and risks, and give informed consent to this (partly) irreversible treatment,
2. And the adolescent:
   - has been informed of the (irreversible) effects and side effects of treatment (including potential loss of fertility and options to preserve fertility),
   - has given informed consent and (particularly when the adolescent has not reached the age of legal medical consent, depending on applicable legislation) the parents or other caretakers or guardians have consented to the treatment and are involved in supporting the adolescent throughout the treatment process,
3. And a pediatric endocrinologist or other clinician experienced in pubertal induction:
   - agrees with the indication for sex hormone treatment,
   - has confirmed that there are no medical contraindications to sex hormone treatment.

Reproduced from World Professional Association for Transgender Health (16).

doi: 10.1210/jc.2017-01658

reasons that are not gender identity related) (11). Clinicians should also be able to diagnose psychiatric conditions accurately and ensure that these conditions are treated appropriately, particularly when the conditions may complicate treatment, affect the outcome of gender-affirming treatment, or be affected by hormone use.

Values and preferences

The task force placed a very high value on avoiding harm from hormone treatment in individuals who have conditions other than GD/gender incongruence and who may not benefit from the physical changes associated with this treatment and placed a low value on any potential benefit these persons believe they may derive from hormone treatment. This justifies the good practice statement.

1.3. We advise that decisions regarding the social transition of prepubertal youths with GD/gender incongruence are made with the assistance of an MHP or another experienced professional. (Ungraded Good Practice Statement).

1.4. We recommend against puberty blocking and gender-affirming hormone treatment in prepubertal children with GD/gender incongruence. (1 |⊕⊕◯◯)

Evidence

In most children diagnosed with GD/gender incongruence, it did not persist into adolescence. The percentages differed among studies, probably dependent on which version of the DSM clinicians used, the patient's age, the recruitment criteria, and perhaps cultural factors. However, the large majority (about 85%) of prepubertal children with a childhood diagnosis did not remain GD/gender incongruent in adolescence (20). If children have completely socially transitioned, they may have great difficulty in returning to the original gender role upon entering puberty (40). Social transition is associated with the persistence of GD/gender incongruence as a child progresses into adolescence. It may be that the presence of GD/gender incongruence in prepubertal children is the earliest sign that a child is destined to be transgender as an adolescent/adult (20). However, social transition (in addition to GD/gender incongruence) has been found to contribute to the likelihood of persistence.

This recommendation, however, does not imply that children should be discouraged from showing gender-variant behaviors or should be punished for exhibiting such behaviors. In individual cases, an early complete social transition may result in a more favorable outcome, but there are currently no criteria to identify the GD/gender-incongruent children to whom this applies. At the present time, clinical experience suggests that persistence of GD/gender incongruence can only be reliably assessed after the first signs of puberty.

Values and preferences

The task force placed a high value on avoiding harm with gender-affirming hormone therapy in prepubertal children with GD/gender incongruence. This justifies the strong recommendation in the face of low-quality evidence.

1.5. We recommend that clinicians inform and counsel all individuals seeking gender-affirming medical treatment regarding options for fertility preservation prior to initiating puberty suppression in adolescents and prior to treating with hormonal therapy of the affirmed gender in both adolescents and adults. (1 |⊕⊕⊕◯)

Remarks

Persons considering hormone use for gender affirmation need adequate information about this treatment in general and about fertility effects of hormone treatment in particular to make an informed and balanced decision (67, 68). Because young adolescents may not feel qualified to make decisions about fertility and may not fully understand the potential effects of hormonal interventions, consent and protocol education should include parents, the referring MHP(s), and other members of the adolescent's support group. To our knowledge, there are no formally evaluated decision aids available to assist in the discussion and decision regarding the future fertility of adolescents or adults beginning gender-affirming treatment.

Treating early pubertal youth with GnRH analogs will temporarily impair spermatogenesis and oocyte maturation. Given that an increasing number of transgender youth want to preserve fertility potential, delaying or temporarily discontinuing GnRH analogs to promote gamete maturation is an option. This option is often not preferred, because mature sperm production is associated with later stages of puberty and with the significant development of secondary sex characteristics.

For those designated male at birth with GD/gender incongruence and who are in early puberty, sperm production and the development of the reproductive tract are insufficient for the cryopreservation of sperm. However, prolonged pubertal suppression using GnRH analogs is reversible and clinicians should inform these individuals that sperm production can be initiated following prolonged gonadotropin suppression. This can be accomplished by spontaneous gonadotropin recovery after

cessation of GnRH analogs or by gonadotropin treatment and will probably be associated with physical manifestations of testosterone production, as stated above. Note that there are no data in this population concerning the time required for sufficient spermatogenesis to collect enough sperm for later fertility. In males treated for precocious puberty, spermarche was reported 0.7 to 3 years after cessation of GnRH analogs (69). In adult men with gonadotropin deficiency, sperm are noted in seminal fluid by 6 to 12 months of gonadotropin treatment. However, sperm numbers when partners of these patients conceive are far below the "normal range" (70, 71).

In girls, no studies have reported long-term, adverse effects of pubertal suppression on ovarian function after treatment cessation (72, 73). Clinicians should inform adolescents that no data are available regarding either time to spontaneous ovulation after cessation of GnRH analogs or the response to ovulation induction following prolonged gonadotropin suppression.

In males with GD/gender incongruence, when medical treatment is started in a later phase of puberty or in adulthood, spermatogenesis is sufficient for cryopreservation and storage of sperm. *In vitro* spermatogenesis is currently under investigation. Restoration of spermatogenesis after prolonged estrogen treatment has not been studied.

In females with GD/gender incongruence, the effect of prolonged treatment with exogenous testosterone on ovarian function is uncertain. There have been reports of an increased incidence of polycystic ovaries in transgender males, both prior to and as a result of androgen treatment (74–77), although these reports were not confirmed by others (78). Pregnancy has been reported in transgender males who have had prolonged androgen treatment and have discontinued testosterone but have not had genital surgery (79, 80). A reproductive endocrine gynecologist can counsel patients before gender-affirming hormone treatment or surgery regarding potential fertility options (81). Techniques for cryopreservation of oocytes, embryos, and ovarian tissue continue to improve, and oocyte maturation of immature tissue is being studied (82).

2.0 Treatment of Adolescents

During the past decade, clinicians have progressively acknowledged the suffering of young adolescents with GD/gender incongruence. In some forms of GD/gender incongruence, psychological interventions may be useful and sufficient. However, for many adolescents with GD/gender incongruence, the pubertal physical changes are unbearable. As early medical intervention may prevent psychological harm, various clinics have decided to start treating young adolescents with GD/gender incongruence with puberty-suppressing medication (a GnRH analog). As compared with starting gender-affirming treatment long after the first phases of puberty, a benefit of pubertal suppression at early puberty may be a better psychological and physical outcome.

In girls, the first physical sign of puberty is the budding of the breasts followed by an increase in breast and fat tissue. Breast development is also associated with the pubertal growth spurt, and menarche occurs ~2 years later. In boys, the first physical change is testicular growth. A testicular volume ≥4 mL is seen as consistent with the initiation of physical puberty. At the beginning of puberty, estradiol and testosterone levels are still low and are best measured in the early morning with an ultrasensitive assay. From a testicular volume of 10 mL, daytime testosterone levels increase, leading to virilization (83). Note that pubic hair and/or axillary hair/odor may not reflect the onset of gonadarche; instead, it may reflect adrenarche alone.

2.1. We suggest that adolescents who meet diagnostic criteria for GD/gender incongruence, fulfill criteria for treatment (Table 5), and are requesting treatment should initially undergo treatment to suppress pubertal development. (2 |⊕⊕◯◯)

2.2. We suggest that clinicians begin pubertal hormone suppression after girls and boys first exhibit physical changes of puberty (Tanner stages G2/B2). (2 |⊕⊕◯◯)

Evidence

Pubertal suppression can expand the diagnostic phase by a long period, giving the subject more time to explore options and to live in the experienced gender before making a decision to proceed with gender-affirming sex hormone treatments and/or surgery, some of which is irreversible (84, 85). Pubertal suppression is fully reversible, enabling full pubertal development in the natal gender, after cessation of treatment, if appropriate. The experience of full endogenous puberty is an undesirable condition for the GD/gender-incongruent individual and may seriously interfere with healthy psychological functioning and well-being. Treating GD/gender-incongruent adolescents entering puberty with GnRH analogs has been shown to improve psychological functioning in several domains (86).

Another reason to start blocking pubertal hormones early in puberty is that the physical outcome is improved compared with initiating physical transition after puberty has been completed (60, 62). Looking like a man or woman when living as the opposite sex creates difficult

barriers with enormous life-long disadvantages. We therefore advise starting suppression in early puberty to prevent the irreversible development of undesirable secondary sex characteristics. However, adolescents with GD/gender incongruence should experience the first changes of their endogenous spontaneous puberty, because their emotional reaction to these first physical changes has diagnostic value in establishing the persistence of GD/gender incongruence (85). Thus, Tanner stage 2 is the optimal time to start pubertal suppression. However, pubertal suppression treatment in early puberty will limit the growth of the penis and scrotum, which will have a potential effect on future surgical treatments (87).

Clinicians can also use pubertal suppression in adolescents in later pubertal stages to stop menses in transgender males and prevent facial hair growth in transgender females. However, in contrast to the effects in early pubertal adolescents, physical sex characteristics (such as more advanced breast development in transgender boys and lowering of the voice and outgrowth of the jaw and brow in transgender girls) are not reversible.

Values and preferences

These recommendations place a high value on avoiding an unsatisfactory physical outcome when secondary sex characteristics have become manifest and irreversible, a higher value on psychological well-being, and a lower value on avoiding potential harm from early pubertal suppression.

Remarks

Table 6 lists the Tanner stages of breast and male genital development. Careful documentation of hallmarks of pubertal development will ensure precise timing when initiating pubertal suppression once puberty has started. Clinicians can use pubertal LH and sex steroid levels to confirm that puberty has progressed sufficiently before starting pubertal suppression (88). Reference ranges for sex steroids by Tanner stage may vary depending on the assay used. Ultrasensitive sex steroid and gonadotropin assays will help clinicians document early pubertal changes.

Irreversible and, for GD/gender-incongruent adolescents, undesirable sex characteristics in female puberty are breasts, female body habitus, and, in some cases, relative short stature. In male puberty, they are a prominent Adam's apple; low voice; male bone configuration, such as a large jaw, big feet and hands, and tall stature; and male hair pattern on the face and extremities.

2.3. We recommend that, where indicated, GnRH analogues are used to suppress pubertal hormones. (1 ⊕⊕◯◯)

Evidence

Clinicians can suppress pubertal development and gonadal function most effectively via gonadotropin suppression using GnRH analogs. GnRH analogs are long-acting agonists that suppress gonadotropins by GnRH receptor desensitization after an initial increase of gonadotropins during ~10 days after the first and (to a lesser degree) the second injection (89). Antagonists immediately suppress pituitary gonadotropin secretion (90, 91). Long-acting GnRH analogs are the currently preferred treatment option. Clinicians may consider long-acting GnRH antagonists when evidence on their safety and efficacy in adolescents becomes available.

During GnRH analog treatment, slight development of secondary sex characteristics may regress, and in a later phase of pubertal development, it will stop. In girls, breast tissue will become atrophic, and menses will stop. In boys, virilization will stop, and testicular volume may decrease (92).

An advantage of using GnRH analogs is the reversibility of the intervention. If, after extensive exploration of his/her transition wish, the individual no longer desires transition, they can discontinue pubertal suppression. In subjects with

Table 6. Tanner Stages of Breast Development and Male External Genitalia

The description of Tanner stages for breast development:
1. Prepubertal
2. Breast and papilla elevated as small mound; areolar diameter increased
3. Breast and areola enlarged, no contour separation
4. Areola and papilla form secondary mound
5. Mature; nipple projects, areola part of general breast contour

For penis and testes:
1. Prepubertal, testicular volume <4 mL
2. Slight enlargement of penis; enlarged scrotum, pink, texture altered, testes 4–6 mL
3. Penis longer, testes larger (8–12 mL)
4. Penis and glans larger, including increase in breadth; testes larger (12–15 mL), scrotum dark
5. Penis adult size; testicular volume > 15 ml

Adapted from Lawrence (56).

precocious puberty, spontaneous pubertal development has been shown to resume after patients discontinue taking GnRH analogs (93).

Recommendations 2.1 to 2.3 are supported by a prospective follow-up study from The Netherlands. This report assessed mental health outcomes in 55 transgender adolescents/young adults (22 transgender females and 33 transgender males) at three time points: (1) before the start of GnRH agonist (average age of 14.8 years at start of treatment), (2) at initiation of gender-affirming hormones (average age of 16.7 years at start of treatment), and (3) 1 year after "gender-reassignment surgery" (average age of 20.7 years) (63). Despite a decrease in depression and an improvement in general mental health functioning, GD/gender incongruence persisted through pubertal suppression, as previously reported (86). However, following sex hormone treatment and gender-reassignment surgery, GD/gender incongruence was resolved and psychological functioning steadily improved (63). Furthermore, well-being was similar to or better than that reported by age-matched young adults from the general population, and none of the study participants regretted treatment. This study represents the first long-term follow-up of individuals managed according to currently existing clinical practice guidelines for transgender youth, and it underscores the benefit of the multidisciplinary approach pioneered in The Netherlands; however, further studies are needed.

Side effects

The primary risks of pubertal suppression in GD/gender-incongruent adolescents may include adverse effects on bone mineralization (which can theoretically be reversed with sex hormone treatment), compromised fertility if the person subsequently is treated with sex hormones, and unknown effects on brain development. Few data are available on the effect of GnRH analogs on BMD in adolescents with GD/gender incongruence. Initial data in GD/gender-incongruent subjects demonstrated no change of absolute areal BMD during 2 years of GnRH analog therapy but a decrease in BMD z scores (85). A recent study also suggested suboptimal bone mineral accrual during GnRH analog treatment. The study reported a decrease in areal BMD z scores and of bone mineral apparent density z scores (which takes the size of the bone into account) in 19 transgender males treated with GnRH analogs from a mean age of 15.0 years (standard deviation = 2.0 years) for a median duration of 1.5 years (0.3 to 5.2 years) and in 15 transgender females treated from 14.9 (±1.9) years for 1.3 years (0.5 to 3.8 years), although not all changes were statistically significant (94). There was incomplete catch-up at age 22 years after sex hormone treatment from age 16.6 (±1.4) years for a median duration of 5.8 years (3.0 to 8.0 years) in transgender females and from age 16.4 (±2.3) years for 5.4 years (2.8 to 7.8 years) in transgender males. Little is known about more prolonged use of GnRH analogs. Researchers reported normal BMD z scores at age 35 years in one individual who used GnRH analogs from age 13.7 years until age 18.6 years before initiating sex hormone treatment (65).

Additional data are available from individuals with late puberty or GnRH analog treatment of other indications. Some studies reported that men with constitutionally delayed puberty have decreased BMD in adulthood (95). However, other studies reported that these men have normal BMD (96, 97). Treating adults with GnRH analogs results in a decrease of BMD (98). In children with central precocious puberty, treatment with GnRH analogs has been found to result in a decrease of BMD during treatment by some (99) but not others (100). Studies have reported normal BMD after discontinuing therapy (69, 72, 73, 101, 102). In adolescents treated with growth hormone who are small for gestational age and have normal pubertal timing, 2-year GnRH analog treatments did not adversely affect BMD (103). Calcium supplementation may be beneficial in optimizing bone health in GnRH analog–treated individuals (104). There are no studies of vitamin D supplementation in this context, but clinicians should offer supplements to vitamin D–deficient adolescents. Physical activity, especially during growth, is important for bone mass in healthy individuals (103) and is therefore likely to be beneficial for bone health in GnRH analog–treated subjects.

GnRH analogs did not induce a change in body mass index standard deviation score in GD/gender-incongruent adolescents (94) but caused an increase in fat mass and decrease in lean body mass percentage (92). Studies in girls treated for precocious puberty also reported a stable body mass index standard deviation score during treatment (72) and body mass index and body composition comparable to controls after treatment (73).

Arterial hypertension has been reported as an adverse effect in a few girls treated with GnRH analogs for precocious/early puberty (105, 106). Blood pressure monitoring before and during treatment is recommended.

Individuals may also experience hot flashes, fatigue, and mood alterations as a consequence of pubertal suppression. There is no consensus on treatment of these side effects in this context.

It is recommended that any use of pubertal blockers (and subsequent use of sex hormones, as detailed below) include a discussion about implications for fertility (see recommendation 1.3). Transgender adolescents may

want to preserve fertility, which may be otherwise compromised if puberty is suppressed at an early stage and the individual completes phenotypic transition with the use of sex hormones.

Limited data are available regarding the effects of GnRH analogs on brain development. A single cross-sectional study demonstrated no compromise of executive function (107), but animal data suggest there may be an effect of GnRH analogs on cognitive function (108).

Values and preferences

Our recommendation of GnRH analogs places a higher value on the superior efficacy, safety, and reversibility of the pubertal hormone suppression achieved (as compared with the alternatives) and a relatively lower value on limiting the cost of therapy. Of the available alternatives, depot and oral progestin preparations are effective. Experience with this treatment dates back prior to the emergence of GnRH analogs for treating precocious puberty in papers from the 1960s and early 1970s (109–112). These compounds are usually safe, but some side effects have been reported (113–115). Only two recent studies involved transgender youth (116, 117). One of these studies described the use of oral lynestrenol monotherapy followed by the addition of testosterone treatment in transgender boys who were at Tanner stage B4 or further at the start of treatment (117). They found lynestrenol safe, but gonadotropins were not fully suppressed. The study reported metrorrhagia in approximately half of the individuals, mainly in the first 6 months. Acne, headache, hot flashes, and fatigue were other frequent side effects. Another progestin that has been studied in the United States is medroxyprogesterone. This agent is not as effective as GnRH analogs in lowering endogenous sex hormones either and may be associated with other side effects (116). Progestin preparations may be an acceptable treatment for persons without access to GnRH analogs or with a needle phobia. If GnRH analog treatment is not available (insurance denial, prohibitive cost, or other reasons), postpubertal, transgender female adolescents may be treated with an antiandrogen that directly suppresses androgen synthesis or action (see adult section).

Remarks

Measurements of gonadotropin and sex steroid levels give precise information about gonadal axis suppression, although there is insufficient evidence for any specific short-term monitoring scheme in children treated with GnRH analogs (88). If the gonadal axis is not completely suppressed—as evidenced by (for example) menses, erections, or progressive hair growth—the interval of GnRH analog treatment can be shortened or the dose increased. During treatment, adolescents should be monitored for negative effects of delaying puberty, including a halted growth spurt and impaired bone mineral accretion. Table 7 illustrates a suggested clinical protocol.

Anthropometric measurements and X-rays of the left hand to monitor bone age are informative for evaluating growth. To assess BMD, clinicians can perform dual-energy X-ray absorptiometry scans.

2.4. In adolescents who request sex hormone treatment (given this is a partly irreversible treatment), we recommend initiating treatment using a gradually increasing dose schedule (see Table 8) after a multidisciplinary team of medical and MHPs has confirmed the persistence of GD/gender incongruence and sufficient mental capacity to give informed consent, which most adolescents have by age 16 years (Table 5). (1 |⊕⊕◯◯)

2.5. We recognize that there may be compelling reasons to initiate sex hormone treatment prior to the age of 16 years in some adolescents with GD/gender incongruence, even though there are minimal published studies of gender-affirming hormone treatments administered before age 13.5 to 14 years. As with the care of adolescents ≥16 years of age, we recommend that an expert multidisciplinary team of medical and MHPs manage this treatment. (1 |⊕◯◯◯)

2.6. We suggest monitoring clinical pubertal development every 3 to 6 months and laboratory parameters every 6 to 12 months during sex hormone treatment (Table 9). (2 |⊕⊕◯◯)

Table 7. Baseline and Follow-Up Protocol During Suppression of Puberty

Every 3–6 mo
Anthropometry: height, weight, sitting height, blood pressure, Tanner stages
Every 6–12 mo
Laboratory: LH, FSH, E2/T, 25OH vitamin D
Every 1–2 y
Bone density using DXA
Bone age on X-ray of the left hand (if clinically indicated)

Abbreviations: DXA, dual-energy X-ray absorptiometry; E2, estradiol; FSH, follicle stimulating hormone; LH, luteinizing hormone; T, testosterone;

Table 8. Protocol Induction of Puberty

Induction of female puberty with oral 17β-estradiol, increasing the dose every 6 mo:
- 5 μg/kg/d
- 10 μg/kg/d
- 15 μg/kg/d
- 20 μg/kg/d
- Adult dose = 2–6 mg/d
- *In postpubertal transgender female adolescents, the dose of 17β-estradiol can be increased more rapidly:*
  - 1 mg/d for 6 mo
  - 2 mg/d

Induction of female puberty with transdermal 17β-estradiol, increasing the dose every 6 mo (new patch is placed every 3.5 d):
- 6.25–12.5 μg/24 h (cut 25-μg patch into quarters, then halves)
- 25 μg/24 h
- 37.5 μg/24 h
- Adult dose = 50–200 μg/24 h
- *For alternatives once at adult dose, see Table 11.*
- *Adjust maintenance dose to mimic physiological estradiol levels (see Table 15).*

Induction of male puberty with testosterone esters increasing the dose every 6 mo (IM or SC):
- 25 mg/m^2/2 wk (or alternatively, half this dose weekly, or double the dose every 4 wk)
- 50 mg/m^2/2 wk
- 75 mg/m^2/2 wk
- 100 mg/m^2/2 wk
- Adult dose = 100–200 mg every 2 wk
- *In postpubertal transgender male adolescents the dose of testosterone esters can be increased more rapidly:*
  - 75 mg/2 wk for 6 mo
  - 125 mg/2 wk
- *For alternatives once at adult dose, see Table 11.*
- *Adjust maintenance dose to mimic physiological testosterone levels (see Table 14).*

Abbreviations: IM, intramuscularly; SC, subcutaneously.

Evidence

Adolescents develop competence in decision making at their own pace. Ideally, the supervising medical professionals should individually assess this competence, although no objective tools to make such an assessment are currently available.

Many adolescents have achieved a reasonable level of competence by age 15 to 16 years (119), and in many countries 16-year-olds are legally competent with regard to medical decision making (120). However, others believe that although some capacities are generally achieved before age 16 years, other abilities (such as good risk assessment) do not develop until well after 18 years (121). They suggest that health care procedures should be divided along a matrix of relative risk, so that younger adolescents can be allowed to decide about low-risk procedures, such as most diagnostic tests and common therapies, but not about high-risk procedures, such as most surgical procedures (121).

Currently available data from transgender adolescents support treatment with sex hormones starting at age 16 years (63, 122). However, some patients may incur potential risks by waiting until age 16 years. These include the potential risk to bone health if puberty is suppressed

Table 9. Baseline and Follow-up Protocol During Induction of Puberty

Every 3–6 mo
- •Anthropometry: height, weight, sitting height, blood pressure, Tanner stages

Every 6–12 mo
- •In transgender males: hemoglobin/hematocrit, lipids, testosterone, 25OH vitamin D
- •In transgender females: prolactin, estradiol, 25OH vitamin D

Every 1–2 y
- •BMD using DXA
- •Bone age on X-ray of the left hand (if clinically indicated)

BMD should be monitored into adulthood (until the age of 25–30 y or until peak bone mass has been reached).
For recommendations on monitoring once pubertal induction has been completed, see Tables 14 and 15.

Adapted from Hembree *et al.* (118).

Abbreviation: DXA, dual-energy X-ray absorptiometry.

doi: 10.1210/jc.2017-01658

for 6 to 7 years before initiating sex hormones (*e.g.*, if someone reached Tanner stage 2 at age 9-10 years old). Additionally, there may be concerns about inappropriate height and potential harm to mental health (emotional and social isolation) if initiation of secondary sex characteristics must wait until the person has reached 16 years of age. However, only minimal data supporting earlier use of gender-affirming hormones in transgender adolescents currently exist (63). Clearly, long-term studies are needed to determine the optimal age of sex hormone treatment in GD/gender-incongruent adolescents.

The MHP who has followed the adolescent during GnRH analog treatment plays an essential role in assessing whether the adolescent is eligible to start sex hormone therapy and capable of consenting to this treatment (Table 5). Support of the family/environment is essential. Prior to the start of sex hormones, clinicians should discuss the implications for fertility (see recommendation 1.5). Throughout pubertal induction, an MHP and a pediatric endocrinologist (or other clinician competent in the evaluation and induction of pubertal development) should monitor the adolescent. In addition to monitoring therapy, it is also important to pay attention to general adolescent health issues, including healthy life style choices, such as not smoking, contraception, and appropriate vaccinations (*e.g.*, human papillomavirus).

For the induction of puberty, clinicians can use a similar dose scheme for hypogonadal adolescents with GD/gender incongruence as they use in other individuals with hypogonadism, carefully monitoring for desired and undesired effects (Table 8). In transgender female adolescents, transdermal 17β-estradiol may be an alternative for oral 17β-estradiol. It is increasingly used for pubertal induction in hypogonadal females. However, the absence of low-dose estrogen patches may be a problem. As a result, individuals may need to cut patches to size themselves to achieve appropriate dosing (123). In transgender male adolescents, clinicians can give testosterone injections intramuscularly or subcutaneously (124, 125).

When puberty is initiated with a gradually increasing schedule of sex steroid doses, the initial levels will not be high enough to suppress endogenous sex steroid secretion. Gonadotropin secretion and endogenous production of testosterone may resume and interfere with the effectiveness of estrogen treatment, in transgender female adolescents (126, 127). Therefore, continuation of GnRH analog treatment is advised until gonadectomy. Given that GD/gender-incongruent adolescents may opt not to have gonadectomy, long-term studies are necessary to examine the potential risks of prolonged GnRH analog treatment. Alternatively, in transgender male adolescents, GnRH analog treatment can be discontinued once an adult dose of testosterone has been reached and the individual is well virilized. If uterine bleeding occurs, a progestin can be added. However, the combined use of a GnRH analog (for ovarian suppression) and testosterone may enable phenotypic transition with a lower dose of testosterone in comparison with testosterone alone. If there is a wish or need to discontinue GnRH analog treatment in transgender female adolescents, they may be treated with an antiandrogen that directly suppresses androgen synthesis or action (see section 3.0 "Hormonal Therapy for Transgender Adults").

Values and preferences

The recommendation to initiate pubertal induction only when the individual has sufficient mental capacity (roughly age 16 years) to give informed consent for this partly irreversible treatment places a higher value on the ability of the adolescent to fully understand and oversee the partially irreversible consequences of sex hormone treatment and to give informed consent. It places a lower value on the possible negative effects of delayed puberty. We may not currently have the means to weigh adequately the potential benefits of waiting until around age 16 years to initiate sex hormones vs the potential risks/harm to BMD and the sense of social isolation from having the timing of puberty be so out of sync with peers (128).

Remarks

Before starting sex hormone treatment, effects on fertility and options for fertility preservation should be discussed. Adult height may be a concern in transgender adolescents. In a transgender female adolescent, clinicians may consider higher doses of estrogen or a more rapid tempo of dose escalation during pubertal induction. There are no established treatments yet to augment adult height in a transgender male adolescent with open epiphyses during pubertal induction. It is not uncommon for transgender adolescents to present for clinical services after having completed or nearly completed puberty. In such cases, induction of puberty with sex hormones can be done more rapidly (see Table 8). Additionally, an adult dose of testosterone in transgender male adolescents may suffice to suppress the gonadal axis without the need to use a separate agent. At the appropriate time, the multidisciplinary team should adequately prepare the adolescent for transition to adult care.

3.0 Hormonal Therapy for Transgender Adults

The two major goals of hormonal therapy are (1) to reduce endogenous sex hormone levels, and thus reduce

the secondary sex characteristics of the individual's designated gender, and (2) to replace endogenous sex hormone levels consistent with the individual's gender identity by using the principles of hormone replacement treatment of hypogonadal patients. The timing of these two goals and the age at which to begin treatment with the sex hormones of the chosen gender is codetermined in collaboration with both the person pursuing transition and the health care providers. The treatment team should include a medical provider knowledgeable in transgender hormone therapy, an MHP knowledgeable in GD/gender incongruence and the mental health concerns of transition, and a primary care provider able to provide care appropriate for transgender individuals. The physical changes induced by this sex hormone transition are usually accompanied by an improvement in mental well-being (129, 130).

3.1. We recommend that clinicians confirm the diagnostic criteria of GD/gender incongruence and the criteria for the endocrine phase of gender transition before beginning treatment. (1 ⊕⊕⊕◯)

3.2. We recommend that clinicians evaluate and address medical conditions that can be exacerbated by hormone depletion and treatment with sex hormones of the affirmed gender before beginning treatment (Table 10). (1 ⊕⊕⊕◯)

3.3. We suggest that clinicians measure hormone levels during treatment to ensure that endogenous sex steroids are suppressed and administered sex steroids are maintained in the normal physiologic range for the affirmed gender. (2 ⊕⊕◯◯)

Evidence

It is the responsibility of the treating clinician to confirm that the person fulfills criteria for treatment. The treating clinician should become familiar with the terms and criteria presented in Tables 1–5 and take a thorough history from the patient in collaboration with the other members of the treatment team. The treating clinician must ensure that the desire for transition is appropriate; the consequences, risks, and benefits of treatment are well understood; and the desire for transition persists. They also need to discuss fertility preservation options (see recommendation 1.3) (67, 68).

Transgender males

Clinical studies have demonstrated the efficacy of several different androgen preparations to induce masculinization in transgender males (Appendix A) (113, 114, 131–134). Regimens to change secondary sex characteristics follow the general principle of hormone replacement treatment of male hypogonadism (135). Clinicians can use either parenteral or transdermal preparations to achieve testosterone values in the normal male range (this is dependent on the specific assay, but is typically 320 to 1000 ng/dL) (Table 11) (136). Sustained supraphysiologic levels of testosterone increase the risk of adverse reactions (see section 4.0 "Adverse Outcome Prevention and Long-Term Care") and should be avoided.

Similar to androgen therapy in hypogonadal men, testosterone treatment in transgender males results in increased muscle mass and decreased fat mass, increased facial hair and acne, male pattern baldness in those genetically predisposed, and increased sexual desire (137).

Table 10. Medical Risks Associated With Sex Hormone Therapy

Transgender female: estrogen
Very high risk of adverse outcomes:
•Thromboembolic disease
Moderate risk of adverse outcomes:
•Macroprolactinoma
•Breast cancer
•Coronary artery disease
•Cerebrovascular disease
•Cholelithiasis
•Hypertriglyceridemia
Transgender male: testosterone
Very high risk of adverse outcomes:
•Erythrocytosis (hematocrit > 50%)
Moderate risk of adverse outcomes:
•Severe liver dysfunction (transaminases > threefold upper limit of normal)
•Coronary artery disease
•Cerebrovascular disease
•Hypertension
•Breast or uterine cancer

doi: 10.1210/jc.2017-01658

Table 11. Hormone Regimens in Transgender Persons

Transgender females[a]	
Estrogen	
Oral	
Estradiol	2.0–6.0 mg/d
Transdermal	
Estradiol transdermal patch (New patch placed every 3–5 d)	0.025–0.2 mg/d
Parenteral	
Estradiol valerate or cypionate	5–30 mg IM every 2 wk 2–10 mg IM every week
Anti-androgens	
Spironolactone	100–300 mg/d
Cyproterone acetate[b]	25–50 mg/d
GnRH agonist	3.75 mg SQ (SC) monthly 11.25 mg SQ (SC) 3-monthly
Transgender males	
Testosterone	
Parenteral testosterone	
Testosterone enanthate or cypionate	100–200 mg SQ (IM) every 2 wk or SQ (SC) 50% per week
Testosterone undecanoate[c]	1000 mg every 12 wk
Transdermal testosterone	
Testosterone gel 1.6%[d]	50–100 mg/d
Testosterone transdermal patch	2.5–7.5 mg/d

Abbreviations: IM, intramuscularly; SQ, sequentially; SC, subcutaneously.

[a]Estrogens used with or without antiandrogens or GnRH agonist.

[b]Not available in the United States.

[c]One thousand milligrams initially followed by an injection at 6 wk then at 12-wk intervals.

[d]Avoid cutaneous transfer to other individuals.

In transgender males, testosterone will result in clitoromegaly, temporary or permanent decreased fertility, deepening of the voice, cessation of menses (usually), and a significant increase in body hair, particularly on the face, chest, and abdomen. Cessation of menses may occur within a few months with testosterone treatment alone, although high doses of testosterone may be required. If uterine bleeding continues, clinicians may consider the addition of a progestational agent or endometrial ablation (138). Clinicians may also administer GnRH analogs or depot medroxyprogesterone to stop menses prior to testosterone treatment.

Transgender females

The hormone regimen for transgender females is more complex than the transgender male regimen (Appendix B). Treatment with physiologic doses of estrogen alone is insufficient to suppress testosterone levels into the normal range for females (139). Most published clinical studies report the need for adjunctive therapy to achieve testosterone levels in the female range (21, 113, 114, 132–134, 139, 140).

Multiple adjunctive medications are available, such as progestins with antiandrogen activity and GnRH agonists (141). Spironolactone works by directly blocking androgens during their interaction with the androgen receptor (114, 133, 142). It may also have estrogenic activity (143). Cyproterone acetate, a progestational compound with antiandrogenic properties (113, 132, 144), is widely used in Europe. 5α-Reductase inhibitors do not reduce testosterone levels and have adverse effects (145).

Dittrich *et al.* (141) reported that monthly doses of the GnRH agonist goserelin acetate in combination with estrogen were effective in reducing testosterone levels with a low incidence of adverse reactions in 60 transgender females. Leuprolide and transdermal estrogen were as effective as cyproterone and transdermal estrogen in a comparative retrospective study (146).

Patients can take estrogen as oral conjugated estrogens, oral 17β-estradiol, or transdermal 17β-estradiol. Among estrogen options, the increased risk of thromboembolic events associated with estrogens in general seems most concerning with ethinyl estradiol specifically (134, 140, 141), which is why we specifically suggest that it not be used in any transgender treatment plan. Data distinguishing among other estrogen options are less well established although there is some thought that oral routes of administration are more thrombogenic due to the "first pass effect" than are transdermal and parenteral routes, and that the risk of thromboembolic events is dose-dependent. Injectable estrogen and sublingual

estrogen may benefit from avoiding the first pass effect, but they can result in more rapid peaks with greater overall periodicity and thus are more difficult to monitor (147, 148). However, there are no data demonstrating that increased periodicity is harmful otherwise.

Clinicians can use serum estradiol levels to monitor oral, transdermal, and intramuscular estradiol. Blood tests cannot monitor conjugated estrogens or synthetic estrogen use. Clinicians should measure serum estradiol and serum testosterone and maintain them at the level for premenopausal females (100 to 200 pg/mL and <50 ng/dL, respectively). The transdermal preparations and injectable estradiol cypionate or valerate preparations may confer an advantage in older transgender females who may be at higher risk for thromboembolic disease (149).

Values

Our recommendation to maintain levels of gender-affirming hormones in the normal adult range places a high value on the avoidance of the long-term complications of pharmacologic doses. Those patients receiving endocrine treatment who have relative contraindications to hormones should have an in-depth discussion with their physician to balance the risks and benefits of therapy.

Remarks

Clinicians should inform all endocrine-treated individuals of all risks and benefits of gender-affirming hormones prior to initiating therapy. Clinicians should strongly encourage tobacco use cessation in transgender females to avoid increased risk of VTE and cardiovascular complications. We strongly discourage the unsupervised use of hormone therapy (150).

Not all individuals with GD/gender incongruence seek treatment as described (*e.g.*, male-to-eunuchs and individuals seeking partial transition). Tailoring current protocols to the individual may be done within the context of accepted safety guidelines using a multidisciplinary approach including mental health. No evidence-based protocols are available for these groups (151). We need prospective studies to better understand treatment options for these persons.

3.4. We suggest that endocrinologists provide education to transgender individuals undergoing treatment about the onset and time course of physical changes induced by sex hormone treatment. (2 |⊕○○○)

Evidence

Transgender males

Physical changes that are expected to occur during the first 1 to 6 months of testosterone therapy include cessation of menses, increased sexual desire, increased facial and body hair, increased oiliness of skin, increased muscle, and redistribution of fat mass. Changes that occur within the first year of testosterone therapy include deepening of the voice (152, 153), clitoromegaly, and male pattern hair loss (in some cases) (114, 144, 154, 155) (Table 12).

Transgender females

Physical changes that may occur in transgender females in the first 3 to 12 months of estrogen and antiandrogen therapy include decreased sexual desire, decreased spontaneous erections, decreased facial and body hair (usually mild), decreased oiliness of skin, increased breast tissue growth, and redistribution of fat mass (114, 139, 149, 154, 155, 161) (Table 13). Breast development is generally maximal at 2 years after initiating hormones (114, 139, 149, 155). Over a long period of time, the prostate gland and testicles will undergo atrophy.

Although the time course of breast development in transgender females has been studied (150), precise information about other changes induced by sex hormones is lacking (141). There is a great deal of variability among individuals, as evidenced during pubertal development. We all know that a major concern for transgender females is breast development. If we work with estrogens, the result will be often not what the transgender female expects.

Alternatively, there are transgender females who report an anecdotal improved breast development, mood, or sexual desire with the use of progestogens. However, there have been no well-designed studies of the role of progestogens in feminizing hormone regimens, so the question is still open.

Our knowledge concerning the natural history and effects of different cross-sex hormone therapies on breast

Table 12. Masculinizing Effects in Transgender Males

Effect	Onset	Maximum
Skin oiliness/acne	1–6 mo	1–2 y
Facial/body hair growth	6–12 mo	4–5 y
Scalp hair loss	6–12 mo	—[a]
Increased muscle mass/strength	6–12 mo	2–5 y
Fat redistribution	1–6 mo	2–5 y
Cessation of menses	1–6 mo	—[b]
Clitoral enlargement	1–6 mo	1–2 y
Vaginal atrophy	1–6 mo	1–2 y
Deepening of voice	6–12 mo	1–2 y

[b]Familial scalp hair loss may occur if estrogens are stopped.

[c]Treatment by speech pathologists for voice training is most effective.

development in transgender females is extremely sparse and based on the low quality of evidence. Current evidence does not indicate that progestogens enhance breast development in transgender females, nor does evidence prove the absence of such an effect. This prevents us from drawing any firm conclusion at this moment and demonstrates the need for further research to clarify these important clinical questions (162).

Values and preferences

Transgender persons have very high expectations regarding the physical changes of hormone treatment and are aware that body changes can be enhanced by surgical procedures (*e.g.*, breast, face, and body habitus). Clear expectations for the extent and timing of sex hormone–induced changes may prevent the potential harm and expense of unnecessary procedures.

4.0 Adverse Outcome Prevention and Long-Term Care

Hormone therapy for transgender males and females confers many of the same risks associated with sex hormone replacement therapy in nontransgender persons. The risks arise from and are worsened by inadvertent or intentional use of supraphysiologic doses of sex hormones, as well as use of inadequate doses of sex hormones to maintain normal physiology (131, 139).

4.1. We suggest regular clinical evaluation for physical changes and potential adverse changes in response to sex steroid hormones and laboratory monitoring of sex steroid hormone levels every 3 months during the first year of hormone therapy for transgender males and females and then once or twice yearly. (2 l⊕⊕○○)

Evidence

Pretreatment screening and appropriate regular medical monitoring are recommended for both transgender males and females during the endocrine transition and periodically thereafter (26, 155). Clinicians should monitor weight and blood pressure, conduct physical exams, and assess routine health questions, such as tobacco use, symptoms of depression, and risk of adverse events such as deep vein thrombosis/pulmonary embolism and other adverse effects of sex steroids.

Transgender males

Table 14 contains a standard monitoring plan for transgender males on testosterone therapy (154, 159). Key issues include maintaining testosterone levels in the physiologic normal male range and avoiding adverse events resulting from excess testosterone therapy, particularly erythrocytosis, sleep apnea, hypertension, excessive weight gain, salt retention, lipid changes, and excessive or cystic acne (135).

Because oral 17-alkylated testosterone is not recommended, serious hepatic toxicity is not anticipated with parenteral or transdermal testosterone use (163, 164). Past concerns regarding liver toxicity with testosterone have been alleviated with subsequent reports that indicate the risk of serious liver disease is minimal (144, 165, 166).

Transgender females

Table 15 contains a standard monitoring plan for transgender females on estrogens, gonadotropin suppression, or antiandrogens (160). Key issues include avoiding supraphysiologic doses or blood levels of estrogen that may lead to increased risk for thromboembolic disease, liver dysfunction, and hypertension. Clinicians should monitor serum estradiol levels using laboratories participating in external quality control, as measurements of estradiol in blood can be very challenging (167).

VTE may be a serious complication. A study reported a 20-fold increase in venous thromboembolic disease in a large cohort of Dutch transgender subjects (161). This increase may have been associated with the use of the synthetic estrogen, ethinyl estradiol (149). The incidence decreased when clinicians stopped administering ethinyl estradiol (161). Thus, the use of synthetic estrogens and conjugated estrogens is undesirable because of the inability to regulate doses by measuring serum levels and the risk of thromboembolic disease. In a German gender clinic, deep vein thrombosis occurred in 1 of 60 of transgender females treated with a GnRH analog and oral

Table 14. Monitoring of Transgender Persons on Gender-Affirming Hormone Therapy: Transgender Male

1. Evaluate patient every 3 mo in the first year and then one to two times per year to monitor for appropriate signs of virilization and for development of adverse reactions.
2. Measure serum testosterone every 3 mo until levels are in the normal physiologic male range:[a]
   a. For testosterone enanthate/cypionate injections, the testosterone level should be measured midway between injections. The target level is 400–700 ng/dL to 400 ng/dL. Alternatively, measure peak and trough levels to ensure levels remain in the normal male range.
   b. For parenteral testosterone undecanoate, testosterone should be measured just before the following injection. If the level is <400 ng/dL, adjust dosing interval.
   c. For transdermal testosterone, the testosterone level can be measured no sooner than after 1 wk of daily application (at least 2 h after application).
3. Measure hematocrit or hemoglobin at baseline and every 3 mo for the first year and then one to two times a year. Monitor weight, blood pressure, and lipids at regular intervals.
4. Screening for osteoporosis should be conducted in those who stop testosterone treatment, are not compliant with hormone therapy, or who develop risks for bone loss.
5. If cervical tissue is present, monitoring as recommended by the American College of Obstetricians and Gynecologists.
6. Ovariectomy can be considered after completion of hormone transition.
7. Conduct sub- and periareolar annual breast examinations if mastectomy performed. If mastectomy is not performed, then consider mammograms as recommended by the American Cancer Society.

[a]Adapted from Lapauw *et al.* (154) and Ott *et al.* (159).

estradiol (141). The patient who developed a deep vein thrombosis was found to have a homozygous C677 T mutation in the methylenetetrahydrofolate reductase gene. In an Austrian gender clinic, administering gender-affirming hormones to 162 transgender females and 89 transgender males was not associated with VTE, despite an 8.0% and 5.6% incidence of thrombophilia (159). A more recent multinational study reported only 10 cases of VTE from a cohort of 1073 subjects (168). Thrombophilia screening of transgender persons initiating hormone treatment should be restricted to those with a personal or family history of VTE (159). Monitoring D-dimer levels during treatment is not recommended (169).

4.2. We suggest periodically monitoring prolactin levels in transgender females treated with estrogens. (2 l⊕⊕○○)

Evidence

Estrogen therapy can increase the growth of pituitary lactrotroph cells. There have been several reports of prolactinomas occurring after long-term, high-dose estrogen therapy (170–173). Up to 20% of transgender females treated with estrogens may have elevations in prolactin levels associated with enlargement of the pituitary gland (156). In most cases, the serum prolactin levels will return to the normal range with a reduction or discontinuation of the estrogen therapy or discontinuation of cyproterone acetate (157, 174, 175).

The onset and time course of hyperprolactinemia during estrogen treatment are not known. Clinicians should measure prolactin levels at baseline and then at least annually during the transition period and every 2 years thereafter. Given that only a few case studies reported prolactinomas, and prolactinomas were not reported in large cohorts of estrogen-treated persons, the risk is likely to be very low. Because the major presenting findings of microprolactinomas (hypogonadism and sometimes gynecomastia) are not apparent in transgender females, clinicians may perform radiologic examinations of the pituitary in those patients whose prolactin levels persistently increase despite stable or reduced estrogen levels. Some transgender individuals receive psychotropic medications that can increase prolactin levels (174).

Table 15. Monitoring of Transgender Persons on Gender-Affirming Hormone Therapy: Transgender Female

1. Evaluate patient every 3 mo in the first year and then one to two times per year to monitor for appropriate signs of feminization and for development of adverse reactions.
2. Measure serum testosterone and estradiol every 3 mo.
   a. Serum testosterone levels should be <50 ng/dL.
   b. Serum estradiol should not exceed the peak physiologic range: 100–200 pg/mL.
3. For individuals on spironolactone, serum electrolytes, particularly potassium, should be monitored every 3 mo in the first year and annually thereafter.
4. Routine cancer screening is recommended, as in nontransgender individuals (all tissues present).
5. Consider BMD testing at baseline (160). In individuals at low risk, screening for osteoporosis should be conducted at age 60 years or in those who are not compliant with hormone therapy.

This table presents strong recommendations and does not include lower level recommendations.

doi: 10.1210/jc.2017-01658

4.3. We suggest that clinicians evaluate transgender persons treated with hormones for cardiovascular risk factors using fasting lipid profiles, diabetes screening, and/or other diagnostic tools. (2 l⊕⊕○○)

Evidence

Transgender males

Administering testosterone to transgender males results in a more atherogenic lipid profile with lowered high-density lipoprotein cholesterol and higher triglyceride and low-density lipoprotein cholesterol values (176–179). Studies of the effect of testosterone on insulin sensitivity have mixed results (178, 180). A randomized, open-label uncontrolled safety study of transgender males treated with testosterone undecanoate demonstrated no insulin resistance after 1 year (181, 182). Numerous studies have demonstrated the effects of sex hormone treatment on the cardiovascular system (160, 179, 183, 184). Long-term studies from The Netherlands found no increased risk for cardiovascular mortality (161). Likewise, a meta-analysis of 19 randomized trials in nontransgender males on testosterone replacement showed no increased incidence of cardiovascular events (185). A systematic review of the literature found that data were insufficient (due to very low–quality evidence) to allow a meaningful assessment of patient-important outcomes, such as death, stroke, myocardial infarction, or VTE in transgender males (176). Future research is needed to ascertain the potential harm of hormonal therapies (176). Clinicians should manage cardiovascular risk factors as they emerge according to established guidelines (186).

Transgender females

A prospective study of transgender females found favorable changes in lipid parameters with increased high-density lipoprotein and decreased low-density lipoprotein concentrations (178). However, increased weight, blood pressure, and markers of insulin resistance attenuated these favorable lipid changes. In a meta-analysis, only serum triglycerides were higher at ≥24 months without changes in other parameters (187). The largest cohort of transgender females (mean age 41 years, followed for a mean of 10 years) showed no increase in cardiovascular mortality despite a 32% rate of tobacco use (161).

Thus, there is limited evidence to determine whether estrogen is protective or detrimental on lipid and glucose metabolism in transgender females (176). With aging, there is usually an increase of body weight. Therefore, as with nontransgender individuals, clinicians should monitor and manage glucose and lipid metabolism and blood pressure regularly according to established guidelines (186).

4.4. We recommend that clinicians obtain BMD measurements when risk factors for osteoporosis exist, specifically in those who stop sex hormone therapy after gonadectomy. (1 l⊕⊕○○)

Evidence

Transgender males

Baseline bone mineral measurements in transgender males are generally in the expected range for their pretreatment gender (188). However, adequate dosing of testosterone is important to maintain bone mass in transgender males (189, 190). In one study (190), serum LH levels were inversely related to BMD, suggesting that low levels of sex hormones were associated with bone loss. Thus, LH levels in the normal range may serve as an indicator of the adequacy of sex steroid administration to preserve bone mass. The protective effect of testosterone may be mediated by peripheral conversion to estradiol, both systemically and locally in the bone.

Transgender females

A baseline study of BMD reported T scores less than −2.5 in 16% of transgender females (191). In aging males, studies suggest that serum estradiol more positively correlates with BMD than does testosterone (192, 193) and is more important for peak bone mass (194). Estrogen preserves BMD in transgender females who continue on estrogen and antiandrogen therapies (188, 190, 191, 195, 196).

Fracture data in transgender males and females are not available. Transgender persons who have undergone gonadectomy may choose not to continue consistent sex steroid treatment after hormonal and surgical sex reassignment, thereby becoming at risk for bone loss. There have been no studies to determine whether clinicians should use the sex assigned at birth or affirmed gender for assessing osteoporosis (*e.g.*, when using the FRAX tool). Although some researchers use the sex assigned at birth (with the assumption that bone mass has usually peaked for transgender people who initiate hormones in early adulthood), this should be assessed on a case-by-case basis until there are more data available. This assumption will be further complicated by the increasing prevalence of transgender people who undergo hormonal transition at a pubertal age or soon after puberty. Sex for comparison within risk assessment tools may be based on the age at which hormones were initiated and the length of exposure to hormones. In some cases, it may be

reasonable to assess risk using both the male and female calculators and using an intermediate value. Because all subjects underwent normal pubertal development, with known effects on bone size, reference values for birth sex were used for all participants (154).

4.5. We suggest that transgender females with no known increased risk of breast cancer follow breast-screening guidelines recommended for those designated female at birth. (2 ⊕⊕◯◯)

4.6. We suggest that transgender females treated with estrogens follow individualized screening according to personal risk for prostatic disease and prostate cancer. (2 ⊕◯◯◯)

Evidence

Studies have reported a few cases of breast cancer in transgender females (197–200). A Dutch study of 1800 transgender females followed for a mean of 15 years (range of 1 30 years) found one case of breast cancer. The Women's Health Initiative study reported that females taking conjugated equine estrogen without progesterone for 7 years did not have an increased risk of breast cancer as compared with females taking placebo (137).

In transgender males, a large retrospective study conducted at the U.S. Veterans Affairs medical health system identified seven breast cancers (194). The authors reported that this was not above the expected rate of breast cancers in cisgender females in this cohort. Furthermore, they did report one breast cancer that developed in a transgender male patient after mastectomy, supporting the fact that breast cancer can occur even after mastectomy. Indeed, there have been case reports of breast cancer developing in subareolar tissue in transgender males, which occurred after mastectomy (201, 202).

Women with primary hypogonadism (Turner syndrome) treated with estrogen replacement exhibited a significantly decreased incidence of breast cancer as compared with national standardized incidence ratios (203, 204). These studies suggest that estrogen therapy does not increase the risk of breast cancer in the short term (<20 to 30 years). We need long-term studies to determine the actual risk, as well as the role of screening mammograms. Regular examinations and gynecologic advice should determine monitoring for breast cancer.

Prostate cancer is very rare before the age of 40, especially with androgen deprivation therapy (205). Childhood or pubertal castration results in regression of the prostate and adult castration reverses benign prostate hypertrophy (206). Although van Kesteren *et al.* (207) reported that estrogen therapy does not induce hypertrophy or premalignant changes in the prostates of transgender females, studies have reported cases of benign prostatic hyperplasia in transgender females treated with estrogens for 20 to 25 years (208, 209). Studies have also reported a few cases of prostate carcinoma in transgender females (210–214).

Transgender females may feel uncomfortable scheduling regular prostate examinations. Gynecologists are not trained to screen for prostate cancer or to monitor prostate growth. Thus, it may be reasonable for transgender females who transitioned after age 20 years to have annual screening digital rectal examinations after age 50 years and prostate-specific antigen tests consistent with U.S. Preventive Services Task Force Guidelines (215).

4.7. We advise that clinicians determine the medical necessity of including a total hysterectomy and oophorectomy as part of gender-affirming surgery. (Ungraded Good Practice Statement)

Evidence

Although aromatization of testosterone to estradiol in transgender males has been suggested as a risk factor for endometrial cancer (216), no cases have been reported. When transgender males undergo hysterectomy, the uterus is small and there is endometrial atrophy (217, 218). Studies have reported cases of ovarian cancer (219, 220). Although there is limited evidence for increased risk of reproductive tract cancers in transgender males, health care providers should determine the medical necessity of a laparoscopic total hysterectomy as part of a gender-affirming surgery to prevent reproductive tract cancer (221).

Values

Given the discomfort that transgender males experience accessing gynecologic care, our recommendation for the medical necessity of total hysterectomy and oophorectomy places a high value on eliminating the risks of female reproductive tract disease and cancer and a lower value on avoiding the risks of these surgical procedures (related to the surgery and to the potential undesirable health consequences of oophorectomy) and their associated costs.

Remarks

The sexual orientation and type of sexual practices will determine the need and types of gynecologic care required following transition. Additionally, in certain countries, the approval required to change the sex in a birth certificate for transgender males may be dependent on having a complete hysterectomy. Clinicians should help patients research nonmedical administrative criteria and

provide counseling. If individuals decide not to undergo hysterectomy, screening for cervical cancer is the same as all other females.

5.0 Surgery for Sex Reassignment and Gender Confirmation

For many transgender adults, genital gender-affirming surgery may be the necessary step toward achieving their ultimate goal of living successfully in their desired gender role. The type of surgery falls into two main categories: (1) those that directly affect fertility and (2) those that do not. Those that change fertility (previously called sex reassignment surgery) include genital surgery to remove the penis and gonads in the male and removal of the uterus and gonads in the female. The surgeries that effect fertility are often governed by the legal system of the state or country in which they are performed. Other gender-conforming surgeries that do not directly affect fertility are not so tightly governed.

Gender-affirming surgical techniques have improved markedly during the past 10 years. Reconstructive genital surgery that preserves neurologic sensation is now the standard. The satisfaction rate with surgical reassignment of sex is now very high (187). Additionally, the mental health of the individual seems to be improved by participating in a treatment program that defines a pathway of gender-affirming treatment that includes hormones and surgery (130, 144) (Table 16).

Surgery that affects fertility is irreversible. The World Professional Association for Transgender Health Standards of Care (222) emphasizes that the "threshold of 18 should not be seen as an indication in itself for active intervention." If the social transition has not been satisfactory, if the person is not satisfied with or is ambivalent about the effects of sex hormone treatment, or if the person is ambivalent about surgery then the individual should not be referred for surgery (223, 224).

Gender-affirming genital surgeries for transgender females that affect fertility include gonadectomy, penectomy, and creation of a neovagina (225, 226). Surgeons often invert the skin of the penis to form the wall of the vagina, and several literatures reviews have reported on outcomes (227). Sometimes there is inadequate tissue to form a full neovagina, so clinicians have revisited using intestine and found it to be successful (87, 228, 229). Some newer vaginoplasty techniques may involve autologuous oral epithelial cells (230, 231).

The scrotum becomes the labia majora. Surgeons use reconstructive surgery to fashion the clitoris and its hood, preserving the neurovascular bundle at the tip of the penis as the neurosensory supply to the clitoris. Some surgeons are also creating a sensate pedicled-spot adding a G spot to the neovagina to increase sensation (232). Most recently, plastic surgeons have developed techniques to fashion labia minora. To further complete the feminization, uterine transplants have been proposed and even attempted (233).

Neovaginal prolapse, rectovaginal fistula, delayed healing, vaginal stenosis, and other complications do sometimes occur (234, 235). Clinicians should strongly remind the transgender person to use their dilators to maintain the depth and width of the vagina throughout the postoperative period. Genital sexual responsivity and other aspects of sexual function are usually preserved following genital gender-affirming surgery (236, 237).

Ancillary surgeries for more feminine or masculine appearance are not within the scope of this guideline. Voice therapy by a speech language pathologist is available to transform speech patterns to the affirmed gender (148). Spontaneous voice deepening occurs during testosterone treatment of transgender males (152, 238). No studies have compared the effectiveness of speech therapy, laryngeal surgery, or combined treatment.

Breast surgery is a good example of gender-confirming surgery that does not affect fertility. In all females, breast size exhibits a very broad spectrum. For transgender females to make the best informed decision, clinicians should delay breast augmentation surgery until the patient has completed at least 2 years of estrogen therapy, because the breasts continue to grow during that time (141, 155).

Another major procedure is the removal of facial and masculine-appearing body hair using either electrolysis or

Table 16. Criteria for Gender-Affirming Surgery, Which Affects Fertility

1. Persistent, well-documented gender dysphoria
2. Legal age of majority in the given country
3. Having continuously and responsibly used gender-affirming hormones for 12 mo (if there is no medical contraindication to receiving such therapy)
4. Successful continuous full-time living in the new gender role for 12 mo
5. If significant medical or mental health concerns are present, they must be well controlled
6. Demonstrable knowledge of all practical aspects of surgery (*e.g.*, cost, required lengths of hospitalizations, likely complications, postsurgical rehabilitation)

laser treatments. Other feminizing surgeries, such as that to feminize the face, are now becoming more popular (239–241).

In transgender males, clinicians usually delay gender-affirming genital surgeries until after a few years of androgen therapy. Those surgeries that affect fertility in this group include oophorectomy, vaginectomy, and complete hysterectomy. Surgeons can safely perform them vaginally with laparoscopy. These are sometimes done in conjunction with the creation of a neopenis. The cosmetic appearance of a neopenis is now very good, but the surgery is multistage and very expensive (242, 243). Radial forearm flap seems to be the most satisfactory procedure (228, 244). Other flaps also exist (245). Surgeons can make neopenile erections possible by reinervation of the flap and subsequent contraction of the muscle, leading to stiffening of the neopenis (246, 247), but results are inconsistent (248). Surgeons can also stiffen the penis by imbedding some mechanical device (*e.g.*, a rod or some inflatable apparatus) (249, 250). Because of these limitations, the creation of a neopenis has often been less than satisfactory. Recently, penis transplants are being proposed (233).

In fact, most transgender males do not have any external genital surgery because of the lack of access, high cost, and significant potential complications. Some choose a metaoidioplasty that brings forward the clitoris, thereby allowing them to void in a standing position without wetting themselves (251, 252). Surgeons can create the scrotum from the labia majora with good cosmetic effect and can implant testicular prostheses (253).

The most important masculinizing surgery for the transgender male is mastectomy, and it does not affect fertility. Breast size only partially regresses with androgen therapy (155). In adults, discussions about mastectomy usually take place after androgen therapy has started. Because some transgender male adolescents present after significant breast development has occurred, they may also consider mastectomy 2 years after they begin androgen therapy and before age 18 years. Clinicians should individualize treatment based on the physical and mental health status of the individual. There are now newer approaches to mastectomy with better outcomes (254, 255). These often involve chest contouring (256). Mastectomy is often necessary for living comfortably in the new gender (256).

5.1. We recommend that a patient pursue genital gender-affirming surgery only after the MHP and the clinician responsible for endocrine transition therapy both agree that surgery is medically necessary and would benefit the patient's overall health and/or well-being. (1 ⊕⊕◯◯)

5.2. We advise that clinicians approve genital gender-affirming surgery only after completion of at least 1 year of consistent and compliant hormone treatment, unless hormone therapy is not desired or medically contraindicated. (Ungraded Good Practice Statement)

5.3. We advise that the clinician responsible for endocrine treatment and the primary care provider ensure appropriate medical clearance of transgender individuals for genital gender-affirming surgery and collaborate with the surgeon regarding hormone use during and after surgery. (Ungraded Good Practice Statement)

5.4. We recommend that clinicians refer hormone-treated transgender individuals for genital surgery when: (1) the individual has had a satisfactory social role change, (2) the individual is satisfied about the hormonal effects, and (3) the individual desires definitive surgical changes. (1 ⊕◯◯◯)

5.5. We suggest that clinicians delay gender-affirming genital surgery involving gonadectomy and/or hysterectomy until the patient is at least 18 years old or legal age of majority in his or her country. (2 ⊕⊕◯◯).

5.6. We suggest that clinicians determine the timing of breast surgery for transgender males based upon the physical and mental health status of the individual. There is insufficient evidence to recommend a specific age requirement. (2 ⊕◯◯◯)

Evidence

Owing to the lack of controlled studies, incomplete follow-up, and lack of valid assessment measures, evaluating various surgical approaches and techniques is difficult. However, one systematic review including a large numbers of studies reported satisfactory cosmetic and functional results for vaginoplasty/neovagina construction (257). For transgender males, the outcomes are less certain. However, the problems are now better understood (258). Several postoperative studies report significant long-term psychological and psychiatric pathology (259–261). One study showed satisfaction with breasts, genitals, and femininity increased significantly and showed the importance of surgical treatment as a key therapeutic option for transgender females (262). Another analysis demonstrated that, despite the young average age at death following surgery and the relatively larger number of individuals with somatic morbidity, the study does not allow for determination of

causal relationships between, for example, specific types of hormonal or surgical treatment received and somatic morbidity and mortality (263). Reversal surgery in regretful male-to-female transsexuals after sexual reassignment surgery represents a complex, multistage procedure with satisfactory outcomes. Further insight into the characteristics of persons who regret their decision postoperatively would facilitate better future selection of applicants eligible for sexual reassignment surgery. We need more studies with appropriate controls that examine long-term quality of life, psychosocial outcomes, and psychiatric outcomes to determine the long-term benefits of surgical treatment.

When a transgender individual decides to have gender-affirming surgery, both the hormone prescribing clinician and the MHP must certify that the patient satisfies criteria for gender-affirming surgery (Table 16).

There is some concern that estrogen therapy may cause an increased risk for venous thrombosis during or following surgery (176). For this reason, the surgeon and the hormone-prescribing clinician should collaborate in making a decision about the use of hormones before and following surgery. One study suggests that preoperative factors (such as compliance) are less important for patient satisfaction than are the physical postoperative results (56). However, other studies and clinical experience dictate that individuals who do not follow medical instructions and do not work with their physicians toward a common goal do not achieve treatment goals (264) and experience higher rates of postoperative infections and other complications (265, 266). It is also important that the person requesting surgery feels comfortable with the anatomical changes that have occurred during hormone therapy. Dissatisfaction with social and physical outcomes during the hormone transition may be a contraindication to surgery (223).

An endocrinologist or experienced medical provider should monitor transgender individuals after surgery. Those who undergo gonadectomy will require hormone replacement therapy, surveillance, or both to prevent adverse effects of chronic hormone deficiency.

IN THE UNITED STATES DISTRICT COURT
FOR THE NORTHERN DISTRICT OF FLORIDA
Tallahassee Division

AUGUST DEKKER, et al., *Plaintiffs*, v. JASON WEIDA, et al., *Defendants*.	Case No. 4:22-cv-00325-RH-MAF

EXPERT REPORT OF JOHANNA OLSON-KENNEDY, M.D., M.S.

I, Johanna Olson-Kennedy, M.D., M.S., hereby declare and state as follows:

1. I have been retained by counsel for Plaintiffs as an expert in connection with the above-captioned litigation.

2. I am over the age of 18. I have actual knowledge of the matters stated herein. If called to testify in this matter, I would testify truthfully and based on my expert opinion.

BAKCGROUND AND QUALIFICATIONS

3. I have been retained by counsel for Plaintiffs in the above-captioned lawsuit to provide an expert opinion on gender identity; the treatment and diagnosis of gender dysphoria; the *Florida Medicaid Generally Accepted*

Professional Medical Standards (GAPMS) Determination on the Treatment of Gender Dysphoria published by Florida's Agency for Health Care Administration (AHCA) in June 2022, along with its attachments; and Fla. Admin. Code. R. 59G-1.050(7) which prohibits Medicaid coverage of puberty blockers, hormone and hormone antagonists, "sex reassignment" surgeries, and any other procedures that alter primary or secondary sexual characteristics.

A. Qualifications and Experience

4. I am a Double Board Certified Physician in Pediatrics and Adolescent Medicine. I specialize in the care of transgender youth and gender diverse children. I am a recognized expert in this field.

5. The information provided regarding my professional background, experiences, publications, and presentations is further detailed in my curriculum vitae ("CV"). A true and correct copy of my most up-to-date CV is attached as **Exhibit A**.

6. I received my Doctor of Medicine (M.D.) degree from the Chicago Medical School in 1997. In 2000, I completed my residency in pediatrics at the Children's Hospital of Orange County, California, and from 2000 to 2003, I was a Fellow in adolescent medicine at the Children's Hospital of Los Angeles.

7. I have been a licensed physician in California since 2000. I am currently the Medical Director of the Center for Transyouth Health and Development, in the Division of Adolescent Medicine at the Children's Hospital in Los Angeles, California. The Center is the largest clinic in the United States for transgender youth and provides gender diverse youth with both medical and mental health services, including consultation for families with gender diverse children and routine use of medications to suppress puberty in peri-pubertal youth (i.e., youth at the onset of puberty), gender-affirming hormone use for masculinization and feminization, as well as surgical referrals. Under my direction, the Center conducts rigorous research aimed at understanding the experience of gender diversity and gender dysphoria from childhood through early adulthood.

8. Over the course of my work with this population during the past 16 years, I have provided services for approximately 1000 young people and their families, and currently have an active panel of around 650 patients of varying ages, up to 25 years old.

9. I have been awarded research grants to examine the impact of early interventions including puberty-delaying medication (commonly known as puberty blockers) and gender-affirming hormones on the physiological and

psychosocial development of gender diverse and transgender youth. I have lectured extensively, across the United States and internationally on the treatment and care of gender diverse children and transgender adolescents, the subjects including pubertal suppression, gender-affirming hormone therapy, transitioning teens and the adolescent experience, age considerations in administering hormones, and the needs, risks, and outcomes of hormonal treatments. I have published numerous articles and chapters, both peer reviewed, and non-peer reviewed, on transgender health-related issues.

10. I am currently the principal investigator on a multisite National Institutes of Health grant to continue, for an additional 5 years, an ongoing study examining the impact of gender-affirming medical care for transgender youth on physiologic and psychological health and well-being. The first five years have already been completed. This is the first study of its kind in the U.S. to determine longitudinal outcomes among this population of vulnerable youth. The study to date has yielded approximately 26 manuscripts.

11. I am an Associate Professor at the Keck School of Medicine at the University of Southern California and attending physician at Children's Hospital of Los Angeles. I have been a member of the World Professional Association for Transgender Health (WPATH) since 2010, and a Board Member of the U.S.

Professional Association for Transgender Health (USPATH) since 2017. I was recently appointed to the Executive Board of the USPATH. I am also a member of the Society for Adolescent Health and Medicine and the American Academy of Pediatrics. In addition, I am a member of the LGBT Special Interest Group of the Society for Adolescent Health and Development.

12. I am the 2014 Recognition Awardee for the Southern California Regional Chapter of the Society for Adolescent Health and Medicine.

13. In 2019, I was invited by the University of Bristol as a Benjamin Meaker visiting professor, the purpose of which is to bring distinguished researchers from overseas to Bristol in order to enhance the research activity of the university.

B. Previous Testimony

14. In the last four years, I have testified as an expert at trial or by deposition in the following cases: *Fain v. Crouch*, No. 3:20-cv-00740 (S.D. W.Va.); *Kadel v. Folwell*, Case No. 1:19-cv-00272-LCB-LPA (M.D.N.C.); *Miller v. Purdue* (Colorado); *In the interest of JA.D.Y. and JU.D.Y., Children*, Case No. DF-15-09887 (255th Jud. District Ct., Dallas Cty., Tex.); and *Paul E. v. Courtney F.*, No. FC2010-051045 (Superior Ct., Maricopa Cty., Ariz.).

C. Compensation

15. I am being compensated for my work on this matter at a rate of $200.00 per hour for preparation of declarations and expert reports, as well as any pre-deposition and/or pre-trial preparation and any deposition testimony or trial testimony. My compensation does not depend on the outcome of this litigation, the opinions I express, or the testimony I may provide.

D. Bases for Opinions

16. In preparing this report, I have relied on my training and years of research and clinical experience, as set out in my curriculum vitae, and on the materials listed therein. *See* **Exhibit A**. It documents my education, training, research, and years of experience in this field and includes a list of publications.

17. I have also reviewed the materials listed in the attached bibliography. *See* **Exhibit B**. The sources cited therein are authoritative, scientific peer-reviewed publications. I generally rely on these materials when I provide expert testimony, and they include the documents specifically cited as supportive examples in particular sections of this declaration.

18. In addition, I have reviewed the Florida Medicaid Generally Accepted Professional Medical Standards (GAPMS) Determination on the Treatment of Gender Dysphoria published by Florida's Agency for Health Care

Administration (AHCA) in June 2022, along with its attachments, including the "assessments" of Dr. Romina Brignardello-Petersen and Dr. Wojtek Wiercioch (Attachment C), Dr. James Cantor (Attachment D), Dr. Quentin Van Meter (Attachment E), Dr. Patrick Lappert (Attachment F), and Dr. G. Kevin Donovan (Attachment G) (hereinafter, "GAPMS Memo"); and Fla. Admin. Code. R. 59G-1.050(7) which prohibits Medicaid coverage of puberty blockers, hormone and hormone antagonists, "sex reassignment" surgeries, and any other procedures that alter primary or secondary sexual characteristics. I may rely on these documents, as well as those cited in my curriculum vitae and the attached bibliography, as additional support for my opinions.

19. The materials I have relied upon in preparing this report are the same types of materials that experts in my field of study regularly rely upon when forming opinions on the subject. I reserve the right to revise and supplement the opinions expressed in this report or the bases for them if any new information becomes available in the future, including as a result of new scientific research or publications or in response to statements and issues that may arise in my area of expertise.

EXPERT OPINIONS

A. Gender Identity

1. The term gender identity was originally coined in 1964 by American psychiatrist Robert J. Stoller, a noted psychoanalyst who studied sexual orientation, gender identity, and differences in sexual development.[1] Gender identity is a distinct characteristic and is defined as one's internal sense of being male or female (or rarely, both or neither). It has a strong biological basis. Every person has a gender identity.

2. The concept of gender identity is contemporaneously understood both colloquially and within the domain of science and medicine to denote someone's gender. It is a concept well-understood and accepted in medicine and science. Indeed, gender identity information is commonly collected and reported on within the context of scientific research.[2]

3. The term cisgender refers to a person whose gender identity matches their sex assigned at birth. The term transgender refers to a person whose gender identity does not match their sex assigned at birth.

---

[1] Stoller, R.J. (1964). A Contribution to the Study of Gender Identity, *The International journal of psycho-analysis*, 45, 220–226.

[2] Clayton JA, Tannenbaum C. (2016). Reporting Sex, Gender, or Both in Clinical Research? *JAMA*. 316(18): 1863–1864.

4. Historically, "gender" was equated with a person's sex assigned at birth, which refers to the sex assigned to a person when they are born, generally based on external genitalia. However, a more contemporary understanding of gender shows that one's gender identity may differ from one's sex assigned at birth.

5. While both gender identity and sex are often assumed and treated as binary and oppositional, they are more accurately experienced as along a spectrum. For example, there are multiple sex characteristics, such as genitalia, chromosomal makeup, hormones, and variations in brain structure and function. For some of these characteristics there is significant variance as reflected by the dozens of intersex mechanisms and varying gender identities. Additionally, not all sex characteristics, including gender identity, are always in alignment. Accordingly, the Endocrine Society Guidelines state that, "As these may not be in line with each other (e.g., a person with XY chromosomes may have female-appearing genitalia), the terms biological sex and biological male or female are imprecise and should be avoided."[3]

[3] Hembree, W.C., Cohen-Kettenis, P.T., Gooren, L., et al. (2017). Endocrine Treatment of Gender-Dysphoric/Gender-Incongruent Persons: An Endocrine Society Clinical Practice Guideline, *The Journal of Clinical Endocrinology & Metabolism*, 102(11): 3869–3903.

6. As early as 1966 it has been understood that gender identity cannot be changed.[4] Efforts to do so have been shown to be unsuccessful and harmful.

B. Gender Dysphoria and its Treatment

7. Gender Dysphoria (GD) is a serious medical condition characterized by distress due to a mismatch between assigned birth sex and a person's internal sense of their gender. GD was formerly categorized as Gender Identity Disorder (GID) but the condition was renamed in May 2013, with the release of the American Psychiatric Association (APA)'s fifth edition of the Diagnostic and Statistical Manual of Mental Disorders (DSM-5).[5] In announcing this change, the APA explained that in addition to the name change, the criteria for the diagnosis were revised "to better characterize the experiences of affected children, adolescents, and adults."[6] The APA further stressed that "gender nonconformity is not in itself a mental disorder. The critical element of gender dysphoria is the presence of clinically significant distress associated with the condition."[7]

[5] A text revision to the Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition was published in 2022 ("DSM-5-TR").

[6] DSM-5.

[7] *Id.*

8. On May 25, 2019, the World Health Assembly approved International Classification of Diseases (ICD) version 11 that had been published by the World Health Organization in 2018.[8] In this newest version of the ICD, all trans-related diagnostic codes were removed from the chapter "Mental and Behavioral Disorders," and the code "Gender incongruence" was included in a new chapter "Conditions related to sexual health." These codes replaced the outdated "Gender Identity Disorder of childhood" (F64.2), "Gender Identity Disorder not otherwise specified" (F64.9), "transsexualism" (F64.0), and "Dual-role transvestism" (F64.1), which perpetuated the idea that patients seeking and undergoing medical interventions for a medical condition are mentally ill.[9]

9. For a person to be diagnosed with GD, there must be a marked difference between the individual's expressed/experienced gender and the gender others would assign to the individual, present for at least six months. In children, the desire to be of the other gender must be present and verbalized.[10] The

[8] World Health Organization. (2018). Gender Incongruence. In International Classification of Diseases, 11th Revision.

[9] Suess Schwend A. (2020). Trans health care from a depathologization and human rights perspective. *Public health reviews*, *41*, 3.

[10] Notably, the DSM-IV included a separate diagnosis for GID in children, which required the child to display a number of behaviors stereotypical of the non-natal gender. That diagnosis, and its list of behavioral requirements, have been deleted from the DSM-5 and replaced by updated and more precise diagnostic criteria.

condition must cause clinically significant distress or impairment in social, occupational, or other important areas of functioning.

10. The World Professional Association of Transgender Health (WPATH) has clear recommendations for the health of transsexual, transgender, and gender non-conforming people in what is now the Standards of Care version 8 (SOC 8).[11] The SOC are based on the best available science and expert professional consensus. Importantly, SOC 8 is based on the best available science and expert professional consensus in transgender health; its recommendation statements were developed based on data derived from independent systematic literature reviews, background reviews, and expert opinions; and its grading of recommendations was based on the available evidence supporting interventions, a discussion of risks and harms, as well as the feasibility and acceptability of these. SOC 8 continues to recommend the provision of medical interventions, such as puberty blockers, hormone therapy, and surgery, as treatment for gender dysphoria, based on an individual patient's needs.

11. The WPATH SOC have been endorsed and cited as authoritative by most major medical associations in the United States, including the American

[11] Coleman, et al. (2022) (SOC 8).

Medical Association, the American Psychiatric Association, the American Psychological Association, the Endocrine Society, the Pediatric Endocrine Society, the American College of Physicians, and the American Academy of Family Physicians, among others.

12. The UCSF Center for Excellence in Transgender Care as well as the Endocrine Society have both published comprehensive guidelines for the care of transgender and non-binary individuals that are largely consistent with the WPATH SOC.[12]

13. The GAPMS Memo and some its attached "assessments" discuss a number of approaches to care, though they fail to properly describe them and to discuss their limitations.

14. One of the approaches discussed by Dr. Van Meter is **"reparative" or "corrective"** therapy. *See* Attachment E to GAPMS Memo, at 6 ("Van Meter"). "Conversion" or "reparative" therapy refers to the practice of attempting to change an individual's sexual orientation and attractions from members of the same sex to those of the opposite sex. A similar model of therapy

[12] Deutsch, M.B. (ed.). (2016). Guidelines for the Primary and Gender-Affirming Care of Transgender and Gender Nonbinary People (2d ed.). San Francisco, CA: UCSF Center of Excellence for Transgender Health, https://transcare.ucsf.edu/guidelines (UCSF Guidelines); Hembree, et al. (2017) (Endocrine Society Guidelines).

for individuals with a transgender identity or experience has historically been an approach promoted by some individuals, notwithstanding its ineffectiveness and harmful effects. Accordingly, 20 states and the District of Columbia have banned reparative therapy for youth, and major medical organizations have issued statements deeming the practice to be unethical.[13]

15. A Williams Institute report published in 2019 estimates that just under 700,000 LGBT individuals in the United States have undergone "conversion therapy" at some point in their lifetime, about half of those during adolescence.[14] Because some psychiatrists and sexologists working in the 1960's and 70's perpetuated the idea that being transgender was likely the result of a pathological early childhood experience, many professionals and lay community members continue to believe that gender is malleable. Tactics have ranged from simple redirection, thought pattern alteration or hypnosis to aversion techniques including induction of vomiting, nausea, paralysis or electric shock, have been employed in order to change the expression, behavior, and assertion of one's

[13] Movement Advancement Proj., *Conversion "Therapy" Laws,* https://www.lgbtmap.org/equality-maps/conversion_therapy (last updated Jan. 30, 2023).

authentic gender.[15] However, multiple studies show that gender identity has a strong biological basis and cannot be changed. As such, reparative therapy is both ineffective and harmful for transgender and gender diverse youth.

16. **"Redirection"** – Under this approach, advocated by people like Dr. Van Meter, a mental health therapist would encourage caregivers to use positive reinforcement to try to "redirect" children toward behavior that is more typical of their birth-designated sex or less gender specific. Underlying this approach is the assumption that a child's gender identity is malleable through social interventions. The goal of redirection is thus to eliminate gender-diverse desires and expressions over time, and to try to prevent the transgender child from being transgender. This approach is not recommended because negative reinforcement (e.g., shaming the child for gender diverse expression) has substantial negative mental and social health consequences.[16] It also ignores that gender identity is innate and cannot be changed.

17. **Wait-and-see** – The wait-and-see approach (also called watchful waiting) involves waiting to see if the child's gender identity will change as the

Research Review: Gender identity in youth: treatment paradigms and controversies. *Journal of child psychology and psychiatry, and allied disciplines*, *59*(12), 1228–1243; Ehrensaft, D. (2017). Gender nonconforming youth: current perspectives. *Adolescent health, medicine and therapeutics*, *8*, 57–67.

child gets older. This approach typically recommends that caregivers prohibit a prepubertal social transition but may allow cross-gender play and clothing within the home or support both masculine and feminine activities as the child explores their interests in other social settings. The wait-and-see approach assumes that gender is binary and becomes fixed at a certain age; it pathologizes gender diversity and fluidity. It is distinguished from following the child's lead, an affirming approach that allows the child to present in the gender role that feels correct and moves at a pace that is largely directed by the child. This approach ignores evidence that young children thrive when given permission to live in the gender that is most authentic to them and are at risk for symptomatic behaviors if prevented from doing so.[17]

18. **Affirmation** – The affirmative approach considers no gender identity outcome: transgender, cisgender, or otherwise, to be preferable.[18] It permits a child to explore gender development and self-definition within a safe setting. A fundamental concept of this approach is that gender diversity is not a mental illness. The gender-affirmative model is defined as a method of therapeutic care that includes allowing children to speak for themselves about

[17] Ehrensaft (2017).

[18] Turban and Ehrensaft (2018).

their self-experienced gender identity and expressions and providing support for them to evolve into their authentic gender selves, no matter at what age. Under this model, a child's self-report is embedded within a collaborative model with the child as subject and the collaborative team including the child, parents, and professionals. Support is not characterized by "encouraging" children or youth to be transgender or not, but rather by allowing children who express a desire to undergo a social transition (which may include changing names, pronouns, clothing, hairstyles, etc.) to do so. **For children who have not yet reached puberty, medical intervention is unnecessary and unwarranted.** After the onset of puberty, medical interventions such as puberty blockers, and later hormones and surgery, may be appropriate.

19. While some argue that gender affirmation leads a child or adolescent down a path of inevitable transgender identity, no such evidence exists, either in the scientific or the clinical setting. To the contrary, studies show that gender identification does not meaningfully differ before and after social transition.[19]

[19] Rae, J. R., Gülgöz, S., Durwood, L., DeMeules, M., Lowe, R., Lindquist, G., & Olson, K. R. (2019). Predicting early-childhood gender transitions. *Psychological Science*, 30(5), 669-681.

20. Under both the "wait and see" and affirmative care models, as understood in the scientific literature, medical care is recommended following the onset of puberty.[20]

21. The most effective treatment for adolescents and adults with GD, in terms of both their mental and medical health, contemplates an individualized approach. Medical and surgical treatment interventions are determined by the care team (usually a medical and mental health professional) in collaboration with the patient, and the patient's family, if the patient is a minor. These medical decisions are made by the care team in conjunction with the patient and, if the patient is a minor, the patient's family, and consider the patient's social situation, level of gender dysphoria, developmental stage, existing medical conditions, and other relevant factors. Sometimes treatment begins with puberty delaying medications (also referred to as puberty blockers), later followed by gender-affirming hormones. Most youth, and certainly all adults, accessing treatment are already well into or have completed puberty.

[20] Ehrensaft (2017).

1) Puberty Blockers

22. The beginning signs of puberty in transgender youth (the development of breast buds in assigned birth females and increased testicular volume in assigned birth males) is often a painful and sometimes traumatic experience that brings increased body dysphoria and the potential development of a host of comorbidities including depression, anxiety, substance abuse, self-harming behaviors, social isolation, high-risk sexual behaviors, and increased suicidality.

23. Puberty suppression, which involves the administration of gonadotrophin-releasing hormone analogues (GnRHa), essentially pauses puberty, thereby allowing the young person the opportunity to explore gender without having to experience the anxiety and distress associated with developing the undesired secondary sexual characteristics. In addition, for parents/guardians who are uneducated about gender diversity and/or who have only recently become aware of their child's transgender identity, puberty blockers provide additional time and opportunity to integrate this new information into their own experience and to develop skills to support their child. Puberty suppression also has the benefit of potentially rendering obsolete some gender-affirming surgeries down the line, such as male chest reconstruction, tracheal shave, facial

feminization, and vocal cord alteration, which otherwise would be required to correct the initial "incorrect" puberty.

24. Puberty suppression has been used safely for decades in children with other medical conditions, including precocious puberty, and is a reversible intervention.[21] If the medication is discontinued, the young person continues their endogenous puberty. The "Dutch protocol," developed from a study conducted in the Netherlands and published in 2006, calls for the commencement of puberty blockers for appropriately diagnosed and assessed gender dysphoric youth as early as 12 years of age.[22] Both the Endocrine Society and the WPATH's SOC, however, recommend initiation of puberty suppression at the earliest stages of puberty (usually, Tanner 2) (assuming someone has engaged in services before or around this time), regardless of chronological age, in order to avoid the stress and trauma associated with developing secondary sex characteristics of the natal sex.

Young Adult Psychological Outcome After Puberty Suppression and Gender Reassignment. *Pediatrics*, *134*(4), 696-704; Biggs M. (2022). The Dutch Protocol for Juvenile Transsexuals: Origins and Evidence. *Journal of sex & marital therapy*, 1–21.

25. A growing body of evidence, including peer-reviewed cross-sectional and longitudinal studies, demonstrates the positive impact of pubertal suppression in youth with GD on psychological functioning including a decrease in behavioral and emotional problems, a decrease in depressive symptoms, and improvement in general functioning.[23]

26. The initial follow-up studies evaluating the use of puberty suppression in relation to psychological well-being in adolescents with GD came from the Netherlands and demonstrated that behavioral and emotional problems and depressive symptoms decreased and general functioning significantly improved during treatment.[24]

(2015). Psychological Support, Puberty Suppression, and Psychosocial Functioning in Adolescents with Gender Dysphoria. *The journal of sexual medicine*, *12*(11), 2206–2214..

[24] de Vries, et al. (2011); de Vries, et al. (2014).

27. A study from the United Kingdom demonstrated that psychological support and puberty suppression were associated with improved global psychosocial functioning in adolescents with gender dysphoria with a combination of psychological support and puberty suppression, attributing to a greater improvement than psychological support only.[25]

28. A more recent cross-sectional study from the Dutch team demonstrated that transgender youth undergoing pubertal suppression had better psychological functioning than those youth who had not yet begun puberty blockade.[26]

29. Achille et al. demonstrated a positive effect of puberty blockade on mental health in a small, prospective investigation. The study characterized a treatment cohort over progressive interventions moving from puberty blockade to GAH treatment.[27]

30. Overall, this growing body of evidence is consistent with and supports clinical experience demonstrating a significant positive effect of puberty blockade in youth with gender dysphoria.

[25] Costa, et al. (2015).

[26] Van der Miesen, et al. (2020).

[27] Achille, et al. (2020).

31. Puberty blockers, thus, afford youth the opportunity to undergo a single, congruent pubertal process and avoid many of the surgical interventions previously necessary for assimilation into an authentic gender role. It is a simple reversible intervention that has the capacity to improve health outcomes and save lives. Over the course of my work in the past sixteen years with gender diverse and transgender youth, I have prescribed hormone suppression for over 350 patients. All of those patients have benefitted from putting their endogenous puberty process on pause, even the small handful who discontinued GnRH analogues and went through their endogenous puberty. Many of these young people were able to matriculate back into school environments, begin appropriate peer relationships, and participate meaningfully in therapy and family functions. Children who had contemplated or attempted suicide or self-harm (including cutting and burning) associated with monthly menstruation or the anxiety about their voice dropping were offered respite from those dark places of despair. GnRH analogues for puberty suppression are, in my opinion, a sentinel event in the history of transgender medicine, and have changed the landscape almost as much as the development of synthetic hormones.

2) Gender-Affirming Hormones

32. Cross-gender or gender-affirming hormone therapy involves administering steroids of the experienced sex (i.e., their gender identity) (estrogen for transfeminine individuals and testosterone for transmasculine individuals). The purpose of this treatment is to attain the appropriate masculinization or feminization of the transgender person to achieve a gender phenotype that matches as closely as possible to their gender identity. Gender-affirming hormone therapy is a partially reversible treatment in that some of the effects produced by the hormones are reversible (e.g., changes in body fat composition, decrease in facial and body hair) while others are irreversible (e.g., deepening of the voice, breast tissue development). Eligibility and medical necessity should be determined case-by-case, based on an assessment of the youth's unique cognitive and emotional maturation and ability to provide a knowing and informed consent. The decision would be made only after a careful review with the youth and parents/guardians of the potential risks and benefits of hormone therapy. The youth's primary care provider, therapist, or another experienced mental health professional can help document and confirm the patient's history of GD, the medical necessity of the intervention, and the youth's readiness to transition medically.

33. As with the use of puberty blockers, the data demonstrating the positive effects of gender affirming hormones (GAH) is well established and growing.

34. The Dutch team at The Center of Expertise on Gender Dysphoria at the VU University Medical Center Amsterdam continued to report out the improvement within their cohort of youth with gender dysphoria after GAH. De Vries et al reported in 2014 that their cohort of young adults who began care in adolescence had steadily improving mental health (including depression, anxiety, anger, internalizing and externalizing psychopathologic symptoms) following puberty blockade, GAH and gender affirming surgery.[28]

35. A German observational study reported that among the participants at follow-up, adolescents in the gender-affirming hormone (GAH) and surgery (GAS) group reported emotional and behavioral problems and physical quality of life scores similar to the German norm mean.[29]

[28] de Vries, et al. (2014).

Psychosocial health in adolescents and young adults with gender dysphoria before and after gender-affirming medical interventions: A descriptive study from the Hamburg Gender Identity Service. *European Child & Adolescent Psychiatry*, 30(11), 1755–1767.

36. Also from Germany, Neider et al. reported that among a group of 75 adolescents with gender dysphoria satisfaction improved the further along the treatment course had progressed.[30]

37. From the United States, Kuper et al. carried out a prospective study and reported their cohort of transgender and non-binary youth starting either pubertal blockade or GAH demonstrated improvement at follow up (around a year) in depression, anxiety and body esteem.[31]

38. While small, Grannis et al. demonstrated decreased depression and anxiety in a group of transmasculine youth taking testosterone versus an untreated control group.[32]

39. Most recently our team at the Trans Youth Care United States (TYC-US) reported in the New England Journal of Medicine an improvement among

41. An established and growing body of evidence combined with decades of clinical evidence demonstrate the positive effect of gender affirming hormones in adolescents and adults with gender dysphoria.

3) Gender-Affirming Surgeries

42. Some transgender individuals need surgical interventions to help bring their phenotype into alignment with their gender. Surgical interventions may include vaginoplasty, tracheal shave, liposuction, breast implants, and orchiectomy for transfeminine individuals and chest reconstruction, hysterectomy, oophorectomy, salpingectomy, construction of a neoscrotum, and metoidioplasty or phalloplasty for transmasculine individuals.

43. The current WPATH SOC recommend that surgical interventions may occur when appropriate for an individual.

44. Decades of research confirms that gender confirmation surgery is therapeutic and therefore an effective treatment for gender dysphoria.[35] In a 1998

[35] *See*, *e.g.*, Almazan, A. N., & Keuroghlian, A. S. (2021). Association Between Gender-Affirming Surgeries and Mental Health Outcomes. *JAMA surgery*, 156(7), 611–618; Almazan, et al. (2021); Murad, M. H., et al. (2010). Sex reassignment: Thirty years of international follow-up studies after sex reassignment surgery, a comprehensive review, 1961-1991.

meta-analysis, Pfafflin and Junge reviewed data from 80 studies, from 12 countries, spanning 30 years. They concluded that "reassignment procedures were effective in relieving gender dysphoria. There were few negative consequences and all aspects of the reassignment process contributed to overwhelmingly positive outcomes."[36]

45. Subsequent studies confirm this conclusion. Researchers reporting on a large-scale prospective study of 325 individuals in the Netherlands concluded that after surgery there was "a virtual absence of gender dysphoria" in the cohort and "results substantiate previous conclusions that sex reassignment is effective."[37] The authors of the study concluded that the surgery "appeared therapeutic and beneficial" across a wide spectrum of factors and "[t]he main symptom for which the patients had requested treatment, gender dysphoria, had decreased to such a degree that it had disappeared." Similarly, a recent systematic review that included data from 1,052 transmasculine patients who obtained chest surgery found that pooled overall postoperative satisfaction was 92%.[38]

46. With regards to transgender adolescents, peer-reviewed research has also shown improvements in mental health following gender-affirming chest surgery for transgender males with gender dysphoria where medically indicated.[39]

* * *

47. Recognizing the importance of individualized care, the SOC 8 has this to say about all gender affirming interventions: "The SOC-8 guidelines are intended to be flexible to meet the diverse health care needs of TGD people globally. While adaptable, they offer standards for promoting optimal health care and for guiding treatment of people experiencing gender incongruence. As in all previous versions of the SOC, the criteria put forth in this document for gender-affirming interventions are clinical guidelines; individual health care professionals and programs may modify them in consultation with the TGD person. Clinical departures from the SOC may come about because of a patient's unique anatomic, social, or psychological situation; an experienced health care professional's evolving method of handling a common situation; a research

Chest Reconstruction and Chest Dysphoria in Transmasculine Minors and Young Adults: Comparisons of Nonsurgical and Postsurgical Cohorts. *JAMA pediatrics*, *172*(5), 431–436.

protocol; lack of resources in various parts of the world; or the need for specific harm-reduction strategies. These departures should be recognized as such, explained to the patient, and documented for quality patient care and legal protection."

48. Gender-affirming medical interventions are considered medically necessary and are recognized as such by many major professional organizations. The denial of this care results in negative health consequences.

49. There are those (see GAPMS Memo at 12-13) who would make the argument that the recent uptick in youth presenting for services related to GD is the result of "social contagion." But if social contagion theory applied to gender and gender identity, there would be zero transgender people, because of the consistent exposure to an overwhelming majority of cisgender people. The social contagion argument that is posited by some confuses the relationship between one's recognition of their gender and their exposure to gender related information and community, particularly with regard to internet activity, asserting that youth are declaring themselves to be transgender or gender diverse because they were exposed to this online, or they have multiple friends who are also experiencing GD. Adolescent development includes finding like groups of peers, which extends to finding friend groups who are also gender diverse. Finally, attributing

GD to "social contagion" is a simplistic perspective that discounts that the process of doing something about one's gender dysphoria is complex and difficult and involves parental consent for minors.

50. There is no scientific evidence that one develops gender dysphoria from being exposed to people with GD. To the contrary, most evidence shows that gender identity has a biological basis[40] and is affixed by early childhood.[41]

C. Critiques of the GAPMS Memo and the Attached "Assessments"

51. The GAPMS Memo and the attached assessments contain a number of inaccurate assertions or misrepresentations, in addition to those noted above.

Misunderstandings and Misrepresentations of Desistance

52. The GAPMS Memo falsely states that "the majority of young adolescents who exhibit signs of gender dysphoria eventually desist and conform to their natal sex and that the puberty suppression can have side effects." (GAPMS Memo at 14). This is a blatant misrepresentation of the scientific literature. The studies pertaining to desistance upon which the GAPMS Memo

[40] Korpaisarn, S., & Safer, J. D. (2019). Etiology of Gender Identity. Endocrinology and metabolism clinics of North America, 48(2), 323–329. https://doi.org/10.1016/j.ecl.2019.01.002; Saraswat, A., Weinand, J.D., & Safer, J. (2015). Evidence supporting the biologic nature of gender identity. Endocrine practice, 21 2, 199-204.

[41] Slaby, R., Frey, K. (1975). Development of Gender Constancy and Selective Attention to Same Sex Models, *Child Development*, 46(4): 849-856.

relies pertain to *pre-pubertal* youth, not adolescents. In fact, contrary to the GAPMS Memo's assertion, studies show that if gender dysphoria is present in adolescence, it usually persists.[42]

53. To be sure, there are a significant number of *pre-pubertal* children who demonstrate an interest or preference for clothing, toys, and games that are stereotypically of interest to members of the "other" gender. Some of these children are transgender and some are not. It is the study of such *pre-pubertal* children that has created confusion about the persistence of gender dysphoria into adolescence and adulthood. Specifically, the *pre-pubertal* children who were the subject of research endeavors in the late 20th century included both children who are transgender and children who are not, i.e., those who would have met current criteria for a diagnosis of "Gender Dysphoria in Children" and those who would be considered "sub-threshold" for this diagnosis.

54. At the time of these studies, the diagnosis of "Gender Dysphoria in Children" did not exist and therefore the study subjects did not need to meet criteria B, which is "the presence of clinically significant distress associated with the condition." In addition, the criteria for the then-used "gender identity disorder

[42] de Vries, et al. (2011).

in children" diagnosis did not require a child to have "a strong desire to be of the other gender or an insistence that one is the other gender (or some alternative gender different from one's assigned gender)," which the current "Gender Dysphoria in Children" diagnosis requires.

55. Thus, given the broader criteria used at the time, it is unsurprising that some of the research undertaken toward the end of the 20th century demonstrated that most children who exhibited gender-nonconforming behavior did not go on to have a transgender identity in adolescence. Yet, notwithstanding its inapplicability and faulty underpinnings, this "evidence" has been used to argue against gender affirmation for children and adolescents.

56. What is more, these arguments about desistance in *pre-pubertal* children are wholly irrelevant to the question of coverage and provision of medical care as treatment for GD. That is because research to date shows that if transgender identification persists into adolescence, then desistance is incredibly rare, and no medical or surgical treatments are recommended for *pre-pubertal* children.

57. Additionally, no studies have ever demonstrated that gender affirmation in childhood "leads to" a child being transgender who otherwise might not have been. Studies have demonstrated that the majority of youth whose

GD and cross-gender identity continue to be present, or those whose GD emerges in adolescence, are highly unlikely to identify and live as cisgender individuals. Youth with GD, particularly those who are unaffirmed and denied care, are at high risk for depression, anxiety, isolation, self-harm and suicidality at the onset of puberty-related changes that feel wrong to them.

The Myth of Social Contagion and Rapid-Onset Gender Dysphoria (ROGD)

58. The GAPMS memo asserts that gender-affirming care should not be provided because the causes of GD are uncertain. It suggests that "exposure to 'social and peer contagion'" accounts for the rise in numbers of adolescents who identify as transgender, pointing to research that has identified so-called "rapid-onset gender dysphoria" (ROGD). (GAPMS Memo at 12-13; see also Cantor ¶ 48-49). However, ROGD is not a diagnosis recognized by any medical or scientific institution, and there is no scientific evidence in support of it.

59. The concept of ROGD originated from a single article authored by Lisa Littman, a researcher who had no experience in the field of gender medicine, transgender issues, or gender dysphoria, prior to the publication of her article.[43]

[43] Littman L. (2018). Parent reports of adolescents and young adults perceived to show signs of a rapid onset of gender dysphoria. *PloS one*, *13*(8), e0202330.

60. Littman's article was heavily criticized for its flawed methodology, potential for bias, and overrepresentation of its findings.[44] For example, Littman's study was based solely on "parent observations and interpretations." But parental reports are not necessarily a reliable basis for understanding a particular youth's experience with their gender, let alone whether the youth has gender dysphoria.[45] Moreover, most of the parents who participated in the study were recruited from websites targeted to parents likely to question their child's gender self-identification and the current best health care approaches. In addition, the study also failed to collect data from the adolescents and young adults (AYAs) or clinicians, which would have been necessary in order to come up with and validate ROGD as a new phenomenon.

[44] *See*, *e.g.*, Brandelli Costa, A. (2019) Formal comment on: Parent reports of adolescents and young adults perceived to show signs of a rapid onset of gender dysphoria. PLoS ONE 14(3): e0212578; Restar A. J. (2020). Methodological Critique of Littman's (2018) Parental-Respondents Accounts of "Rapid-Onset Gender Dysphoria". *Archives of sexual behavior*, *49*(1), 61–66.

[45] *See*, *e.g.*, Kennedy, N. (2022) Deferral: the sociology of young trans people's epiphanies and coming out. *Journal of LGBT Youth*, 19:1, 53-75; Brandelli Costa (2019).

61. Following the numerous critiques of the Littman study, the journal that published the study retracted it, ordered a post-publication review, and republished the article with a correction notice,[46] along with an apology.[47]

62. The correction notice acknowledged, among other things, that: [48]

a. "there is some information about the AYAs that the parents would not have access to and the answers might reflect parent perspectives" and that "consideration of what information parents may or may not have access to is an important element of the findings";

b. "the study's output was hypothesis-generating rather than hypothesis-testing";

c. "three of the sites that posted recruitment information expressed cautious or negative views about medical and surgical interventions for gender dysphoric adolescents and young adults

[46] Littman L. (2019) Correction: Parent reports of adolescents and young adults perceived to show signs of a rapid onset of gender dysphoria. *PLoS ONE*, 14(3): e0214157.

[47] Heber, J. Correcting the scientific record on gender incongruence – and an apology, PLoS ONE (Mar. 19, 2019), https://everyone.plos.org/2019/03/19/correcting-the-scientific-record-and-anapology/.

[48] Littman (2019).

and cautious or negative views about categorizing gender dysphoric youth as transgender"; and

d. "There is expected variation in how objective parents can be about their own children" and that the "descriptive study was not designed to explore or measure the objectivity of participants."

63. Thus, the correction notice ultimately acknowledged that the study "does not validate the phenomenon" of ROGD and that the term ROGD "should not be used in a way to imply that it explains the experiences of all gender dysphoric youth nor should it be used to stigmatize vulnerable individuals."[49] In the end, aside from the correction notice, the journal that published the study issued an apology "for oversights that occurred during the original assessment of the study."[50]

64. To date, no study has been published that validates or proves the hypothesis of ROGD presented by the Littman study. Indeed, Lisa Littman herself said at the GenSpect 2021 Conference that ROGD was not a new phenomenon, but rather a re-naming of late onset GD.

[49] *Id.*

[50] Heber (2019).

65. The GAPMS Memo, Dr. Cantor, and Dr. Van Meter incorrectly allege that an increase in numbers of youth presenting for care related to GD provides support for the social contagion theory. (See GAPMS Memo at 12-13; Van Meter at 9-10). For one, varying estimates of prevalence are the result of inconsistent measures of transgender populations. Some studies have assessed the fraction of a population which had received the DSM-IV diagnosis of GID or the ICD 10 diagnosis of transsexualism, both of which were limited to clinical populations who sought a binary transition (male-to-female or female-to-male). For example, the prevalence reported in DSM-5 (0.005–0.014% for birth-assigned males; 0.002–0.003% for birth-assigned females) are based on people who received a diagnosis of GID or transsexualism and were seeking hormone treatment and surgery from gender specialty clinics, and, therefore, do not reflect the number of all individuals with gender dysphoria or who identify as transgender.[51] Other studies have reported on those who self-identified as transgender or gender incongruent and found that measuring self-identity yields much higher numbers. In 2016, data from the Center for Disease Control's Behavioral Risk Factor Surveillance System suggested that 0.6% of U.S. adults

[51] Coleman, et al. (2022).

identify as transgender, double the estimate utilizing data from the previous decade.[52] Ultimately, there is nothing surprising about the fact that more transgender people have begun identifying themselves to others as societal stigma has started to abate, and nothing about that lends support to the "social contagion" theory.

Dr. Cantor's False Assertion of Transition-on-Demand

66. In his "assessment," Dr. Cantor, a psychologist with no clinical experience in treating gender dysphoria in minors and no experience monitoring patients receiving drug treatments for gender dysphoria, states that "transition-on-demand" increases the probability of unnecessary transition and unnecessary medical risks. (Cantor ¶ 21).

67. His claim is wholly divorced from the reality of care for transgender people. First, like all health care, gender-affirming care for every transgender person is individualized. There simply is no one specific route.

68. Second, Dr. Cantor inaccurately assumes that every transgender person wants and receives rapid access to services. For most transgender individuals seeking care, nothing about their process has been rapid, even when

[52] Byne, W., Karasic, D. H., Coleman, E., Eyler, A. E., Kidd, J. D., Meyer-Bahlburg, H. F. L., … Pula, J. (2018). Gender dysphoria in adults: An overview and primer for psychiatrists. *Transgender Health*, *3*(1), 57-70.

they are young. Most individuals with gender dysphoria have engaged in a long, arduous and private process of understanding their gender to be different from the one assumed at birth. Dr. Cantor gives no credibility to transgender patients regarding their right to bodily autonomy nor their capacity to make sound and informed decisions.

69. Finally, Dr. Cantor is wrong to assert that affirmation "increases the probability of unnecessary transition and unnecessary medical risks." (Cantor ¶ 21). There is no evidence to support the notion that affirmation of gender in pre-pubertal children, or at any age, leads to transition. Medical interventions are not recommended and are not appropriate for pre-pubertal children. If one's gender could be impacted by the role of rearing, there would be few transgender people who transition in adulthood, as most were reared in the gender role that corresponded with their sex assigned at birth. It is not logical to think that while we have been epically failing at convincing transgender people to be cisgender, we would be able to make someone who is cisgender into someone who is transgender, a directionality that may correspond with higher rates of discrimination, harassment, and even violence. There is no data to support any such notion that children who are socially transitioned in a pre-pubertal time

period who then go on to embrace their assumed gender at birth are damaged. I know several such young people who are healthy and happy.

The Quality of the Evidence and Lack of Randomized Controlled Trials

70. The care of transgender individuals has a long history. As with all medical care, there is a range of quality in the existing data regarding the treatment of gender dysphoria,[53] and there is certainly a need for additional studies of a longitudinal nature. But again, that is true with most medical care.

71. Between 1963 and 1979, over 20 university-based gender identity clinics opened in the United States.[54] These clinics provided interdisciplinary care that included psychiatrists and other mental health professionals and played an important role in the provision of medical services to transgender people and in promoting research to improve their care. The majority of these clinics closed following a 1981 decision of the U.S. Department of Health and Human Services (HHS) that labeled sex reassignment surgery as experimental, in large part due to advocacy by Dr. Paul McHugh.[55] That decision was overturned by HHS in 2014 in a determination that concluded that the 1981 decision was "not

[53] See Deutsch (ed.) (2016) (UCSF Guidelines).

[54] Byne, et al. (2018).

[55] In this way, Dr. McHugh actively attempted to suppress the research that he complains is lacking in this field of care.

reasonable" and found that gender-affirming surgery is "a safe and effective treatment option."[56]

72. Over the last four decades: research has continued to occur in the United States and internationally; WPATH (formerly the Henry Benjamin International Gender Dysphoria Association) published the first iteration of the Standards of Care in 1979, which is now in its 8th version; the DSM and ICD stopped classifying transgender identification as a mental disorder; the American Psychological Association and Endocrine Society, as well as other medical organizations, adopted clinical guidelines consistent with the WPATH Standards of Care; and dozens of interdisciplinary gender clinics associated with research institutions and teaching hospitals have been providing gender-affirming care for transgender youth and adults across the United States.

73. Drs. Brignardello-Petersen and Wiercioch repeatedly refer to an apparent lack of data comparing treated vs. untreated individuals with gender dysphoria. Their report continually places emphasis on data that they rated as "low certainty" based on GRADE criteria. These observations about the data do not mean that gender-affirming care is experimental or investigational.

[56] U.S. Dep't Health & Hum. Servs., NCD 140.3, Transsexual Surgery 18, 21 (2014); Byne, et al. (2018).

74. One of the intrinsic elements of rating the quality of evidence is the study design. Randomized controlled trials (RCTs) are considered the highest quality in the grading of evidence. Many of the research studies on gender-affirming care get a "low quality" grade due to the lack of RCTs.

75. But it is well-established that utilizing an untreated control group is unethical in this context – gender-affirming medical interventions have been used for decades, resulting in a vast amount of clinical knowledge about their efficacy. That said, we have a large de facto group of untreated individuals with gender dysphoria who experience significant psychiatric symptoms because of widespread barriers to access to care.

76. Clinicians who are competent in the care of transgender individuals practice according to a "first do no harm" ethic which understands that doing nothing is not a neutral option for those with gender dysphoria. Multiple studies have demonstrated the safety of gender-affirming hormones, and a growing body

of evidence does the same with regards to the safety of GnRH analogues.[57] The same is true with regards to surgery.[58]

77. In addition, RCTs are ill-suited to studying the effects of gender-affirming interventions on psychological wellbeing and quality of life of trans people. Adequate masking, adherence, and generalizability are severely impeded in transgender care, thereby negating the superior scientific value of RCTs.

78. Gender-affirming interventions have physiologically evident effects, making it impossible to mask RCTs. The purpose of puberty blockers, hormone therapy, and transition-related surgeries is to inhibit or produce visible bodily changes.

79. In an RCT, adolescents who are on puberty blockers would notice that their endogenous pubertal development had stopped, whereas those not on puberty blockers will notice that they had not. Hormonal suppression is achieved

[57] Kuper, et al. (2020); Chew, D., Anderson, J., Williams, K., May, T., & Pang, K. (2018). Hormonal Treatment in Young People With Gender Dysphoria: A Systematic Review. *Pediatrics*, *141*(4), e20173742; Colton-Meier, S. L., Fitzgerald, K. M., Pardo, S. T., & Babcock, J. (2011). The effects of hormonal gender affirmation treatment on mental health in female-to-male transsexuals. *Journal of Gay & Lesbian Mental Health*, 15(3), 281-299.

[58] Marano, A. A., Louis, M. R., & Coon, D. (2021). Gender-Affirming Surgeries and Improved Psychosocial Health Outcomes. *JAMA surgery*, *156*(7), 685–687; Olson-Kennedy, et al. (2018); Murad, et al. (2010); Smith, et al. (2005); Pfafflin & Junge (1998).

around four weeks after treatment is initiated, but it may take multiple months before participants notice that pubertal development has ceased.

80. Similarly, transgender people given hormone therapy would notice bodily changes from taking estrogen or testosterone, whereas transgender people in the control arm would notice no such changes. The onset of visible effects from hormone therapy varies from person-to-person. The first changes typically appear between one and six months of initiation, whereas other desired changes may not begin for up to a year.

81. Although it may take some time before participants are able to ascertain which treatment they were allocated to due to the delayed effect of puberty blockers and the progressive effect of and hormone therapy, large-scale unmasking is inevitable. Because the physiological changes are the primary purpose of gender-affirming care, meaningful effects on psychological wellbeing and quality of life are not expected until unmasking occurs. As such, while RCTs can be utilized to examine the effects of gender-affirming care on physiology, using RCTs to measure the effect of gender-affirming care on psychological wellbeing and quality of life would be inappropriate.

82. Unmasking an RCT of gender-affirming care would lead to non-compliance, cross-over, and response bias in the control arm of the study.

Transgender people with gender dysphoria who pursue gender-affirming care are typically insistent and persistent in seeking the interventions. They are not ambivalent as to whether they are assigned to the intervention or control arm of the study. Upon realizing that they are in the control arm due to physiological effects or lack thereof, a large proportion of the study participants would likely withdraw from the study or pursue alternative sources of gender-affirming interventions.

83. Withdrawing from the study and noncompliance with the study protocol is most likely among people who have alternative means of securing gender-affirming care and who experience more severe bodily gender dysphoria, raising grave concerns of systematic bias. Gender-affirming interventions can be obtained from parents, peers, illicit or unauthorized sources, other providers within or outside of the health care system, and through medication-sharing with participants from the active arm of the study. Some of these options are associated with elevated safety risks, giving rise to additional ethical concerns about the use of RCTs. Intentional withdrawal with the goal of forcing the study to end is also possible. Resentment towards researchers for not allowing all participants to receive gender-affirming interventions may also increase the risk of response bias compared to observational studies, and the experimental design

may motivate youths to engage in self-harm or suicidal behavior to influence the study results, aggravating scientific and ethical concerns.

84. Given that withdrawal rates could be high enough for studies to be terminated before they are concluded, RCTs may prove impossible to conduct altogether. The likelihood of withdrawal, non-adherence, and response bias in the context of transgender care undermines RCTs' ability to detect true associations and avoid specious associations between the intervention and the outcomes.

85. Many disciplines and areas of research rely on observational studies because RCTs are considered impracticable or unethical. This is especially common when studying the mental health outcomes of physiologically evident interventions due to the impossibility of masking, and when studying the outcomes of highly desired interventions due to the risks of de-randomization. Psychological and psychosocial interventions are most commonly studied using observational methodologies, and many research questions remain unstudied with RCTs.

86. Thus, while the GAPMS Memo correctly notes that "[p]resently, no RCTs that evaluate puberty suppression as a method to treat gender dysphoria are available," the lack of RCTs is easily understood considering the above

observations about RCTs in this context. (See GAPMS Memo at 15). And, the GAPMS Memo fails to mention that "[d]espite GnRH analogue treatment being used in precocious puberty for more than 20 years, there are no randomized controlled trials to evaluate the effect of GnRHa on a final height compared with untreated controls."[59]

87. In addition, the GAPMS Memo's focus on RCTs reveals AHCA's fundamental misunderstanding of "evidence-based medicine." (GAPMS Memo at 9).

88. Evidence-based medicine, which originated in the second half of the 19th Century, means the conscientious, explicit, judicious, and reasonable use of current best evidence in making decisions about the care of individual patients. Since its inception, evidence-based medicine has included an element of clinician expertise. Indeed, the modern understanding of evidence-based medicine is a systematic approach to clinical problem solving which allows the integration of the best available research evidence with *clinical expertise and patient values*.[60]

[59] Mul & Hughes (2008).

[60] Masic, I., Miokovic, M., & Muhamedagic, B. (2008). Evidence based medicine - new approaches and challenges. *Acta informatica medica : AIM : journal of the Society for Medical Informatics of Bosnia & Herzegovina : casopis Drustva za medicinsku informatiku BiH*, *16*(4), 219–225.

89. Contemporaneous evidence-based medicine is defined by the *integration of clinical knowledge and skills* with the best critically-appraised-evidence available *as well as patient values and preferences in order to make a clinical decision*. The research literature is continually growing as new discoveries unravel.

90. The GAPMS Memo assigns no value to clinician expertise, experience, and skill, nor to the desires of the individual seeking services. In fact, the GAPMS Memo repeatedly and broadly asserts that recommendations for treatment of GD by well-established professional associations do not rely on evidence-based medicine, but rather on the recommendations outlined by WPATH, the Endocrine Society or others. But these two organizations not only examine best available evidence, but the guidelines and standards of care are updated by clinicians and scientists at the top of the field.

The Use of "Off-Label" Medications

91. Both the GAPMS Memo and Dr. Van Meter repeatedly express concern that the U.S. Food and Drug Administration (FDA) has not approved puberty blockers or hormone therapy for the treatment of GD. (See, e.g., GAPMS Memo at 8, 19; Van Meter at 8). Indeed, Dr. Van Meter asserts that the mere use of these medications "off-label" amounts to "uncontrolled, non-consentable

experimentation on children." (Van Meter at 8). These concerns are misleading and false.

92. The use of "off-label" medications is extremely common across all fields in medicine and there are many medications that are used "off-label" in the pediatric population. Most of the therapies prescribed to children are on an off-label or unlicensed basis.[61] Common medications that are used "off-label" in pediatrics include antibiotics, antihistamines, and antidepressants. That is because the majority of drugs prescribed have not been tested in children and safety and efficacy of children's medicines are frequently supported by low quality evidence. This is explained by the lack of clinical research in this population, caused by ethical, scientific, and technical issues, as well as commercial priorities.

93. "From the FDA perspective, once the FDA approves a drug, healthcare providers generally may prescribe the drug for an unapproved use when they judge that it is medically appropriate for their patient."[62] Indeed, for

[61] Allen, H.C., Garbe, M.C., Lees, J., Aziz, N., Chaaban, H., Miller, J.L., Johnson, P., & DeLeon, S. (2018). Off-Label Medication use in Children, More Common than We Think: A Systematic Review of the Literature. *The Journal of the Oklahoma State Medical Association*, *111*(8), 776–783.

[62] U.S. Food and Drug Admin. Understanding Unapproved Use of Approved Drugs "Off Label" (Feb. 5, 2018), https://www.fda.gov/patients/learn-about-expanded-access-and-other-treatmentoptions/understanding-unapproved-use-approved-drugs-label.

over 40 years, the FDA has informed the medical community that "once a [drug] product has been approved …, a physician may prescribe it for uses or in treatment regimens of patient populations that are not included in approved labeling."[63] Accordingly, the American Academy of Pediatrics has stated that "off-label use of medications is neither experimentation nor research."[64] Thus, "[t]he administration of an approved drug for a use that is not approved by the FDA is not considered research and does not warrant special consent or review if it is deemed to be in the individual patient's best interests."

Concerns about the Diagnosis of Gender Dysphoria and the Use of Self-Reports

94. The GAPMS Memo and Dr. Cantor criticize that the diagnosis of gender dysphoria is based, at least in part, on a patient's self-report. (GAPMS Memo at 19, 24, 28; Cantor ¶¶ 42, 49). This critique demonstrates a fundamental misunderstanding of how gender-affirming care is provided.

95. While we have continued to attain a greater understanding about the etiology of gender incongruence, patients do not self-diagnose, as Dr. Cantor

[63] U.S. Food and Drug Admin, "Citizen Petition Regarding the Food and Drug Administration's Policy on Promotion of Unapproved Uses of Approved Drugs and Devices; Request for Comments," 59 Fed. Reg. 59,820 (Nov. 18, 1994).

[64] Frattarelli, D. A., Galinkin, J. L., Green, T. P., Johnson, T. D., Neville, K. A., Paul, I. M., Van Den Anker, J. N., & American Academy of Pediatrics Committee on Drugs (2014). Off-label use of drugs in children. *Pediatrics*, *133*(3), 563–567.

suggests. (Cantor ¶¶ 42, 49). However, it is not unusual or extraordinary in medicine for a provider to consider patients' reports of their symptoms as part of the medical assessment. Much like the diagnosis of many clinical conditions, providers rely on self-report to ascertain accurate diagnoses. Consider the diagnosis of chronic fatigue. The diagnostic criteria for this diagnosis include the following: fatigue so severe that it interferes with the ability to engage in pre-illness activities; of new or definite onset (not lifelong); not substantially alleviated by rest; worsened by physical, mental or emotional exertion. Like gender dysphoria, these diagnostic criteria are a subjective telling of an individual's personal experience. It is incumbent upon providers of gender-affirming care to acquire skills that help them ascertain many details about their patient's gender experience including but not limited to the history, developmental trajectory, and expectations regarding treatment options.

96. The provision of gender-affirming care occurs in multi-disciplinary settings, and indeed, the WPATH SOC recommend such an approach.[65] The

[65] Chen, D., Hidalgo, M. A., Leibowitz, S., Leininger, J., Simons, L., Finlayson, C., & Garofalo, R. (2016). Multidisciplinary Care for Gender-Diverse Youth: A Narrative Review and Unique Model of Gender-Affirming Care. *Transgender health*, *1*(1), 117–123; Coleman, et al. (2022); Coleman, E., Bockting, W., Botzer, M., Cohen-Kettenis, P., DeCuypere, G., Feldman, J., ... & Zucker, K. (2012). Standards of care for the health of transsexual, transgender, and gendernonconforming people, version 7. *International Journal of Transgenderism*, 13(4), 165-232.

multiple health providers involved, from various fields, are well trained to conduct clinical interviews and to assess a patient's report to determine whether they meet the diagnostic criteria for GD.

Particular Concerns about the Use of Puberty Delaying Medications

97. The GAPMS Memo and Dr. Cantor allege that the provision of puberty delaying medications for the treatment of GD is not effective. This is not true.

98. A substantial body of evidence shows that gender-affirming medical interventions improve mental health outcomes for transgender persons with GD, who, without treatment, experience higher levels of depression, anxiety, and suicidality. Each of these studies—as with all studies in medicine—has strengths and limitations, and no one study design can answer all questions regarding an intervention. But taken together, these studies indicate that gender-affirming medical care improves mental health for adolescents who require such care.

99. Keeping this in mind, peer-reviewed cross-sectional and longitudinal studies have found that pubertal suppression is associated with a range of improved mental health outcomes for transgender adolescents, including statistically significant improvements in internalizing psychopathology (*e.g.*,

anxiety and depression), externalizing psychopathology (*e.g.*, disruptive behaviors), global functioning, and suicidality.[66]

100. For example, in the realm of cross-sectional studies, Turban et al. *Pediatrics* 2020 found that, after controlling for a range of other variables, those who accessed pubertal suppression had lower odds of lifetime suicidal ideation than those who desired but were unable to access this intervention during adolescence. A similar study by van der Miesen et al. in the *Journal of Adolescent Health*, noted above, compared 272 adolescents who had not yet received pubertal suppression with 178 adolescents who had been treated with pubertal suppression. Those who had received pubertal suppression had statistically significant lower "internalizing psychopathology" scores (a measure of anxiety and depression).[67]

101. Longitudinal studies have yielded similar results. For example, de Vries et al. in the *Journal of Sexual Medicine* (discussed above) found statistically significant improvements in symptoms of depression and general

[66] *See*, *e.g.*, Tordoff, D. M., Wanta, J. W., Collin, A., Stepney, C., Inwards-Breland, D. J., & Ahrens, K. (2022). Mental Health Outcomes in Transgender and Nonbinary Youths Receiving Gender-Affirming Care. *JAMA network open*, *5*(2), e220978; Turban, et al. (2020); van der Miesen, et al. (2020); Achille, et al. (2020); de Vries, et al. (2014); de Vries, et al. (2011). *See also* paragraphs 25-30, *supra*.

[67] van der Miesen, et al. (2020).

functioning following pubertal suppression for adolescents with gender dysphoria.[68]

102. The GAPMS Memo, as well as the "assessments" by Dr. Brignardello-Petersen and Dr. Wiercioch and by Dr. Cantor, emphasize the possible risks and side effects associated with the provision of gender-affirming care. Every single medication, however, has potential negative side effects, in addition to the possibility of new side effects that have not been historically documented. This is one of the reasons that evidence-based medicine relies heavily on experienced clinicians to exercise their expertise and judgement.

103. The risks associated with the provision of GnRH analogues are comparable when used for transgender and non-transgender patients alike. For example, many of the side effects and risks associated with the provision of GnRH analogues have been well-studied with regards to the use of these medications for the treatment of central precocious puberty (CPP).[69]

104. Given than puberty blockers are reversible, permanent sterility is not a side effect. There is no data to support that patients who have been treated with

[68] de Vries, et al. (2011).

[69] Eugster E. A. (2019). Treatment of Central Precocious Puberty. *Journal of the Endocrine Society*, *3*(5), 965–972.

blockers for central precocious puberty are "sterilized" following its use. To the contrary, information regarding long-term outcomes of patients treated with GnRH analogues with respect to gonadal function are reassuring. In fact, some studies have shown that assigned males had normal sperm function following treatment and cisgender women treated as children did not need assisted reproductive techniques.

105. In addition, while during the course of treatment with pubertal delaying medication, there is some loss in bone density, which is a side effect that we discuss with all patients and their families, studies show that with removal of the blocking agent or addition of gender affirming hormone therapy, bone mineral density begins to improve.[70] Studies regarding the use of GnRH analogues for the treatment of CPP document that following cessation of therapy with puberty delaying medications bone mineral accrual appears to be within the normal range compared with population norms. Indeed, patients treated with pubertal suppression for CPP are on pubertal blockades without affirming

[70] Vlot, M. C., et al. (2017). Effect of pubertal suppression and cross-sex hormone therapy on bone turnover markers and bone mineral apparent density (BMAD) in transgender adolescents. *Bone*, *95*, 11–19; Klink, D., et al. (2015). Bone mass in young adulthood following gonadotropin-releasing hormone analog treatment and cross-sex hormone treatment in adolescents with gender dysphoria. *The Journal of clinical endocrinology and metabolism*, *100*(2), E270–E275.

hormones for longer periods of time than patients treated with puberty blockers for the treatment of gender dysphoria and the same risks are present.[71]

Particular Concerns about the Use of Cross-Sex Hormones

106. The claim that treating gender dysphoria with medically supervised and recommended hormone treatment is particularly risky or causes serious mental health effects is not supported by data.

107. Peer-reviewed research studies have found improved mental health outcomes following gender-affirming hormone treatment (*e.g.*, estrogen or testosterone) for individuals with gender dysphoria, including adolescents.[72] These include statistically significant improvements in internalizing psychopathology (*e.g.*, anxiety and depression), general well-being, and suicidality. For example, Allen et al. followed a cohort of 47 adolescents with gender dysphoria, and found statistically significant improvements in general well-being and suicidality, as measured by the National Institutes of Health "Ask Suicide Screening Questions" instrument.[73]

---

[71] Eugster (2019).

[72] *See*, *e.g.*, Achille, et al. (2020); de Lara, D.L., Rodríguez, O.P., Flores, I.C., *et al*. (2020). Psychosocial Assessment in Transgender Adolescents. *Anales de Pediatría (English Edition)*, 93(1), 41-48; Grannis, et al. (2021); Allen, L.R., Watson, L.B., Egan, A.M., & Moser, C.N. (2019). Well-Being and Suicidality Among Transgender Youth After Gender-Affirming Hormones. *Clinical Practice in Pediatric Psychology*, 7(3), 302-311.

[73] Allen, et al. (2019).

108. What is more, the side effects and risks associated with these treatments are not unique to transgender individuals placed on these therapies.

109. The WPATH SOC require that fertility preservation is offered to all transgender patients prior to the initiation of gender affirming hormones. However, data shows that treatment with testosterone is not sterilizing.[74] And many transgender men become pregnant on their own.

110. It is also important to note that when these risks are reported, they are rare risks. While starting a transgender individual with GD on gender affirming hormones can raise their risk, their risk profile remains similar to their cisgender counterparts. Many times, the lipid profiles, hematologic profiles, and findings are equivalent to that of the gender these individuals identify with, as opposed to that of their sex assigned at birth.

The Misconceived Notion that Psychotherapy Alone Is Sufficient for the Treatment of Gender Dysphoria

111. Dr. Cantor describes several studies and claims that because the study subjects who were recipients of both gender-affirming hormones or puberty blockers, on the one hand, and psychotherapy, on the other hand, demonstrated

[74] Yaish, I., et al. (2021). Functional ovarian reserve in transgender men receiving testosterone therapy: evidence for preserved anti-Müllerian hormone and antral follicle count under prolonged treatment. *Human reproduction (Oxford, England)*, *36*(10), 2753–2760.

improvements in mental health, that the medical interventions could not be differentiated as responsible for the improvement. (Cantor ¶¶ 40-41).

112. Historically the psychotherapy professional world advocated for a "therapy only" model to address gender dysphoria. As early as the 1920's and 1930's it became evident to the preeminent scholars in the field that gender dysphoria (named something else at that time) was refractory to psychotherapy. As noted in 1966 in Harry Benjamin's The Transsexual Phenomenon, "Allegedly, transsexualism, although basically a psychiatric condition, is paradoxically resistant to psychiatric help."[75] In this statement, Harry Benjamin acknowledges that psychiatric intervention cannot alter people's gender, nor does it lead to a diminishing of the distress that arises from gender incongruence. There has been an abundance of opportunity to demonstrate unequivocally that gender dysphoria is best treated with psychotherapy alone, and yet it never has been. To suggest this is now an appropriate approach simply because transgender people are coming out at younger ages is illogical.

[75] Benjamin (1966).

Dr. Lappert's Critique of My Published Work

113. In his "assessment," Dr. Lappert criticizes a 2018 article I co-wrote that was published in JAMA Pediatrics, which he acknowledges to be a "leading journal." He refers to the article as "reckless" and using "low-quality data." (Lappert, p. 7).

114. Dr. Lappert takes issue with the claim in this article that regret for surgery is "rare." (Lappert p. 7). The manuscript describes that no individual who had undergone chest reconstruction in this cohort regretted this decision. While no single study can capture all experiences, the data reported in this study and clinical experience support the claim that regret after chest surgery is rare.

115. Dr. Lappert additionally calls surgery on minors a "reckless, experimental practice" and, without citing any evidence to support his claims, states that it has "apparently been abandoned as unethical" in England, Sweden, and Finland. (Lappert p. 7). Chest surgery for transmasculine youth younger than the age of majority is not experimental. While the scientific study of the care of transgender youth is still ongoing and growing, this does not make such care experimental. By its very nature, science is ever growing and ongoing. Moreover, Dr. Lappert's claim completely discounts the clinical experiences of both community members and providers of such care.

116. Dr. Lappert seems to take issue with the methods my study used to recruit participants, which he terms "convenience sampling" and suggests constitutes "self-selection" and confirmation bias. (Lappert p. 7). While it is true that the participants were recruited from our practice, individuals seeking such a surgical intervention will also be enrolled in care at clinics familiar with gender affirming care, therefore, they are "self-selecting" to become patients. As noted in my manuscript, we made an attempt to reach all patients in our clinic who had been referred for chest surgery.

117. Dr. Lappert emphasizes that 26% of study participants who had undergone surgery could not be reached during follow-up phone calls. (Lappert p. 7). He further highlights that of the individuals we were able to reach by phone, 72% completed our survey. Again Dr. Lappert bemoans these facts as demonstrating self-selection and confirmation bias. Our Center provides services for youth and young adults up to the age of 25. Some participants who were unable to be reached had aged out of services, moved, changed their phone numbers, or simply didn't answer a phone call. This is common among all research.

118. Dr. Lappert additionally criticizes our paper for using a novel measure of gender dysphoria, which he claims is "entirely unvalidated" and "junk

science." (Lappert p. 8). When no measures exist to gain understanding about an experience, measures need to be created. Chest dysphoria is a latent construct, and as such needs to be captured through a collective of questions. The chest dysphoria scale components were developed through both content and face validity. The scale was not validated, as I clearly reported in the manuscript. In a manuscript by Sood et al., Chest Dysphoria, as measured by the scale I created, among 156 transmasculine youth, showed a significant, positive association with anxiety and depression.[76]

119. Dr. Lappert suggests that our findings, which looked at satisfaction with gender-affirming surgery for patients who had undergone surgery between less than 1 to 5 years prior to the survey, are "misleading" and "deceptive" because they are not completely consistent with other long-term longitudinal population studies. (Lappert p. 8). I have not seen any longitudinal studies looking at chest surgery that dispute the findings laid out in my manuscript. In a meta-analysis related to satisfaction following masculinizing chest surgery,

[76] Sood, R., Chen, D., Muldoon, A. L., Chen, L., Kwasny, M. J., Simons, L. K., Gangopadhyay, N., Corcoran, J. F., & Jordan, S. W. (2021). Association of Chest Dysphoria With Anxiety and Depression in Transmasculine and Nonbinary Adolescents Seeking Gender-Affirming Care. *The Journal of adolescent health: official publication of the Society for Adolescent Medicine*, *68*(6), 1135–1141.

Bustos et al. found that among 1,052 transmasculine patients, the overall satisfaction rate was 92%.[77]

120. Based on his review of my study, Dr. Lappert concludes that it "is essentially useless in making any clinical decisions regarding who should be offered surgery, what is the likelihood they will benefit from it, and what is the likelihood they will regret their decision." (Lappert p. 8). There have been at least two studies since my manuscript that have duplicated the findings laid out in my manuscript in addition to the meta-analysis conducted by Bustos et al. described above.

CONCLUSION

121. Gender-affirming medical and surgical care is effective, beneficial, and necessary for transgender people suffering with gender dysphoria, including transgender youth after the onset of puberty. It is well documented and studied, through years of clinical experience, observational scientific studies, and even some longitudinal studies. It is also the accepted standard of care by all major medical organizations in the United States.

[77] Bustos, et al. (2021).

122. The denial of gender-affirming care, on the other hand, is harmful to transgender people. It exacerbates their dysphoria and may cause anxiety, depression, and suicidality, among other harms.

123. The GAPMS memo is misguided and informed by individuals with no experience or knowledge base regarding the provision of gender-affirming care, not to mention well-documented biases against transgender people and/or the provision of gender-affirming care. The report leans heavily on manuscripts that are not contemporaneous with our modern understanding of gender identity and gender dysphoria, demonstrated by outdated and incorrect terminology.

124. While data may be described as weak due to the lack of randomized controlled trials, many disciplines and areas of research rely on observational studies because RCTs are considered impractical or unethical. This is especially common when studying the mental health outcomes of physiologically evident interventions due to the impossibility of masking, and when studying the outcomes of highly desired interventions due to the risks of de-randomization. Psychological and psychosocial interventions are most commonly studied using observational methodologies, and many research questions remain unstudied with RCTs.

125. Finally, the reports completely overlook bodily autonomy. Given the repeated conflation of children and adolescents, it is not surprising that the "assessments" relied upon by the GAPMS Memo and the GAPMS Memo itself view adolescents as too immature to understand their own gender. However, many studies have demonstrated that cisgender children as young as age 2 know their gender. Denying medical care to adolescent youth with gender dysphoria is an act of acquiescence to the fear of what is not understood.

126. I do not disagree that, as with every field of medicine, there is more to learn in the field of transgender youth care. That is why I became an investigator. However, there is room to provide gender-affirming medical interventions in a thoughtful manner that extrapolates from relevant fields of science and medicine, existing data and clinical expertise while simultaneously carrying out necessary investigations.

127. The denial of much needed care only serves to harm transgender people.

I declare under penalty of perjury under the laws of the United States of America that the foregoing is true and correct.

Executed this 16 day of February, 2023.

2006 - 2011	Los Angeles Pediatric Society (Past president 2010)
2010 - present	Professional Association for Transgender Health
2014 - present	Society for Pediatric Research
2017 - present	US Professional Association for Transgender Health

MAJOR LEADERSHIP POSITIONS: (E.G., DEAN, CHAIR, INSTITUTE DIRECTOR, HOSPITAL ADMINISTRATION, ETC.)

RESEARCH AND SCHOLARSHIP

EDITORSHIPS AND EDITORIAL BOARDS:

Year-Year	*Position*	*Journal/Board Name*
2015 - present	Associate Editor	Journal of Transgender Health

MANUSCRIPT REVIEW:

Year-Year	*Journal*
2014 - present	Pediatrics
2014 - present	Journal of Adolescent Health
2014 - present	LGBT Health
2014 - present	International Journal of Transgenderism
2015 - present	Journal of Transgender Health
2018 - present	Clinical Child Psychology and Psychiatry
2018 - present	Journal of Sexual Medicine
2018 - present	Journal of Transgender Health
2021 - present	JAMA Peds

GRANT REVIEWS:

Year	*Description*	*Awarding agency, City, State, Country*
2017	Cognition and Perception Study Section	National Institutes of Health, Bethesda, Maryland, USA
2017	Neurological, Aging and Musculoskeletal Epidemiology Study Section	National Institutes of Health, Bethesda, Maryland, USA
2018	Social Psychology, Personality and Interpersonal Processes Study Section	National Institutes of Health, Bethesda, Maryland, USA
2018	Neurological, Aging and Musculoskeletal Epidemiology Study Section	National Institutes of Health, Bethesda, Maryland, USA
2019	Special Emphasis Panel Review of Research Conference (R13) Grants	National Institutes of Health, Bethesda, Maryland, USA
2019	The Einstein Foundation Award for Promoting Quality in Research	Einstein Foundation, Berlin
2020	Biobehavioral and Behavioral Sciences Study Section	National Institutes of Health, Bethesda, Maryland, USA
2021	Social Psychology, Personality and Interpersonal Processes Study Section	National Institutes of Health, Bethesda, Maryland, USA

MAJOR AREAS OF RESEARCH INTEREST

Research Areas
1. Transgender and non-binary children, adolescents and young adults
2. HIV medication adherence

GRANT SUPPORT - CURRENT:

Grant No. (PI)2R01HD082554-06A1 (Olson-Kennedy)	*Dates of Award: 2021-2026*
Agency: NICHD	*Percent Effort 25%*
Title: The Impact of Early Medical Treatment in Transgender Youth	
Description: This is the continuations of a multicenter study, the first of its kind in the U.S. to evaluate the long-term outcomes of medical treatment for transgender youth. This study will provide essential, evidence-based information on the physiological and psychosocial impact, as well as safety, of hormone blockers and cross-sex hormones use in this population.	

Role: Principle Investigator
*Total Direct Costs: $*4,918,586

Grant No. 1R01HD097122-01 (Hidalgo)	*Dates of Award: 2019-2024*
Agency: NICHD	*Percent Effort 2.5%*
Title: A Longitudinal Study of Gender Nonconformity in Prepubescent Children	
Description: The purpose of this study is to establish a national cohort of prepubertal transgender/gender nonconforming (TGNC) children (and their parents), and longitudinally observe this cohort to expand the body of empirical knowledge pertaining to gender development and cognition in TGNC children, their mental health symptomology and functioning over time, and how family-initiated social gender transition may predict or alleviate mental health symptoms and/or diagnoses.	
Role: Site PI	
Total Direct Costs: $2,884,950	

GRANT SUPPORT - PAST:

Grant No. (PI) 1RO1HD082554-01A1	*Dates of Award: 2015-2020*
Agency: NICHD	*Percent Effort 45%*
Title: The Impact of Early Medical Treatment in Transgender Youth	
Description: This is a multicenter study, the first of its kind in the U.S. to evaluate the long-term outcomes of medical treatment for transgender youth. This study will provide essential, evidence-based information on the physiological and psychosocial impact, as well as safety, of hormone blockers and cross-sex hormones use in this population.	
Role: Principle Investigator	
*Total Direct Costs: $*4,631,970	
Grant No. (COI) R01AI128796-01	Dates of Award: 2/24/17-1/31/18
Agency: NIAID	Percent Effort: 5%
Title: Maturation, Infectibility and Trauma Contributes to HIV Susceptibility in Adolescents	
Description: This proposal explores the overarching hypothesis that fluctuations in sex steroid levels and mucosal trauma (sexual activity) are key determinants of mucosal immune activation and epithelial integrity, and that microbial communities are central to these processes. We will pursue this hypothesis by examining longitudinal changes in the anogenital microbiome as well as protein expression at these mucosal sites during sexual maturation (cisgender youth) and in hormonally-controlled sexual maturation (transgender youth). Associations between sex steroid levels, microbial community composition, mucosal trauma, and vaginal proteins will be determined and modeled.	
Role: Co-Investigator	
Total Direct Costs: $44,816	

Grant No. (PI) U01HD040463	*Dates of Award* 2006 – 2016
Agency: NIH/NICHD	*Percent Effort: 10%*
Title: Adolescent Medicine Trials Network for HIV/AIDS	
Description: Adolescent Medicine Trials Network for HIV/AIDS	

Role: Co-Investigator
Total Direct Costs: 2,225,674

Grant No. (PI) SC CTSI 8KL2TR000131	*Dates of Award: 2012-2014*
Agency: KL2 Mentored Career Research Development Program of the Center for Education, Training and Career Development	*Percent Effort: 37.5%*
Title: The Impact of Hormone Blockers on the Physiologic and Psychosocial Development of Gender Non-Conforming Peri-Pubertal Youth	
Description: This study aimed to understand the impact of puberty blocking medications on mental health and physiolgic parameters in peri-pubertal transgender youth.	
Role: Principal Investigator	
Total Direct Costs: 191,525	

Invited Lectures, Symposia, keynote addresses

Date	***Type***	***Title, Location***
2014	Invited Lecture	Transgender Youth; Needs, Risks, Outcomes and the Role of the System, Including Permanency and Inclusion for Our Youth, Administrative Office of the Courts, Center for Families and Children, San Diego, California
2015	Invited Lecture	Caring for Gender Non-Conforming and Transgender Youth, Lopez Family Foundation Special Lecture for Puerto Rico and Panama, Lopez Family Foundation, Children's Hospital Los Angeles, Los Angeles, California
2015	Symposium	Transgender Youth – An Overview of Medical and Mental Health Needs of Gender Non-Conforming Children and Transgender Adolescents, Public Child Welfare Training Academy, Academy for Professional Excellence at San Diego State University School of Social Work, San Diego, California
2015	Invited Lecture	Meeting the Needs of Transgender Adolescents; 1st Annual Southern California LGBT Health Symposium; USC/UCLA, Los Angeles, California
2015	Symposium	Transgender Youth; An Overview of Medical and Mental Health Needs of Gender Non-conforming Children and Transgender Adolescents; GetReal California's Initiative; "Integrating Sexual Orientation, Gender Identity, and Expression (SOGIE) into California's Child Welfare System," Oakland, California
2016	Invited Symposium	Caring for Gender Nonconforming and Transgender Youth; Idyllwild, California
2016	Educational symposium	Gender 101: A Primer; Vista Mar, California
2016	Invited Lecture	Caring for Gender Non-conforming Children and Teens in the New Millennium - A Multidisciplinary Team Approach, California Association of Marriage and Family Therapists, Los Angeles, California
2016	Invited Lecture	Caring for Gender Nonconforming Children and Transgender Youth, California Psychological Association, Continuing Education Institute, Irvine, California
2016	Invited Lecture	Health Issues Related to Transgender Youth; LA City Health Commission, Los Angeles, California

2016	Invited Lecture	Caring for Gender Nonconforming and Transgender Youth, Medical Directors 12th Annual Update on Reproductive Health and Medical Leadership, Planned Parenthood, Steamboat Springs, Colorado
2016	Invited Lecture	Caring For Transgender Teens, UCLA Meet the Professor, Los Angeles, CA
2017	Symposium	Caring for Gender Non-Conforming and Transgender Youth, TransYouth Care, Santa Barbara, CA
2017	Invited Lecture	Healthcare for TGNC Youth, Expanding Competency for LGBT Youth in the System, Washington DC
2017	Invited Lecture	Gender Non-conforming and Transgender Children and Youth; Center for Early Education, West Hollywood, CA
2017	Invited Lecture	Rethinking Gender, University of Massachusetts, Annual Convocation Welcome Luncheon, Worcester, MA
2017	Invited Lecture	Gender Non-Conforming Children and Transgender Youth, Board of Behavioral Sciences, Orange, CA
2017	Invited Lecture	Puberty Suppression and Hormones; Medical Interventions for Transgender Youth, Santa Monica Rape Treatment Center, Santa Monica, CA
2017	Invited Lecture	Transgender Youth Care in the New Millennium, USC Law and Global Health Initiative, Los Angeles, CA
2018	Invited Lecture	Supporting Gender Diverse and Transgender Youth: A Deeper Look at Gender Dysphoria, Studio City, CA
2018	Invited Lecture	Working with Trans and Gender Non-Conforming Youth, Children's Hospital Orange County, CA
2018	Invited Lecture	Caring for gender Non-conforming and Transgender Youth and Young Adults, Ascend Residential, Encino CA
2018	Invited Lecture	Caring for gender Non-conforming and Transgender Youth and Young Adults, California State University Northridge, Northridge, CA
2018	Invited Lecture	Gender Dysphoria; School Nurse Organization of Idaho Annual Conference, Idaho
2018	Invited Lecture	Gender and What You Should Know, Archer School for Girls, Brentwood, CA
2018	Symposium	Caring for Gender Non-Conforming and Transgender Youth, TransYouth Care, Oceanside, CA
2018	Invited Lecture	Gender Dysphoria: Beyond the Diagnosis, Advance LA, Los Angeles, CA
2018	Invited Lecture	Caring for Gender Non-Conforming and Transgender Youth, Andrology Society of America Clinical Symposium, Portland, OR
2018	Symposium	Caring for Gender Non-Conforming and Transgender Youth, TransYouth Care, Los Angeles, CA
2018	Invited Lecture	Caring for Gender Non-Conforming and Transgender Youth, Center for Early Education, Los Angeles, CA
2019	Symposium	The Care of Trans and Gender Non-Conforming Youth and Young Adults, Cal State Los Angeles, California
2019	Symposium	The Care of Trans and Gender Non-Conforming Youth and Young Adults, Claremont Colleges, California
2019	Symposium	TransYouth Care; Flagstaff, AZ
2019	Invited Lecture	Transgender and Gender Non-conforming Youth, Ascend Residential Treatment, Utah
2019	Invited Lecture	Gender Diverse and Transgender Youth; What Pediatricians Should Know, Common Problems in Pediatrics Conference, Utah AAP, Utah

2019	Invited Lecture	Gender Diverse and Transgender Youth; What Pediatricians Should Know, Common Problems in Pediatrics Conference, Utah AAP, Utah
2019	Invited Lecture	Caring for Gender Diverse and Transgender Youth, Grand Rounds, UCLA Olive View, CA
2019	Invited Lecture	Caring for Gender Diverse and Transgender Youth, Grand Rounds, Good Samaritan, CA
2019	Invited Lecture	Puberty Suppression in Youth with Gender Dysphoria, Fenway Trans Health Program, Boston
2019	Invited Lecture	Recognizing the Needs of Transgender Youth, California Department of Corrections and Rehabilitation, Ventura, CA
2019	Invited Lecture	Gender Dysphoria; Beyond the Diagnosis, Gender Education Demystification Symposium, GA
2019	Invited Lecture	Caring for Gender Nonconforming and Transgender Youth, Los Angeles Superior Court/Los Angeles Bar Association Training, CA
2019	Invited Lecture	Supporting Gender Diverse and Transgender Youth; A Deeper Look at Gender Dysphoria, Oakwood School, CA
2020	Symposium	Trans Youth Care, Chico Transgender Week, Virtual Presentation
2020	Invited Lecture	Gender Nonconforming and Transgender Youth, Novartis, Virtual Presentation
2020	Invited Lecture	Advanced Hormones; More than Just T and E, CHLA, Virtual Presentation
2020	Invited Lecture	Video Telehealth and Transgender Youth, Telehealth Best Practices for the Trans Community, The Central Texas Transgender Health Coalition, Virtual Presentation
2020	Invited Lecture	Gear Talk, Transforming Families, Virtual Lecture
2020	Invited Lecture	Tips for Parenting a Trans or Gender Diverse Youth, Models of Pride, Virtual Presentation
2020	Invited Lecture	Caring for Gender Diverse and Transgender Youth, LGBTQ+ Clinical Academy, Palo Alto University, Virtual presentation
2020	Invited Lecture	USC Medical School, Los Angeles, CA
2020	Invited Lecture	Medical Interventions for transgender youth, Cal State Los Angeles, Los Angeles
2020	Plenary Session	Understanding Issues Involving Gender Non-Conforming and Transgender Individuals Coming to a Courtroom Near You, Mid-Winter Workshop for Judges of the Ninth Circuit, Palm Springs, CA
2021	Invited Lecture	Gender Affirmation through a Social Justice Lens; Center for Gender Equity in Medicine and Science (GEMS) at Keck School of Medicine, Los Angeles
2021	Invited Lecture	Introduction to the Care of Gender Diverse and Transgender Youth, Providence Medical Group – South Bay Pediatrics (Torrance, San Pedro, Redondo Beach), virtual lecture
2021	Invited Lecture	Caring for Gender Diverse and Transgender Youth. SLO Acceptance, Cal Poly, Virtual Presentation
2022	Invited Lecture	Transgender and Non-binary children and youth, Board of Behavioral Sciences
2022	Invited Lecture	Gender Affirmation through a Social Justice Lens; University of Arizona Health Sciences LGBTQ+ Symposium & Health Fair

2022	Invited Lecture	Gender Dysphoria in Children, Adolescents and Young Adults, MedLambda and PsychSIG Keck USC School of Medicine, Virtual Lecture
2022	Invited Lecture	Caring for Transgender and Gender Nonconforming Youth, Presbyterian Healthcare Services, New Mexico, Virtual lecture
2022	Invited Lecture	Transgender and Non-Binary Youth, Rogers Behavioral Health, Virtual Lecture
2023	Invited Lecture	**Transgender and Non-binary Youth and Young Adults 101,** When Healthcare Gets Political; Health Justice and Systems of Care course, Keck USC School of Medicine, Los Angeles

Invited Grand Rounds, CME Lectures

Tallahassee Division

AUGUST DEKKER, et al., *Plaintiffs*, v. JASON WEIDA, et al., *Defendants*.	Case No. 4:22-cv-00325-RH-MAF

EXPERT REPORT OF DANIEL SHUMER, M.D.

I, Daniel Shumer, M.D., hereby declare and state as follows:

1. I have been retained by counsel for Plaintiffs as an expert in connection with the above-captioned litigation.

2. I have actual knowledge of the matters stated herein. If called to testify in this matter, I would testify truthfully and based on my expert opinion.

I. BACKGROUND AND QUALIFICATIONS

A. Qualifications

3. I am a Pediatric Endocrinologist, Associate Professor of Pediatrics, and the Clinical Director of the Child and Adolescent Gender Clinic at Mott Children's Hospital at Michigan Medicine. I am also the Medical Director of the

Comprehensive Gender Services Program at Michigan Medicine, University of Michigan.

4. I am Board Certified in Pediatrics and Pediatric Endocrinology by the American Board of Pediatrics and licensed to practice medicine in the state of Michigan.

5. I received my medical degree from Northwestern University in 2008. After completing a Residency in Pediatrics at Vermont Children's Hospital, I began a Fellowship in Pediatric Endocrinology at Harvard University's Boston Children's Hospital. Concurrent with the Fellowship, I completed a Master of Public Health from Harvard's T.H. Chan School of Public Health. I completed both the Fellowship and the MPH degree in 2015.

6. I have extensive experience in working with and treating children and adolescents with endocrine conditions including differences in sex development (DSD) (also referred to as intersex conditions), gender dysphoria, type 1 diabetes, thyroid disorders, growth problems, and delayed or precocious puberty. I have been treating patients with gender dysphoria since 2015.

7. A major focus of my clinical, teaching, and research work pertains to the assessment and management of transgender adolescents.

8. I have published extensively on the topic of gender identity in pediatrics and the treatment of gender dysphoria, as well as reviewed the peer-reviewed literature concerning medical treatments for gender dysphoria, the current standards of care the treatment of gender dysphoria, and research articles on a variety of topics with a focus on mental health in transgender adolescents.

9. I am involved in education of medical trainees. I am the Fellowship Director in the Division of Pediatric Endocrinology, Education Lead for the Division of Pediatric Endocrinology, and Course Director for a medical student elective in Transgender Medicine. My additional academic duties as an Associate Professor include teaching several lectures, including those entitled "Puberty," "Transgender Medicine," and "Pediatric Growth and Development."

10. As a Fellow at Harvard, I was mentored by Dr. Norman Spack. Dr. Spack established the Gender Management Services Clinic (GeMS) at Boston Children's Hospital. While working and training at GeMS, I became a clinical expert in the field of transgender medicine within Pediatric Endocrinology and began conducting research on gender identity, gender dysphoria, and the evaluation and management of gender dysphoria in children and adolescents.

11. Based on my work at GeMS, I was recruited to establish a similar program assessing and treating gender diverse and transgender children and

adolescents at the C.S. Mott Children's Hospital in Ann Arbor. In October 2015, I founded the hospital's Child and Adolescent Gender Services Clinic.

12. The Child and Adolescent Gender Services Clinic has treated over 600 patients since its founding. The clinic provides comprehensive assessment, and when appropriate, treatment with pubertal suppression and hormonal therapies, to patients diagnosed with gender dysphoria. I have personally evaluated and treated over 400 patients with gender dysphoria. The majority of the patients receiving care range between 10 and 21 years old. Most patients attending clinic live in Michigan or Ohio. As the Clinical Director, I oversee the clinical practice, which currently includes 4 physicians (including 1 psychiatrist), 1 nurse practitioner, 2 social workers, 1 research coordinator, as well as nursing and administrative staff. I also actively conduct research related to transgender medicine, gender dysphoria treatment, and mental health concerns specific to transgender youth.

13. I also provide care in in the Differences/Disorders of Sex Development (DSD) Clinic at Michigan Medicine at Mott Children's Hospital. The DSD Clinic is a multidisciplinary clinic focused on providing care to infants and children with differences in the typical path of sex development, which may be influence by the arrangement of sex chromosomes, the functioning of our gonads (i.e. testes, ovaries), and our bodies' response to hormones. The clinic is comprised of members from

Pediatric Endocrinology, Genetics, Psychology, Urology, Gynecology, Surgery, and Social Work. In this clinic I have assessed and treated over 100 patients with DSD. In my role as Medical Director of the Comprehensive Gender Services Program (CGSP), I lead Michigan Medicine's broader efforts related to transgender services. CGSP is comprised of providers from across the health system including pediatric care, adult hormone provision, gynecologic services, adult surgical services, speech/language therapy, mental health services, and primary care. I run monthly meetings with representatives from these areas to help coordinate communication between Departments. I coordinate strategic planning aimed to improve care within the health system related to our transgender population. I also serve as the medical representative for CGSP in discussions with health system administrators and outside entities.

14. I have authored numerous peer-reviewed articles related to treatment of transgender youth. I have also co-authored chapters of medical textbooks related to medical management of transgender patients. I have been invited to speak at numerous hospitals, clinics, and conferences on topics related to clinical care and standards for treating transgender children and youth.

15. The information provided regarding my professional background, experiences, publications, and presentations is detailed in my curriculum vitae, a true and correct copy of the most up-to-date version of which is attached as **Exhibit A**.

B. Prior Testimony

16. In the past four years, I have been retained as an expert and provided testimony at trial or by deposition in the following cases: *Roe et al v. Utah High School Activities Association et al* (Third District Court in and for Salt Lake County, UT); and *Menefee v. City of Huntsville Bd. of Educ.*, No. 5:18-cv-01481 (N.D. Ala.). I also provided expert witness testimony on behalf of a parent in a custody dispute involving a transgender child in the following case: *In the Interest of Younger*, No. DF-15-09887 (Dallas County, Texas).

C. Compensation

17. I am being compensated at an hourly rate for the actual time that I devote to this case, at the rate of $325 per hour for any review of records, preparation of reports, declarations, and deposition and trial testimony. My compensation does not depend on the outcome of this litigation, the opinions that I express, or the testimony that I provide.

D. Bases for Opinions

18. This report sets forth my opinions in this case and the bases for my opinions.

19. In preparing this report, I reviewed the text of *Florida Medicaid – Generally Accepted Professional Medical Standards Determination on the Treatment of Gender Dysphoria*, including the attachments, as well as the Complaint in this case.

20. I have also reviewed the materials listed in the bibliography attached as **Exhibit B** to this report, as well as the materials listed within my curriculum vitae, which is attached as **Exhibit A**. The sources cited therein include authoritative, scientific peer-reviewed publications. They include the documents specifically cited as supportive examples in particular sections of this report. I may rely on these materials as additional support for my opinions.

21. In addition, I have relied on my scientific education, training, and years of clinical and research experience, and my knowledge of the scientific literature in the pertinent fields.

22. The materials I have relied upon in preparing this report are the same types of materials that experts in my field of study regularly rely upon when forming opinions on these subjects.

23. To the best of my knowledge, I have not met or spoken with the Plaintiffs or their parents. My opinions are based solely on my extensive background and experience treating transgender patients.

24. I may wish to supplement or revise these opinions or the bases for them due to new scientific research or publications or in response to statements and issues that may arise in my area of expertise.

II. EXPERT OPINIONS

A. MEDICAL AND SCIENTIFIC BACKGROUND ON SEX AND GENDER IDENTITY

25. *Sex* is comprised of several components, including, among others, internal reproductive organs, external genitalia, chromosomes, hormones, gender identity, and secondary sex characteristics (IOM, 2011).

26. *Gender identity* is the medical term for a person's internal, innate sense of belonging to a particular sex. Everyone has a gender identity. Diversity of gender identity and incongruence between assigned sex at birth and gender identity are naturally occurring sources of human biological diversity (IOM, 2011). The term *transgender* refers to individuals whose gender identity does not align with their sex assigned at birth (Shumer, et al., 2013).

27. The terms *gender role* and *gender identity* refer to different things. *Gender roles* are behaviors, attitudes, and personality traits that a particular society

considers masculine or feminine, or associates with male or female social roles. For example, the convention that girls wear pink and have longer hair, or that boys wear blue and have shorter hair, are socially constructed gender roles from a particular culture and historical period. By contrast, *gender identity* does not refer to socially contingent behaviors, attitudes, or personality traits. It is an internal and largely biological phenomenon, as reviewed below. Living consistent with one's gender identity is critical to the health and well-being of any person, including transgender people (Hidalgo, et al., 2013; Shumer, et al., 2013; White Hughto, et al., 2015).

28. A person's understanding of their gender identity may evolve over time in the natural course of their life, however, attempts to "cure" transgender individuals by forcing their gender identity into alignment with their birth sex (sometimes descried as "conversion therapy") has been found to be both harmful and ineffective. In one study, transgender adults who recall previous attempts from healthcare professionals to alter their gender identity reported an increase in lifetime suicide attempts and higher rates of severe psychological distress in the present (Turban, et al., 2020a). In another study, exposure to these types of attempts were found to increase the likelihood that a transgender adolescent will attempt suicide by 55% and more than double the risk for running away from home (Campbell, et al., 2002). Those practices have been denounced as unethical by all major

professional associations of medical and mental health professionals, such as the American Medical Association, the American Academy of Pediatrics, the American Psychiatric Association, and the American Psychological Association, among others (Fish, et al., 2022).

29. Scientific research and medical literature across disciplines demonstrates that gender identity, like other components of sex, has a strong biological foundation. For example, there are numerous studies detailing the similarities in the brain structures of transgender and non-transgender people with the same gender identity (Luders, et al., 2009; Rametti, et al., 2011; Berglund, et al., 2008; Savic, et al., 2011). In one such study, the volume of the bed nucleus of the *stria terminalis* (a collection of cells in the central brain) in transgender women was equivalent to the volume found in cisgender women (Chung, et al., 2002).

30. There are also studies highlighting the genetic components of gender identity. Twin studies are a helpful way to understand genetic influences on human diversity. Identical twins share the same DNA, while fraternal twins share roughly 50% of the same DNA, however both types of twins share the same environment. Therefore, studies comparing differences between identical and fraternal twin pairs can help isolate the genetic contribution of human characteristics. Twin studies have shown that if an identical twin is transgender, the other twin is much more likely to

be transgender compared to fraternal twins, a finding which points to genetic underpinnings to gender identity development (Heylens, et al., 2012).

31. There is also ongoing research on how differences in fetal exposures to hormones may influence gender identity. This influence can be examined by studying a medical condition called congenital adrenal hyperplasia. Female fetuses affected by congenital adrenal hyperplasia produce much higher levels of testosterone compared to fetuses without the condition. While most females with congenital adrenal hyperplasia have a female gender identity in adulthood, the percentage of those with gender dysphoria is higher than that of the general population. This suggests that fetal hormone exposures contribute to the later development of gender identity (Dessens, et al, 2005).

32. There has also been research examining specific genetic differences that appear associated with gender identity formation (Rosenthal, 2014). For example, one study examining differences in the estrogen receptor gene among transgender women and cisgender male controls found that the transgender individuals were more likely to have a genetic difference in this gene (Henningsson, et al., 2005).

33. The above studies are representative examples of scientific research demonstrating biological influences on gender identity. Gender identity, like other

complex human characteristics, is rooted in biology with important contributions from neuroanatomic, genetic and hormonal variation (Roselli, 2018).

B. RATIONALE FOR MEDICAL TREATMENT OF GENDER DYSPHORIA IN ADOLECENTS AND ADULTS

34. All medical interventions, including treatment for gender dysphoria, require rigorous study and evidence base.

35. There are several studies demonstrating positive results of gender-affirming care in adolescents and adults (de Vries, et al., 2014; de Vries, et al., 2011; Green, et al., 2022; Smith, et al., 2005; Turban, et al., 2022). These studies consistently demonstrate improvement of gender dysphoria with associated improvement of psychological functioning. A 2014 long-term follow-up study following patients from early adolescence through young adulthood showed that gender-affirming treatment allowed transgender adolescents to make age-appropriate developmental transitions while living as their affirmed gender with positive outcomes as young adults (de Vries, et al., 2014). More recently, Green et al. (2022) describe that gender-affirming hormone therapy is correlated with reduced rates of depression and suicidality among transgender adolescents. Turban et al. (2022) documented that access to gender-affirming hormone therapy in adolescence is associated with favorable mental health outcomes in adulthood, when compared to individuals who desired but could not access hormonal interventions.

C. ASSESSMENT OF GENDER DYSPHORIA IN CHILDREN, ADOLESCENTS, AND ADULTS

36. Due to the incongruence between their assigned sex and gender identity, transgender people experience varying degrees of gender dysphoria, a serious medical condition defined in both the American Psychiatric Association's *Diagnostic and Statistical Manual of Mental Disorders* (DSM-5 TR) (APA, 2022). *Gender Dysphoria* is defined as an incongruence between a patient's assigned sex and their gender identity present for at least six months, which causes clinically important distress in the person's life. This distress is further defined as impairment in social, occupational, or other important areas of functioning (APA, 2022). Additional features may include a strong desire to be rid of one's primary or secondary sex characteristics, a strong desire to be treated as a member of the identified gender, or a strong conviction that one has the typical feelings of identified gender (APA, 2022).

37. The World Health Organization's International Classification of Diseases (ICD), the diagnostic and coding compendia for mental health and medical professionals, codifies Gender Incongruence as the diagnosis resulting from the incongruity between one's gender identity and sex assigned at birth. The Gender Incongruence diagnosis is part of a new "Conditions related to sexual health" chapter in the ICD-11, which is the most recent iteration of the ICD published in 2019

(Costa, et al., 2015; WHO, 2019). This reflects evidence that transgender and gender diverse identities are not conditions of mental ill health and classifying them as such can cause enormous stigma.

38. In children and adolescents, the diagnosis of gender dysphoria is made by a health provider including but not limited to a psychiatrist, psychologist, social worker, or therapist with expertise in gender identity concerns. It is recommended that children and adolescents diagnosed with gender dysphoria engage with a multidisciplinary team of mental health and medical professionals to formulate a treatment plan, in coordination with the parent(s) or guardian(s), with a goal of reduction of gender dysphoria. The *Standards of Care for the Health of Transgender and Gender Diverse People, Version 8* ("SOC 8"), published by the World Professional Association for Transgender Health (WPATH), provides guidance to providers on how to provide comprehensive assessment and care to this patient population based on medical evidence. These standards recommend involving relevant disciplines, including mental health and medical professionals, to reach a decision with families about whether medical interventions are appropriate and remain indicated through the course of treatment. Multidisciplinary clinics, such as the Child and Adolescent Gender Clinic where I practice, have structured their programs around this model, as guided by the WPATH SOC.

39. In transgender adults, the WPATH SOC recommends that a health care provider assessing and treating a transgender patient should ensure diagnostic criteria are met prior to initiating gender-affirming treatments and ensure that any health conditions that could negatively impact the outcome of treatment are assessed, with risks and benefits discussed, before a decision is made regarding treatment. The capacity of the adult. to consent for the specific treatment should be confirmed prior to initiation (Coleman, et al., 2022).

D. EVIDENCE-BASED CLINICAL PRACTICE GUIDELINES FOR THE TREATMENT OF GENDER DYSPHORIA IN CHILDREN, ADOLESCENTS AND ADULTS

40. The goal of any intervention for gender dysphoria is to reduce dysphoria, improve functioning, and prevent the harms caused by untreated gender dysphoria.

41. Gender dysphoria is highly treatable and can be effectively managed. If left untreated, however, it can result in severe anxiety and depression, eating disorders, substance abuse, self-harm, and suicidality (Reisner, et al., 2015).

42. Based on longitudinal data, and my own clinical experience, when transgender adolescents are provided with appropriate medical treatment and have parental and social support, they are more likely to thrive and grow into healthy adults (de Vries, et al., 2014).

43. In children and adolescents, a comprehensive biopsychosocial assessment is typically the first step in evaluation, performed by a mental health provider with experience in gender identity. The goals of this assessment are to develop a deep understanding of the young person's experience with gender identity, to consider whether the child or adolescent meets criteria for a diagnosis of gender dysphoria, and to understand what options may be desired and helpful for the adolescent (Coleman, et al., 2022; Coleman, et al., 2012; Hembree, et al., 2017; Hembree, et al., 2009).

44. For children younger than pubertal age, the only recommended treatments do not involve medications. For adolescents, additional treatments involving medications may be appropriate.

45. For pre-pubertal children with gender dysphoria, treatments may include supportive therapy, encouraging support from loved ones, and assisting the young person through elements of a social transition. Social transition may include adopting a new name and pronouns, appearance, and clothing, and correcting identity documents.

46. Options for treatment after the onset of puberty include the use of gonadotropin-releasing hormone agonists ("GnRHa") for purposes of preventing progression of pubertal development, and hormonal interventions such as

testosterone and estrogen administration. These treatment options are based on robust research and clinical experience, which consistently demonstrate safety and efficacy.

47. Clinical practice guidelines have been published by several long-standing and well-respected medical bodies: the World Professional Association for Transgender Health (WPATH) and the Endocrine Society (Coleman, et al., 2022; Coleman, et al., 2012; Hembree, et al., 2017; Hembree, et al., 2009), as well as the UCSF Center for Excellence in Transgender Health (Deutsch (ed.), 2016). The clinical practice guidelines and standards of care published by these organizations provide a framework for treatment of gender dysphoria in adolescents.

48. WPATH has been recognized as the standard-setting organization for the treatment of gender dysphoria since its founding in 1979. The most recent WPATH Standards of Care (SOC 8) were published in 2022 and represent expert consensus for clinicians related to medical care for transgender people, based on the best available science and clinical experience (Coleman, et al., 2022).

49. The purpose of the WPATH Standards of Care is to assist health providers in delivering necessary medical care to transgender people, to maximize their patients' overall health, psychological well-being, and self-fulfillment. The

WPATH Standards of Care serve as one of the foundations for the care provided in my own clinic.

50. The WPATH SOC 8 is based on rigorous review of the best available science and expert professional consensus in transgender health. International professionals were selected to serve on the SOC 8 writing committee. Recommendation statements were developed based on data derived from independent systemic literature reviews. Grading of evidence was performed by an Evidence Review Team which determined the strength of evidence presented in each individual study relied upon in the document (Coleman, et al., 2022).

51. The previous version (SOC 7), published in 2012 (Coleman, et al., 2012), was the most recent version at the time of the adoption of Florida Administrative Code, 59G-1.050(7) (the "Challenged Exclusion"). SOC 7 was similar to SOC 8 in the basic tenets of management for transgender adolescents and adults; however, SOC 8 further reinforces these guidelines with data published since the release of SOC 7.

52. In addition, the Endocrine Society is a 100-year-old global membership organization representing professionals in the field of adult and pediatric endocrinology. In 2017, the Endocrine Society published clinical practice guidelines on treatment recommendations for the medical management of gender dysphoria, in

collaboration with Pediatric Endocrine Society, the European Societies for Endocrinology and Pediatric Endocrinology, and WPATH, among others (Hembree, et al, 2017).

53. The Endocrine Society Clinical Guidelines were developed through rigorous scientific processes that "followed the approach recommended by the Grading of Recommendations, Assessment, Development, and Evaluation group, an international group with expertise in the development and implementation of evidence-based guidelines." The guidelines affirm that patients with gender dysphoria often must be treated with "a safe and effective hormone regimen that will (1) suppress endogenous sex hormone secretion determined by the person's genetic/gonadal sex and (2) maintain sex hormone levels within the normal range for the person's affirmed gender." (Hembree, et al., 2017).

54. The AAP is the preeminent professional body of pediatricians in the United States, with over 67,000 members. The AAP endorses a commitment to the optimal physical, mental, and social health and well-being for youth. The 2018 policy statement titled *Ensuring Comprehensive Care and Support for Transgender and Gender-Diverse Children and Adolescents* further lends support to the treatment options outlined in the WPATH Standards of Care and the Endocrine Society's Clinical Practice Guidelines (Rafferty, et al., 2018).

55. Aside from the AAP, the tenets set forth by the Endocrine Society Clinical Practice Guidelines and the WPATH Standards of Care are supported by the major professional medical and mental health associations in the United States, including the American Medical Association, the American Psychological Association, the American Psychiatric Association, and American Academy of Family Physicians, among others (e.g., AMA, 2019; American Psychological Association, 2015; Drescher, et al., 2018 (American Psychiatric Association); Hembree, et al., 2017 (Endocrine Society); Klein, et al., 2018 (AAFP); National Academies, 2020; WPATH, 2016).

56. As a board-certified pediatric endocrinologist, I follow the Endocrine Society Clinical Practice Guidelines and the WPATH Standards of Care when treating my patients.

E. TREATMENT PROTOCOLS FOR GENDER DYSPHORIA

57. Undergoing treatment to alleviate gender dysphoria is commonly referred to as a transition. The transition process in adolescence typically includes (i) social transition and/or (ii) medications, including puberty-delaying medication and hormone therapy. The steps that make up a person's transition and their sequence will depend on that individual's medical and mental health needs and decisions made between the patient, family, and multidisciplinary care team.

58. There are no medications considered for transition until after the onset of puberty. Puberty is a process of maturation heralded by production of sex hormones—testosterone and estrogen—leading to the development of secondary sex characteristics. Secondary sex characteristics include testosterone-induced effects such as deepening of the voice, muscular changes, facial and body hair, and estrogen-induced effects such as breast development. There is diversity in the age of pubertal onset; however, most adolescents begin puberty between ages 10 and 12 years.

59. Gender exploration in childhood is expected and healthy. The majority of prepubertal children exploring their gender do not develop gender dysphoria and are not expected to become transgender adolescents or adults. In contrast, data and personal experience shows that children whose gender dysphoria persists into adolescence are highly likely to be transgender (van der Loos, et al., 2022). Some individuals in this field misinterpret older studies showing that a large percentage of children diagnosed with gender identity disorder did not grow up to be transgender (e.g., GAPMS Memo at 14; Attachment D (Cantor) to GAPMS Memo at 6-9). Those studies include children who would not fulfill the current diagnostic criteria for gender dysphoria and, in any case, have no relevance to this case because no medications are prescribed to prepubertal children.

60. Puberty-delaying medication and hormone-replacement therapy—both individually and in combination—can significantly improve a transgender young person's mental health. These treatments allow for a physical appearance more closely aligning with gender identity and decreases the likelihood that a transgender young person will be incorrectly identified with their assigned sex, further alleviating their gender dysphoria, and bolstering the effectiveness of their social transition.

61. At the onset of puberty, adolescents begin to experience the onset of secondary sex characteristics. Adolescents with differences in gender identity may have intensification of gender dysphoria during this time due to development of secondary sex characteristics incongruent with gender identity. Persistence or intensification of gender dysphoria as puberty begins is used as a helpful diagnostic tool as it becomes more predictive of gender identity persistence into adolescence and adulthood (de Vries, et al., 2012).

i. Treatment with puberty-delaying medications

62. Adolescents diagnosed with gender dysphoria who have entered puberty (Tanner Stage 2) may be prescribed puberty-delaying medications (GnRHa) to prevent the distress of developing permanent, unwanted physical characteristics that do not align with the adolescent's gender identity. Tanner Stage 2 refers to the

stage in puberty whereby the physical effects of testosterone or estrogen production are first apparent on physical exam. Specifically, this is heralded by the onset of breast budding in an individual assigned female at birth, or the onset of testicular enlargement in an individual assigned male at birth. For individuals assigned male at birth, Tanner Stage 2 typically occurs between age 9-14, and for those assigned female at birth between age 8-12.

63. The treatment works by pausing endogenous puberty at whatever stage it is at when the treatment begins, limiting the influence of a person's endogenous hormones on their body. For example, a transgender girl will experience no progression of physical changes caused by testosterone, including facial and body hair, an Adam's apple, or masculinized facial structures. And, in a transgender boy, those medications would prevent progression of breast development, menstruation, and widening of the hips (Coleman, et al., 2022; de Vries, et al., 2012; Deutsch (ed.), 2016; Hembree, et al., 2017; Rosenthal, 2014).

64. GnRHa have been used extensively in pediatrics for several decades. Prior to their use for gender dysphoria, they were used (and still are used) to treat precocious puberty. GnRHa work by suppressing the signal hormones from the pituitary gland (luteinizing hormone [LH] and follicle stimulating hormone [FSH])

that stimulate the testes or ovaries to produce sex hormones. Upon discontinuation of GnRHa, LH and FSH production resume and puberty will also resume.

65. GnRHa have no long-term implications on fertility. In transgender youth, it is most typical to use GnRHa from the onset of puberty (Tanner Stage 2) until mid-adolescence. While treating, the decision to continue treatment will be continually evaluated. Should pubertal suppression no longer be desired, GnRHa would be discontinued, and puberty would re-commence.

66. Prior to initiation of GnRHa, providers counsel patients and their families extensively on potential benefits and risks. Designed benefit of treatment is to reduce the risk of worsening gender dysphoria and mental health deterioration. More specifically, use of GnRHa in transmasculine adolescents allows for decreased chest development, reducing the need for breast binding and surgical intervention in adulthood. For transfeminine adolescents GnRHa limits facial and body hair growth, voice deepening, and masculine bone structure development, which greatly reduce distress both at the time of treatment and later in life and reduce the need for later interventions such as voice therapy, hair removal, and facial feminization surgery.

67. The goal in using GnRHa is to minimize the patient's dysphoria related to progression of puberty and allow for later initiation of puberty consistent with gender identity. When a patient presents to care, the provider assesses the patient's

pubertal stage, pubertal history, and individual needs. A patient may present prior to the onset of puberty (Tanner Stage 1), at the onset of puberty (Tanner Stage 2), or further along in puberty (Tanner Stages 3-5). The pubertal stage and individual needs of the patient then direct conversations regarding care options. A patient at Tanner Stage 2 may benefit from GnRHa, while an older patient who has completed puberty may benefit from pubertal initiation with hormones, as described below. I have observed that providing individualized care based on individual patient characteristics, using the WPATH Standards of Care as the foundation of this care, provides significant benefit to patients, minimizes gender dysphoria, and can eliminate the need for surgical treatments in adulthood.

68. As an experienced pediatric endocrinologist, I treat patients with these same medications for both precocious puberty and gender dysphoria and in both cases the side effects are comparable and easily managed. And for both patient populations the risks are greatly outweighed by the benefits of treatment.

69. In addition, I regularly prescribe GnRHa for patients who do not meet criteria for precocious puberty but who require pubertal suppression. Examples include patients with disabilities who are unable to tolerate puberty at the typical age due to hygienic concerns; minors with growth hormone deficiency who despite growth hormone treatment will have a very short adult height; and young women

with endometriosis. As with gender dysphoria, the prescription of GnRHa to treat these conditions is "off-label," yet it is widely accepted within the field of endocrinology and not considered experimental. The same holds true for other common medications used in pediatric endocrinology: using metformin for weight loss; growth hormone for short stature not caused by growth hormone deficiency; countless medications used to control type 2 diabetes which have an adult indication but whose manufacturers have not applied for a pediatric indication.

ii. Treatment with hormone therapy

70. In mid-adolescence, the patient, their parents, and the patient's care team may discuss the possibility of beginning the use of testosterone or estrogen. In my practice we discuss these treatments for a patient who is currently receiving GnRHa, or patients who have already gone through their endogenous puberty and either did not have access to, desire, or elect for GnRHa treatment. In adult patients, use of GnRHa is uncommon, but rather medical decisions are focused more on testosterone or estrogen therapy.

71. These hormone therapies are used to treat gender dysphoria in adolescents and adults to facilitate development of sex-specific physical changes congruent with their gender identity. For example, a transgender man prescribed testosterone will develop a lower voice as well as facial and body hair, while a

transgender woman prescribed estrogen will experience breast growth, female fat distribution, and softer skin.

72. Under the Endocrine Society Clinical Guidelines and SOC 8, hormone therapy is an appropriate treatment for transgender adolescents with gender dysphoria when the experience of dysphoria is marked and sustained over time, the adolescent demonstrates emotional and cognitive maturity required to provide and informed consent/assent for treatment, other mental health concerns (if any) that may interfere with diagnostic clarity and capacity to consent have been addressed, the adolescent has discussed reproductive options with their provider. SOC 8 also highlights the importance of involving parent(s)/guardian(s) in the assessment and treatment process for minors (Coleman, et al., 2022; Hembree, et al., 2017).

73. Under the Endocrine Society Clinical Guidelines and SOC 8, hormone therapy is an appropriate treatment for transgender adults with gender dysphoria when the experience of dysphoria is marked and sustained, other possible causes of apparent gender dysphoria are excluded, any mental and physical health conditions that could negatively impact the outcome of treatment are assessed, the adult has capacity to understand risks and benefits of treatment and provide consent for treatment (Coleman, et al., 2022; Hembree, et al., 2017).

74. Similar to GnRHa, the risks and benefits of hormone treatment are discussed with patients (and families, if the patient is a minor) prior to initiation of testosterone or estrogen. When treated with testosterone or estrogen, the goal is to maintain the patient's hormone levels within the normal range for their gender. Laboratory testing is recommended to ensure proper dosing and hormonal levels. If starting hormonal care after completing puberty, discussion of egg or sperm preservation prior to starting treatment is recommended.

75. Regardless of the treatment plan prescribed, at every encounter with the care team there is a re-evaluation of the patient's gender identity and their transition goals. Should a patient desire to discontinue a medical intervention, the intervention is discontinued. Discontinuation of GnRHa will result in commencement of puberty. Findings from studies in which participants have undergone comprehensive evaluation prior to gender care show low levels of regret (de Vries, et al., 2011; van der Loos, et al., 2022; Wiepjes, et al., 2018).

F. SAFETY AND EFFICACY OF PUBERTY-DELAYING MEDICATIONS AND HORMONE THERAPY TO TREAT GENDER DYSPHORIA

76. GnRHa, prescribed for delaying puberty in transgender adolescents, is both a safe and effective treatment. Patients under consideration for treatment are working within a multidisciplinary team of providers all dedicated to making

informed and appropriate decisions with the patient and family in the best interest of the adolescent. Physicians providing this intervention are trained and qualified in gender identity concerns and childhood growth and development and are participating in this care out of a desire to improve the health and wellness of transgender youth and prevent negative outcomes such as depression and suicide.

77. GnRHa, including injectable leuprolide and implantable histrelin, have rare side effects which are discussed with patients and families prior to initiation. Mild negative effects may include pain at the injection or implantation site, sterile abscess formation, weight gain, hot flashes, abdominal pain, and headaches. These effects can be seen in patients receiving GnRHa for gender dysphoria, or for other indications such as precocious puberty. I counsel patients on maintaining a healthy diet and promote physical activity, and regularly document height and weight during treatment. Nutritional support can be provided for patients at risk for obesity.

78. Risk of lower bone mineral density in prolonged use of GnRHa can be mitigated by screening for, and treating, vitamin D deficiency when present, and by limiting the number of years of treatment based on a patient's clinical course (Rosenthal, 2014). An exceptionally rare but significant side effect, increased intracranial pressure, has been reported in six patients (five treated for precocious puberty, one for transgender care), prompting an FDA warning in July 2022 (AAP,

2022). These cases represent an extremely small fraction of the thousands of patients who have been treated with GnRHa over decades. Symptoms of this side effect (headache, vomiting, visual changes) are reviewed with families and if they occur the medication is discontinued.

79. GnRHa do not have long-term implications on fertility. This is clearly proven from decades of use in the treatment of precocious puberty (Guaraldi, et al., 2016; Martinerie, et al, 2021). Progression through natal puberty is required for maturation of egg or sperm. If attempting fertility after previous treatment with GnRHa followed by hormone therapy is desired, an adult patient would withdraw from hormones and allow pubertal progression. Assistive reproduction could be employed if needed (T'Sjoen, et al., 2013).

80. Patients who initiate hormones after completing puberty are offered gamete preservation prior to hormonal initiation (Coleman, et al., 2022), but even when not undertaken, withdrawal of hormones in adulthood often is successful in achieving fertility when it is desired (Light, et al., 2014; Knudson, et al., 2017).

81. Discussing the topic of fertility is important, and not specifically unique to treatment of gender dysphoria. Medications used for other medical conditions, such as chemotherapeutics used in cancer treatment, can affect fertility. For all medications with potential impacts on fertility, the potential risks and benefits of

both treatment and non-treatment should be reviewed and data regarding risk for infertility clearly articulated prior to the consent or assent of the patient. Risk for fertility changes must be balanced with the risk of withholding treatment.

82. Review of relevant medical literature clearly supports the benefits of GnRHa treatment on both short-term and long-term psychological functioning and quality of life (e.g., Achille, et al., 2020; Carmichael, et al., 2021; Costa, et al., 2015; de Vries, et al., 2014; de Vries, et al., 2011; Kuper, et al., 2020; Turban, et al., 2020b; van der Miesen, et al., 2020). For example, a 2014 long-term follow-up study following patients from early adolescence through young adulthood showed that gender-affirming treatment allowed transgender adolescents to make age-appropriate developmental transitions while living as their affirmed gender with positive outcomes as young adults (de Vries, et al., 2014).

83. In my own practice, adolescent patients struggling with significant distress at the onset of puberty routinely have dramatic improvements in mood, school performance, and quality of life with appropriate use of GnRHa. Side effects encountered are similar to those seen in other patients treated with these medications and easily managed.

84. Hormone therapy (testosterone or estrogen) is prescribed to older adolescents with gender dysphoria. As is the case with GnRHa, the need for hormone

therapy is not unique to transgender adolescents. Patients with conditions such as delayed puberty, hypogonadism, Turner Syndrome, Klinefelter Syndrome, agonism, premature ovarian failure, and disorders of sex development all require treatment with these hormones, often times starting in adolescence and continuing lifelong. Without testosterone or estrogen treatment, these patients would be unable to progress through puberty normally, which would have serious medical and social consequences. Whether used in adolescents to treat gender dysphoria, or to treat any of these other conditions, testosterone and estrogen are prescribed with a goal to raise the testosterone or estrogen level into the normal male or female range for the patient's age. Careful monitoring of blood levels and clinical progress are required. Side effects are rare, but most often related to overtreatment, which can be minimized with this monitoring. Additionally, side effects are considered, discussed, and easily managed in all individuals needing hormone therapy regardless of the diagnosis necessitating these medications.

85. Venous thromboembolism (blood clotting) is a known side effect of estrogen therapy in all individuals placed on it including transgender women. Risk is increased in old age, in patients with cancer, and in patients who smoke nicotine. This side effect is mitigated by careful and accurate prescribing and monitoring. In my career, no patient has suffered a thromboembolism while on estrogen therapy.

86. Treatment of gender dysphoria with testosterone or estrogen is highly beneficial for both short-term and long-term psychological functioning of adolescents with gender dysphoria and withholding treatment from those who need it is harmful (e.g., Achille, et al., 2020; Allen, et al., 2019; Chen, et al., 2023; de Lara, et al., 2020; de Vries, et al., 2014; Grannis, et al., 2021; Green, et al., 2022; Kaltiala, et al., 2020; Kuper, et al., 2020). To highlight examples, Green et al. (2022) describe that gender-affirming hormone therapy is correlated with reduced rates of depression and suicidality among transgender adolescents. Turban et al. (2022) documented that access to gender-affirming hormone therapy in adolescence is associated with favorable mental health outcomes in adulthood, when compared to individuals who desired but could not access hormonal interventions.

87. I treat many patients with gender dysphoria GnRHa, testosterone, and estrogen. Side effects related to these medications is very rare and can be treated with dose adjustment and/or lifestyle changes.

88. The efficacy of hormone treatment in transgender adults is similarly robust. At least 11 longitudinal studies document improvement in various mental health parameters including depression, anxiety, self-confidence, body image and self-image, general psychological functioning (e.g., Colizzi, et al., 2013; Colizzi, et al., 2014; Corda, et al., 2016; Defreyne, et al., 2018; Fisher, et al., 2016; Heylens, et

al., 2014; Keo-Meier, et al., 2015; Manieri, et al., 2014; Motta, et al., 2018; Oda, et al., 2017; Turan, et al., 2018).

89. In sum, the use of GnRHa and hormones in adolescents, and hormones in adults for the treatment of gender dysphoria is the current standard of care and certainly not experimental. This is due to robust evidence of safety and efficacy. The sum of the data supports the conclusion that treatment of gender dysphoria with these interventions promotes wellness and helps to prevent negative mental health outcomes, including suicidality in adolescent and adult age groups. The data to support these interventions are so strong that withholding such interventions would be negligent and unethical.

G. HARMS ASSOCIATED WITH PROHIBITING AND DISCONTINUING TREATMENT

90. Prohibition of gender-affirming care, or coverage thereof, for adolescents and adults is likely to have devastating consequences. I am concerned that the Challenged Exclusion might lead to a staggering increase in mental health problems including suicidality for transgender Floridians. One study which highlights my concern is a study of over 21,000 patients who report ever desiring gender-affirming hormone care. When comparing those who were able to access this care to those desiring but never accessing care, those able to access care had lower odds of suicidality within the past year. In addition, those individuals where were

able to access care in adolescence had lower odds of suicidality compared to those waiting to access until adulthood (Turban, et al., 2022).

91. Even more concerning is a situation where patients currently receiving care and thriving would be forced to discontinue this care.

III. CONCLUSION

92. In summary, banning coverage of gender-affirming care runs counter to evidence-based best practices and standards of care for the treatment of gender dysphoria in adolescence and adulthood.

93. Gender dysphoria is a challenging condition, but it is treatable through individualized assessment and treatment, which may include social transition, psychotherapy, pubertal suppression, and hormonal therapy. These treatments are not experimental and are supported by all major medical bodies in the field of transgender medicine and pediatrics.

94. Lack of access to these treatments will result in worse outcomes for countless individuals in Florida. Furthermore, banning coverage for evidence-based treatment for gender dysphoria sends a message that transgender people are not valid and should be stigmatized.

95. In my own clinical practice in Michigan, I have seen an influx of patients from states banning medically proven treatments for gender dysphoria who

report not feeling safe living in the community that they have always called home. Adult patients, and parents who love and support their transgender children, have described themselves as "refugees" in their own country, moving to avoid discriminatory laws which they know would clearly harm their health or the health of their child.

96. Banning coverage of effective treatment for gender dysphoria will not eliminate transgender people, but will, unfortunately, lead to an increase in mental health problems and suicidality in an already vulnerable population.

I declare under penalty of perjury under the laws of the United States of America that the foregoing is true and correct.

Executed this 16th day of February 2023.

Daniel Shumer, M.D.

Exhibit A

Curriculum Vitae

Daniel Shumer, MD MPH

Clinical Associate Professor in Pediatrics - Endocrinology

Email: dshumer@umich.edu

EDUCATION AND TRAINING

Education

08/2000-08/2003	BA, Northwestern University, Evanston, United States
08/2004-05/2008	MD, Northwestern University, Feinberg School of Medicine, Chicago, United States
07/2013-05/2015	MPH, Harvard T.H. Chan School of Public Health, Boston, United States

Postdoctoral Training

06/2008-06/2011	Residency, Pediatrics, Vermont Children's Hospital at Fletcher Allen Health Care, Burlington, VT
07/2011-06/2012	Chief Resident, Chief Resident, Vermont Children's Hospital at Fletcher Allen Health Care, Burlington, VT
07/2012-06/2015	Clinical Fellow, Pediatric Endocrinology, Boston Children's Hospital, Boston, MA

CERTIFICATION AND LICENSURE

Certification

10/2011-Present	American Board of Pediatrics, General

Licensure

	Michigan, Medical License
	Michigan, Controlled Substance
08/2015-Present	Michigan, Medical License

09/2015-Present Michigan, DEA Registration

09/2015-Present Michigan, Controlled Substance

WORK EXPERIENCE

Academic Appointment

10/2015-9/2022 Clinical Assistant Professor in Pediatrics - Endocrinology, University of Michigan - Ann Arbor, Ann Arbor

09/2022-Present Clinical Associate Professor in Pediatrics - Endocrinology, University of Michigan - Ann Arbor, Ann Arbor

Administrative Appointment

07/2019-Present Fellowship Director - Pediatric Endocrinology, Michigan Medicine, Department of Pediatrics, Ann Arbor

07/2020-Present Medical Director of the University of Michigan Comprehensive Gender Services Program, Michigan Medicine, Ann Arbor

Oversee the provision of care to transgender and gender non-conforming patients at Michigan Medicine.

07/2020-Present Education Lead - Pediatric Endocrinology, University of Michigan - Department of Pediatrics, Ann Arbor

Clinical Appointments

04/2022-05/2023 Medical Director in UMMG Faculty Benefits Appt., University of Michigan - Ann Arbor, Ann Arbor

Private Practice

08/2013-09/2015 Staff Physician, Harvard Vanguard Medical Associates, Braintree

RESEARCH INTERESTS

- Gender dysphoria

CLINICAL INTERESTS

- Gender dysphoria
- Disorders of Sex Development
- Prader Willi Syndrome

GRANTS

Past Grants

A Phase 2b/3 study to evaluate the safety, tolerability, and effects of Livoletide (AZP-531), an unacylated ghrelin analog, on food-related behaviors in patients with Prader-Willi syndrome
PI
Millendo Therapeutics
04/2019 - 04/2021

HONORS AND AWARDS

National

2014	Annual Pediatric Endocrine Society Essay Competition: Ethical Dilemmas in Pediatric Endocrinology: competition winner - The Role of Assent in the Treatment of Transgender Adolescents

Institutional

2012 - 2015	Harvard Pediatric Health Services Research Fellowship; funded my final two years of pediatric endocrine fellowship and provided tuition support for my public health degree

2016	The University of Michigan Distinguished Diversity Leaders Award, awarded by The Office of Diversity, Equity and Inclusion to the Child and Adolescent Gender Services Team under my leadership
2019	Lecturer of the Month, Department of Pediatrics, Michigan Medicine

TEACHING MENTORSHIP

Resident

07/2020-Present	Rebecca Warwick, Michigan Medicine (co-author on publication #22)

Clinical Fellow

07/2017-06/2020	Adrian Araya, Michigan Medicine (co-author on publication #22, book chapter #4)
12/2020-Present	Jessica Jary, Michigan Medicine - Division of Adolescent Medicine

Medical Student

09/2017-06/2020	Michael Ho, Michigan Medicine
07/2019-Present	Hadrian Kinnear, University of Michigan Medical School (co-author on book chapter #3, abstract #3)
07/2019-Present	Jourdin Batchelor, University of Michigan

TEACHING ACTIVITY

Regional

08/2018-Present	Pediatric Boards Review Course sponsored by U-M: "Thyroid Disorders and Diabetes". Ann Arbor, MI

IN THE UNITED STATES DISTRICT COURT
FOR THE NORTHERN DISTRICT OF FLORIDA
Tallahassee Division

AUGUST DEKKER, et al., *Plaintiffs*, v. JASON WEIDA, et al., *Defendants*.	Case No. 4:22-cv-00325-RH-MAF

EXPERT REPORT OF KELLAN E. BAKER, MA, MPH, PhD

I, Kellan E. Baker, MA, MPH, PhD, declare and state as follows:

1. I have been retained by counsel for Plaintiffs in connection with the above-captioned litigation.

2. I have actual knowledge of the matters stated herein. If called to testify in this matter, I would testify truthfully and based on my expert opinion.

BACKGROUND AND QUALIFICATIONS

A. Qualifications

3. I am the Executive Director and Chief Learning Officer of the Whitman-Walker Institute. In this role I oversee the Whitman-Walker Institute, which is the research, policy, and educational arm of Whitman-Walker, a community health system that includes Whitman-Walker Health, a federally qualified

community health center with 50 years of expertise in serving diverse communities across the Washington, D.C. metro area, particularly LGBTQ+ people and people living with HIV.

4. In 2021, I received my Doctor of Philosophy in Health Policy and Management from the Johns Hopkins Bloomberg School of Public Health, where I focused on Health Services Research and Policy as a Centennial Scholar and a Robert Wood Johnson Health Policy Research Scholar. I also completed a three-year Certificate Program in Public Health Economics at the Johns Hopkins Bloomberg School of Public Health and received an Executive Certificate in Health Care Leadership and Management from the Johns Hopkins Carey Business School.

5. In 2011, I received my Master of Public Health in Global Health Policy from The George Washington University Milken Institute School of Public Health and in the same year received my Master of Arts in International Development Studies from The George Washington University Elliott School of International Affairs.

6. Through my academic training and professional experience, I have extensive experience as a researcher and health policy expert regarding topics such as insurance reform and the Patient Protection and Affordable Care Act ("Affordable Care Act"), federal and state regulatory policy, public health, and government statistics. I have expertise in developing and analyzing health policy; conducting,

synthesizing, and communicating scientific research; and working with government, philanthropy, and other partners toward health policy objectives.

7. A significant part of my scholarship, research, and experience has focused on ensuring health equity for medically underserved populations, including sexual and gender minority communities, communities of color, and people with disabilities. My work has a particular emphasis on health care access and insurance issues in relation to the transgender population.

8. I have also worked with the National Academies of Sciences, Engineering, and Medicine ("National Academies") in several capacities. In 2017-2018, I served as a Steering Committee Member for the National Academies Project on Demography of Sexual and Gender Minority Populations. In 2019-2021, I served as a consultant to the National Academies Committee on Population on the convening of a National Academies Consensus Study Committee to assess the health and well-being of sexual and gender diverse populations. In this capacity, I advised on the preparation, creation, and dissemination of the Consensus Study Report "Understanding the Well-Being of LGBTQI+ Populations," which was published in 2020. As part of my role I participated in Consensus Study Committee discussions and authored and edited report components related to physical and mental health,

health services access and use, health policy, data collection, and demography.[1] As a consensus study report by the National Academies, the report documents the evidence-based consensus on the study's statement of task, was subjected to a rigorous and independent peer-review process, and represents the position of the National Academies on the statement of task.

9. Of relevance to this case, the National Academies 2020 consensus study report states that:

a. "Clinicians who provide gender-affirming psychosocial and medical services in the United States are informed by expert evidence-based guidelines";

b. Each of the guidelines published by the World Professional Association for Transgender Health ("WPATH") (Coleman et al., 2012); the Endocrine Society (Hembree et al., 2017); and the Center of Excellence for Transgender Health (UCSF Transgender Care, 2016) "is informed by the best available data and is intended to be flexible and holistic in application to individual people"; and

c. "Mental and physical health problems need not be resolved before a person can begin a process of medical gender affirmation, but they

[1] National Academies of Sciences, Engineering, and Medicine. (2020). Understanding the Well-Being of LGBTQI+ Populations. Washington, DC: The National Academies Press. https://doi.org/10.17226/25877.

should be managed sufficiently such that they do not interfere with treatment."

10. In 2021, I was appointed as a member of the National Academies Consensus Study Committee on Measuring Sex, Gender Identity, and Sexual Orientation, which was charged with developing recommendations for the National Institutes of Health on the measurement of sex, gender identity, and sexual orientation. In March 2022, the Committee published the report "Measuring Sex, Gender Identity and Sexual Orientation."[2]

11. In 2013, I co-founded Out2Enroll, which is a nationwide nonprofit initiative focused on connecting low- and middle-income LGBT people with health insurance coverage under the Affordable Care Act. Over the last decade, Out2Enroll has provided technical assistance to enrollment organizations, federal and state governments, and other stakeholders on insurance coverage issues related to LGBT populations; trained more than 15,000 enrollment assisters in all 50 states; and conducted annual research on the content of coverage sold through the Health Insurance Marketplaces.

[2] National Academies of Sciences, Engineering, and Medicine. 2022. Measuring Sex, Gender Identity, and Sexual Orientation. Washington, DC: The National Academies Press. https://doi.org/10.17226/26424.

12. For the last two years, I have been an appointed consumer representative to the National Association of Insurance Commissioners (NAIC), where I bring expert and consumer perspectives to inform the activities and policy positions of the NAIC.

13. I am the author of 22 peer-reviewed journal articles, 42 non-peer-reviewed articles and reports, and three book chapters. My peer-reviewed journal articles have been published in high-impact journals such as the *Journal of the American Medical Association*, *New England Journal of Medicine*, and *American Journal of Public Health*, among others.

14. Among my peer-reviewed publications are the following: "Utilization and Costs of Gender-Affirming Care in a Commercially Insured Transgender Population," published in 2022 in the *Journal of Law, Medicine, and Ethics*; "Health and Health Care Among Transgender Adults in the United States," published in 2021 in the *Annual Review of Public Health*; "Hormone Therapy, Mental Health, and Quality of Life among Transgender People: A Systematic Review," published in 2021 in the *Journal of the Endocrine Society*; "The Future of Transgender Coverage," published in 2017 in the *New England Journal of Medicine*; and "Coverage for Gender Affirmation: Making Health Insurance Work for Transgender Americans," published in 2017 in *LGBT Health*.

15. I am also a senior researcher with the What We Know Project, a Cornell University–based initiative that conducts scoping reviews of the evidence in relation to complex legal and social issues involving LGBTQ populations in order to present the public and other stakeholders with primary source materials and summary findings. In 2018, I was the lead author of the What We Know Project's review of the effects of gender affirmation on the well-being of transgender people.[3]

16. This project included a systematic literature review of all peer-reviewed articles published in English between 1991 and June 2017 that assessed the effects of gender-affirming medical care on health-related outcomes among transgender people. We identified 55 studies that consisted of primary research on this topic, of which 51 (93%) found that gender-affirming medical care improves outcomes for transgender people, while 4 (7%) reported mixed or null findings. We found no studies concluding that gender-affirming care causes overall harm.

17. In addition, I am an author of multiple policy statements and technical reports, and I have served as a reviewer for 30 peer-reviewed journals, including the *New England Journal of Medicine*, *Journal of the American Medical Association*, and *Transgender Health*.

[3] What We Know Project. (2018). What Does the Scholarly Research Say About the Effect of Gender Transition on Transgender Wellbeing? Cornell University Center for the Study of Inequality. https://whatweknow.inequality.cornell.edu/topics/lgbt-equality/what-does-the-scholarly-research-say-about-the-well-being-of-transgender-people/

18. I have taught courses in LGBTQ health policy and health equity, as well as given dozens of invited lectures, presentations, keynotes, and plenaries related to health policy, health coverage, health disparities, and transgender health.

19. More detailed information regarding my professional background, experiences, publications, and presentations is outlined in my curriculum vitae, a true and correct copy of which is attached as **Exhibit B**.

B. Prior Testimony

20. I have not testified as an expert at deposition or trial within the last four years.

C. Compensation

21. I am being compensated at an hourly rate of $200 per hour for preparation of expert declarations and reports and time spent preparing for or giving deposition or trial testimony. My compensation does not depend on the outcome of this litigation, the opinions I express, or the testimony I provide.

BASES FOR OPINIONS

22. This report sets forth my opinions in this case and the bases for my opinions.

23. In preparing this report, I reviewed Florida's Administrative Rule governing the determination of generally accepted professional medical standards under Florida Medicaid coverage (Fla. Admin. Code R. 59G-1.035); the text of

"Florida Medicaid: Generally Accepted Professional Medical Standards Determination on the Treatment of Gender Dysphoria" ("GAPMS Memo"),[4] including all attachments; Fla. Admin. Code. R. 59G-1.050(7), which prohibits Medicaid coverage of puberty-delaying medications (commonly referred to as "puberty blockers"), hormone and hormone antagonists, "sex reassignment" surgeries, and any other procedures that alter primary or secondary sexual characteristics, on the basis that the services do not meet Florida's definition of "medical necessity" for purposes of its Medicaid program; and the Complaint in this Case.

24. I also reviewed the materials listed in the attached Bibliography (**Exhibit A**), as well as the materials listed within my curriculum vitae (attached as **Exhibit B**). I may rely on those documents as additional support for my opinions.

25. In addition, I have relied on my education, training, and years of professional and research experience, as well as my knowledge of the scientific literature in the pertinent fields.

26. The materials I have relied upon in preparing this declaration are the same types of materials that experts in health and public policy regularly rely upon when forming opinions on this type of subject. I may wish to supplement these

[4] June 2022. Accessed February 6, 2022. Available at https://ahca.myflorida.com/letkidsbekids/docs/AHCA_GAPMS_June_2022_Report.pdf.

opinions or the bases for them due to new scientific research or publications, or in response to statements and issues that may arise in my area of expertise.

TRANSGENDER PEOPLE AND GENDER DYSPHORIA

27. Transgender people are individuals whose gender identity, meaning their innate, deeply seated knowledge of their own gender, is different from that typically associated with the sex they were assigned at birth.[5]

28. There are approximately 1.6 million transgender people in the United States today, comprising approximately 0.6 percent of the U.S. population.[6] This estimate has remained steady since the authors' initial assessments of this population size in 2016[7] and 2017.[8] Compared to the general U.S. population, transgender people are more likely to not have health insurance coverage, to be unemployed and living in poverty, and to have a disability.[9] Scientific studies consistently identify experiences of discrimination and a lack of access to appropriate medical care as

[9] James SE, Herman JL, Rankin S, Keisling M, Mottet L, Anafi M. (2016). *The Report of the 2015 U.S. Transgender Survey*. Washington, DC: National Center for Transgender Equality. https://www.ustranssurvey.org/reports

major drivers of these disparities.[10] Because of these systematic and well-documented gaps in health and overall well-being, the transgender population is designated as a health disparity population by the National Institutes of Health.[11]

29. Many transgender people seek medical treatment to physically transition from the sex that they were assigned at birth to the sex that aligns with their gender. According to the Diagnostic and Statistical Manual of Mental Disorders (DSM-5-TR), the diagnostic term that describes the medical necessity of transition is gender dysphoria, which refers to the distress and impairment transgender individuals may experience due to a profound misalignment between their gender and their assigned birth sex.[12]

30. Gender dysphoria is recognized as a serious medical condition by major medical associations such as the American Medical Association (AMA), the American Psychiatric Association, and the American Psychological Association, among many others.[13] A 2008 AMA resolution notes that the consequences of gender dysphoria can include "clinically significant psychological distress,

[10] National Academies of Sciences, Engineering, and Medicine. (2020). *Understanding the Well-Being of LGBTQI+ Populations*. Washington, D.C.: National Academies Press.

[13] See https://transhealthproject.org/resources/medical-organization-statements/

dysfunction, debilitating depression and, for some people without access to appropriate medical care and treatment, suicidality and death."[14]

31. Treatment for gender dysphoria, which may include mental health counseling, hormone therapy, and surgeries, is provided in the United States by licensed clinicians according to expert standards developed by professional medical associations such as the Endocrine Society[15] and the World Professional Association for Transgender Health (WPATH).[16] Interventions to treat gender dysphoria have been linked to multiple positive health outcomes, including better quality of life; lower rates of mental health conditions such as depression, anxiety, and psychological distress; decrease in or elimination of distress associated with gender dysphoria; and mitigation of stigma and discrimination.[17]

INSURANCE COVERAGE OF TREATMENT FOR GENDER DYSPHORIA

32. The first U.S. clinics opened to provide treatment for gender dysphoria to transgender individuals in the 1960s and 1970s, and the first edition of the

[17] National Academies of Sciences, Engineering, and Medicine. (2020). Understanding the Well-Being of LGBTQI+ Populations. Washington, DC: The National Academies Press.

WPATH Standards of Care was published in 1979.[18] By the late 1970s, nationwide trends favored insurance coverage for treatment of gender dysphoria, particularly through state Medicaid programs.

Private Health Coverage

State-Regulated Individual and Group Coverage

33. In the U.S., the states are the traditional regulators of private insurance coverage sold in the individual, small group, and large group markets. Over the last two decades, many states have required plans under their jurisdiction to remove exclusions of coverage for gender dysphoria.

34. In 2005, California became the first state to prohibit discrimination against transgender individuals by state-regulated individual and group plans by enacting the Insurance Gender Nondiscrimination Act (IGNA), which bans discrimination in health insurance coverage because of gender identity.

35. In 2012, the California Department of Insurance issued a regulation under IGNA defining gender identity discrimination in health insurance coverage to mean "denying or limiting coverage, or denying a claim, for…health care services related to gender transition if coverage is available for those services under the policy when the services are not related to gender transition, including but not limited to

[18] Allee KM. (2009). Harry Benjamin International Gender Dysphoria Association. In *Encyclopedia of gender and society, volume 1* (Ed. J O'Brien). Thousand Oaks, CA: SAGE.

hormone therapy, hysterectomy, mastectomy, and vocal training."[19] Since 2012, 24 other states and the District of Columbia have prohibited exclusions of coverage for gender dysphoria in state-regulated individual and group plans.[20]

36. Most recently, Colorado added new explicit coverage requirements for plans in its state-regulated individual and small group markets.[21] Those plans in Colorado are now required to cover the following procedures for transgender people: gender-affirming hormone therapy, chest reconstruction, augmentation mammoplasty, genital surgeries, facial feminization surgeries, and laser or electrolysis hair removal. An actuarial analysis commissioned by the state to assess the cost of these procedures estimated that their long-term steady state cost is 0.04% of total allowed claims.[22]

37. Similarly, in 2022, 21 state regulators wrote a joint letter to the U.S. Department of Health and Human Services (HHS) stating, "Transgender people should have equal access to the same health insurance and care as every other insured American. This includes health care related to gender affirmation, which for years

[19] CAL. CODE REGS., tit. 10, § 2561.2(a)(4)(A).

[22] Colorado Benchmark Plan for 2023. https://www.cms.gov/files/zip/co-ehb-benchmark.zip

has been recognized by every major U.S. medical society as effective and medically necessary for many individuals."[23]

38. In addition to state regulators, insurance carriers themselves have also spoken strongly about their interest in ensuring that transgender enrollees can access treatment for gender dysphoria. In 2022, America's Health Insurance Plans (AHIP), the professional trade association that represents 1,300 member companies that sell health insurance coverage for more than 200 million people nationwide, wrote in a letter to HHS that they "strongly support ensuring that appropriate gender-affirming care is available and accessible to enrollees. We [are committed] to ensuring benefit designs and coverage decisions reflect evidence-based guidelines and recommendations and do not restrict coverage related to gender identity."[24]

Employer-Sponsored Coverage

39. Employee coverage through large employers in the U.S. is primarily regulated by the federal government under the Employee Retirement Income Security Act (ERISA), though states retain authority over the plans they offer to their employees. The federal government also oversees coverage requirements for federal

[23] Letter from state insurance commissioners to U.S. Department of Health and Human Services Secretary Xavier Becerra. (2022). http://www.insurance.ca.gov/0400-news/0100-press-releases/2022/upload/joint-Letter-Final_ACA_SECTION_1557_NPRM_sign-on_letter_2022-2.pdf

[24] America's Health Insurance Plans. (2022). Letter to Dr. Ellen Montz, Administrator, Center for Consumer Information and Insurance Oversight, U.S. Department of Health and Human Services. https://ahiporg-production.s3.amazonaws.com/documents/AHIP-Letter-to-CMS-on-Nondiscrimination-2.16.22.pdf

employees nationwide through the Federal Employees Health Benefits Program (FEHBP). Trends in employer coverage of treatment for gender dysphoria parallel the expansion of coverage evident in state-regulated individual and group coverage.

40. Among state employee benefit plans, 42 states and territories do not have categorical transgender-specific exclusions in their plans; of these, 24 states and D.C. affirmatively spell out the gender-affirming services that their state employee plans cover.[25]

41. According to the Corporate Equality Index (CEI), which has tracked the status of private employer-sponsored coverage for treatment of gender dysphoria since 2002, 67 percent of the entire Fortune 500—and 86 percent of all CEI-rated businesses (1,088 of 1,271)—offered employee benefits with no transgender-specific exclusions in 2022.[26] In 2015, 54 percent (421 of 781) companies offered at least one fully inclusive plan to their employees, and by 2022 that number had reached 91 percent (1,160 out of 1,271).

42. In 2016, the White House Office of Personnel Management (OPM) required all FEBHP carriers to remove blanket exclusions of services, drugs, or

[25] LGBT Movement Advancement Project. (2023). Equality Maps. https://www.lgbtmap.org/equality-maps/healthcare_laws_and_policies/state_employees. West Virginia's exclusion was recently removed as a result of a settlement agreement.
[26] Human Rights Campaign Foundation. (2022). Corporate Equality Index. https://reports.hrc.org/corporate-equality-index-2022

supplies related to the treatment of gender dysphoria. For plan year 2023, OPM instituted the following requirements for FEHB carriers:[27]

a. Have adopted one or more recognized entities in order to guide evidence-based benefits coverage and medical policies pertaining to gender affirming care and services, such as the World Professional Association of Transgender Health (WPATH) Standards of Care, the Endocrine Society, and the Fenway Institute. These entities provide evidence-based clinical guidelines for health professionals to assist transgender and gender diverse people with safe and effective pathways that maximize their overall health, including physical and psychological well-being.

b. Will provide individuals diagnosed with and/or undergoing evaluation for gender dysphoria the option to use a Care Coordinator to assist and support them as they seek gender-affirming care and services. If network providers are not available to provide medically necessary treatment of gender dysphoria, FEHB Carriers will provide members direction on how to find qualified providers with experience delivering this specialized care.

c. Have reviewed their formularies to ensure that transgender and gender diverse individuals have equitable access to medications and provide coverage of medically necessary hormonal therapies for gender transition care.

Health Insurance Marketplace Coverage

43. Another major source of individual and small group insurance beyond traditional state-regulated private markets are the Health Insurance Marketplaces established by the Patient Protection and Affordable Care Act (ACA), where

[27] United States Office of Personnel Management. (2022). Federal Benefits Open Season November 14, 2022 – December 12, 2022. https://cdn.govexec.com/media/gbc/docs/pdfs_edit/093022ew1.pdf

income-eligible consumers can purchase plans with government financial subsidies. Approximately one-third of states operate their own Marketplace, while the federal government operates the Marketplace for the remaining states, including Florida, through the HealthCare.gov platform.

44. Since 2017, the Out2Enroll initiative has conducted research on the prevalence of exclusions for gender dysphoria in plans sold through HealthCare.gov. Over the past seven years, this research has documented that the vast majority of plans sold through HealthCare.gov do not have transgender-specific exclusions.[28]

45. In 2023, for instance, 92% of 1,429 HealthCare.gov plans reviewed from 33 states, including Florida, did not have categorical exclusions of gender dysphoria treatment. Almost half (47%) of all plans reviewed explicitly stated that medically necessary treatment for gender dysphoria is covered.

46. Of the eight carriers selling coverage through HealthCare.gov in Florida, seven (88%) expressly cover medical care related to gender affirmation. The remaining carrier excludes coverage only for some gender-affirming services, and no carriers offer plans with categorical exclusions of the type established in Fla. Admin. Code R. 59G-1.035.[29]

Public Health Coverage

Medicare

47. An exclusion of Medicare coverage for "transsexual surgery" was introduced in 1981 and codified in a 1989 National Coverage Determination. In 2014, the HHS Departmental Appeals Board (DAB) ruled that this exclusion of treatment for gender dysphoria was invalid on the grounds that it was based on outdated evidence that was not complete or adequate to support the determination that this treatment was never medically necessary.[30]

48. In its ruling, the DAB rejected the assertion that gender-affirming surgeries are "experimental" and "controversial," finding instead that current evidence "indicates a consensus among researchers and mainstream medical organizations that transsexual surgery is an effective, safe and medically necessary treatment for transsexualism." Following the rescinding of the exclusion, Medicare covers surgeries and other gender-affirming care for transgender individuals according to case-by-case assessments of medical necessity.

49. An example of this coverage policy in practice is a 2016 ruling by the Medicare Appeals Council ("the Council"), which is part of the DAB, finding that a Medicare Advantage plan's decision to deny coverage for gender-affirming surgery

[30] Dep't of Health & Human Servs., Departmental Appeals Bd., Appellate Div., Decision No. 2676 (May 30, 2014), hhs.gov/sites/default/files/static/dab/decisions/board-decisions/2014/dab2576.pdf.

to a transgender Medicare beneficiary did not comport with Medicare's statutory "reasonable and necessary" coverage criterion.[31]

50. The Council asserted that the WPATH Standards of Care are "reasonable guidelines to determine medical necessity" and found that, inasmuch as the enrollee "satisfies all of the WPATH clinical requirements for gender reassignment surgery…the requested vaginoplasty is medically reasonable and necessary for treatment of this enrollee's gender dysphoria under Section 1862(a)(1)(A) of the [Social Security] Act and is covered under existing [Centers for Medicare & Medicaid Services] guidance."

Medicaid

51. Medicaid coverage for gender-affirming care predates the first iteration of WPATH's Standards of Care. For example, Medicaid coverage for such care in California can be documented as far back as the 1970s. In a pair of cases decided in 1978 (*J.D. v. Lackner* and *G.B. v. Lackner*) pertaining to Medicaid coverage of vaginoplasty for transgender women, a California court found that the plaintiff "has an illness and … as far as her illness affects her, the proposed surgery is medically reasonable and necessary and…there is no other effective treatment method." The judges further asserted that "the proposed surgery is medically reasonable and

[31] In the Case of United Health Care / AARP Medicare Complete, No. M-15-1069 at 8 (Jan. 21, 2016), https://www.hhs.gov/sites/default/files/static/dab/decisions/council-decisions/m-15-1069.pdf.

necessary" and should thus be covered by Medicaid, and they added that "we do not believe, by the wildest stretch of the imagination, that such surgery can reasonably and logically be characterized as cosmetic."

52. Other states likewise provided Medicaid coverage for gender-affirming care as far back as the 1970s and 1980s.[32] When the federal Medicare program instituted its exclusion in 1981, however, many Medicaid programs followed suit.

53. Beginning in the early 2000s and over the course of the next 20 years, categorical exclusions of coverage in many state Medicaid programs began to be removed—whether administratively, by statute, or after court orders—in response to successive iterations of the standards of care and increasingly sophisticated clinical practice guidelines for the treatment of gender dysphoria.

54. As of present, the overwhelming majority of states do not exclude coverage of gender-affirming care from Medicaid. As of early 2023, 47 states and territories, as well as D.C., no longer have categorical exclusions of gender dysphoria treatment in their Medicaid programs. Of these, 27 states and D.C. explicitly and affirmatively delineate coverage of a range of gender-affirming services.

[32] *See*, *e.g.*, *Pinneke v. Preisser*, 623 F.2d 546 (8th Cir. 1980) (pertaining to Iowa's Medicaid program); *Doe v. State, Dep't of Pub. Welfare*, 257 N.W.2d 816 (Minn. 1977) (pertaining to Minnesota's Medicaid program).

55. The GAPMS Memo outlines that there are eight states that explicitly ban coverage for treatment of gender dysphoria. However, these limitations are typically not as broad or all-encompassing as Fla. Admin. Code. R. 59G-1.050(7). For example, the exclusions in Missouri, Nebraska, and Texas are limited to surgery and do not extend to coverage for puberty delay medications and hormone therapy, while the exclusion in Arkansas is limited to minors.[33] Meanwhile, the exclusion in Ohio appears to be inoperative, as officials in Ohio do not appear to be enforcing the exclusion and managed care organizations operating under Ohio's Medicaid program have clinical policy guidelines for covering gender-affirming care; thus, the scope of coverage is unclear. Finally, the GAPMS Memo erroneously states that Georgia excludes coverage of gender-affirming care in Medicaid.

56. Taking stock of Medicaid coverage policies requires assessment not just of a state's regulations and statutes, but also operative guidance, managed care organizations' policies, and relevant administrative and court decisions in the state.

57. When one does so, Florida stands apart as one of less than a handful of states with exclusions of similar breadth and scope among the 56 jurisdictions in the United States that operate Medicaid programs (i.e., the 50 states, five U.S. territories, and D.C.). Florida's recently adopted exclusion therefore runs counter to the clear and overwhelming trend among Medicaid programs to remove such exclusions and, as

[33] ARK. CODE § 20-9-1503(d).

outlined further below, to affirmatively provide guidance on coverage for treatment of gender dysphoria.

58. Some states have recently explicitly broadened and clarified the scope of Medicaid coverage for gender dysphoria. In Washington State, for instance, 2021 legislation codified that the state's Medicaid program covers a range of "surgical and ancillary services," as well as puberty-delaying medications, for transgender people.[34] The legislation indicates that the list of covered services is not exhaustive and requires that a "health care provider with experience prescribing and/or delivering gender affirming treatment must review and confirm the appropriateness of any adverse benefit determination.[35]

COSTS AND UTILIZATION OF TREATMENT FOR GENDER DYSPHORIA

59. While the number of people with transgender-specific diagnostic codes in commercial insurance claims databases has increased over the last decade, the increase is attributable to national policy trends that have made coverage for gender-affirming care more accessible. As such, more transgender people are now able to access coverage for treatment of gender dysphoria, and more providers are able to appropriately code for these encounters without triggering coverage exclusions.

[34] Washington State Legislature. SB 5313 (2021-2022). https://app.leg.wa.gov/billsummary?BillNumber=5313&Initiative=false&Year=2021
[35] Washington State Healthcare Authority. (2022). Transhealth Program. https://www.hca.wa.gov/billers-providers-partners/programs-and-services/transhealth-program

60. Even as coverage has become more accessible, utilization rates remain low. Moreover, evidence indicates that insurance coverage of treatment for gender dysphoria is low-cost and highly cost-effective. The impact of gender-affirming care on payer budgets has thus remained nominal even as coverage has become more available, standardized, and routine.

61. A California Department of Insurance assessment of IGNA, the state law that broadly prohibited insurance discrimination against transgender beneficiaries, for instance, showed that a major state university-sponsored plan had a utilization rate of only 0.062 per 1,000 covered persons for this care over the 6.5 years following the law's enactment; across the state, impacts on premium costs were "immaterial," leading the Department to conclude that "the benefits of eliminating discrimination far exceed the insignificant costs."[36]

62. A 2016 economic model evaluating the cost-effectiveness of care for transgender men that included hormone replacement therapy, mastectomy, abdominoplasty, hysterectomy, genital reconstruction, and other services underscores this conclusion, finding that the incremental cost-effectiveness ratio

[36] State of California Department of Insurance. (2012). Economic Impact Assessment: Gender Nondiscrimination in Health Insurance. http://transgenderlawcenter.org/wp-content/uploads/2013/04/Economic-Impact-Assessment-Gender-Nondiscrimination-In-Health-Insurance.pdf

(ICER) of these services was less than $8,000 per quality-adjusted life year (QALY) gained over a ten-year time horizon.[37]

63. This is far below a typical U.S. "willingness to pay" threshold of $100,000 per QALY.[38] This study also found that, on a per member per month (PMPM) basis, coverage of surgical and other services for transgender men and women together cost $0.016.

64. My own recent research indicates that each covered transgender person in a major national commercial insurance database incurred an average of less than $1,800 in costs per year for hormone therapy (including puberty delay medications) and surgeries (including facial surgeries) combined to treat gender dysphoria.[39] Considered on a PMPM basis, the budget impact of covering this care was $0.73 per year, or $0.06 PMPM.

[37] Padula, W. V., Heru, S., & Campbell, J. D. (2016). Societal Implications of Health Insurance Coverage for Medically Necessary Services in the U.S. Transgender Population: A Cost-Effectiveness Analysis. Journal of General Internal Medicine, 31(4), 394–401. https://doi.org/10.1007/s11606-015-3529-6

[38] Cameron, D., Ubels, J., & Norström, F. (2018). On what basis are medical cost-effectiveness thresholds set? Clashing opinions and an absence of data: a systematic review. Global health action, 11(1), 1447828. https://doi.org/10.1080/16549716.2018.1447828

[39] Baker, K., & Restar, A. (2022). Utilization and Costs of Gender-Affirming Care in a Commercially Insured Transgender Population. Journal of Law, Medicine & Ethics, 50(3), 456-470. doi:10.1017/jme.2022.87

65. Similarly, an actuarial assessment conducted for the North Carolina State Health Plan estimated a PMPM cost range of $0.06-$0.15 (0.011% to 0.027% of premiums).[40]

66. Estimates from other states show equally low utilization and related low costs, with Alaska estimating that coverage for gender dysphoria would result in increases of 0.03% to 0.04% of total costs for its state employee plan[41] and Wisconsin noting costs to its state employee plan are "immaterial, since it represents less than 0.1% of the overall costs of medical care."[42]

67. Cost estimates of coverage for gender-affirming care under Wisconsin Medicaid were "actuarially immaterial, as they are equal to approximately 0.008% to 0.03%" of Wisconsin's share of its Medicaid budget.[43]

68. An analysis in the military context concluded that the cost of covering gender-affirming care was "too low to matter"[44] or, as military leadership noted, "'budget dust,' hardly even a rounding error.[45]

69. Overall, the actuarial evidence indicates that gender-affirming care is not expensive when considered from a payer or societal perspective, but it can easily be beyond the individual reach of transgender people, particularly those who rely on public coverage programs such as Medicaid.

CONCLUSION

70. The transgender population, at a steady 0.6% of the U.S. population, is a small and medically vulnerable population for whom decades of scientific research and medical practice have established a robust consensus on the appropriateness of gender-affirming care. Over the last 20 years, state regulators, Medicaid programs, insurance carriers, and employers have increasingly taken affirmative action to ensure that transgender people do not face barriers to coverage for the medically necessary treatment of gender dysphoria. The exclusion recently instituted at Fla. Admin. Code. R. 59G-1.050(7) thus is both out-of-step with expert medical standards used by both public and private health insurance programs and runs counter to prevailing nationwide trends in every form of insurance, including Medicaid, Medicare, and private coverage.

I declare under penalty of perjury under the laws of the United States of America that the foregoing is true and correct.

Executed this 17th day of February 2023.

EDUCATION

Johns Hopkins Bloomberg School of Public Health 2016-2021
Doctor of Philosophy in Health Policy and Management
Concentration in Health Services Research and Policy
Dissertation: *Clinically Documented Social Risk Factors, Health Care Utilization, and Expenditures in a Commercially Insured Transgender Population*
Activities: Centennial Scholar, Health Policy Research Scholar, Gordis Teaching Fellow

Johns Hopkins Bloomberg School of Public Health 2016-2019
Certificate in Public Health Economics

Johns Hopkins Carey Business School 2018
Executive Certificate in Health Care Leadership and Management

University of the South School of Theology 2008-2012
Certificate in Theological Education

George Washington University School of Public Health and Health Services 2008-2011
Master of Public Health
Concentration in Global Public Health Policy
Thesis: *Transforming Health: International Rights-Based Advocacy for Transgender Health*
Activities: Delta Omega Public Health Honors Society

George Washington University Elliott School of International Affairs 2008-2011
Master of Arts in International Development
Thesis: *Security, Development, and Sexual and Gender-Based Violence in Conflict Settings*

Diplomatic Academy of Vienna 2007-2008
Graduate study in International Economics

University of Vienna 2007-2008
Certificate of Advanced Proficiency in German Language

Swarthmore College 2000-2004
Bachelor of Arts with High Honors in Astrophysics and Russian Literature
Activities: External Honors Program

PROFESSIONAL EXPERIENCE

Whitman-Walker Institute
Executive Director and Chief Learning Officer 2021-present

- Lead the research, policy, and education activities of Whitman-Walker, a community health system in Washington, DC that also includes Whitman-Walker Health, a Federally Qualified Health Center with 50+ years of experience serving diverse patient populations across the DC metro area, with a particular focus on people living with HIV and sexual and gender minority populations.
- Oversee daily operations for the Institute, including personnel, grants management, financial reporting and fiscal accountability, strategic planning, quality assurance for training and research activities, and development of internal and external partnerships.
- Oversee a 55-person team of researchers, policy analysts, and administrative staff in conducting epidemiologic, econometric, clinical, and policy research; translating research findings into policy, practice, and programming recommendations; and advancing methodology for research centering the impact of structural factors on individual and population health.
- Partner with clinicians and clinic management at Whitman-Walker on health services research using clinical data for quality assessment and practice improvement.
- Represent Whitman-Walker in interactions with media, government, academic institutions, public and private payers, professional societies, community members, and other stakeholders.

Johns Hopkins School of Public Health
Affiliate Faculty, Department of Health Policy and Management 2021-present

George Washington University School of Public Health and Health Services
Affiliate Faculty, Department of Health Policy and Management 2021-present

National Academy of Sciences, Division of Behavioral and Social Sciences and Education
Consultant 2019-2021

- Advised the Committee on Population on the development, funding, and coordination of a consensus study project on health and other domains of well-being in sexual and gender diverse populations.
- Authored and edited report components related to physical and mental health; health services access and use; health policy; data collection; and demography.
- Led report dissemination to policy, academic, medical, media, and community audiences.

Johns Hopkins Evidence-Based Practice Center
Research Associate 2018-2021

Designed and conducted systematic reviews to support the revision of the leading expert treatment guidelines in the field of transgender health.

Cornell University Center for the Study of Inequality
Senior Researcher 2017-2019

Designed and conducted systematic reviews of social inequality and health policy issues.

Johns Hopkins School of Public Health, Department of Epidemiology
Research Associate 2017-2018

Built economic models assessing the cost-effectiveness of integrating HIV testing, prevention, and treatment into primary care in low-resource settings.

Center for American Progress
Senior Fellow 2014-2017

- Designed and implemented strategies to advance policy goals around health equity, Affordable Care Act (ACA) implementation, health system transformation, health insurance reform, appropriations and budget, nondiscrimination, and data collection and research at all levels of government and with hospitals, health insurance carriers, and other private stakeholders.
- With Fenway Community Health, co-founded and directed a project that secured new data elements in the federal regulations governing the Meaningful Use of Electronic Health Records program.
- Coordinated and represented coalitions of diverse organizations focusing on civil rights, health care, and public health in regulatory and legislative policymaking activities with decisionmakers and staff at all levels of government.
- Developed and published original research, policy analyses, and policy and practice recommendations for audiences such as the White House, the federal agencies, the Presidential Advisory Council on HIV/AIDS, congressional and other legislative staff, state and local health departments, and state and federal insurance regulators.
- Regularly quoted and published in venues such as *Washington Post*, *New York Times*, *Reuters*, *Time*, *Scientific American*, *US News and World Report*, and National Public Radio.

Out2Enroll Founding Steering Committee Member 2013-2017

- Conceived and co-led Out2Enroll, a $1-million national communications, training, and policy partnership with the U.S. Department of Health & Human Services (HHS) and the White House to connect low-income sexual and gender minority people with insurance coverage under the ACA.
- Managed strategic and daily operations, including overseeing a coalition of more than 70 partners, developing communications strategies, fundraising, and grants management.
- Created the training "Reaching and Assisting LGBT Communities" (in-person and online) and trained more than 15,000 enrollment assisters in all 50 states, the US territories, and Washington, DC.
- At the request of the HHS Office for Civil Rights, created and presented trainings on the ACA and civil rights to the HHS Regional Offices.

Associate Director 2013-2014

- Led the health policy portfolio of the Federal Agencies Project, a national funder collaborative pursuing health reform and health equity objectives via federal regulatory policy.
- Managed a staff of research and policy analysts.

Senior Policy Analyst 2011-2013

- Conducted policy analyses and wrote reports, memos, regulatory comments, and media pieces on issues such as health reform, HIV/AIDS, health disparities, and health information technology.
- Created and oversaw the LGBT State Exchanges Project, a training and technical assistance partnership with five states to address coverage gaps through the implementation of the ACA.

Astraea Lesbian Foundation for Justice
Consultant 2014
Managed strategic planning activities of the Global Philanthropy Project, a group of 15 international funders supporting the human rights of sexual and gender minorities.

Kaiser Foundation Health Plan
Consultant 2013-2014
Advised on the development of Kaiser's industry-leading LGBTI Health Equity Program.

The Joint Commission
Consultant 2010
Co-authored "Advancing Effective Communication, Cultural Competence, and Patient- and Family-Centered Care for the LGBT Community: A Field Guide."

Open Society Foundations
Consultant 2010-2013
Authored "Transforming Health: International Rights-Based Advocacy for Trans Health," featuring case studies from nine countries and the World Health Organization.

Danish Refugee Council
Fellow 2010
Conducted French-language focus group research in the Central African Republic and wrote a needs assessment about addressing sexual and gender-based violence in conflict situations.

National Coalition for LGBT Health
Policy Analyst 2009-2011
In coordination with 75 member organizations in 22 states and other stakeholders, developed and implemented a national policy strategy for advancing LGBT health equity.

The White House
Intern 2009
Staffed the Special Assistant to the President for Disability Policy.

Wonder Sprachinstitut (Vienna, Austria)
TOEFL Preparation Instructor 2007-2008
Taught beginning and advanced English.

Vienna University of Economics and Business (Vienna, Austria)
Executive MBA Program Tutor 2007-2008
Tutored students on English and economics topics.

Kommersant **Newspaper (Moscow, Russia)**
Russian–English Translator 2006-2007
Translated international news, politics, business, and editorial content for a leading daily newspaper.

Nauka/Interperiodica (Moscow, Russia)
Russian–English Translation Editor 2004-2005
Edited translated scientific journal articles in the areas of physics, chemistry, geology, and biology under a contract with the Russian Academy of Sciences.

SERVICE TO PROFESSIONAL ORGANIZATIONS

National Institutes of Health 2022-present
Appointed Member, Sexual and Gender Minority Working Group of the NIH Council of Councils

Public Health AmeriCorps 2022-present
Member, Technical Working Group for National Process, Outcomes, and Impact Evaluation

AcademyHealth 2022-present
Member, Advisory Group on Health Services Research Innovation, Inclusion, and Impact

UnitedHealthcare 2022-present
Member, Ambassadors for the Community (health equity initiative focused on dual eligibles in DC)

Personalized Medicine Coalition 2022-present
Member, Health Equity Task Force

National Association of Insurance Commissioners 2022-present
Appointed Consumer Representative

California Health Interview Survey 2022-present
Member, Sexual Orientation and Gender Identity Working Group

National Academies of Sciences, Engineering, and Medicine 2021-present
Appointed Member, Consensus Study Committee on Measuring Sex, Gender Identity, and Sexual Orientation for the National Institutes of Health

Agency for Healthcare Research and Quality 2021-present
Invited Participant, AHRQ Health Equity Summits

National Institutes of Health, Inter-Society Coordinating Committee for Practitioner Education in Genomics 2021-present
Founder and Co-Chair, Project on LGBTQI+ Issues in Genomics and Genomics Education

European Research Council 2021-present
Grant Reviewer

National Academies of Sciences, Engineering, and Medicine 2021-present
Partner, Assessing Meaningful Community Engagement in Health & Health Care Leadership Consortium

AcademyHealth 2020-present
Appointed Member, National Advisory Group on Diversity, Equity, and Inclusion

Harvard Medical School 2020-present
Professional Advisory Council Member, Sexual and Gender Minority Health Equity Initiative

National Center for Transgender Equality 2019-present
Scientific Advisory Council Member, 2022 US Transgender Survey

National Institutes of Health 2016-present
Community Engagement Working Group Member, National Human Genome Research Institute

American Councils for International Education 2016-present
Flagship Program Orientation Facilitator (Russia, Kazakhstan, Azerbaijan, Tajikistan)

Equality Federation 2015-present
Board of Directors (current Immediate Past Chair, past Treasurer)

TEDMED 2020
Invited Health Equity Expert

Biden-Harris Presidential Campaign 2020
Equity Review Board Member, Health Policy Committee

Biden-Harris Presidential Campaign 2020
Co-Chair, LGBTQ Health Policy Committee

Congressional Tri-Caucus, Families USA, and UnidosUS 2016-2020
Steering Committee Member, Health Equity and Accountability Act

10.10.10 Cities: Health Social Entrepreneurship Program 2019
Health Start-Up Team "Ninja"

Community Catalyst and the Robert Wood Johnson Foundation 2017-2019
National Advisory Council Member, Consumer Advocacy for Health System Transformation

Gilead Sciences 2017-2019
Transgender Advisory Council Member

American Association for the Advancement of Science 2016-2019
Selection Committee Member, Executive Branch Science and Technology Policy Fellowship

Centers for Medicare & Medicaid Services, U.S. Department of Health & Human Services 2014-2019
Appointed Member, Advisory Panel on Outreach and Education

National Academies of Sciences, Engineering, and Medicine 2017-2018
Steering Committee Member, Project on Demography of Sexual and Gender Minority Populations

Johns Hopkins Bloomberg School of Public Health 2018
Member, Schoolwide Honors and Awards Committee

National Institutes of Health 2018
Invited Participant, Expert Workshop on Methods in Sexual & Gender Minority Health Research

Johns Hopkins Medicine and Harvard University School of Medicine 2013-2018
Member, EQUALITY Study Stakeholder Advisory Board

Robert Wood Johnson Foundation 2017
Application Reviewer, Culture of Health Program

U.S. Professional Association for Transgender Health 2016-2017
Scientific Program Committee Member, Inaugural USPATH Scientific Conference

AcademyHealth 2015-2017
Advisory Council Member and Grant Reviewer, Community Health Peer Learning Program

Center for Consumer Information & Insurance Oversight, U.S. Department of Health & Human Services 2015
Grant Reviewer, HealthCare.gov Enrollment Navigator Program

Robert Carr Civil Society Networks 2015
Grant Reviewer

University of California at San Francisco Center of Excellence for Transgender Health 2013, 2015
Policy Track Co-Chair, National Transgender Health Summit

National Action Alliance for Suicide Prevention 2012
Member, LGBT Task Force

The Fenway Institute 2011-2016
Affiliated Faculty for LGBT Health Policy

U.S. Department of State 2009-2013
National Security Language Initiative for Youth Program Orientation Facilitator (Russia)

The DC Center for the LGBT Community 2009-2011
Board of Directors (DC for Marriage Campaign Co-Chair)

GRANT SUPPORT

DC Center for AIDS Research 2022-2023
Developing Best Practices for Integrating HIV Prevention into Gender-Affirming Care for Transgender Adults
Amount: $49,961
Role: Principal Investigator

Wellspring Advisors 2015-2017
Conducting nationwide outreach and enrollment activities through the Out2Enroll campaign
Amount: $200,000
Role: Project Co-Director

Robert Wood Johnson Foundation 2015-2016
Conducting nationwide outreach and enrollment activities through the Out2Enroll campaign
Amount: $199,472
Role: Project Co-Director

Robert Wood Johnson Foundation 2014-2015
Building the Out2Enroll online enrollment assistance tool
Amount: $148,800
Role: Project Co-Director

Wellspring Advisors 2014-2015
Conducting nationwide outreach and enrollment activities through the Out2Enroll campaign
Amount: $100,000
Role: Project Co-Director

Arcus Foundation 2014-2015
Conducting nationwide outreach and enrollment activities through the Out2Enroll campaign
Amount: $100,000
Role: Project Co-Director

Robert Wood Johnson Foundation 2014-2015
Establishing the "Do Ask, Do Tell" project
Amount: $84,000
Role: Co-Principal Investigator

Wellspring Advisors 2013-2016
Impact of the Affordable Care Act on LGBT Communities
Amount: $600,000
Role: Co-Principal Investigator

Palette Fund 2013-2014
Launching the Out2Enroll campaign
Amount: $10,000
Role: Project Co-Director

Nathan Cummings Foundation 2013-2014
Launching the Out2Enroll campaign
Amount: $10,000
Role: Project Co-Director

Open Society Foundations 2013-2014
Transgender Medical Policy Reform in Russia and the Former Soviet Union
Amount: $88,000
Role: Co-Principal Investigator

Elliott School of International Affairs 2010
Investigating sexual- and gender-based violence in conflict situations
Amount: $10,000
Role: Co-Principal Investigator

TEACHING

Classes Taught

Issues in LGBTQ Health Policy Fall 2021, Fall 2022
Johns Hopkins School of Public Health (Baltimore, MD)

Policy, Politics, and Power in Health Equity Fall 2019, Spring 2020
Johns Hopkins University (Baltimore, MD)
Upper-division undergraduate seminar designed and taught through the Gordis Teaching Fellowship

Guest Lectures

Sexuality, Gender Identity, & The Law 02/2022
American University Washington College of Law (Washington, DC)

Epidemiology of LGBTQIA Health 02/2022
George Washington University (Washington, DC)

O'Neill Institute for National and Global Health Law Colloquium 11/2021
Georgetown Law Center (Washington, DC)

Health Equity Policy 10/2021
Georgetown University (Washington, DC)

Social Epidemiology 10/2021
Temple University College of Public Health (Philadelphia, PA)

Advanced Topics in Health Promotion and Behavioral Sciences 04/2021
University of Louisville (Louisville, KY)

LGBT Health Law and Policy 03/2021
Georgetown Law School (Washington, DC)

Health Policy and Advocacy 02/2021
SUNY Upstate Medical College (Syracuse, NY)

Issues in LGBTQ Health Policy 12/2020
Johns Hopkins Bloomberg School of Public Health (Baltimore, MD)

Epidemiology of LGBT Health 11/2020
Johns Hopkins Bloomberg School of Public Health (Baltimore, MD)

Issues in LGBTQ Health Policy 11/2020
Johns Hopkins Bloomberg School of Public Health (Baltimore, MD)

LGBTQ Politics and Policy 10/2020
American University (Washington, DC)

Research Ethics and Integrity 03/2020
Johns Hopkins Bloomberg School of Public Health (Baltimore, MD)

LGBT Health Policy 03/2020
Johns Hopkins Bloomberg School of Public Health (Baltimore, MD)

LGBT Health Law and Policy 02/2020
Georgetown Law School (Washington, DC)

LGBT Health Policy 02/2020
Johns Hopkins Bloomberg School of Public Health (Baltimore, MD)

Epidemiology of LGBT Health 12/2019
Johns Hopkins Bloomberg School of Public Health (Baltimore, MD)

Economic Evaluation II 12/2018
Johns Hopkins Bloomberg School of Public Health (Baltimore, MD)

Epidemiology of LGBT Health 12/2018
Johns Hopkins Bloomberg School of Public Health (Baltimore, MD)

Public Health Policy 11/2018
SUNY Upstate Medical College (Syracuse, NY)

LGBTQI Health: Research, Policies, and Best Practices 05/2018
Mt. Sinai Icahn School of Medicine (New York, NY)

Epidemiology of LGBT Health 12/2017
Johns Hopkins Bloomberg School of Public Health (Baltimore, MD)

LGBTQ Issues in Public Policy 11/2017
New York University Wagner School of Public Service (New York, NY)

Health Policy and Public Health 10/2017
Baldwin Wallace University (Berea, OH)

LGBT Health Law and Policy 09/2017
Georgetown Law School (Washington, DC)

Epidemiology of LGBT Health 12/2016
Johns Hopkins Bloomberg School of Public Health (Baltimore, MD)

LGBT Health Policy and Practice Graduate Certificate Program 01/2016
George Washington University (Washington, DC)

Epidemiology of LGBT Health 12/2015
Johns Hopkins Bloomberg School of Public Health (Baltimore, MD)

LGBT Health Policy and Practice Graduate Certificate Program 01/2015
George Washington University (Washington, DC)

Health Policy and Public Health 10/2014
Baldwin Wallace University (Berea, OH)

Teaching Assistant Positions

Teaching Assistant, Department of Health Policy and Management 2017-2020
Johns Hopkins Bloomberg School of Public Health (Baltimore, MD)

- Economic Evaluation I and II
- Health Economics for Managers

- Fundamentals of Health Policy and Management
- Introduction to Bioethics in Public Health Practice and Research
- Research Ethics and Integrity: U.S. and International Issues
- Science of Patient Safety
- The Political Economy of Social Inequalities and Its Consequences for Health and Quality of Life

MPH Capstone Teaching Assistant 2019
Johns Hopkins Bloomberg School of Public Health (Baltimore, MD)

Teaching Assistant, Pfizer Executive Program in Economic Evaluation 2018
University of Chicago (New York, NY)

Trainings

"Reaching and Assisting LGBT Communities" – in-person and online training developed for Out2Enroll and presented to Health Insurance Marketplace Navigators and other enrollment assisters

IN THE UNITED STATES DISTRICT COURT
FOR THE NORTHERN DISTRICT OF FLORIDA
Tallahassee Division

AUGUST DEKKER, et al., *Plaintiffs*, v. JASON WEIDA, et al., *Defendants*.	Case No. 4:22-cv-00325-RH-MAF

EXPERT DECLARATION OF
ARMAND H. MATHENY ANTOMMARIA, MD, PhD, FAAP, HEC-C

I, ARMAND H. MATHENY ANTOMMARIA, MD, PhD, FAAP, HEC-C, have been retained by counsel for Plaintiffs in connection with the above-captioned litigation.

1. This declaration provides the following expert opinions, which are explained in further detail below:

2. General Medicaid Policy Rule 59G-1.050 ("the Exclusion") excludes from coverage certain medical services, which I will refer to as gender-affirming medical care, when these interventions are used to treat gender dysphoria.[1]

[1] Gender dysphoria is "a marked incongruence between one's experienced/expressed gender and their assigned gender" which is "associated with clinically significant distress or impairment in social, occupational, or other important areas of functioning." American Psychiatric Association. *Diagnostic and Statistical Manual of Mental Disorders*. 5th ed, Text Revision. American

3. Gender-affirming medical care is consistent with generally accepted professional medical standards and is not experimental or investigational. It is endorsed by evidence-based clinical practice guidelines that are themselves based on studies published in the peer-reviewed literature demonstrating that it improves individuals' health outcomes. Gender-affirming medical care is also supported by increasing utilization trends and coverage by other creditable insurance payors.

4. In the Exclusion and other supporting documents, the Florida Agency for Health Care Administration (AHCA) persistently mischaracterizes these treatments and singles them out for anomalous treatment by withholding Medicaid coverage for them only when they are used to treat gender dysphoria. Specifically, AHCA mischaracterizes

a. individuals as diagnosing themselves with gender dysphoria,

b. treatments for gender dysphoria and "off-label" treatments as experimental,

c. treatments of gender dysphoria as "eminence-based medicine" and the evidence base supporting many medical treatments, and

d. the informed consent process for the treatment of gender dysphoria in minors.

Psychiatric Publishing; 2022.

5. I have actual knowledge of the matters stated in this declaration. In preparing this declaration, I reviewed the Exclusion, "Florida Medicaid: Generally Accepted Professional Medical Standards Determination on the Treatment of Gender Dysphoria" ("GAPMS Memo"),[2] including Attachment G, a commissioned, unpublished paper written by G. Kevin Donovan, MD, MA, entitled "Medical Experimentation without Informed Consent: An Ethicist's View of Transgender Treatment for Children."[3] I also reviewed the materials listed in the attached Bibliography (Exhibit A), and I may rely on those documents as additional support for my opinions. I have also relied on my years of research and clinical practice, as set out in my curriculum vitae (Exhibit B), and on the materials listed therein. The materials I have relied upon in preparing this declaration are the same types of materials that experts in medicine and bioethics regularly rely upon when forming opinions on this type of subject. I may wish to supplement these opinions or the bases for them due to new scientific research or publications, or in response to statements and issues that may arise in my area of expertise.

BACKGROUND AND QUALIFICATIONS

6. I am the Director of the Ethics Center, the Lee Ault Carter Chair of Pediatric Ethics, and an Attending Physician in the Division of Hospital Medicine at Cincinnati Children's Hospital Medical Center ("Cincinnati Children's"). I am also a Professor in the Departments of Pediatrics and Surgery at the University of Cincinnati College of Medicine.

7. In 2000, I received both my medical degree from Washington University School of Medicine in St. Louis, Missouri and my PhD in Religious Ethics from The University of Chicago Divinity School. I completed my pediatrics residency at the University of Utah in 2003.

8. I have been licensed to practice medicine since 2001 and am currently licensed to practice medicine in Ohio. I have been Board Certified in General Pediatrics since 2004 and in Pediatric Hospital Medicine since the inception of this certification in 2019. I have been certified as a Healthcare Ethics Consultant since the inception of this certification in 2019.

9. I have extensive experience as a practicing physician. I have been in clinical practice since 2003 and approximately 30 percent of my current work is dedicated to caring for hospitalized patients. Cincinnati Children's is a nonprofit pediatric academic medical center with 622 total registered beds. It admits patients up to age 25 and older patients under certain conditions, including patients in the

Adults with Congenital Heart Disease and Young Adults with Cancer programs. I routinely admit and care for adult patients.

10. I also have extensive experience as a bioethicist. Bioethicists examine the ethical issues that arise in medicine and the life sciences. I was Chair of the Ethics Committee at Primary Children's Medical Center in Salt Lake City, Utah from 2005 to 2012 and have been Director of the Ethics Center at Cincinnati Children's since 2012.

11. I regularly consult on patients in the Transgender Health Clinic at Cincinnati Children's whose care presents unique ethical issues and participate in the Clinic's monthly multidisciplinary team meetings. I remain current with the medical and bioethics literature regarding the treatment of individuals with gender dysphoria, particularly minors. I am also the Chair of Cincinnati Children's Fetal Care Center's Oversight Committee which provides the Center with recommendations on the use of innovative treatments and experimental interventions.

12. I am a member of the American Academy of Pediatrics (AAP), the American Society for Bioethics and Humanities (ASBH), the Association of Bioethics Program Directors, and the Society for Pediatric Research. I was a member of the AAP's Committee on Bioethics from 2005 to 2011. I have also served as a member of the ASBH's Clinical Ethics Consultation Affairs Committee from 2009

to 2014 and currently serve on its Healthcare Ethics Consultant Certification Commission.

13. I am the author of 41 peer-reviewed journal articles, 11 non-peer-reviewed journal articles, six book chapters, and 28 commentaries. My peer-reviewed journal articles have been published in high-impact journals including the *Journal of the American Medical Association* and *Annals of Internal Medicine.* I am also an author of 17 policy statements and technical reports, including four as lead author, by the AAP.

14. I am a member of the Executive Editorial Board and the Associate Editor for Ethics Rounds of *Pediatrics*. *Pediatrics* is the AAP's flagship journal and Ethics Rounds is a type of article in which commentators analyze cases that raise ethical issues. I am an active peer reviewer for many medical journals, including the *American Journal of Bioethics* and the *Journal of Pediatrics*. I also review abstracts for the annual meetings of professional organizations, including the Pediatric Academic Societies and ABSH. I was previously a member of the editorial boards of the *Journal of Clinical Ethics* and the *Journal of Medical Humanities*.

15. I previously testified as an expert witness at trial or deposition in the following cases: *Brant v. Rutledge*, Case No. 4:21CV450-JM (E.D. Ark.), *Doe v. Abbott*, No. D-1-GN-22-000977, 2022 WL 628912 (Tex. Dist. 353rd Judicial

District, March 2, 2022), and *Eknes-Tucker* v *Marshall*, Case No. 2:22-cv-184-LCB (M.D. Ala. May 13, 2022).

16. I am being compensated at an hourly rate of $250 per hour for preparation of expert declarations and reports, and $400 per hour for time spent preparing for or giving deposition or trial testimony. My compensation does not depend on the outcome of this litigation, the opinions I express, or the testimony I provide.

GENDER-AFFIRMING MEDICAL CARE IS SUPPORTED BY EVIDENCE-BASED CLINICAL PRACTICE GUIDELINES

17. Medical care for individuals with gender dysphoria is evidence-based and is supported by clinical practice guidelines developed by medical professional organizations including the Endocrine Society ("the Society").

18. The Society was established in 1916[4] and is an international medical organization whose membership is comprised of over 18,000 endocrinology researchers and clinicians.[5] It uses rigorous methods to develop guidelines on a variety of clinical conditions. Members of guideline development panels are nominated by the Society's Board of Directors, its Clinical Guidelines Committee, and any co-sponsoring organizations; they are selected based on their clinical

[4] Endocrine Society. Our History. Accessed December 31, 2022. Available at https://www.endocrine.org/our-community/advancing-endocrinology-and-public-health/history/.
[5] Endocrine Society. Who We Are. Accessed December 31, 2022. Available at https://www.endocrine.org/about-us.

expertise and other skills; and they are screened for conflicts of interest. Panels are multidisciplinary and include a patient representative and a methodologist—someone trained in the methods for developing clinical practice guidelines. The Society uses the Grading of Recommendations Assessment, Development and Evaluation (GRADE) methodology. Guidelines undergo both internal and external review including a public comment period. After any revisions, the proposed guidelines undergo a second review by the Society's Clinical Guidelines Committee, its Board of Directors Reviewer, and an expert reviewer. If approved, they undergo peer review prior to publication. Guidelines are periodically reviewed and may be updated or retired.[6]

19. The GRADE approach is a widely utilized method for developing clinical practice guidelines.[7] It involves both rating the quality of the evidence and the strength of the recommendations.[8] In this context, evidence is the studies' relevant to a recommendation. It is best practice to ascertain the studies via systematic reviews of the literature.[9] The evidence provides an estimate of the effect

[6] Endocrine Society Guideline Methodology. Accessed November 25, 2022. Available at https://www.endocrine.org/-/media/endocrine/files/cpg/methodology-page-refresh/endocrine_society_guideline_methodology_links.pdf.

[8] Guyatt G, Oxman AD, Akl EA, et al. GRADE guidelines: 1. Introduction-GRADE evidence profiles and summary of findings tables. *J Clin Epidemiol*. 2011;64(4):383-394.
[9] Systematic reviews use exhaustive, transparent, and repeatable methods to identify, select, and appraise the relevant research. For example, medical librarians may help develop strategies to search multiple databases and several investigators may screen each articles' title and abstract

of an intervention both in terms of the size of the effect and the certainty of the knowledge about it. The quality of the evidence rating reflects "the extent of our confidence that the estimates of an effect are adequate to support a particular decision or recommendation."[10] The higher the quality of the evidence, the more confidence there is in our knowledge about the estimated magnitude of the effect and the more likely the true magnitude of the effect is the same as the estimate. The lower the quality of the evidence, the less confidence there is in the estimate of the effect and the more likely the true effect differs from the estimate. The GRADE approach uses four categories to rate the quality of the evidence: "high," "moderate," "low," and "very low."[11]

20. In the rating process, randomized trials are initially rated as high quality and observational studies as low quality.[12] In randomized trials, participants are randomly assigned to an intervention or a control group. Randomization is like flipping a coin. In double blind or masked randomized trials, neither the investigators nor the participants know to which group the participants are assigned.

[12] Balshem H, Helfand M, Schunemann HJ, et al. GRADE guidelines: 3. Rating the quality of evidence. *J Clin Epidemiol*. 2011;64(4):401-406.

Observational studies include cross-sectional and cohort studies. In cross-sectional studies, investigators collect data at a single point in time or within a short period of time. In cohort studies, researchers identify a group of participants and then make measurements over time. The measurements may be retrospective and/or prospective.[13]

21. The initial rating of the evidence may subsequently be modified based on additional factors. The rating of randomized trials may, for example, be decreased if they have serious risks of bias[14] like a lack of masking.[15] The rating of observational trials may be increased if they have large effects, e.g., those receiving the intervention are more than two times or less than one-half as likely to experience the outcome.[16]

22. The strength of a recommendation is related to the confidence that a treatment's desirable outcomes outweigh its undesirable ones. The GRADE approach conceptualizes recommendations on a continuum: "strong against," "weak against," "only in research," "weak for," and "strong for." Strong recommendations are ones where all or almost all informed people would make the recommended

choice and weak recommendations are ones where most informed people would, but a substantial number would not, make the recommended choice.[17] The strength of a recommendation is based on the balance between desirable and undesirable outcomes, confidence in the magnitude of estimates of the intervention's effect, confidence in values and preferences, and resource use.[18] Low quality evidence may be sufficient to justify a strong recommendation.[19] Because of the potential to confuse low quality evidence and weak recommendations, the GRADE approach offers the following alternative ways to describe a weak recommendation: "conditional," "discretionary," and "qualified."[20]

23. The Society's clinical practice guideline for the endocrine treatment of gender-dysphoric/gender-incongruent persons makes 28 recommendations.[21] Ten are strong, 12 are weak, and six are ungraded good practice statements; three are

[17] Andrews J, Guyatt G, Oxman AD, et al. GRADE guidelines: 14. Going from evidence to recommendations: The significance and presentation of recommendations. *J Clin Epidemiol*. 2013;66(7):719-725.

based on moderate, 14 on low, and five on very low-quality evidence. Table 1 (Exhibit C). The recommendation, "We suggest that adolescents who meet diagnostic criteria for [gender dysphoria]/gender incongruence, fulfill criteria for treatment, and are requesting treatment should initially undergo treatment to suppress pubertal development," for example, is a weak recommendation based on low-quality evidence. Recall that a weak recommendation is one where most informed people would make the recommended choice. The evidence includes cohort studies conducted at VU University Medical Center in the Netherlands demonstrating that gender-affirming medical care improves individuals' mental health outcomes.[22] The recommendation "We recommend that clinicians confirm the diagnostic criteria of [gender dysphoria]/gender incongruence and the criteria for the endocrine phase of gender transition before beginning treatment" is a strong recommendation based on moderate quality evidence. The evidence includes a randomized trial of three different testosterone formulations in transgender men (individuals who were assigned female at birth and identify as male).[23]

24. Professional associations' treatment recommendations for pediatric

patients are infrequently based on well-designed and conducted randomized controlled trials due to their rarity and are frequently based on observational studies. For example, the Society has developed two other guidelines that focus on the pediatric population: guidelines on pediatric obesity and congenital adrenal hyperplasia. They contain 84 recommendations. None are based on high, 24 (29%) on moderate, and 49 (58%) on low or very low-quality evidence. Forty-three (51%) recommendations are strong and 30 (36%) weak. The remaining recommendations (11, 13%) are Ungraded Good Practice Statements.[24] Table 1 (Exhibit C).

25. Medical research on children is less likely to use randomized trials than is medical research for adults. Reasons for this disparity include the low prevalence of childhood disease or conditions, small market share for therapeutic agents in children, low level of National Institutes of Health funding, and difficulty enrolling children in research.[25]

26. It may also, at times, be unethical to conduct randomized trials. For randomized trials to be ethical, clinical equipoise must exist; there must be uncertainty about whether the efficacy of the intervention or the control is greater.

[24] Speiser PW, Arlt W, Auchus RJ, et al. Congenital adrenal hyperplasia due to steroid 21-hydroxylase deficiency: An Endocrine Society clinical practice guideline. *J Clin Endocrinol Metab*. 2018;103(11):4043-4088; Styne DM, Arslanian SA, Connor EL, et al. [25] Martinez-Castaldi C, Silverstein M, Baucher H. Child versus adult research: The gap in high-quality study design. *Pediatrics*. 2008;122(1):52-57.

It would be unethical to knowingly expose some participants to an inferior intervention. Trials must also be feasible. It would be unethical to expose individuals to the risks of trial participation without the benefit of the trial generating generalizable knowledge. A randomized trial that is unlikely to enroll enough participants because they believe they might be randomized to an inferior intervention would be unethical because it could not generate generalizable knowledge due to an inadequate sample size.[26]

27. Under the applicable ethical standards, randomized, placebo-controlled trials (trials that compare pharmacological treatment to no pharmacological treatment) of individuals with gender dysphoria are currently unethical. Potential investigators no longer have equipoise between pharmacological treatment and no pharmacological treatment; they believe that pharmacological treatment is superior. It is also highly unlikely that enough participants would enroll in such randomized controlled trials for them to be informative.[27]

28. Even if randomized, placebo-controlled trials of gender-affirming health care were ethical, they would provide a lower quality of evidence because of intrinsic limitations in their design. For example, it would be impossible to mask

which participants were receiving an active medication or a placebo; the investigators and the participant would know if the participant was in the intervention or control group due to the physical changes in the participant's body, or the lack thereof, over time. This might bias their perception of the outcomes and lower the rating of the study's quality.[28]

29. Gender-affirming medical care is also recommended by the World Professional Association for Transgender Health's (WPATH's) Standards of Care for the Health of Transgender and Gender Diverse People which is currently in its 8th version ("SOC-8").[29] WPATH is an international interdisciplinary professional and educational organization[30] whose over 2,500 members include physicians, psychologists, lawyers, and social workers.[31] The SOC-8 revision committee included subject matter experts, stakeholders, and an expert in developing clinical practice guidelines each of whom completed conflict of interest declarations. An independent, evidence review team conducted selected systematic reviews of the literature. Consensus on recommendations was attained using a Delphi process; a voting process requiring approval by 75% of participating committee members. If

GENDER-AFFIRMING MEDICAL CARE IS NOT EXPERIMENTAL

31. Clinical practice and research are distinguished by their goals and methods. The goal of clinical practice is to benefit individual patients, and its method is individualized decision-making. The goal of research is to contribute to generalizable knowledge, and its method uses formal protocols that describe the research study's objectives and procedures.[41]

32. To the extent that the GAPMS Memo uses the term "experimental" or "investigational" to convey that gender-affirming medical care is new, untested, or different, that suggestion is baseless. GAPMS Memo at 29, 30; Attachment G at 1, 4. Hormone treatment for gender dysphoria began after estrogen and testosterone

became commercially available in the 1930's. The first documented male to female gender-affirming genital surgery was performed in 1931 and Christine Jorgensen famously underwent gender-affirming surgery in 1952.[42] The use of gonadotropin releasing hormone analogues, also known as puberty blockers or puberty-delaying medications, to treat gender dysphoria in adolescents, while a somewhat more recent treatment, is also not new. The first reference to this treatment in the medical literature was in 1998, approximately 25 years ago.[43] Observational studies of puberty blockers began recruiting participants in 2000.[44] As described above, gender-affirming medical care is supported by clinical studies, the same type of studies that support many other widely accepted medical treatments.

33. The clinical use of puberty blockers, gender-affirming hormone treatment and surgeries are not research or experimentation. When administering these treatments, clinicians seek to benefit individual patients and adjust the treatment based on individual patients' responses.

34. The GAPMS Memo's suggestion that, because puberty blockers and gender-affirming hormone treatment are being used "off-label," they are experimental, untested, or unsafe is also misleading. GAPMS Memo at 8, 14, 16, 19,

21; Attachment G at 4. Off-label use of medications is legal, common, and often evidence-based.

35. Approval by the United States (US) Food and Drug Administration (FDA) is not required for all uses of a medication. Once the FDA has approved a medication for one indication,[45] thereby agreeing that it is safe (i.e., its benefits outweigh its potential risks) and effective for this intended use, as is the case with the medications at issue here, prescribers are generally free to prescribe it for other indications.[46] Prescribing an approved medication for an unapproved indication is colloquially referred to as "off-label" use. The AAP Committee on Drugs states, "[i]t is important to note that the term 'off-label' does not imply an improper, illegal, contraindicated, or investigational use" and "[t]he administration of an approved drug for a use that is not approved by the FDA is not considered research and does

[45] According to the FDA, an indication includes several factors: the particular disease or condition or the manifestation or symptoms of the disease or condition for which the drug is approved; whether the drug is approved for treatment, prevention, mitigation, cure, or diagnosis; and the population, including age group, for which the drug is safe and effective. Center for Drug Evaluation and Research and Center for Biologics Evaluation and Research, Food and Drug Administration, U.S. Department of Health and Human Services. Indications and Usage Section of Labeling for Human Prescription Drug and Biological Products—Content and Format: Guidance for Industry. July 2018. Accessed August 25, 2022. not warrant special consent or review if it is deemed to be in the individual patient's best interest."[47]

36. The AAP Committee on Drugs further states "in no way does a lack of labeling signify that therapy is unsupported by clinical experience or data in children."[48] Among the reasons for this is that, even if there is substantial evidence of safety and efficacy for a new indication, a sponsor may not seek FDA approval for it because the sponsor does not expect that the future revenue will offset the costs of obtaining approval.[49]

37. "Off-label" use of drugs is common in many areas of medicine, including pediatrics. For example, magnesium sulfate is only approved by the FDA for replacement therapy in magnesium deficiency, in nutrition given by vein to correct or prevent low magnesium levels, or to prevent or control seizures due to high blood pressure during pregnancy.[50] It is, nonetheless, recommended for the short-term prolongation of pregnancy and to prevent neurologic injuries to the fetus and newborn [51] and as an adjunct treatment in severe, unresponsive asthma

exacerbations.[52] A recent study of children's hospitals found that in 28.1% of encounters, at least one off-label drug was prescribed.[53] Examples of medications used off-label in this study included: albuterol, which is used to treat asthma; morphine, which is used to treat pain; and lansoprazole (Prevacid®), which is used to treat gastrointestinal reflux. The rate of off-label use may be significantly higher in certain age groups, categories of drugs, and clinical settings.

38. The GAPMS Memo misleadingly notes that testosterone is a Schedule III controlled substance because of its "high probability of abuse." GAPMS Memo at 19. But there is no evidence of abuse or dependence of anabolic-androgenic steroids from therapeutic use. And Schedule III drugs have a moderate to low potential for physical and psychological dependence.[54] Dependence has only been reported among weightlifters and bodybuilders receiving non-therapeutic, supraphysiologic doses.[55]

SUBSTANTIAL INCREASES IN THE UTILIZATION OF GENDER-AFFIRMING MEDICAL CARE

39. In addition to evidence-based clinical practice guidelines, utilization trends and insurance coverage policies provide further evidence that gender-affirming medical care is a consistent with generally accepted medical standards. The peer-reviewed evidence of the efficacy of gender-affirming medical care and the recommendations of it by clinical practice guidelines are likely to increase the utilization of gender-affirming medical care and coverage by insurance companies. There have been substantial increases in the utilization of gender-affirming medical care in the last 30 years. This has included increases in referrals for care as well as the use of different forms of care. Evidence for these changes comes from a variety of sources and investigators use different ways to describe the increases in utilization. Studies demonstrate increasing referrals to children's hospitals and specialized gender clinics.[56] Handler and colleagues, for example, report that between February 2015 and June 2018 there was a significant increase in the volume of pediatric referrals to the specialized gender clinic at Kaiser Permanente North California; the average number of monthly referrals increased from 5.1 to 25.7 individuals per month which is an increase of 504%.[57]

40. Studies have also demonstrated significant increases in the utilization of various forms of gender-affirming medical care including puberty blockers,[58] hormone therapy,[59] and surgery.[60] Baker and colleagues, for example, conducted a study using the OptumLabs Data Warehouse. The Warehouse includes de-identified administrative claims data for commercially insured enrollees in a large, private US health plan. They found that the percentage of transgender people who were receiving hormone therapy or underwent surgery increased from 17% and 0.5% respectively in 2011 to 65% and 8% by 2019. This percentile increase represents a substantial number of individuals as the number of transgender people with coverage increased from 71 per million enrollees in 1993 to 411 per million in 2019.[61] The Society for Plastic Surgery reports also that the number of gender-affirming

surgeries performed by its members increased from 2,470 in 2015[62] to 16,353 in 2020,[63] which is an increase of 562%.

COVERAGE BY OTHER CREDITABLE INSURANCE PAYORS

41. Coverage of gender-affirming medical care is provided by other creditable insurance payors. In 2014, the Department of Health and Human Services' Departmental Appeals Board determined that the National Coverage Determination denying Medicare coverage of gender-affirming surgery was invalid.[64] A 2018 analysis of Medicare prescription drug plans found that the proportion of plans providing coverage of hormone therapy varied by hormone with 100/75% providing coverage/unrestricted coverage of testosterone-cypionate, 89/89% estradiol-valerate, and 100/100% spironolactone.[65] A study of state Medicaid programs published in 2021 found that 67% covered gender affirming

hormone treatment, 18% did not cover it, and 16% were indeterminate. With respect to gender affirming surgery, the results were 51%, 43%, and 8% respectively.[66]

42. Gender-affirming medical care is also covered by private health insurance plans. A study of self-insured, corporate health insurance benefit plans conducted in 2019 found that 56.4% covered transition care, 8.8% did not cover it, 5.8% were ambiguous, and 29.1% were silent. The investigators did not differentiate between gender-affirming hormone treatment and surgery.[67] Coverage for surgery is highest for bilateral mastectomy for transgender men and genital surgery for transgender men and women (transgender women are individuals assigned male at birth who identify as female). National surveys of private insurance plans found 96% covered mastectomy[68] and 91% genital surgery.[69] Private insurance plans cover other types of gender-affirming surgery,[70] such as breast augmentation,[71]

facial feminization surgery,[72] voice surgery,[73] and hair removal procedures[74] for transgender women albeit at lower rates.

GENDER DYSPHORIA IS A MEDICAL DIAGNOSIS

43. Several other mischaracterizations of gender-affirming medical care in the GAPMS Memo should be addressed. While the GAPMS Memo correctly acknowledges that gender dysphoria is a medical diagnosis contained in the American Psychiatric Association's *Diagnostic and Statistical Manual of Mental Disorders (DSM)* 5th ed,[75] it falsely characterizes individuals with gender dysphoria as "self-diagnosing." GAPMS Memo at 30; Attachment G at 5. The diagnosis of gender dysphoria in adolescents and adults, like many other common medical diagnoses, relies on individuals' self-report of their symptoms. The diagnosis of migraine headaches, for example, depends on individuals' report of the number, duration, and characteristics of their headaches. The characteristics include the

[75] American Psychiatric Association. *Diagnostic and Statistical Manual of Mental Disorders*. 5th ed. American Psychiatric Publishing; 2013. A text revision, which contains the same diagnosis and diagnostic criteria, has subsequently been published. American Psychiatric Association. *Diagnostic and Statistical Manual of Mental Disorders*. 5th ed, Text Revision. American Psychiatric Publishing; 2022.

headaches' location, quality, intensity, and aggravating factors as well as the presence of nausea and/or vomiting, and light and sound sensitivity. It is common for diagnostic criteria to utilize qualitative terms, e.g., the intensity of migraine headaches is moderate to severe.[76] Like gender dysphoria, there is no confirmatory laboratory or radiographic study for the diagnosis of migraine headaches. Radiographic studies and electroencephalograms (EEG) are only used if the history and physical examination suggest that the headache is secondary to another condition, e.g., meningitis or subarachnoid hemorrhage.[77]

44. Individuals with symptoms of gender dysphoria may anticipate their diagnosis in the same way that individuals with fever, cough, and difficulty breathing may reasonably suspect that they have pneumonia. It is, however, incorrect to suggest that these patients "self-diagnose," or that such suspicions serve as the basis for the diagnosis or subsequent treatment. Only licensed healthcare providers or teams of providers, based on patient reports and, in the case of minors, parent reports, make the diagnosis of gender dysphoria and any subsequent treatment recommendations.

PARENTS AND LEGAL GUARDIANS ARE CAPABLE OF PROVIDING INFORMED CONSENT FOR GENDER-AFFIRMING MEDICAL CARE

45. The GAPMS Memo and attachments incorrectly claim that parents or legal guardians are unable to understand and appreciate the potential risks of gender-affirming health care and, therefore, are incapable of providing informed consent. GAPMS Memo at 18, 29; Attachment G at 3-4.

46. First and foremost, the current standard of care for treating gender dysphoria in minors is consistent with general ethical principles instantiated in the practices of informed consent and shared decision-making.

47. Parents or legal guardians generally must provide informed consent for medical treatment for their minor children, including for gender-affirming medical care. AHCA and Dr. Donovan cite no evidence in support of the assertion that parents or guardians of adolescents with gender dysphoria, nor the adolescents themselves, are unable to understand or appreciate the potential risks of gender-affirming medical care. ACHA and Dr. Donovan also cite to no evidence that clinicians are not sufficiently disclosing the risks of gender-affirming medical care to parents or legal guardians, or to minor patients. GAPMS Memo p. 29-30; Attachment G at 2-4.

48. Parents and legal guardians frequently consent to medical treatments for minors unrelated to gender dysphoria which have comparable risks, uncertainty,

or levels of evidence. For example, parents and legal guardians consent to the treatment of nonmalignant medical conditions for their minor children, including some rheumatologic disorders and hematologic conditions, which may impair fertility.[78]

49. Adolescents generally possess comparable medical decision-making capacity to adults.[79] There is evidence that most adolescents with gender dysphoria have sufficient medical decision-making capacity to make decisions regarding puberty blockers.[80] And there are steps that healthcare providers take to promote adolescents' decision-making capacity.[81]

50. The Society's clinical practice guideline extensively discusses the potential benefits, risks, and alternatives to gender-affirming medical care, and its recommendations regarding the timing of interventions are based in part on the treatment's potential risks and the adolescent's decision-making capacity. The guideline recommends that informed consent for pubertal blockers and gender-

affirming hormones include a discussion of the implications for fertility and options for fertility preservation.[82]

51. The Society's clinical guideline also advises delaying gender-affirming hormone treatment, which results in partly irreversible physical changes, until an adolescent has developed sufficient medical decision-making capacity. The guideline states clinicians should individualize decision-making for chest surgery in transgender males and that chest surgery may be considered in some instances for individuals under 18 years old. The guideline recommends gender-affirming genital surgery involving gonadectomy and/or hysterectomy only in individuals 18 years old or older. [83]

THE EXCLUSION SINGLES OUT GENDER-AFFIRMING CARE FOR ANOMALOUS TREATMENT

52. The Exclusion does not provide a basis for excluding coverage of the provision of gender-affirming medical care to individuals with gender dysphoria and treating it differently from other comparable medical interventions. For example, while the Exclusion would eliminate coverage of chest surgery for the treatment of gender dysphoria for transgender Medicaid beneficiaries, cisgender Medicaid

[82] Hembree WC, Cohen-Kettenis PT, Gooren L, et al. Endocrine treatment of gender-dysphoric/gender-incongruent persons: An Endocrine Society clinical practice guideline. *J Clin Endocrinol Metab*. 2017;102(11):3869-3903.

[83] Or the legal age of majority in his or her country. Hembree WC, Cohen-Kettenis PT, Gooren L, et al. Endocrine treatment of gender-dysphoric/gender-incongruent persons: An Endocrine Society clinical practice guideline. *J Clin Endocrinol Metab*. 2017;102(11):3869-3903.

beneficiaries are provided coverage for comparable surgeries, such as those for gynecomastia.[84] Gynecomastia is the proliferation of ductal or glandular breast tissue, as opposed to adipose tissue or fat, in individuals whose sex assigned at birth is male. While surgery to treat gynecomastia may at times lessen pain, it also commonly reduces psychosocial distress. The surgery has the effect of affirming cisgender male patients' gender identity, that is, to help individuals assigned male at birth feel their bodies are more typically masculine. Risks associated with the procedure include bruising, bleeding, infection, scarring, poor cosmetic outcome, and loss of sensation.[85]

53. There is nothing unique about chest surgery for gender dysphoria that justifies singling this treatment, or other medical treatments for gender dysphoria, out for non-coverage based on a concern regarding evidence of safety or efficacy; adult patients', or parents' or guardians' ability to consent; or adolescents' ability to assent. As with other conditions, medical decisions regarding treatment for gender dysphoria should continue to be left to the discretion of adult patients, or parents or legal guardians and their minor children, and their healthcare providers.

CONCLUSION

54. Based on my research and experience as a physician and bioethicist, treatment for gender dysphoria is not experimental and is consistent with generally accepted professional medical standards including standards for informed consent. There is not a sound medical or ethical basis for excluding such care from coverage by Florida Medicaid and so doing is inconsistent with the program's other medical coverage decisions.

I declare under penalty of perjury under the laws of the United States of America that the foregoing is true and correct.

PERSONAL DATA

Armand H. Matheny Antommaria, MD, PhD, FAAP, HEC-C
Birth Place: Pittsburgh, Pennsylvania
Citizenship: United States of America

CONTACT INFORMATION

Address: 3333 Burnet Ave, ML 15006, Cincinnati, OH 45229
Telephone Number: (513) 636-4939
Electronic Mail Address: armand.antommaria@cchmc.org

EDUCATION

1983-1987	BSEE	Valparaiso University, with High Distinction Valparaiso, IN
1983-1987	BS	Valparaiso University (Chemistry), with High Distinction Valparaiso, IN
1987-1989	MD	Washington University School of Medicine
1998-2000		Saint Louis, MO
1989-2000	PhD	The University of Chicago Divinity School (Religious Ethics) Chicago, IL
2000-2003	Resident	University of Utah (Pediatrics) Salt Lake City, UT
2005-2006	Certificate	Conflict Resolution Certificate Program, University of Utah Salt Lake City, UT

BOARD CERTIFICATION

2019 Pediatric Hospital Medicine, American Board of Pediatrics
2019 Healthcare Ethics Consultant-Certified, Healthcare Ethics Consultation Certification Commission
2004 General Pediatrics, American Board of Pediatrics

PROFESSIONAL LICENSES

2012-Present	Doctor of Medicine, Ohio
2006-2010	Alternative Dispute Resolution Provider—Mediator, Utah
2001-2014	Physician and Surgeon, Utah
2001-2014	Physician and Surgeon Controlled Substance, Utah

PROFESSIONAL EXPERIENCE

Full Time Positions

2019-Present *Professor*
Cincinnati Children's Hospital Medical Center, Cincinnati, OH
Department of Surgery

2019-Present *Professor of Clinical-Affiliated*
University of Cincinnati, Cincinnati, OH
Department of Surgery

2017-Present *Professor*
Cincinnati Children's Hospital Medical Center, Cincinnati, OH
Division of Pediatric Hospital Medicine

2017-Present *Professor of Clinical-Affiliated*
University of Cincinnati, Cincinnati, OH
Department of Pediatrics

2016-2017 *Associate Professor of Clinical-Affiliated*
University of Cincinnati, Cincinnati, OH
Department of Pediatrics

2012-2017 *Associate Professor*
Cincinnati Children's Hospital Medical Center, Cincinnati, OH
Division of Pediatric Hospital Medicine

2012-Present *Lee Ault Carter Chair in Pediatric Ethics*
Cincinnati Children's Hospital Medical Center

2012-2016 *Associate Professor-Affiliated*
University of Cincinnati, Cincinnati, OH
Department of Pediatrics

2010-2012 *Associate Professor of Pediatrics* (with Tenure)
University of Utah School of Medicine, Salt Lake City, UT
Divisions of Inpatient Medicine and Medical Ethics

2010-2012 *Adjunct Associate Professor of Medicine*
University of Utah School of Medicine, Salt Lake City, UT
Division of Medical Ethics and Humanities

2004-2010 *Assistant Professor of Pediatrics* (Tenure Track)
University of Utah School of Medicine, Salt Lake City, UT
Divisions of Inpatient Medicine and Medical Ethics

2004-2010 *Adjunct Assistant Professor of Medicine*
University of Utah School of Medicine, Salt Lake City, UT
Division of Medical Ethics and Humanities

2003-2004 *Instructor of Pediatrics* (Clinical Track)
University of Utah School of Medicine, Salt Lake City, UT
Divisions of Inpatient Medicine and Medical Ethics

2003-2004 *Adjunct Instructor of Medicine*
University of Utah School of Medicine, Salt Lake City, UT
Division of Medical Ethics

Part Time Positions

2022- Present *Expert Witness,* Testimony
Eknes-Tucker, et al., v. Marshall, et al., United States District Court Middle District of Alabama Northern Division, Case No. 2:22-cv0-184-LCB.

2022-Present	*Expert Witness,* Testimony Jane Doe, et al., v. Greg Abbott, et al., District Court of Travis County, Texas 353rd Judicial District, Case No. D-1-GN-22-000977
2021-2022	*Expert Witness*, Deposition and Testimony Dylan Brandt, et al., v. Leslie Rutledge, et al., United States District Court, Eastern District of Arkansas, Case No.: 5:21-CV-00450-JM-1
2021	*Consultant* Proctor & Gamble, Cincinnati, OH
2019	*Consultant* Sanofi Genzyme, Cambridge, MA
2018-Present	*Consultant* Center for Conflict Resolution in Healthcare, Memphis, TN
2017-2020	*Consultant* Amicus Therapeutics, Cranbury, NJ
2017	*Consultant* Sarepta Therapeutics, Cambridge, MA
2014	*Consultant* Genzyme, A Sanofi Company, Cambridge, MA

Editorial Experience

Editorial Board

2020-Present	*Pediatrics,* Associate Editor for Ethics Rounds and Member of the Executive Editorial Board
2015-2020	*Journal of Clinical Ethics*
2009-2020	*Journal of Medical Humanities*

Guest Academic Editor

2017	*PLOS|ONE*

Ad Hoc Reviewer: *Academic Medicine, Academic Pediatrics, AJOB Primary Research, American Journal of Bioethics, American Journal of Law & Medicine, American Journal of Medical Genetics, American Journal of Transplantation, BMC Medical Ethics, BMJ Open, Canadian Journal of Bioethics, CHEST, Clinical Transplantation, European Journal of Human Genetics, European Journal of Pediatrics, Frontiers in Genetics, Hospital Medicine, International Journal of Health Policy and Management, International Journal of Nursing Studies, Journal of Adolescent and Young Adult Oncology, Journal of Clinical Ethics, Journal of Empirical Research on Human Research Ethics, Journal of General Internal Medicine, Journal of Healthcare Leadership, Journal of Hospital Medicine, Journal of the Kennedy Institute of Ethics, Journal of Law, Medicine & Ethics, Journal of Medical Ethics, Journal of Medical Humanities, Journal of Medicine and Life, Journal of Palliative Care, Journal of Pediatrics, Journal of Pediatric Surgery, Mayo Clinic Proceedings, Medicine, Healthcare and Philosophy, Molecular Diagnosis & Therapy, New England Journal of Medicine, Patient Preference and Adherence, Pediatrics, Pediatrics in Review, Personalized Medicine, PLOS\|ONE, Risk Management and Healthcare Policy, Saudi Medical Journal, SSM - Qualitative Research in Health,* and *Theoretical Medicine and Bioethics*

SCHOLASTIC AND PROFESSIONAL HONORS

2021	*Hidden Gem Award,* Cincinnati Children's Hospital Medical Center, Cincinnati, OH
2019-2022	*Presidential Citation,* American Society for Bioethics and Humanities, Chicago, IL
2016	*Laura Mirkinson, MD, FAAP Lecturer,* Section on Hospital Medicine, American Academy of Pediatrics, Elk Grove Village, IL
2016, 2018	*Certificate of Excellence*, American Society for Bioethics and Humanities, Glenview, IL
2013, 2016	*Senior Resident Division Teaching Award,* Cincinnati Children's Hospital Medical Center, Cincinnati, OH
2012	*Role Model*, Quality Review Committee, Primary Children's Medical Center, Salt Lake City, UT
2011	*Member*, Society for Pediatric Research, The Woodlands, TX
2011	*Presidential Citation*, American Society for Bioethics and Humanities, Glenview, IL
2009	*Role Model*, Quality Review Committee, Primary Children's Medical Center, Salt Lake City, UT
2008	*Nominee,* Physician of the Year, Primary Children's Medical Center, Salt Lake City, UT
2005-2006	*Fellow,* Medical Scholars Program, University of Utah School of Medicine, Salt Lake City, UT
1995-1997	*Doctoral Scholar*, Crossroads, A Program of Evangelicals for Social Action, Philadelphia PA
1989-1992	*Fellow*, The Pew Program in Medicine, Arts, and the Social Sciences, University of Chicago, Chicago, IL

ADMINISTRATIVE EXPERIENCE

Administrative Duties

2019-Present	*Chair,* Oversight Committee, Cincinnati Fetal Center, Cincinnati, OH
2014-Present	*Chair*, Ethics Committee, Cincinnati Children's Hospital Medical Center, Cincinnati, OH
2012-Present	*Director*, Ethics Center, Cincinnati Children's Hospital Medical Center, Cincinnati, OH
2012-Present	*Chair,* Ethics Consultation Subcommittee, Cincinnati Children's Hospital Medical Center, Cincinnati, OH
2010	*Co-Chair,* Ethics Subcommittee, Work Group for Emergency Mass Critical Care in Pediatrics, Centers for Disease Control and Prevention, Atlanta, GA
2009	*Chair*, Ethics Working Group, H1N1 and Winter Surge, Primary Children's Medical Center, Salt Lake City, UT
2005-2012	*Chair*, Ethics Committee, Primary Children's Medical Center, Salt Lake City, UT
2005-2012	*Chair*, Ethics Consultation Subcommittee, Primary Children's Medical Center, Salt Lake City, UT
2003-4	*Chair*, Clinical Pertinence Committee, Primary Children's Medical Center, Salt Lake City, UT

Professional & Scientific Committees

Committees

2021	*Member*, EMCO Capacity Collaboration, Ohio Hospital Association, Columbus, OH
2020-2021	*Member*, Allocation of Scarce Resources Work Group, Ohio Hospital Association, Columbus, OH
2020-Present	*Member,* Literature Selection Technical Review Committee, National Library of Medicine, Bethesda, MD
2020	*Member*, Crisis Standards of Care Workgroup, The Health Collaborative, Cincinnati, OH
2019-Present	*Member,* Healthcare Ethics Consultant Certification Commission, Oak Park, IL

2019	*Member,* Expert Panel, Pediatric Oncology End-of-Life Care Quality Markers, Institute for Cancer Outcomes & Survivorship, University of Alabama at Birmingham, Birmingham, AL
2018	*Member,* Resource Planning and Allocation Team Implementation Task Force, Ohio Department of Health, Columbus, OH
2012-Present	*Member*, Gaucher Initiative Medical Expert Committee, Project HOPE, Millwood, VA
2009-2014	*Member,* Clinical Ethics Consultation Affairs Committee, American Society for Bioethics and Humanities, Glenview, IL
2005-2011	*Member,* Committee on Bioethics, American Academy of Pediatrics, Oak Park, IL

Data Safety and Monitoring Boards

2019-Present	*Member,* Data and Safety Monitoring Board, Sickle Cell Domestic Trials, National Heart, Lung, and Blood Institute, Bethesda, MD
2018-2019	*Member,* Standing Safety Committee for P-188-NF (Carmeseal-MD™) in Duchenne Muscular Dystrophy, Phrixus Pharmaceuticals, Inc., Ann Arbor, MI
2017-Present	*Member*, Observational Study Monitoring Board, Sickle Cell Disease Observational Monitoring Board, National Heart, Lung, and Blood Institute, Bethesda, MD
2016-2018	*Member,* Observational Study Monitoring Board, Long Term Effects of Hydroxyurea in Children with Sickle Cell Anemia, National Heart, Lung, and Blood Institute, Bethesda, MD

Reviewer

2020-Present	*Abstract Reviewer*, American Society for Bioethics and Humanities Annual Meeting
2020	*Grant Reviewer,* The Croatian Science Foundation, Hvatska zaklada za znanost (HRZZ)
2018	*Book Proposal Reviewer*, Elsevier
2018-2019	*Category Leader,* Religion, Culture, and Social Sciences, American Society for Bioethics and Humanities Annual Meeting
2017	*Timekeeper,* American Society for Bioethics and Humanities Annual Meeting
2017-Present	*Abstract Reviewer,* Pediatric Academic Societies Annual Meeting
2016-2021	*Workshop Reviewer*, Pediatric Academic Societies Annual Meeting
2016	*Grant Reviewer*, Innovation Research Incentives Scheme, The Netherlands Organisation for Health Research and Development
2016-2017	*Abstract Reviewer*, American Society for Bioethics and Humanities Annual Meeting
2014, 2016	*External Peer Reviewer*, PSI Foundation, Toronto, Ontario, Canada
2014	*Member,* Scientific Committee, International Conference on Clinical Ethics and Consultation
2013	*Abstract Reviewer*, American Society for Bioethics and Humanities Annual Meeting
2013	*Reviewer*, Open Research Area Plus, Agence Nationale de la Research, Deutsche Forschungsgemeinschaft, Economic and Social Research Council, National Science Foundation, and Organization for Scientific Research
2011-2012	*Abstract Reviewer,* Pediatric Academic Societies Annual Meeting
2011-2013	*Workshop Reviewer*, Pediatric Academic Societies Annual Meeting
2011-2014	*Abstract Reviewer*, Pediatric Hospital Medicine Annual Meeting
2011-2012	*Religious Studies Subcommittee Leader,* Program Committee, American Society for Bioethics and Humanities Annual Meeting
2010	*Abstract Reviewer*, American Society for Bioethics and Humanities Annual Meeting

Other

2021	*Timekeeper,* American Society for Bioethics and Humanities Annual Meeting
2021	*Mentor,* Early Career Advisor Professional Development Track, American Society for Bioethics and Humanities.

2021	*Mentor,* Early Career Advisor Paper or Project Track, American Society for Bioethics and Humanities.
2109	*Mentor*, Early Career Advising Program, American Society for Bioethics and Humanities
2018	*Passing Point Determination*, Healthcare Ethics Consultant-Certified Examination, Healthcare Ethics Consultant Certification Commission
2018	*Member*, Examination Committee, Healthcare Ethics Consultant-Certified Examination, Healthcare Ethics Consultant Certification Commission
2018	*Item Writer*, Healthcare Ethics Consultant-Certified Examination, Healthcare Ethics Consultant Certification Commission

UNIVERSITY COMMUNITY ACTIVITIES

Cincinnati Children's Hospital Medical Center

2020-Present	*Member*, Faculty Diversity and Inclusion Steering Committee
2020-Present	*Member*, Medical Management of COVID-19 Committee
2020-2021	*Member,* Caregiver Refusal Team
2020-2021	*Member,* COVID-19 Vaccine Allocation Committee
2020	*Member*, Personal Protective Equipment Subcommittee of the COVID-19 Steering. Committee
2018-2019	*Member,* Planning Committee, Center for Clinical & Translational Science & Training Research Ethics Conference
2017-Present	*Member*, Donor Selection Committee
2017-2020	*Member,* Employee Emergency Fund Review Committee
2017	*Member,* Root Cause Analysis Team
2016-2017	*Member,* Planning Committee, Center for Clinical & Translational Science & Training Research Ethics Conference
2015-2019	*Member,* Destination Excellence Medical Advisory Committee
2015-Present	*Member,* Disorders of Sexual Development Case Review Committee
2015-2019	*Member,* Destination Excellence Case Review Committee
2014-2018	*Member,* Genomics Review Group, Institutional Review Board
2014-2017	*Member,* Center for Pediatric Genomics Leadership Committee
2013-2017	*Member,* Genetic Testing Subcommittee, Health Network
2013-2016	*Member,* Schwartz Center Rounds Planning Committee
2013-2014	*Member*, Genomics Ad Hoc Subcommittee, Board of Directors
2012-Present	*Member,* Cincinnati Fetal Center Oversight Committee
2012-Present	*Member,* Ethics Committee
2012-Present	*Member,* G-23
2012-2016	*Member,* Integrated Solid Organ Transplant Steering Committee

University of Utah

2009-2012	*Member,* Consolidated Hearing Committee

University of Utah School of Medicine

2010-2012	*Member,* Medical Ethics, Humanities, and Cultural Competence Thread Committee
2008-2010	*Member,* Fourth Year Curriculum Committee

University of Utah Department of Pediatrics

2010-2011	*Member,* Planning Committee, 25th Annual Biological Basis of Children's Health Conference, "Sex, Gender, and Sexuality"
2009-2012	*Member,* Medical Executive Committee
2005-2012	*Member,* Retention, Promotion, and Tenure Committee
2004-2012	*Interviewer,* Residency Program

2003-2012 *Member,* Education Committee

Intermountain Healthcare
2009-2012 *Member,* System-Wide Bioethics Resource Service
2009-2012 *Member,* Pediatric Guidance Council

Primary Children's Medical Center
2012-2012 *Member,* Shared Accountability Organization Steering Committee
2009 *Member*, H1N1 and Winter Surge Executive Planning Team
2005-2010 *Member,* Continuing Medical Education Committee
2005-2010 *Member*, Grand Rounds Planning Committee
2003-2012 *Member*, Ethics Committee

ACTIVE MEMBERSHIPS IN PROFESSIONAL SOCIETIES

2012-Present Association of Bioethics Program Directors
2011-Present Society for Pediatric Research
2000-Present American Academy of Pediatrics
1999-Present American Society of Bioethics and Humanities

FUNDING

Past Grants

2015-2019 "Better Outcomes for Children: Promoting Excellence in Healthcare Genomics to Inform Policy."
Percent Effort: 9%
National Human Genome Research Institute
Grant Number: 1U01 HG008666-01
Role: Investigator

2015-2016 "Ethics of Informed Consent for Youth in Foster Care"
Direct Costs: $10,000
Ethics Grant, Center for Clinical and Translational Science and Training
University of Cincinnati Academic Health Center
Role: Co-Investigator

2014-2015 "Extreme Personal Exposure Biomarker Levels: Engaging Community Physicians and Ethicists for Guidance"
Direct Costs: $11,640
Center for Environmental Genetics
University of Cincinnati College of Medicine
Role: Investigator

2014-2015 "Child, Adolescent, and Parent Opinions on Disclosure Policies for Incidental Findings in Clinical Whole Exome Sequencing"
Direct Costs: $4,434
Ethics Grant, Center for Clinical and Translational Science and Training, University of Cincinnati Academic Health Center
Role: Principal Investigator

2013-2014 "Better Outcomes for Children: GWAS & PheWAS in eMERGEII
Percent Effort: 5%
National Human Genome Research Institute
Grant Number: 3U01HG006828-0251
Role: Investigator

2004-2005 "Potential Patients' Knowledge, Attitudes, and Beliefs Regarding Participating in Medical Education: Can They be Interpreted in Terms of Presumed Consent?"
Direct Costs: $8,000
Interdisciplinary Research in Applied Ethics and Human Values, University Research Committee, University of Utah
Role: Principal Investigator

TEACHING RESPONSIBILITIES/ASSIGNMENTS

Course and Curriculum Development

2003-2012 Medical Ethics, Internal Medicine 7560, University of Utah School of Medicine, Taught 1 time per year, Taken by medical students, Enrollment 100

Course Lectures

2018, 2021 Introduction to Biotechnology, "Ethics and Biotechnology" and "Clinical Ethics," BIOL 3027, University of Cincinnati, Taught 1 time per year, Taken by undergraduate students, Enrollment 25.

2018-Present Biomedical Ethics, "Conscientious Objection in Healthcare" and "Ethical Issues in the Care of Transgender Adolescents," MEDS 4035 & MEDS 4036, University of Cincinnati College of Medicine, Taught 1 time per year, Taken by senior undergraduate students, Enrollment 52.

2016 Foundations of Healthcare Ethics and Law, "Clinical Ethics," HESA 390, Xavier University.

2014-Present Physicians and Society, "Transfusion and the Jehovah's Witness Faith," "Obesity Management: Ethics, Policy, and Physician Implicit Bias," "Embryos and Ethics: The Ethics of Designer Babies," "Ethics and Genetic Testing," and "Ethics and Direct to Consumer Genetic Testing," 26950112 and 26950116, University of Cincinnati School of Medicine, Taken by first and second year medical students, Enrollment 100.

2014-Present Ethical Issues in Health Care, "Ethical Issues in Managing Drug Shortages: The Macro, Meso, and Micro Levels," HESA 583, College of Social Sciences, Health, and Education Health Services Administration, Xavier University, Taken by health services administration students, Enrollment 25.

2009 Physical Diagnosis II, Internal Medicine 7160, University of Utah School of Medicine, Taught 1 time per year, Taken by medical students, Enrollment 100

2003-2012 Medical Ethics, Internal Medicine 7560, University of Utah School of Medicine, Taught 1 time per year, Taken by fourth year medical students, Enrollment 100

Small Group Teaching

2018-Present Ethics in Research, GNTD 7003-001, University of Cincinnati School of Medicine, Taught 1 time per year, Taken by fellows, MS, and PhD students, Enrollment 110.

2007 Physical Diagnosis I, Internal Medicine 7150, University of Utah School of Medicine, Taught 1 time per year, Taken by medical students, Enrollment 100

2003-2012 Medical Ethics, Internal Medicine 7560, University of Utah School of Medicine, Taught 1 time per year, Taken by fourth medical students, Enrollment 100

2003 Pediatric Organ System, Pediatrics 7020, University of Utah School of Medicine, Taught 1 time per year, Taken by medical students, Enrollment 100

Graduate Student Committees

2018-2022 *Chair,* Scholarship Oversight Committee, William Sveen, Pediatric Critical Care Fellowship, Cincinnati Children's Hospital Medical Center, Cincinnati, OH

2018-2020 *Member*, Scholarship Oversight Committee, Anne Heueman, Genetic Counseling, University of Cincinnati, Cincinnati, OH

2017-2019 *Chair*, Scholarship Oversight Committee, Bryana Rivers, Genetic Counseling, University of Cincinnati, Cincinnati, OH

2013-2015 *Mentor*, Sophia Hufnagel, Combined Pediatrics/Genetics Residency, Cincinnati Children's Hospital Medical Center, Cincinnati, OH

2013-2015 *Co-Chair,* Scholarship Oversight Committee, Andrea Murad, Genetic Counseling, University of Cincinnati, Cincinnati, OH

2013-2014 *Member*, Scholarship Oversight Committee, Grace Tran, Genetic Counseling, University of Cincinnati, Cincinnati, OH

2011-2012 *Chair,* Scholarship Oversight Committee, Kevin E. Nelson, MD, PhD, Pediatric Inpatient Medicine Fellowship, University of Utah, Salt Lake City, UT

Continuing Education Lectures

2008 Choosing Healthplans All Together (CHAT) Exercise Facilitator, 18th Annual Intermountain Medical Ethics Conference, "Setting Priorities for Healthcare in Utah: What Choices are We Ready to Make?," Salt Lake City, Utah, October 3.

2007 *Speaker*, Infant Medical Surgical Unit, Primary Children's Medical Center, "Withholding and Withdrawing Artificial Nutrition and Hydration: Can It Be Consistent With Care?," Salt Lake City, Utah, September 6.

2007 *Faculty Scholar-in Residence,* Summer Seminar, "The Role of Religion in Bioethics," Utah Valley State College, Orem, Utah, May 1.

2006 *Workshop Leader,* Faculty Education Retreat, "Publications and Publishing in Medical Education," University of Utah School of Medicine, Salt Lake City, Utah, September 15.

2006 *Breakout Session,* 16th Annual Intermountain Medical Ethics Conference, "Donation after Cardiac Death: Evolution of a Policy," Salt Lake City, Utah, March 28.

Other Educational Activities

2008 *Instructor*, Contemporary Ethical Issues in Medicine and Medical Research, Osher Lifelong Learning Institute, University of Utah, "Religion and Bioethics: Religiously Based Demands for and Refusals of Treatment," Salt Lake City, Utah, February 7.

2007 *Speaker*, Biology Seminar, Utah Valley State College, "Is He Dead?: Criteria of the Determination of Death and Their Implications for Withdrawing Treatment and Recovering Organs for Transplant," Orem, Utah, September 21.

PEER-REVIEWED JOURNAL ARTICLES

1. William N. Sveen, Armand H. Matheny Antommaria, Stephen Gilene, and Erika L. Stalets. (Forthcoming) "Adverse Events During Apnea Testing for the Determination of Death by Neurologic Criteria: A Single Center, Retrospective Pediatric Cohort." *Pediatric Critical Care Medicine.*
2. Erica K. Salter, Jay R. Malone, Amanda Berg, Annie Friedrich, Alexandra Hucker, Hillary King, and Armand H. Matheny Antommaria. (Online ahead of print) "Triage Policies at U.S. Hospitals with Pediatric Intensive Care Units." *AJOB Empirical Bioethics.* PMID: 36576201.
3. Armand H. Matheny Antommaria, Elizabeth Lanphier, Anne Housholder, and Michelle McGowan. (2023). "A mixed methods analysis of requests for religious exemptions to a COVID-19 vaccine requirement." *AJOB Empirical Bioethics.* 14: 15-22. PMID: 36161802.

4. Anne C Heuerman, Danielle Bessett, Armand H. Matheny Antommaria, Leandra. K. Tolusso, Nicki Smith, Alison H. Norris and Michelle L. McGowan (2022). "Experiences of reproductive genetic counselors with abortion regulations in Ohio." *Journal of Genetic Counseling*. 31: 641-652. PMID: 34755409.
5. Armand H. Matheny Antommaria and Ndidi I. Unaka. (2021) "Counterpoint: Prioritizing Health Care Workers for Scarce Critical Care Resources is Impractical and Unjust. *Journal of Hospital Medicine.* 16: 182-3. PMID 33617445.
6. Gregory A. Grabowski, Armand H. Matheny Antommaria, Edwin H. Kolodny, and Pramod K. Mistry. (2021) "Gaucher Disease: Basic and Translational Science Needs for More Complete Therapy and Management." *Molecular Genetics and Metabolism*. 132: 59-75. PMID: 33419694.
7. Armand H. Matheny Antommaria, Laura Monhollen, and Joshua K. Schaffzin. (2021) "An Ethical Analysis of Hospital Visitor Restrictions and Masking Requirements During the COVID-19." *Journal of Clinical Ethics.* 32(1): 35-44. PMID 33416516.
8. Armand H. Matheny Antommaria (2020) "The Pediatric Hospital Medicine Core Competencies: 4.05 Ethics." *Journal of Hospital Medicine.* 15(S1): 120-121.
9. Armand H. Matheny Antommaria, Tyler S. Gibb, Amy L. McGuire, Paul Root Wolpe, Matthew K. Wynia, Megan K. Applewhite, Arthur Caplan, Douglas S. Diekema, D. Micah Hester, Lisa Soleymani Lehmann, Renee McLeod-Sordjan, Tamar Schiff, Holly K. Tabor, Sarah E. Wieten, and Jason T. Eberl for a Task Force of the Association of Bioethics Program Directors (2020) "Ventilator Triage Policies During the COVID-19 Pandemic at U.S. Hospitals Associated With Members of the Association of Bioethics Program Directors." *Annals of Internal Medicine.* 173(3): 188-194. PMID: 32330224.
10. Armand H. Matheny Antommaria (2020) "Conflicting Duties and Reciprocal Obligations During a Pandemic." *Journal of Hospital Medicine.* 5:284-286. PMID: 32379030.
11. Mary V. Greiner, Sarah J. Beal, and Armand H. Matheny Antommaria (2020) "Perspectives on Informed Consent Practices for Minimal-Risk Research Involving Foster Youth." *Pediatrics*. 45:e20192845. PMID: 32156772.
12. Jennifer deSante-Bertkau, Michelle McGowan, and Armand H. Matheny Antommaria (2018) "Systematic Review of Typologies Used to Characterize Clinical Ethics Consultations." *Journal of Clinical Ethics.* 29:291-304. PMID: 30605439.
13. Andrew J. Redmann, Melissa Schopper, Armand H. Matheny Antommaria, Judith Ragsdale, Alessandro de Alarcon, Michael J. Jutter, Catherine K. Hart, and Charles M. Myer. (2018) "To Transfuse or Not to Transfuse? Jehovah's Witnesses and PostOperative Hemorrhage in Pediatric Otolaryngology." *International Journal of Pediatric Otorhinolaryngology*. 115:188-192. PMID: 30368384.
14. Armand H. Matheny Antommaria, Kyle B. Brothers, John A. Myers, Yana B Feygin, Sharon A. Aufox, Murray H. Brilliant, Pat Conway, Stephanie M. Fullerton, Nanibaa' A. Garrison, Carol R. Horowitz, Gail P. Jarvik, Rongling Li, Evette J. Ludman, Catherine A. McCarty, Jennifer B. McCormick, Nathaniel D. Mercaldo, Melanie F. Myers, Saskia C. Sanderson, Martha J. Shrubsole, Jonathan S. Schildcrout, Janet L. Williams, Maureen E. Smith, Ellen Wright Clayton, Ingrid A. Holm. (2018) "Parents' Attitudes toward Consent and Data Sharing in Biobanks: A Multi-Site Experimental Survey." *AJOB Empirical Research.* 21:1-15. PMID: 30240342.
15. Armand H. Matheny Antommaria and Cynthia A. Prows. (2018) "Content Analysis of Requests for Religious Exemptions from a Mandatory Influenza Vaccination Program for Healthcare Personnel" *Journal of Medical Ethics.* 44: 389-391. PMID: 29463693.
16. Armand H. Matheny Antommaria (2017) "May Medical Centers Give Nonresident Patients Priority in Scheduling Outpatient Follow-Up Appointments?" *Journal of Clinical Ethics.* 28: 217-221. PMID: 28930708.

17. Andrea M. Murad, Melanie F. Myers, Susan D. Thompson, Rachel Fisher, and Armand H. Matheny Antommaria (2017) "A Qualitative Study of Adolescents' Understanding of Biobanks and Their Attitudes Toward Participation, Re-contact, and Data Sharing." *American Journal of Medical Genetics: Part A.* 173: 930-937. PMID: 28328120.
18. Saskia Sanderson, Kyle Borthers, Nathaniel Mercaldo, Ellen Wright Clayton, Armand Antommaria, Sharon Aufox, Murray Brillant, Diego Campos, David Carrell, John Connolly, Pat Conway, Stephanie Fullerton, Nanibaa Garrison, Carol Horowitz, Gail Jarvik, David Kaufman, Terrie Kitchner, Rongling Li, Evette Ludman, Cahterine McCarty, Jennifer McCormick, Valerie McManus, Melanie Myers, Aaron Scrol, Janet Williams, Martha Shrubsole, Jonathan Schildcrout, Maureen Smith, and Ingrid Holm (2017) "Public Attitudes Towards Consent and Data Sharing in Biobank Research: A Large Multisite Experimental Survey in the US." *The American Journal of Human Genetics*. 100: 414-427. PMID: 28190457.
19. Maureen E. Smith, Saskia C Sanderson, Kyle B Brothers, Melanie F Myers, Jennifer McCormick, Sharon A Aufox, Martha J Shrubsole, Nanibaa' A Garrison, Nathaniel D Mercaldo, Jonathan S Schildcrout, Ellen Wright Clayton, Armand H. Matheny Antommaria, Melissa Basford, Murray Brilliant, John J Connolly, Stephanie M Fullerton, Carol R Horowitz, Gail P Jarvik, Dave Kaufman, Terrie Kitchner, Rongling Li, Evette J Ludman, Catherine McCarty, Valerie McManus, Sarah C Stallings, Janet L Williams, and Ingrid A Holm (2016) "Conducting a Large, Multi-Site Survey about Patients' Views on Broad Consent: Challenges and Solutions." *BMC Medical Research Methodology.* 16: 162. PMID: 27881091.
20. Angela Lorts, Thomas D. Ryan, Armand H. Matheny Antommaria, Michael Lake, and John Bucuvalas (2016) "Obtaining Consensus Regarding International Transplantation Continues to be Difficult for Pediatric Centers in the United States." *Pediatric Transplant.* 20: 774-777. PMID: 27477950.
21. Sophia B. Hufnagel, Lisa J. Martin, Amy Cassedy, Robert J. Hopkin, and Armand H. Matheny Antommaria (2016) "Adolescents' Preferences Regarding Disclosure of Incidental Findings in Genomic Sequencing That Are Not Medically Actionable in Childhood." *American Journal of Medical Genetics Part A*. 170: 2083-2088. PMID: 27149544.
22. Nanibaa' A. Garrison, Nila A. Sathe, Armand H. Matheny Antommaria, Ingrid A. Holm, Saskia Sanderson, Maureen E. Smith, Melissa McPheeters, and Ellen Wright Clayton (2016) "A Systematic Literature Review of Individuals' Perspectives on Broad Consent and Data Sharing in the United States." *Genetics in Medicine.* 18: 663-71. PMID: 26583683.
23. Kyle B. Brothers, Ingrid A. Holm Janet E. Childerhose, Armand H. Matheny Antommaria, Barbara A. Bernhardt, Ellen Wright Clayton, Bruce D. Gelb, Steven Joffe, John A. Lynch, Jennifer B. McCormick, Laurence B. McCullough, D. William Parsons, Agnes S. Sundaresan, Wendy A. Wolf, Joon-Ho Yu, and Benjamin S. Wilfond (2016) "When Genomic Research Participants Grow Up: Contact and Consent at the Age of Majority." *The Journal of Pediatrics* 168: 226-31. PMID: 26477867.
24. Erin E. Bennett, Jill Sweney, Cecile Aguayo, Criag Myrick, Armand H. Matheny Antommaria, and Susan L. Bratton (2015) "Pediatric Organ Donation Potential at a Children's Hospital." *Pediatric Critical Care Medicine.* 16: 814-820. PMID: 26237656.
25. Anita J. Tarzian, Lucia D. Wocial, and the ASBH Clinical Ethics Consultation Affairs Committee (2015) "A Code of Ethics for Health Care Ethics Consultants: Journey to the Present and Implications for the Field." *American Journal of Bioethics*. 15: 38-51. PMID: 25970392.
26. Armand H. Matheny Antommaria, Christopher A. Collura, Ryan M. Antiel, and John D. Lantos (2015) "Two Infants, Same Prognosis, Different Parental Preferences." *Pediatrics*, 135: 918-923. PMID: 25847802.
27. Stefanie Benoit, Armand H. Matheny Antommaria, Norbert Weidner, and Angela Lorts (2015) "Difficult Decision: What should we do when a VAD supported child experiences a severe stroke?" *Pediatric Transplantation* 19: 139-43. PMID: 25557132.

28. Kyle B. Brothers, John A. Lynch, Sharon A. Aufox, John J. Connolly, Bruce D. Gelb, Ingrid A. Holm, Saskia C. Sanderson, Jennifer B. McCormick, Janet L. Williams, Wendy A. Wolf, Armand H. Matheny Antommaria, and Ellen W. Clayton (2014) "Practical Guidance on Informed Consent for Pediatric Participants in a Biorepository." *Mayo Clinic Proceedings,* 89: 1471-80. PMID: 25264176.
29. Sophia M. Bous Hufnagel and Armand H. Matheny Antommaria (2014) "Laboratory Policies on Reporting Secondary Findings in Clinical Whole Exome Sequencing: Initial Uptake of the ACMG's Recommendations." *American Journal of Medical Genetics Part A*, 164: 1328-31. PMID: 24458369.
30. Wylie Burke, Armand H. Matheny Antommaria, Robin Bennett, Jeffrey Botkin, Ellen Wright Clayton, Gail E. Henderson, Ingrid A. Holm, Gail P. Jarvik, Muin J. Khoury, Bartha Maria Knoppers, Nancy A. Press, Lainie Friedman Ross, Mark A. Rothstein, Howard Saal, Wendy R. Uhlmann, Benjamin Wilfond, Susan M. Wold, and Ron Zimmern (2013) "Recommendations for Returning Genomic Incidental Findings? We Need to Talk!" *Genetics in Medicine*, 15: 854-859. PMID: 23907645.
31. Armand H. Matheny Antommaria (2013) "An Ethical Analysis of Mandatory Influenza Vaccination of Health Care Personnel: Implementing Fairly and Balancing Benefits and Burdens," *American Journal of Bioethics*, 13: 30-37. PMID: 23952830.

ORAL PRESENTATIONS

Keynote/Plenary Lectures

International

1. 2021, *Panelist*, Partnership for Quality Medical Donations, Charitable Access Programming for Rare Diseases, "Ethical Issues," Webinar, April 6.
2. 2017, *Invited Speaker*, Spina Bifida Fetoscopic Repair Study Group and Consortium, "Ethics of Innovation and Research in Fetal Surgery," Cincinnati, Ohio, October 26.
3. 2014, *Invited Speaker,* CIC 2013 CCI: Canadian Immunization Conference, "Condition-of-Service Influenza Prevention in Health Care Settings," Ottawa, Canada, December 2.
4. 2014, *Invited Speaker*, National Conference of the Chinese Pediatric Society, "A Brief Introduction to Pediatric Research and Clinical Ethics," Chongqing, China, September 12.

National

1. 2020, *Panelist*, Children's Mercy Bioethics Center, "Ethical Issues in the COVID Pandemic at Children's Hospitals," Webinar, March 2.
2. 2019, *Invited Speaker*, North American Fetal Therapy Network (NAFTnet), "Ethics of Innovation," Chicago, Illinois, October 12.
3. 2019, *Panelist,* National Society of Genetic Counselors Prenatal Special Interest Group, "Fetal Intervention Ethics," Webinar, September 12.
4. 2017, *Invited Participant,* American College of Epidemiology Annual Meeting, Preconference Workshop, "Extreme Personal Exposure Biomarker Levels: Guidance for Study Investigators," New Orleans, Louisiana, September 24.
5. 2016, *Invited Speaker,* American Academy of Pediatrics National Conference & Exhibition, Joint Program: Section on Hospital Medicine and Section on Bioethics, "Resource Allocation: Do We Spend Money to Save One Patient with Ebola or Over a 1,000?" San Francisco, California, October 23.
6. 2016, *Invited Speaker*, 26th Annual Specialist Education in Extracorporeal Membrane Oxygenation (SEECHMO) Conference, "Ethical Issues in ECMO: The Bridge to Nowhere," Cincinnati, Ohio, June 5.
7. 2015, *Invited Speaker,* Extracorporeal Life Support Organization (ELSO) 26th Annual Conference, "ECMO-Supported Donation after Circulatory Death: An Ethical Analysis," Atlanta, Georgia, September 20.

8. 2014, *Invited Speaker*, Pediatric Evidence-Based Practice 2014 Conference: Evidence Implementation for Changing Models of Pediatric Health Care, "Ethical Issues in Evidence-Based Practice," Cincinnati, Ohio, September 19.
9. 2014, *Invited Speaker,* 6th Annual David Kline Symposium on Public Philosophy: Exploring the Synergy Between Pediatric Bioethics and Child Rights, "Does Predictive Genetic Testing for Adult Onset Conditions that Are Not Medically Actionable in Childhood Violate Children's Rights?" Jacksonville, Florida, March 6.
10. 2010, *Invited Speaker,* Quest for Research Excellence: The Intersection of Standards, Culture and Ethics in Childhood Obesity, "Research Integrity and Religious Issues in Childhood Obesity Research," Denver, Colorado, April 21.
11. 2010, *Invited Speaker*, Symposium on the Future of Rights of Conscience in Health Care: Legal and Ethical Perspectives, J. Reuben Clark Law School at Brigham Young University and the Ave Maria School of Law, "Conscientious Objection in Clinical Practice: Disclosure, Consent, Referral, and Emergency Treatment," Provo, Utah, February 26.
12. 2009, *Invited Speaker*, Pediatric Organ Donation Summit, "Research Findings Regarding Variations in Pediatric Hospital Donation after Cardiac Death Policies," Chicago, Illinois, August 18.
13. 2008, *Meet-the-Experts*, American Academy of Pediatrics National Conference & Exhibition, "Physician Refusal to Provide Treatment: What are the ethical issues?" Boston, Massachusetts, October 11.
14. 2008, *Invited Conference Faulty*, Conscience and Clinical Practice: Medical Ethics in the Face of Moral Controversy, The MacLean Center for Clinical Medical Ethics at the University of Chicago, "Defending Positions or Identifying Interests: The Uses of Ethical Argumentation in the Debate over Conscience in Clinical Practice," Chicago, IL, March 18.
15. 2007, *Symposium Speaker*, Alternative Dispute Resolution Strategies in End-of-Life Decisions, The Ohio State University Mortiz College of Law, "The Representation of Children in Disputes at the End-of-Life," Columbus, Ohio, January 18.
16. 2005, *Keynote Speaker*, Decisions and Families, *Journal of Law and Family Studies* and The University of Utah S.J. Quinney College of Law, "Jehovah's Witnesses, Roman Catholicism, and Calvinism: Religion and State Intervention in Parental, Medical Decision-Making," Salt Lake City, Utah, September 23.

Regional/Local

1. 2021, *Panelist*, Pediatric Residency Noon Conference, University of Tennessee Health Science Center, "Bioethics Rounds—Ethical Issues in the Care of Transgender Adolescents," Memphis, Tennessee, September 21.
2. 2020, *Keynote Speaker*, 53rd Annual Clinical Advances in Pediatrics, "Referral to a Fetal Care Center: How You Can Help Patients' Mothers Address the Ethical Issues," Kansas City, Kansas, September 16.
3. 2019, *Speaker,* Patient and Family Support Services, Primary Children's Hospital, "Ethical Issues in the Care of Trans Adolescents," Salt Lake City, Utah, December 5.
4. 2019, *Speaker,* Evening Ethics, Program in Medical Ethics and Humanities, University of Utah School of Medicine, "Patients, Parents, and Professionals: Ethical Issues in the Treatment of Trans Adolescents," Salt Lake City, Utah, December 4.
5. 2019, *Speaker,* Pediatric Hospital Medicine Board Review Course, "Ethics, Legal Issues, and Human Rights including Ethics in Research," Cincinnati, Ohio, September 8.
6. 2019, *Speaker,* Advances in Fetology, "Evolving Attitudes Toward the Treatment of Children with Trisomies," Cincinnati, Ohio, September 6.
7. 2019, *Speaker,* Half-Day Ethics Training: Ethics Consultation & Ethics Committees, "Navigating the Rapids of Clinical Ethics Consultation: Intake, Recommendations, and Documentation," Salt Lake City, Utah, June 1.

8. 2019, *Speaker*, Scientific and Ethical Underpinnings of Gene Transfer/Therapy in Vulnerable Populations: Considerations Supporting Novel Treatments, BioNJ, "What Next? An Ethical analysis of Prioritizing Conditions and Populations for Developing Novel Therapies," Cranbury, New Jersey, March 7.
9. 2018, *Panelist*, Periviability, 17th Annual Regional Perinatal Summit, Cincinnati, Ohio, October 12.
10. 2018, *Speaker,* Regional Advance Practice Registered Nurse (APRN) Conference, "Adults are Not Large Children: Ethical Issues in Caring for Adults in Children's Hospitals," Cincinnati, Ohio, April 26.
11. 2018, *Speaker*, Southern Ohio/Northern Kentucky Sigma Theta Tau International Annual Conference, "Between Hope and Hype: Ethical Issues in Precision Medicine," Sharonville, Ohio, March 2.
12. 2017, *Speaker*, Advances in Fetology 2017, "Ethics of Innovation and Research: Special Considerations in Fetal Therapy Centers," Cincinnati, Ohio, October 27.
13. 2016, *Speaker*, End-of-Life Pediatric Palliative Care Regional Conference, "Ethical/Legal Issues in Pediatric Palliative Care," Cincinnati, Ohio, September 15.
14. 2016, *Speaker*, 26th Annual Bioethics Network of Ohio (BENO) Conference, "When Does Parental Refusal of Medical Treatment for Religious Reasons Constitute Neglect?" Dublin, Ohio, May 29.
15. 2014, *Speaker,* Cincinnati Comprehensive Sickle Cell Center Symposium: Research Ethics of Hydroxyurea Therapy for Sickle Cell Disease During Pregnancy and Lactation, "Ethical Issues in Research with Pregnant and Lactating Women," Cincinnati, Ohio, October 30.
16. 2014, *Speaker,* Advances in Fetology 2014, "The 'Miracle Baby' and Other Cases for Discussion," Cincinnati, Ohio, September 26.
17. 2014, *Speaker,* Advances in Fetology 2014, "'Can you tell me …?': Achieving Informed Consent Given the Prevalence of Low Health Literacy," Cincinnati, Ohio, September 26.
18. 2014, *Panelist*, Center for Clinical & Translational Science & Training, Secrets of the Dead: The Ethics of Sharing their Data, Cincinnati, Ohio, August 28.
19. 2014, *Speaker,* Office for Human Research Protections Research Community Forum: Clinical Research … and All That Regulatory Jazz, "Research Results and Incidental Findings: Do Investigators Have a Duty to Return Results to Participants," Cincinnati, Ohio, May 21.
20. 2013, *Opening Presentation*, Empirical Bioethics: Emerging Trends for the 21st Century, University of Cincinnati Center for Clinical & Translational Science & Training, "Empirical vs. Normative Ethics: A Comparison of Methods," Cincinnati, Ohio, February 21.
21. 2012, *Videoconference,* New York State Task Force on Life and the Law, "Pediatric Critical Care Triage," New York, New York, March 1.
22. 2011, *Presenter,* Fall Faculty Development Workshop, College of Social Work, University of Utah, "Teaching Ethics to Students in the Professions, " Salt Lake City, Utah, November 14.
23. 2011, *Speaker,* 15th Annual Conference, Utah Chapter of the National Association of Pediatric Nurse Practitioners, "Ethical Issues in Pediatric Practice," Salt Lake City, Utah, September 22.
24. 2011, *Speaker*, Code Silver! Active Shooter in the Hospital, Utah Hospitals & Health Systems Association, Salt Lake City, Utah, March 21.
25. 2009, *Speaker,* Medical Staff Leadership Conference, Intermountain Healthcare, "The Ethics of Leadership," Park City, Utah, October 30.
26. 2008, *Speaker*, The Art and Medicine of Caring: Supporting Hope for Children and Families, Primary Children's Medical Center, "Medically Provided Hydration and Nutrition: Ethical Considerations," Salt Lake City, Utah, February 25.
27. 2005, *Speaker*, Utah NAPNAP (National Association of Pediatric Nurse Practitioners) Chapter Pharmacology and Pediatric Conference, "Immunization Update," Salt Lake City, Utah, August 18.
28. 2005, *Keynote Speaker,* 17th Annual Conference, Utah Society for Social Work Leadership in Health Care, "Brain Death: Accommodation and Consultation," Salt Lake City, March 18.
29. 2004, *Continuing Education Presentation*, Utah NAPNAP (National Association of Pediatric Nurse Practitioners), "Febrile Seizures," Salt Lake City, Utah, April 22.

30. 2004, *Speaker,* Advocacy Workshop for Primary Care Providers, "Ethics of Advocacy," Park City, Utah, April 3.
31. 2002, *Speaker,* 16th Annual Biologic Basis of Pediatric Practice Symposium, "Stem Cells: Religious Perspectives," Deer Valley, Utah, September 14.

Meeting Presentations

International

1. 2018, *Speaker*, International Conference on Clinical Ethics and Consultation, "A Systematic Review of Typologies Used to Characterize Clinical Ethics Consultations," Oxford, United Kingdom, June 21.

National

1. 2022, *Speaker,* American Society for Bioethics and Humanities Annual Meeting, "A Mixed Methods Analysis of Requests for Religious Exemptions to a COVID-19 Vaccine Requirement." Portland, Oregon, October 27.
2. 2022, *Panelist,* American Society for Bioethics and Humanities Annual Meeting, Pediatric Ethics Affinity Group, "When Ethical Healthcare Is Prohibited By Law, How Do We Respond?" Portland, Oregon, October 27.
3. 2022, *Speaker,* APPD/PAS Fellow Core Curriculum Workshop, Pediatric Academic Societies Annual Meeting, "From Idea to Implementation: Navigating the Ethical Landscape of Pediatric Clinical Research," Denver, Colorado, April 22.
4. 2021, *Panelist,* Pediatric Endocrine Society Annual Meeting, Difference of Sex Development Special Interest Group, Virtual Conference, April 29.
5. 2020, *Speaker,* American Society for Bioethics and Humanities Annual Meeting, "Is This Child Dead? Controversies Regarding the Neurological Criteria for Death," Virtual Conference, October 17.
6. 2020, *Speaker,* American Society for Bioethics and Humanities Annual Meeting, "Contemporary Ethical Controversy in Fetal Therapy: Innovation, Research, Access, and Justice," Virtual Conference, October 15.
7. 2020, *Speaker,* American Society for Bioethics and Humanities Annual Meeting, "K-12 Schools and Mandatory Public Health Programs During the COVID-19 Pandemic," Virtual Conference, October 15.
8. 2019, *Speaker,* American Society for Bioethics and Humanities Annual Meeting, "Ethical Issues in Translating Gene Transfer Studies Involving Children with Neurodegenerative Disorders," Pittsburgh, Pennsylvania, October 26.
9. 2019, *Moderator,* Pediatric Academic Societies Annual Meeting, Clinical Bioethics, Baltimore, Maryland, April 28.
10. 2018, *Presenter,* American Society for Bioethics and Humanities Annual Meeting, "Looking to the Past, Understanding the Present, and Imaging the Future of Bioethics and Medical Humanities' Engagement with Transgender Health," Anaheim, California, October 19.
11. 2018, *Speaker,* American Society for Bioethics and Humanities Annual Meeting, "Should Vaccination Be a Prerequisite for Sold Organ Transplantation?" Anaheim, California, October 18.
12. 2018, Lindsey Douglas, Armand H. Matheny Antommaria, Derek Williams. *Workshop Presenter*, Pediatric Hospital Medicine Annual Meeting, "IRB Approved! Tips and Tricks to Smooth Sailing through the Institutional Review Board (IRB)." Atlanta, Georgia, July 20.
13. 2018, Alan Schroeder, Armand H. Matheny Antommaria, Hannah Bassett, Kevin Chi, Shawn Ralston, Rebecca Blankenburg. *Workshop Speaker,* Pediatric Hospital Medicine Annual Meeting, "When You Don't Agree with the Plan: Balancing Diplomacy, Value, and Moral Distress," Atlanta, Georgia, July 20.

14. 2018, Alan Schroeder, Hannah Bassett, Rebecca Blankenburg, Kevin Chi, Shawn Ralston, Armand H. Matheny Antommaria. *Workshop Speaker,* Pediatric Academic Societies Annual Meeting, "When You Don't Agree with the Plan: Balancing Diplomacy, Value, and Moral Distress," Toronto, Ontario, Canada, May 7.
15. 2017, *Speaker,* American Society for Bioethics and Humanities Annual Meeting, "Tensions in Informed Consent for Gender Affirming Hormone Therapy and Fertility Preservation in Transgender Adolescents," Kansas City, Missouri, October 19.
16. Lindsey Douglas, Armand H. Matheny Antommaria, and Derek Williams. 2017, *Workshop Leader,* PHM[Pediatric Hospital Medicine]2017, "IRB Approved! Tips and Tricks to Smooth Sailing through the Institutional Review Board (IRB) Process," Nashville, Tennessee, July 21.
17. 2016, *Speaker*, American Society for Bioethics and Humanities Annual Meeting, "Ethical Challenges in the Care of International Patients: Organization, Justice, and Cultural Considerations," Washington, DC, October 9.
18. 2015, *Coauthor,* The American Society of Human Genetics Annual Meeting, "Adolescents' Opinions on Disclosure of Non-Actionable Secondary Findings in Whole Exome Sequencing," Baltimore, Maryland, October 9.
19. 2012, *Speaker*, American Society for Bioethics and Humanities Annual Meeting, "A Public Health Ethics Analysis of the Mandatory Immunization of Healthcare Personnel: Minimizing Burdens and Increasing Fairness," Washington, DC, October 21.
20. Armand H. Matheny Antommaria, Valerie Gutmann Koch, Susie A. Han, Carrie S. Zoubul. 2012, *Moderator*, American Society for Bioethics and Humanities Annual Meeting, "Representing the Underrepresented in Allocating Scarce Resources in a Public Health Emergency: Ethical and Legal Considerations," Washington, DC, October 21.
21. 2012, *Platform Presentation,* Pediatric Academic Societies Annual Meeting, "Qualitative Analysis of International Variation in Donation after Circulatory Death Policies and Rates," Boston, Massachusetts, April 30. Publication 3150.4.
22. 2011, *Speaker*, American Society for Bioethics and Humanities Annual Meeting, "The Intersection of Policy, Medicine, and Ethics during a Public Health Disaster: Special Considerations for Children and Families," Minneapolis, Minnesota, October 13.
23. Armand H. Matheny Antommaria and Joel Frader. 2010, *Workshop Leader,* Pediatric Academic Societies Annual Meeting, "Conscientious Objection in Health Care: Respecting Conscience and Providing Access," Vancouver, British Columbia, Canada. May 1. Session 1710.
24. 2009, *Workshop Leader,* American Society for Bioethics and Humanities Annual Meeting, "Advanced Clinical Ethics Consultation Skills Workshop: Process and Interpersonal Skills," Washington, DC, October 15.
25. 2009, *Platform Presentation*, Pediatric Academic Societies Annual Meeting, "Qualitative Analysis of Donation after Cardiac Death Policies at Children's Hospitals," Baltimore, Maryland, May 2. Publication 2120.6.
26. 2008, *Speaker*, American Society for Bioethics and Humanities Annual Meeting, "Qualitative Analysis of Donation After Cardiac Death (DCD) Policies at Children's Hospitals," Cleveland, Ohio, October 26.
27. 2007, *Participant,* Hamline University School of Law Biennial Symposium on Advanced Issues in Dispute Resolution, "An Intentional Conversation About Conflict Resolution in Health Care," Saint Paul, Minnesota, November 8-10.
28. *2007*, *Speaker,* American Society of Bioethics and Humanities Annual Meeting, "Bioethics Consultation and Alternative Dispute Resolution: Opportunities for Collaboration," Washington, DC, October 21.
29. 2007, *Speaker,* American Society of Bioethics and Humanities Annual Meeting, "DNAR Orders in Schools: Collaborations Beyond the Hospital," Washington, DC, October 18.

IN THE UNITED STATES DISTRICT COURT
FOR THE NORTHERN DISTRICT OF FLORIDA
Tallahassee Division

AUGUST DEKKER, et al., *Plaintiffs*, v. JASON WEIDA, et al., *Defendants*.	Case No. 4:22-cv-00325-RH-MAF

EXPERT REPORT OF DAN H. KARASIC, M.D.

I, Dan H. Karasic, M.D., hereby declare and state as follows:

1. I have been retained by counsel for Plaintiffs as an expert in connection with the above-captioned litigation.

2. I am over the age of 18. I have actual knowledge of the matters stated herein. If called to testify in this matter, I would testify truthfully and based on my expert opinion.

I. BACKGROUND AND QUALIFICATIONS

A. Qualifications

3. The information provided regarding my professional background, experiences, publications, and presentations are detailed in my curriculum vitae ("CV"). A true and correct copy of my CV is attached as **Exhibit A**.

4. I am a Professor Emeritus of Psychiatry at the University of California – San Francisco (UCSF) Weill Institute for Neurosciences. I have been on faculty at UCSF since 1991. I have also had a telepsychiatry private practice since 2020.

5. I received my Doctor of Medicine (M.D.) degree from the Yale Medical School in 1987. In 1991, I completed my residency in psychiatry at the University of California – Los Angeles (UCLA) Neuropsychiatric Institute, and from 1990 to 1991, I was a postdoctoral fellow in a training program in mental health services for persons living with AIDS at UCLA.

6. For over 30 years, I have worked with patients with gender dysphoria. I am a Distinguished Life Fellow of the American Psychiatric Association and currently the chair of the American Psychiatric Association Workgroup on Gender Dysphoria, as well as the sole author of the chapter on transgender care in the American Psychiatric Press's Clinical Manual of Cultural Psychiatry, Second Edition.

7. Over the past 30 years, I have provided care for thousands of transgender patients. For 17 years, I was the psychiatrist for the Dimensions Clinic for transgender youth in San Francisco. The clinic treats trans youth 12-25 years old.

8. I previously sat on the Board of Directors of the World Professional Association for Transgender Health (WPATH) and am a co-author of WPATH's *Standards of Care for the Health of Transsexual, Transgender, and Gender*

Nonconforming People, Versions 7 and 8, which are the internationally accepted guidelines designed to promote the health and welfare of transgender, transsexual, and gender variant persons. For the Version 8, I was the lead author on the Mental Health chapter.

9. As a member of the WPATH Global Education Initiative, I helped develop a specialty certification program in transgender health and helped train over 2,000 health care providers.

10. At UCSF, I developed protocols and outcome measures for the Transgender Surgery Program at the UCSF Medical Center. I also served on the Medical Advisory Board for the UCSF Center of Excellence for Transgender Care and co-wrote the mental health section of the original *Guidelines for the Primary and Gender-Affirming Care of Transgender and Gender Nonbinary People* and the revision in 2016.

11. I have also worked with the San Francisco Department of Public Health, having helped develop and implement their program for the care of transgender patients and for mental health assessments for gender-affirming surgery. I served on the City and County of San Francisco Human Rights Commission's LGBT Advisory Committee, and I have been an expert consultant for California state agencies and on multiple occasions for the United Nations Development Programme on international issues in transgender care.

12. I have held numerous clinical positions concurrent to my clinical professorship at UCSF. Among these, I served as an attending psychiatrist for San Francisco General Hospital's consultation-liaison service for AIDS care, as an outpatient psychiatrist for HIV-AIDS patients at UCSF, as a psychiatrist for the Transgender Life Care Program and the Dimensions Clinic at Castro Mission Health Center, and the founder and co-lead of the UCSF Alliance Health Project's Transgender Team. In these clinical roles, I specialized in the evaluation and treatment of transgender, gender dysphoric, and HIV-positive patients. I also regularly provide consultation on challenging cases to psychologists and other psychotherapists working with transgender and gender dysphoric patients. I have been a consultant in transgender care to the California Department of State Hospitals and am currently a consultant for the California Department of Corrections and Rehabilitation on the care of incarcerated transgender people.

13. As part of my psychiatric practice treating individuals diagnosed with gender dysphoria and who receive other medical and surgical treatment for that condition, as well as a co-author of the WPATH Standards of Care and UCSF's *Guidelines for the Primary and Gender-Affirming Care of Transgender and Gender Nonbinary People*, I am and must be familiar with additional aspects of medical care for the diagnosis of gender dysphoria, beyond mental health treatment, assessment, and diagnosis.

14. In addition to this work, I have done research on the treatment of depression. I have authored many articles and book chapters and edited the book *Sexual and Gender Diagnoses of the Diagnostic and Statistical Manual (DSM): A Reevaluation*.

15. Since 2018, I have performed over 100 independent medical reviews for the State of California to determine the medical necessity of transgender care in appeals of denial of insurance coverage.

B. Compensation

16. I am being compensated for my work on this matter at a rate of $400.00 per hour for preparation of declarations and expert reports. I will be compensated $3,200.00 per day for any deposition testimony or trial testimony. My compensation does not depend on the outcome of this litigation, the opinions I express, or the testimony I may provide.

C. Previous Testimony

17. Over the past four years, I have given expert testimony at trial or by deposition in the following cases: *C.P. v. Blue Cross Blue Shield of Illinois*, No. 3:20-cv-06145-RJB (W.D. Wash.); *Kadel v. Folwell*, No. 1:19-cv-00272 (M.D.N.C.); *Fain v. Crouch*, 3:20-cv-00740 (S.D.W. Va.); and *Brandt v. Rutledge*, No. 4:21-cv-00450 (E.D. Ark.). To the best of my recollection, I have not given expert testimony at a trial or at a deposition in any other case during this period.

II. BASES FOR OPINIONS

18. In preparing this report, I have relied on my training and years of research and clinical experience, as set out in my curriculum vitae, and on the materials listed therein, as documented in my curriculum vitae, which is attached hereto as **Exhibit A**.

19. I have also reviewed the materials listed in the bibliography attached hereto as **Exhibit B**. The sources cited therein include authoritative, scientific peer-reviewed publications. They include the documents specifically cited as supportive examples in particular sections of this report.

20. Additionally, I have reviewed Florida's Administrative Rule governing the determination of generally accepted professional medical standards under Florida Medicaid coverage (Fla. Admin. Code R. 59G-1.035); the Florida Medicaid Generally Accepted Professional Medical Standards (GAPMS) Determination on the Treatment of Gender Dysphoria published by Florida's Agency for Health Care Administration (AHCA) in June 2022, along with its attachments, including the reports of Dr. Romina Brignardello-Petersen and Dr. Wojtek Wiercioch (Attachment C), Dr. James Cantor (Attachment D), Dr. Quentin Van Meter (Attachment E), Dr. Patrick Lappert (Attachment F), and Dr. G. Kevin Donovan (Attachment G) (hereinafter, "GAPMS Memo"); and Fla. Admin. Code. R. 59G-1.050(7) which prohibits Medicaid coverage of puberty-delaying medications (commonly referred

to as "puberty blockers"), hormone and hormone antagonists, "sex reassignment" surgeries, and any other procedures that alter primary or secondary sexual characteristics, on the basis that the services do not meet Florida's definition of "medical necessity" for purposes of its Medicaid program.

21. The materials I have relied upon in preparing this report are the same types of materials that experts in my field of study regularly rely upon when forming opinions on the subject. I reserve the right to revise and supplement the opinions expressed in this report or the bases for them if any new information becomes available in the future, including as a result of new scientific research or publications or in response to statements and issues that may arise in my area of expertise.

III. EXPERT OPINIONS

A. Gender Identity

22. Sex assigned at birth refers to the sex assigned to a person at the time of their birth, typically based on the appearance of external genital characteristics. While the terms "male sex" and "female sex" are sometimes used in reference to a person's genitals, chromosomes, and hormones, the reality is that sex is complicated and multifactorial. Aside from external genital characteristics, chromosomes, and endogenous hormones, other factors related to sex include gonads, gender identity, and variations in brain structure and function. Because these factors may not always be in alignment as typically male or typically female, "the terms biological sex and

biological male or female are imprecise and should be avoided." (Hembree, et al., 2017).

23. Gender identity is "a person's deeply felt, inherent sense of being a girl, woman, or female; a man, or male; a blend of male or female; or an alternative gender" (American Psychological Association, 2015, at 834). Gender identity does not always align with sex assigned at birth. Gender identity, which has biological bases, is not a product of external influence and not subject to voluntary change. As documented by multiple leading medical authorities, efforts to change a person's gender identity are ineffective, can cause harm, and are unethical. (American Psychological Association, 2021; Byne, et al., 2018; Coleman, et al., 2022).

B. Gender Dysphoria

24. The term "gender dysphoria" is distress related to the incongruence between one's gender identity and attributes related to one's sex assigned at birth.

25. The diagnosis of Gender Dysphoria in the *Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition, Text Revision* (DSM-5-TR) (DSM-5 released in 2013 and DSM-5-TR released in 2022), involves two major diagnostic criteria for adolescents and adults:

A. A marked incongruence between one's experienced/expressed gender and assigned gender, of at least 6 months duration, as

manifested by at least two of the following (one of which must be Criterion A1):

1. A marked incongruence between one's experienced/expressed gender and primary or secondary sex characteristics.
2. A strong desire to be rid of one's primary and/or secondary sex characteristics because of a marked incongruence with one's experienced/expressed gender.
3. A strong desire for the primary and/or secondary sex characteristics of the other gender.
4. A strong desire to be of the other gender (or some alternative gender different from one's assigned gender).
5. A strong desire to be treated as the other gender (or some alternative gender different from one's assigned gender).
6. A strong conviction that one has the typical feelings and reactions of the other gender (or some alternative gender different from one's assigned gender).

B. The condition is associated with clinically significant distress or impairment in social, occupational, or other important areas of functioning.

26. Given that gender dysphoria can cause such distress, many transgender individuals face depression, anxiety, and higher rates of suicidality than cisgender people. This is noted both in adults and adolescents. However, gender dysphoria is a condition that is highly amenable to treatment, and the prevailing treatment for it is highly effective. These risks decline when transgender individuals are supported and live according to their gender identity. And with access to medically indicated care, transgender people can experience significant and potentially complete relief from their symptoms of gender dysphoria. Not only is this documented in scientific literature and published data, but I witness this each time I see my patients being supported by their community, family, school, and medical providers.

C. Evidence-Based Guidelines for Treatment of Gender Dysphoria

27. The World Professional Association of Transgender Health (WPATH) has issued *Standards of Care for the Health of Transgender and Gender Diverse People* ("WPATH SOC") since 1979. The current version is WPATH SOC 8, published in 2022. The WPATH SOC provide guidelines for multidisciplinary care of transgender individuals and describes criteria for medical interventions to treat gender dysphoria, including hormone treatment and surgery when medically indicated.

28. The SOC 8 is based upon a more rigorous and methodological evidence-based approach than previous versions. (Coleman, et al., 2022). This

evidence is not only based on the published literature (direct as well as background evidence) but also on consensus-based expert opinion. Its recommendations are evidence-based, informed by a systematic review of evidence and an assessment of the benefits and harms of alternative care options. The process for development of the SOC 8 incorporated recommendations on clinical practice guideline development from the National Academies of Medicine and The World Health Organization. Its recommendations were graded using a modified GRADE methodology (Guyatt, et al., 2011), considering the available evidence supporting interventions, risks and harms, and feasibility and acceptability.

29. While SOC 8 includes important updates, it does not change the substance of any of the opinions I expressed in my previous declaration. Indeed, SOC 8 continues to recommend the provision of medical interventions, such as puberty blockers, hormone therapy, and surgery, as medically appropriate and necessary treatments for gender dysphoria, based on an individual patient's needs.

30. WPATH SOC 8 also states, "Gender identity change efforts (gender reparative or gender conversion programs aimed at making the person cisgender) are widespread, cause harm to TGD people, and (like efforts targeting sexual orientation) are considered unethical." (Coleman, et al., 2022).

31. A clinical practice guideline from the Endocrine Society (the Endocrine Society Guidelines) provides similar protocols for the medically necessary treatment of gender dysphoria. (Hembree, et al., 2017).

32. Guidelines from other organizations, including those developed by the UCSF Center of Excellence for Transgender Care, also list similar protocols for the medically necessary treatment of gender dysphoria.

33. Each of these guidelines are evidence-based and supported by scientific research and literature, as well as extensive clinical experience.

34. The protocols and policies set forth by the WPATH Standards of Care and the Endocrine Society Guidelines are endorsed and cited as authoritative by the major professional medical and mental health associations in the United States, including the American Medical Association, the American Academy of Pediatrics, the American Psychiatric Association, the American Psychological Association, the American College of Obstetrics and Gynecology, the American College of Physicians, and the World Medical Association, among others.

35. To be sure, being transgender is widely accepted as a variation in human development and is not considered a mental illness. People who are transgender have no impairment in their ability to be productive, contributing members of society simply because of their transgender status.

a. The American Psychiatric Association's DSM 5 states: Gender dysphoria "is more descriptive than the previous DSM-IV term 'gender identity disorder' and focuses on dysphoria as the clinical problem, not identity per se." (APA, 2013).

b. WPATH SOC 8 states: "The expression of gender characteristics, including identities, that are not stereotypically associated with one's sex assigned at birth is a common and a culturally diverse human phenomenon that should not be seen as inherently negative or pathological. … It should be recognized gender diversity is common to all human beings and is not pathological. However, gender incongruence that causes clinically significant distress and impairment often requires medically necessary clinical interventions." (Coleman, et al. 2022).

c. The American Psychological Association states: "Whereas diversity in gender identity and expression is part of the human experience and transgender and gender nonbinary identities and expressions are healthy, incongruence between one's sex and gender is neither pathological nor a mental health disorder." (American Psychological Association, 2021).

d. The World Health Organization states: "Gender incongruence has thus broadly been moved out of the 'Mental and behavioural disorders' chapter and into the new 'Conditions related to sexual health' chapter. This reflects evidence that trans-related and gender diverse identities are not conditions of mental ill health, and classifying them as such can cause enormous stigma." (WHO Europe).

36. Thus, the overarching goal of treatment is to eliminate the distress of gender dysphoria by aligning an individual patient's body and presentation with their internal sense of self. The denial of medically indicated care to transgender people not only results in the prolonging of their gender dysphoria, but causes additional distress and poses other health risks, such as depression, posttraumatic stress disorder, and suicidality. In other words, lack of access to gender-affirming care directly contributes to poorer mental health outcomes for transgender people. (Owen-Smith, et al., 2018).

37. For patients for whom gender-affirming medical care is indicated, no alternative treatments have been demonstrated to be effective. The American Psychological Association states that gender identity change efforts provide no benefit and instead do harm. (American Psychological Association, 2021).

38. Accordingly, major medical organizations, such as the American Medical Association, American Psychiatric Association, the Endocrine Society,

American College of Obstetricians and Gynecologists, and American Academy of Family Physicians oppose the denial of this medically necessary care and support public and private health insurance coverage for treatment of gender dysphoria as recommended by the patient's physician. (American Medical Association, 2021; American Psychiatric Association, 2018; Endocrine Society, 2020; American College of Obstetricians and Gynecologists, 2021; American Academy of Family Physicians, 2020).

D. Treatment of Gender Dysphoria

39. The WPATH SOC 8 and the Endocrine Society Guidelines establish authoritative protocols for the treatment of gender dysphoria.

40. In accordance with the WPATH SOC 8 and the Endocrine Society Guidelines, medical interventions to treat gender dysphoria may include treatment with pubertal suppression and/or hormones, and treatment with surgery.

41. No medical or surgical treatment for gender dysphoria is provided to pre-pubertal children.

42. Once a patient enters puberty, treatment options include pubertal suppression therapy and gender-affirming hormones. Pubertal blocking involves methods of temporarily suppressing endogenous puberty to alleviate gender dysphoria and give the patient more time to work with their mental health providers to assess treatment needs. These blockers are reversible medications and once

stopped, a patient returns to the stage of pubertal development that had begun when the treatment was initiated.

43. If a patient is assessed to have a medical need for hormone therapy, gender-affirming hormone therapy involves administering steroids of the experienced sex (i.e., their gender identity), such as testosterone in transgender male individuals and estrogen in transgender female individuals, to treat gender dysphoria later in puberty. The purpose of this treatment is to attain the appropriate masculinization or feminization of the transgender person to achieve a gender phenotype that matches as closely as possible to their gender identity. For adolescents, this treatment allows patients to have pubertal changes and development consistent with their gender identity. Gender-affirming hormone therapy is a partially reversible treatment in that some of the effects produced by the hormones are reversible (e.g., changes in body fat composition, decrease in facial and body hair) while others are irreversible (e.g., deepening of the voice, decreased testicular mass).

44. Some transgender individuals need surgical interventions to help bring their phenotype into alignment with their gender. Surgical interventions may include, *inter alia*, vaginoplasty and orchiectomy for transgender female individuals, and chest reconstruction and hysterectomy for transgender male individuals.

45. According to WPATH SOC 8, "Chest masculinization surgery can be considered in minors when clinically and developmentally appropriate as determined

by a multidisciplinary team experienced in adolescent and gender development" (Coleman, et al. 2022).

46. The treatment protocols for gender dysphoria are comparable to those for other mental health and medical conditions. Indeed, these or similar procedures are provided for cisgender people with other diagnoses.

E. Assessments of Patients with Gender Dysphoria.

47. WPATH SOC 8 recommends that health care professionals working with transgender and non-binary adolescents be licensed, hold a postgraduate degree in relevant clinical field, have received training and developed expertise in working with children and adolescents, including those with autism spectrum disorder, and have received training and developed expertise in gender identity and diversity in youth, and in the ability of youth to assent/consent to care (Coleman, et al., 2022).

48. WPATH SOC 8 recommends a "comprehensive biopsychosocial assessment" for adolescents "prior to any medically necessary medical or surgical intervention" for gender dysphoria. The assessment should include gender identity development, social development and support, diagnostic assessment of co-occurring mental health or developmental concerns, and capacity for decision-making (Coleman, et al., 2022).

49. For assessing an adult for gender-affirming medical care, WPATH SOC 8 states that the health professional should be licensed and trained in identifying

gender dysphoria as well as co-existing mental health and psychosocial concerns, and that medical or surgical treatment should only be recommended when "gender incongruence is marked and sustained," when there is capacity for consent, when other conditions that might affect outcomes have been assessed, and when diagnostic criteria for Gender Dysphoria of DSM 5-TR (in the US) or Gender Incongruence of ICD-11(outside the US) are met.

50. Before gender affirming care is provided, WPATH SOC 8 recommends that impacts on fertility of care, and fertility preservation options be discussed thoroughly with the patient, and in the case of a minor, with parents or guardians.

51. Affirming care for transgender youth does not mean steering them in any particular direction, but rather supporting them through their period of exploration of gender expression and increasing self-awareness of their identity (Ehrensaft, 2017). WPATH SOC 8 states, "We recommend health professionals working with gender diverse adolescents facilitate the exploration and expression of gender openly and respectfully so that no one particularly in favored." (Coleman, et al., 2022). WPATH SOC 8 states "For some youth, obtaining gender-affirming medical care is important while for others these steps might not be necessary." (Coleman, et al., 2022). In my clinical experience, some adolescent patients have a critical need for medical interventions at or at some point after the onset of puberty

and others do not. As with all medical interventions, it is highly individualized and responsive to the particular medical and mental health needs of each patient.

52. The Endocrine Society Guidelines state that only "[mental health professionals] who ha[ve] training/experience in child and adolescent gender development (as well as child and adolescent psychopathology) should make the diagnosis," which usually includes "a complete psychodiagnostic assessment." (Hembree, et al., 2017, at 3877). It further provides that because gender dysphoria "may be accompanied with psychological or psychiatric problems" it is necessary that clinicians involved in diagnosis and psychosocial assessment meet specific competency requirements and that they undertake or refer for appropriate psychological or psychiatric treatment. *Id.*, at 3876. And "in cases in which severe psychopathology" "interfere[s] with diagnostic work or make[s] satisfactory treatment unlikely, clinicians should assist the adolescent in managing these other issues." *Id*.

F. Gender-Affirming Medical and Surgical Care Is Safe and Effective.

53. Gender-affirming medical and surgical interventions in accordance with the WPATH SOC and Endocrine Society Guidelines are widely recognized in the medical community as safe, effective, and medically necessary for many transgender people with gender dysphoria. (See American Academy of Pediatrics, 2018; the American Medical Association, 2021; the Endocrine Society, 2020; the

Pediatric Endocrine Society, 2021; the American Psychiatric Association, 2018; the American Psychological Association, 2021; the American Congress of Obstetricians and Gynecologists, 2021; the American Academy of Family Physicians, 2020; WPATH, 2016).

54. There is substantial evidence that gender-affirming medical and surgical care is effective in treating gender dysphoria. This evidence includes scientific studies assessing mental health outcomes for transgender people who are treated with these interventions, including adolescents, and decades of clinical experience.

55. The research and studies supporting the necessity, safety, and effectiveness of medical and surgical care for gender dysphoria are the same type of evidence-based data that the medical community routinely relies upon when treating other medical conditions.

56. Medical treatment for gender dysphoria has been studied for over half a century, and there is substantial evidence that it improves quality of life and measures of mental health. (Aldridge et al., 2021; Almazan, et al., 2021; Baker et al., 2021; Murad, et al., 2010; Nobili et al., 2018; Pfafflin & Junge, 1998; T'Sjoen et al. 2019; van de Grift et al., 2018; White Hughto and Reisner, 2016; Wierckx et al., 2014).

57. A systematic review of 20 studies showed improved quality of life, decreased depression, and decreased anxiety with hormonal treatment in transgender people. (Baker, et al., 2021). Another systematic review showed improvement in mental health and quality of life measures in transgender people with hormonal treatment (White Hughto and Reisner, 2016). In the United Kingdom, one study demonstrated that depression and anxiety were substantially reduced over 18 months of gender-affirming hormonal treatment. (Aldridge, et al., 2021). In a secondary analysis of data from the US Transgender Survey, having had genital surgery was associated with decreased psychological distress and suicidal ideation. (Almazan, et al., 2021). In transgender patients followed 4-6 years after surgery, satisfaction was very high (over 90%) and regret was low. (van de Grift et al., 2018). The Cornell "What We Know" systematic review of 55 studies from 1991-2017 strongly supported that gender-affirming hormone and surgical treatment improved the well-being of transgender individuals. (What We Know, 2018).

58. Transgender people have been benefiting from gender-affirming medical and surgical care for decades. Researchers interviewed fifteen transgender people 40 years after they had received gender-affirming surgical care at University of Virginia. Participants reported continued benefits over 40 years from gender affirming care, including improved mental health, reduced suicidality, reduced

gender dysphoria, and high patient satisfaction, with no reported cases of regret (Park, et al. 2022).

59. The studies on gender-affirming medical care for treatment of dysphoria are consistent with decades of clinical experience of mental health providers across the U.S. and around the world. At professional conferences and other settings in which I interact with colleagues, clinicians report that gender-affirming medical care, for those for whom it is indicated, provides great clinical benefit. In my 30 years of clinical experience treating gender dysphoric patients, I have seen the benefits of gender-affirming medical care on my patients' health and well-being. I have seen many patients show improvements in mental health, as well as in performance in school, in social functioning with peers, and in family relationships when they experience relief from gender dysphoria with gender-affirming medical care.

60. Accordingly, treatments for gender dysphoria are not considered elective or cosmetic. Indeed, as WPATH (2016) states, "The medical procedures attendant to gender-affirming/confirming surgeries are not 'cosmetic' or 'elective' or 'for the mere convenience of the patient.' These reconstructive procedures are not optional in any meaningful sense but are understood to be medically necessary for the treatment of the diagnosed condition. In some cases, such surgery is the only

effective treatment for the condition, and for some people genital surgery is essential and life-saving."

61. As part of the treatment process for gender dysphoria, patients provide informed consent to their care. In addition, a treating doctor will not offer gender-affirming medical treatments unless they have concluded after weighing the risks and benefits of care for the specific patient that treatment is appropriate. The risks and benefits of care are discussed with the transgender patient, who must consent or assent, as appropriate. This process is no different than the informed consent process for other medical treatments. However, for gender-affirming medical care, there is the additional safeguard of the recommended assessments by a health care professional, who must not only be experienced in the assessment of gender dysphoria, but also in the assessment of a patient's capacity to consent/assent to treatment and ability to understand the risks and benefits of treatment. Indeed, SOC 8 notes that mental health professionals are the best positioned practitioners to conduct these assessments for adolescents and also recommends, for all patients, that a mental health professional address any mental health issues that may interfere with a patient's ability to consent prior to the initiation of gender-affirming care.

62. Regret among those who are treated with gender-affirming medical care is rare. For example, in one study in the Netherlands, none of the youth who received puberty-delaying treatment, hormones, and surgery, and were followed over an 8-

year period expressed regret. (DeVries, 2014.) Zucker, et al., (2010), summarizing key studies on regret for adolescents referred for surgery when they reached the age of majority in the Netherlands, states, "there was virtually no evidence of regret, suggesting that the intervention was effective."

63. A study of 209 gender-affirming mastectomies in transmasculine adolescents aged 12-17, performed at Kaiser Permanente Northern California from 2013 to 2020, showed a regret rate of 1%. (Tang, et al 2022).

64. Regret rates for gender-affirming surgery in adults are also very low. A pooled review across multiple studies of 7,928 patients receiving gender-affirming surgery showed a regret rate of 1%. (Bustos, et al., 2021). Over 50 years of gender-affirming surgery in Sweden, the regret rate, as measured by legal gender change reversal, was 2%. (Dhejne, et al., 2014). These are very low regret rates for surgery. For example, 47% of women expressed at least some regret after reconstructive breast surgery following mastectomy for breast cancer. (Sheehan, et al., 2008).

65. For all the reasons above, I am aware of no basis in medicine or science for categorical exclusion of coverage for gender-affirming care.

66. One misperception is that puberty-delaying medications and hormone therapy are experimental because they are not FDA-approved for the specific application of treating Gender Dysphoria. Medications very commonly are prescribed for off-label uses. All gender-affirming hormone treatments are approved

for treatment of other conditions and have been used to treat those conditions, as well as for gender-affirming care, for many years, supporting their safety and efficacy. The U.S. Department of Health and Human Services Agency for Healthcare Research and Quality states, "[Off-label prescribing] is legal and common. In fact, one in five prescriptions written today are for off-label use."[1]

67. Finally, the cost of providing coverage for gender-affirming care is generally very low. To begin, transgender people constitute a small percentage of the overall population, approximately 0.5%. (Crissman, et. al., 2017). Furthermore, the fraction of the population receiving clinical care for Gender Dysphoria is much smaller, well under one in a thousand patients (Zhang, et al., 2020). As a result, one study estimated an average cost of $0.016 cents per member per month to provide gender-affirming care (Padula, et al., 2016). A study by Herman (2013) similarly found low costs to providing health coverage for gender-affirming care. Additionally, when a form of treatment is covered for cisgender people under an insurance plan, it is generally not disproportionately costly to cover the same treatment for transgender people simply because it is provided to treat gender dysphoria.

[1] See https://www.ahrq.gov/patients-consumers/patient-involvement/off-label-drug-usage.html.

G. Harms of Denying Gender-Affirming Care

68. The overarching goal of treatment is to eliminate the distress of gender dysphoria by aligning an individual patient's body and presentation with their internal sense of self. The denial of medically indicated care to transgender people not only results in the prolonging of their gender dysphoria, but causes additional distress and poses other health risks, such as depression, posttraumatic stress disorder, and suicidality. The prevalence of these mental health conditions is also thought to be a consequence of minority stress, the chronic stress from coping with societal stigma and discrimination because of one's identity, including gender identity and gender expression. (American Medical Association, 2019). In other words, lack of access to gender-affirming care directly contributes to poorer mental health outcomes for transgender people. (Owen-Smith, et al., 2018).

69. Accordingly, major medical organizations, such as the American Medical Association, American Psychiatric Association, and American College of Obstetricians and Gynecologists, oppose the denial of this medically necessary care and support public and private health insurance coverage for treatment of gender dysphoria as recommended by the patient's physician. (American Medical Association, 2019).

70. Denial of this appropriate care for transgender adolescents is also opposed by mainstream organizations responsible for the care of youth, including

the American Academy of Pediatrics, the Academy of Child and Adolescent Psychiatry, and the Pediatric Endocrine Society.

71. Familial and social support and the provision of gender-affirming medical treatment have been associated with dramatically less suicidal ideation in transgender people. (Bauer, et al., 2015). Provision of puberty blockers and gender-affirming hormones for transgender youth likewise decreases suicidality (Tordoff, et al., 2022; Turban, et al., 2020; Green, et al., 2022; Allen, et al., 2019). The American Academy of Child and Adolescent Psychiatry states, "Research consistently demonstrates that gender diverse youth who are supported to live and/or explore the gender role that is consistent with their gender identity have better mental health outcomes than those who are not." (AACAP, 2019).

72. In a multicenter NIH-funded study, 315 transgender and nonbinary youth followed over two years showed a decrease in anxiety and depression and an improvement in appearance congruence and life satisfaction with gender affirming medical treatment. (Chen, et al., 2023).

73. In a University of Washington study of 104 transgender and nonbinary youth, treatment with puberty blockers or hormones was associated with 60% less moderate to severe depression and 73% less suicidal ideation over 12 months, compared to youth not treated. (Tordoff, et al. 2022).

74. In a University of Texas Southwestern study, treatment with gender-affirming hormones in transgender youth was associated with a substantial reduction in body dissatisfaction, as well as improvement on measures of depression and anxiety. (Kuper, et al., 2020).

75. In a University of Southern California and Children's Hospital Los Angeles study of 136 transgender male youth, the half that had received chest masculinizing surgery had far less gender dysphoria than those who had not yet had surgery. (Olson-Kennedy, et al., 2018).

76. In a University of Pennsylvania and University of Rochester study, transgender male youth aged 13-21 suffered substantial emotional distress and functional impairment from dysphoria related to their chest. Chest dysphoria resolved with surgery. Youth reported improvement functionally and in quality of life (Mehringer, et al., 2021).

77. In the past 10 years, there has been a reversal in longstanding coverage policies that had excluded reimbursement of gender-affirming care for transgender people. There are many more clinics providing care to transgender youth and adults in academic medical centers than a decade ago, because funding is now available. This change is allowing clinical researchers to expand the body of research in the United States, as well as increasing access to care.

H. The GAPMS Memo and AHCA's Decision to Prohibit Medicaid Coverage of Gender-Affirming Care

78. According to criteria of the Florida Administrative Code 59G-1.035, the Agency for Health Care Administration (AHCA) makes coverage determinations based on "Generally accepted professional medical standards—standards based on reliable scientific evidence published in peer-reviewed scientific literature generally recognized by the relevant medical community or practitioner specialty associations' recommendations." It is my understanding that AHCA purports to have used the standards set forth in this rule to reach the conclusion set forth in its June 2022 GAPMS Memo that gender-affirming care, including puberty blockers, hormone replacement therapy, and gender-affirming surgery does not meet generally accepted professional medical standards and is therefore, experimental and investigational.

79. To craft the GAPMS Memo (which served as the basis for AHCA's decision to ban gender-affirming care in accordance with Fla. Admin. Code R. 59G-1.050(7)), AHCA enlisted Drs. Romina Brignardello-Petersen and Wojtek Wiercioch. Dr. Brignardello-Petersen is a dentist who is an assistant professor in the Department of Health Research Methods, Evidence, and Impact at McMaster University in Canada. Dr. Wiercioch is a post-doctoral research fellow in the same department as Dr. Brignardello-Petersen. Both authors report no academic interests in the care of people with gender dysphoria.

80. Drs. Brignardello-Petersen and Wiercioch performed a manual search of websites that includes only one non-governmental organization site: the Society for Evidence-Based Gender Medicine (SEGM). The fact that SEGM was chosen instead of much larger and more established organizations representing the mainstream of care, e.g., the American Psychological Association, the American Medical Association, or the American Psychiatric Association, raises a concern for bias, as SEGM is a small group founded recently specifically in opposition to gender-affirming care.

81. To support the conclusions provided to AHCA, Drs. Brignardello-Petersen and Wiercioch preferentially relied on studies that only included participants under age 25. Drs. Brignardello-Petersen and Wiercioch do not provide a basis to support their selection of only these studies, or of leaving out a multitude of other studies that include participants that are over age 25. In my experience working with patients with gender dysphoria, many of those who seek gender-affirming surgery are over 25. The average age of 7,905 transgender patients who had gender-affirming surgery in the US from 2009-2015, identified by insurance data, was 29.8 years old (Lane, et al., 2018). Thus, reliance on studies related preferentially to those under age 25 does not accurately capture the full body of scientific evidence pertaining to this form of care. This is especially important given

that the GAPMS memo concludes that gender-affirming care is not a generally accepted professional medical standard for individuals at any age.

82. Brignardello-Petersen and Wiercioch excluded from consideration the vast majority of studies on transgender health. They state, "After screening 1854 records found through our searches, we found 10 eligible studies."

83. Drs. Brignardello-Petersen and Wiercioch relied on an overview of a very small sample of systematic reviews of studies of transgender care (they looked at only 10 of 61 systematic reviews), for which they purported to rank the quality of evidence using GRADE criteria. GRADE criteria assigns low quality scores to studies not performed by randomized, blinded clinical trials. However, randomly selecting people to receive or not receive gender-affirming medical or surgical interventions is impossible, for practical and ethical reasons. Notably, many treatments for other conditions are in widely accepted use without having been studied through randomized, controlled clinical trials. Many drugs for cancer and hematologic disorders have been FDA approved without a randomized controlled trial (Hatswell, et al., 2016). Many other drugs have been FDA approved with randomized controlled trials for one indication but are commonly used for another condition or in a different population than the one for which it was approved (Wittich, et. al., 2012).

84. People have been receiving gender-affirming medical and surgical treatment for well over half a century, with very low regret rates (Dhejne, et al., 2014), and there is substantial research and clinical experience that supports gender-affirming care as treatment for gender dysphoria. The scientific evidence "published in peer-reviewed scientific literature generally recognized by the relevant medical community or practitioner specialty associations" led the American Medical Association, the American Academy of Pediatrics, the American Psychiatric Association, the American Psychological Association, and other mainstream medical organizations to conclude that the provision of gender-affirming medical and surgical interventions falls within generally accepted professional medical standards.

85. Another person enlisted to provide an opinion to AHCA in drafting its GAPMS memo is James Cantor, PhD, a forensic psychologist in Toronto, Canada. Dr. Cantor's report indicates that his work at the University of Toronto from 1998 to 2018 was limited to its adult forensic program, that is, Dr. Cantor worked with people with paraphilias,[2] and in particular with pedophiles. Dr. Cantor is well known for this work, but not for his work with transgender people. In testimony in *Eknes-Tucker v. Marshall*, Dr. Cantor stated that he had not personally diagnosed any child or

[2] Paraphilias are persistent and recurrent sexual interests, urges, fantasies, or behaviors of marked intensity involving objects, activities, or even situations that are atypical in nature. Being transgender is not a paraphilic disorder.

adolescent with gender dysphoria, and that he had personally never treated any child or adolescent for gender dysphoria.

86. Dr. Cantor agrees that transgender adults "adjust well to life as the opposite sex" if they are otherwise mentally healthy. Dr. Cantor is also correct to report that regret rates are low.

87. Dr. Cantor focuses on desistance rates of prepubertal children brought into clinics in Toronto and Amsterdam. However, given that these prior longitudinal studies included gender nonconforming children who were not transgender due to the broad criteria for the since-abandoned "gender identity disorder in children" diagnosis, or who did not qualify even for the gender identity disorder in children diagnosis, these studies shed little light into questions of persistence and desistance of gender dysphoria in pre-pubertal children. In fact, a more recent study, which is the only large American prospective study that has been published in the past 35 years, showed much lower desistance rates (Olson, et al., 2022). Specifically, only 2.5% of the youth studied identified with their sex assigned at birth.[3]

88. In any event, longitudinal studies show that gender dysphoria in adolescence usually persists (DeVries, et al., 2011; van der Loos, et al., 2022). And

[3] Of these, youth with cisgender identities were more common among youth whose initial social transition occurred before age 6 years; their retransitions often occurred before age 10 years. And, again, no medical treatment is recommended for any transgender person prior to the onset of puberty.

no medical treatment, let alone irreversible medical and surgical interventions, is used prior to puberty. Even in the clinics with higher desistance rates for *pre-pubertal* children upon which Dr. Cantor relies, puberty blockers and hormones were used when gender dysphoria persisted after the onset of puberty. In sum, the desistance statistics of *pre-pubertal* children do not inform the decision whether to initiate these treatments in adolescents and adults.

89. The WPATH Standards of Care and the American Psychiatric Association each recommend that transgender people who also suffer from depression, anxiety, and other mental health symptoms should seek out treatment for these symptoms. However, in most cases, having a history of mental illness should not prevent people from receiving gender-affirming medical and surgical treatment. (Coleman, et al., 2022; Byne, et al., 2018).

90. Dr. Cantor's uses the term "affirmation on demand" as a straw man. The WPATH Standards of Care require a comprehensive mental health assessment for patients who are minors, and clinical assessments are also required for adults. (Coleman, et al., 2022).

91. Dr. Cantor cites a Finnish study as evidence for his conclusion that adolescents should not be prescribed gender-affirming hormones because they are supposedly not effective in the treatment of gender dysphoria. (Kaltiala, et al., 2020). However, in that study, the need for treatment for depression dropped from 54% of

the youth to 15%; the need for treatment for anxiety dropped from 48% of the youth to 15%; and the need for treatment for suicidality/self-harm dropped from 35% to 4%. All of these were statistically highly significant changes.

92. Dr. Cantor states that the study by Kuper, et al. 2020 did not show benefit from treatment. This statement is misleading at best. The article concludes, "Youth reported large improvements in body dissatisfaction ($P < .001$), small to moderate improvements in self-report of depressive symptoms ($P < .001$), and small improvements in total anxiety symptoms ($P < .01$)." Dr. Cantor further states that the study by Achille et al. does not show that those studied benefitted from endocrine treatment. Again, Cantor's characterization of this study's conclusion is misleading. The results of the paper show that, "Mean depression scores and suicidal ideation decreased over time while mean quality of life scores improved over time. When controlling for psychiatric medications and engagement in counseling, regression analysis suggested improvement with endocrine intervention. This reached significance in male-to-female participants."

93. In reviewing the international health care consensus regarding gender-affirming care, Dr. Cantor refers to an interim report on care of transgender youth in the United Kingdom's National Health System which is currently being compiled by Dr. Hilary Cass. The interim report states that the final report will synthesize published evidence with expert opinion and stakeholder input. Notably, the interim

report recommends increasing the number of health providers, shortening wait times, and increasing the number of centers across the country providing care to transgender youth.

94. Swedish and Finnish national health authorities, which Dr. Cantor also references, have recommended caution and more research but have not banned care for transgender youth. In these countries, gender-affirming care for adults and for youth who qualify is fully paid for by the national health system of each country.

95. There remains strong international support for the continued provision of gender-affirming medical and surgical care. Experts from the around the world collaborated on the new WPATH Standards of Care Version 8. I was chapter lead of the Mental Health chapter of this version, and the authors of that chapter included psychiatrists who are leaders of transgender health programs in Belgium, Sweden, and Turkey. There is broad agreement in philosophy of care, including support for gender-affirming care and opposition to conversion therapy.

96. The ethics of providing transgender care are discussed by one expert, Dr. G. Kevin Donovan. Dr. Donovan ignores the larger ethical question raised by Florida's actions to terminate Medicaid coverage of gender-affirming care for those who were previously approved for that same coverage. Florida's actions amount to forced detransition. As Dr. Donovan states, the principles of ethical care include autonomy, beneficence, and justice. There has been little research on those forced to

detransition, but abruptly terminating Medicaid coverage for low-income and disabled Floridians will force these Medicaid recipients into detransition, an experiment to which they did not consent. Autonomy, beneficence, and justice are entirely ignored in this experiment, with no respect for the autonomy of the individual to decide their course, no concern for "do no harm" or maximizing benefits and minimizing harm, and no justice—fairness in distribution of risks and benefits—as the poor and those with disabilities will be forced into this detransition experiment while those with resources will be spared.

97. I have only had a few patients over the years who have been forced to detransition, because of incarceration or institutionalization, or other circumstances, and results have been uniformly disastrous, with suicide and self-harm attempts, depression, and deterioration of functioning. Some of my patients forced to detransition were receiving intensive mental health care at the time, on psychiatric wards. But no amount of psychotherapy could counter the deleterious effects of forced detransition and the withholding of needed gender-affirming medical and surgical care.

IV. CONCLUSION

98. The categorical exclusion of coverage for gender-affirming medical care adopted by Florida's Agency for Health Care Administration, which bars coverage for medical treatments for gender dysphoria, is contrary to widely accepted

medical protocols for the treatment of transgender people with gender dysphoria that are recognized by major medical and mental health professional associations in the United States.

99. The accepted protocols for the treatment of transgender people with gender dysphoria provide for mental health assessments, including of co-occurring conditions; criteria for eligibility for each treatment; and an informed consent process before medical interventions are initiated.

100. Decades of medical research and clinical experience have demonstrated that the medical treatments AHCA has barred from Medicaid coverage are safe, effective, and medically necessary to relieve gender dysphoria for transgender people. AHCA's conclusion otherwise is not supported by medical evidence or consensus.

101. Denying gender-affirming medical care to transgender people for whom it is medically indicated puts them at risk of significant harm to their health and wellbeing, including heightened risk of depression and suicidality.

I declare under penalty of perjury under the laws of the United States of America that the foregoing is true and correct.

Executed this 15th day of February 2023.

Curriculum Vitae

University of California, San Francisco

CURRICULUM VITAE

Name: Dan H. Karasic, MD

Position: Professor Emeritus
Psychiatry
School of Medicine

Voice: 415-935-1511
Fax: 888-232-9336

EDUCATION

1978 - 1982	Occidental College, Los Angeles	A.B.; Summa Cum Laude	Biology
1982 - 1987	Yale University School of Medicine	M.D.	Medicine
1987 - 1988	University of California, Los Angeles	Intern	Medicine, Psychiatry, and Neurology
1988 - 1991	University of California, Los Angeles; Neuropsychiatric Institute	Resident	Psychiatry
1990 - 1991	University of California, Los Angeles; Department of Sociology	Postdoctoral Fellow	Training Program in Mental Health Services for Persons with AIDS

LICENSES, CERTIFICATION

1990	Medical Licensure, California, License Number G65105
1990	Drug Enforcement Administration Registration Number BK1765354
1993	American Board of Psychiatry and Neurology, Board Certified in Psychiatry

PRINCIPAL POSITIONS HELD

1991 - 1993	University of California, San Francisco	Health Sciences Psychiatry Clincial Instructor
1993 - 1999	University of California, San Francisco	Health Sciences Psychiatry Assistant Clinical Professor
1999 - 2005	University of California, San Francisco	Health Sciences Psychiatry

		Associate Clinical Professor	
2005 - present	University of California, San Francisco	Health Sciences Psychiatry Clinical Professor	

OTHER POSITIONS HELD CONCURRENTLY

1980 - 1980	Associated Western Universities / U.S. Department of Energy	Honors Undergraduate Research Fellow	UCLA Medicine
1981 - 1981	University of California, Los Angeles; Medicine American Heart Association, California Affiliate	Summer Student Research Fellow	UCLA
1986 - 1987	Yale University School of Medicine; American Heart Association, Connecticut Affiliate	Medical Student Research Fellow	Psychiatry
1990 - 1991	University of California, Los Angeles Postdoctoral	Sociology Fellow	
1991 - 2001	SFGH Consultation-Liaison Service; AIDS Care	Attending Psychiatrist	Psychiatry
1991 - 2001	AIDS Consultation-Liaison Medical Student Elective	Course Director	Psychiatry
1991 - present	UCSF Positive Health Program at San General Hospital (Ward 86)	HIV/AIDS Outpatient Psychiatrist	Psychiatry Francisco
1991 - present	UCSF AHP (AIDS Health Project/Alliance Health Project)	HIV/AIDS Outpatient Psychiatrist	Psychiatry
1994 - 2002	St. Mary's Medical Center CARE Unit. The CARE Unit specializes in the care of patients with AIDS dementia.	Consultant	Psychiatry
2001 - 2010	Depression and Antiretroviral Adherence Study (The H.O.M.E. study: Health Outcomes of Mood Enhancement)	Clinical Director	Psychiatry and Medicine
2003 - 2020	Transgender Life Care Program and Clinic, Castro Mission Health Center	Psychiatrist Dimensions Clinic	Dimensions
2013 - 2020	UCSF Alliance Health Project, Co-lead, Transgender Team	Co-Lead and Psychiatrist	Psychiatry

HONORS AND AWARDS

1981	Phi Beta Kappa Honor Society	Phi Beta Kappa
1990	NIMH Postdoctoral Fellowship in Mental Health Services for People with	National Institute of Mental Health

	AIDS (1990-1991)	
2001	Lesbian Gay Bisexual Transgender Leadership Award, LGBT Task Force of the Cultural Competence and Diversity Program	SFGH Department of Psychiatry
2006	Distinguished Fellow	American Psychiatric Association
2012	Chancellor's Award for Leadership in LGBT Health	UCSF
2023	Alumni Seal Award for Professional Achievement	Occidental College

MEMBERSHIPS

1992 - present Northern California Psychiatric Society

1992 - present American Psychiatric Association

2000 - 2019 Bay Area Gender Associates (an organization of psychotherapists working with transgendered clients)

2001 - present World Professional Association for Transgender Health

SERVICE TO PROFESSIONAL ORGANIZATIONS

1981 - 1982	The Occidental	News Editor
1984 - 1985	Yale University School of Medicine	Class President
1989 - 1991	Kaposi's Sarcoma Group, AIDS Project Los Angeles	Volunteer Facilitator
1992 - 1996	Early Career Psychiatrist Committee, Association of Gay Lesbian Psychiatrists	Chair and
1992 - 1996	Board of Directors, Association of Gay and Lesbian Psychiatrists	Member
1993 - 1993	Local Arrangements Committee, Association of Gay and Psychiatrists	Chair Lesbian
1994 - 1995	Educational Program, Association of Gay and Lesbian 1995 Annual Meeting	Director Psychiatrists,
1994 - 1998	Board of Directors, BAY Positives	Member
1994 - present	Committee on Lesbian, Gay, Bisexual and Transgender Issues, Northern California Psychiatric Society	Member
1995 - 1997	Board of Directors, Bay Area Young Positives. BAY	President

	Positives is the nation's first community-based organization providing psychosocial and recreational services to HIV-positive youth	
1995 - 1997	Executive Committee, Bay Area Young Positives.	Chair
1996 - 2004	Committee on Lesbian, Gay, Bisexual and Transgender Issues, Northern California Psychiatric Society	Chair
1998 - 2002	City of San Francisco Human Rights Commission, Lesbian, Gay Bisexual Transgender Advisory Committee	Member
2000 - 2004	Association of Gay and Lesbian Psychiatrists.	Vice President Responsible for the organization's educational programs
2004 - 2005	Association of Gay and Lesbian Psychiatrists	President-elect
2005 - 2007	Caucus of Lesbian, Gay, and Bisexual Psychiatrists of the American Psychiatric Association	Chair
2005 - 2007	Association of Gay and Lesbian Psychiatrists	President
2007 - 2009	Association of Gay and Lesbian Psychiatrists	Immediate Past President
2009 - 2010	Consensus Committee for Revision of the Sexual and Gender Identity Disorders for DSM-V, GID of Adults subcommittee. (Wrote WPATH recommendations as advisory body to the APA DSM V Committee for the Sexual and Gender Identity Disorders chapter revision.)	Member
2010 - 2011	Scientific Committee, 2011 WPATH Biennial Symposium, Atlanta	Member
2010 -2022	World Professional Association for Transgender Care Standards of Care Workgroup and Committee (writing seventh and eighth revisions of the WPATH Standards of Care, which is used internationally for transgender care.)	Member
2010 - 2018	ICD 11 Advisory Committee, World Professional Association for Transgender Health	Member

GOVERNMENT AND OTHER PROFESSIONAL SERVICE

1998 - 2002	City and County of San Francisco Human Rights Member Commission LGBT Advisory Committee

I am the chair of the American Psychiatric Association Workgroup on Gender Dysphoria, which developed a CME course fort the 2015 and 2016 APA Annual Meetings, and is now embarking on a larger educational mission to train American psychiatrists to better care for transgender patients. I have been leading education efforts in transgender health at APA meetings since 1998. On the APA Workgroup on Gender Dysphoria, I am a co-author of a paper of transgender issues that has been approved by the American Psychiatric Association as a resource document and is in press for the American Journal of Psychiatry. I am also the sole author of the chapter on transgender care in the American Psychiatric Press's Clinical Manual of Cultural Psychiatry, Second Edition.

I have been active internationally in transgender health through my work as a member of the Board of Directors of the World Professional Association for Transgender Health. I am an author of the WPATH Standards of Care, Version 7, and am Chapter Lead for the Mental Health Chapter of SOC 8.
I chaired of the WPATH Public Policy Committee and was a member of the Global Education Initiative, which developed a specialty certification program in transgender health. I helped plan the 2016 WPATH Amsterdam conference, and was on the scientific committee for the last four biennial international conferences. I was on the founding committee of USPATH, the national affiliate of WPATH, and I chaired the inaugural USPATH conference, in Los Angeles in 2017. As a member of the steering committee of the WPATH Global Educational Initiative, I helped train over 2000 health providers in transgender health, and helped develop a board certification program and examination in transgender health.

EXPERT DECLARATION OF LOREN S. SCHECHTER, M.D.

Preliminary Statement

1. I am a board-certified plastic surgeon. I specialize in performing gender confirming surgeries[1] (including chest reconstruction surgeries, genital reconstruction surgeries, and other procedures to feminize or masculinize the face

[1] I refer to the family of procedures discussed in this report as "gender confirmation," "gender confirming surgeries," or "gender affirming surgeries" because they are one of the therapeutic tools used to enable people to be comfortable living in accordance with their gender identities. Out of the myriad of labels I've heard for these procedures—"sex reassignment surgery," "gender reassignment surgery," and "sex change operation," to name but a few—none is as accurate when it comes to describing what is actually taking place as "gender confirmation" or "gender affirmation surgery." Most, if not all, of the other names used for these procedures suggest that a person is making a choice to switch genders, or that there is a single "surgery" involved. From the hundreds of discussions I have had with patients over the years, nothing could be further from the truth. This is not about choice; it is about using one or more surgical procedures as therapeutic tools to enable people to live authentically.

and body, as described in more detail below), and I am a recognized expert in this field.

2. I have been retained by counsel for Plaintiffs in the above-captioned lawsuit to provide an expert opinion on the standards of care for treating individuals diagnosed with gender dysphoria. In particular, I have been asked: 1) whether gender confirming surgeries are safe and effective medical treatment for gender dysphoria experienced by transgender people, including adults age 21 and over and adolescents up to age 21; 2) whether gender confirming surgeries are experimental or investigational; and 3) whether a categorical exclusion on Medicaid coverage for gender confirming surgeries violates the prevailing standards of care for treating transgender people, including for adults age 21 and over and for adolescents up to age 21, who have been diagnosed with gender dysphoria. Additionally, I submit this declaration to respond to points raised in the Florida Agency for Health Care Administration's "Florida Medicaid Generally Accepted Professional Medical Standards Determination on the Treatment of Gender Dysphoria" report ("GAPMS Report") and the assessment drafted by Patrick W. Lappert, M.D. that was attached to the GAPMS Report ("Lappert Assessment").

Qualifications and Experience

3. The information provided regarding my professional background, experiences, publications, and presentations are detailed in my curriculum vitae ("CV"). A true and correct copy of my most up-to-date CV is attached as **Exhibit A**.

4. I received my medical degree from the University of Chicago, Pritzker School of Medicine. I completed my residency and chief residency in plastic and reconstructive surgery and a fellowship in reconstructive microsurgery at the University of Chicago Hospitals.

5. I previously served as a Clinical Professor of Surgery at the University of Illinois at Chicago. I resigned that position to become the Director of Gender Affirmation Surgery at Rush University Medical Center in April 2022. I am also a Professor of Surgery and Urology at Rush University Medical Center. In addition, I maintain a clinical practice in plastic surgery in Illinois where I treat patients from around the country, as well as from around the world.

6. I have been performing gender confirming surgeries for more than 28 years. For at least the past five years, I have been performing approximately 150 gender confirmation procedures every year. I have performed over 1,500 gender confirmation surgeries during my medical career. Currently,

approximately 90 percent of the patients in my clinical practice are transgender people seeking gender confirmation surgeries.

7. I was a contributing author to the World Professional Association for Transgender Health's ("WPATH") Standards of Care for the Health of Transsexual, Transgender, and Gender-Nonconforming People, Version Seven, which were published in 2012. In particular, I wrote the section focused on the relationship of the surgeon with the treating mental health professional and the physician prescribing hormone therapy. In September 2022, WPATH published the Standards of Care for the Health of Transgender and Gender Diverse People, Version Eight ("Standards of Care") in the International Journal of Transgender Health.[2] I was the co-lead author of the surgical and postoperative care chapter of Version Eight.

8. The Standards of Care provide clinical guidance for health professionals based on the best available science and expert professional consensus. The purpose of the Standards of Care is to assist health providers in delivering medical care to transgender people in order to provide them with safe

[2] Coleman, E. et al. (2022). Standards of Care for the Health of Transgender and Gender Diverse People, Version 8. Int'l J. of Transgender Health, 23: S1-S259, doi: 10.1080/26895269.2022.2100644 [hereinafter "Standards of Care"].

and effective treatment for gender dysphoria, in order to maximize their overall health, psychological well-being, and self-fulfillment.

9. In addition, I have written a number of peer-reviewed journal articles and chapters in professional textbooks about gender confirmation surgeries. In 2016, I published Surgical Management of the Transgender Patient, the first surgical atlas (a reference guide for surgeons on how to perform surgical procedures using safe, well-established techniques) dedicated to gender confirming surgeries. In 2020, I published a guide for surgeons entitled Gender Confirmation Surgery: Principles and Techniques for an Emerging Field. I am also a co-investigator on a study regarding uterine transplantation for transgender women. A full and complete list of my publications is included in my CV.

10. I am a guest reviewer for several peer-reviewed medical journals, including the Journal of Plastic and Reconstructive Surgery, the Journal of Reconstructive Microsurgery, the Journal of the American College of Plastic Surgeons, the Journal of Plastic and Aesthetic Research, and the Journal of Sexual Medicine. I also serve on the editorial board of both Transgender Health and the International Journal of Transgender Health. Each of these publications is a peer-reviewed medical journal. A full and complete list of my reviewerships and editorial roles is included in my CV.

11. I am actively involved in training other surgeons to perform gender confirmation surgeries. In 2017, I started the surgical fellowship in gender surgery, now placed at Rush University Medical Center in Chicago. I am currently the Director of that fellowship.

12. I have given dozens of public addresses, seminars, and lectures on gender confirming surgery, including many through the American Society of Plastic Surgeons. I have also taught a number of courses through WPATH's Gender Education Institute, which provides training courses toward a member certification program in transgender health for practitioners around the world. In addition, in 2018, I co-directed the first live surgery course in gender confirming procedures at Mount Sinai Hospital in New York City, and I am the Director for this upcoming live surgery course in 2023. In 2019, I directed the inaugural Gender Affirming Breast, Chest, and Body Master Class for the American Society of Plastic Surgeons.

13. I am also a founding member and president of the Society for Gender Surgeons; a current member of the Executive Committee of the Board of Directors of WPATH, where I serve as treasurer; and a former member of the Board of Governors of the American College of Surgeons. I am a guest examiner for the American Board of Plastic Surgery, which involves administering the

plastic surgery oral board exam to surgeons who have completed their plastic surgery training and seek board certification.

14. I am the former Chair of the Patient Safety Committee for the American Society of Plastic Surgeons, and current Patient Safety Officer for the Division of Plastic Surgery at Rush University Medical Center. In 2017, I was an invited discussant at the Pentagon regarding transgender service members. I recently delivered the Bevan 2023 Lecture at the Chicago Surgical Society, which is a lecture that began in 1928 and was established by Arthur Bevan, a former President of the American Medical Association and Founder of the American Board of Surgery.

Previous Testimony

15. In the past four years, I have provided expert testimony in the following matters: *Kadel v. Folwell*, M.D.N.C. (deposition); *Toomey v. State of Arizona*, D. Ariz. (deposition); and *Fain v. Crouch*, S.D.W.V. (deposition).

Compensation

16. I am being compensated at an hourly rate of $400/hour plus expenses for my time spent preparing this declaration and for providing any local testimony (including deposition or hearing testimony by telephone or video-teleconference). I will be compensated a flat daily rate of $7,500 for any out-of-

town deposition or hearing testimony. My compensation does not depend on the outcome of this litigation, the opinions I express, or the testimony I may provide.

Basis for Opinions

17. My opinions contained in this report are based on all of the following: (1) my clinical experience of over 28 years of caring for transgender patients, including my experience teaching other surgeons and medical students to care for this population; (2) my review and familiarity with relevant peer-reviewed literature,[3] including my own, regarding gender confirming surgeries, which reflects the clinical advancements in these procedures and the corresponding growth in research related to the safety and effectiveness of these procedures in treating gender dysphoria; and (3) discussions with colleagues and other experts in the field, including attendance and participation in various educational conferences both nationally and internationally. The research and

[3] I regularly and routinely perform literature searches as an educator, including in my roles as a Professor of Surgery at Rush University Medical Center and an attending surgeon at Rush University, where I participate in fellow, resident, and student education; Director of Gender Affirmation Surgery at Rush University Medical Center; lecturer for the Global Education Initiative for WPATH; invited lecturer at national and international conferences; co-lead author of the surgery and post-operative care chapter of the WPATH Standards of Care Version 8; an editor and reviewer for peer-reviewed publications; and a course director for various educational opportunities for WPATH, American Society of Plastic Surgeons, and other organizations.

materials I relied on in preparing this declaration are cited in the footnotes and detailed in the reference list attached as **Exhibit B** to this declaration.

18. Additionally, in preparing this declaration, I reviewed the GAPMS Report and the Lappert Assessment, as well as the coverage exclusion challenged in this case (Fla. Admin. Code R. 59G-1.050(7)).

DISCUSSION

Background on Gender Identity and Gender Dysphoria

19. The term "transgender" is used to describe a diverse group of individuals whose gender identity, or internal sense of gender, differs from the sex they were assigned at birth.

20. Many transgender people experience gender dysphoria at some point in their lives. Gender dysphoria is a serious medical condition, defined by the Diagnostic and Statistical Manual of Mental Disorders (DSM-5TR) published by the American Psychiatric Association as clinically significant distress or impairment related to gender incongruence, which may include desire to change primary and/or secondary sex characteristics. Gender dysphoria is also recognized by the International Classification of Diseases-11 (ICD-11), under the label of gender incongruence, and the International Classification of Diseases-10 (ICD-10).

21. Individuals diagnosed with gender dysphoria have an intense and persistent discomfort with the primary and/or secondary sex characteristics of the sex they were assigned at birth. Gender dysphoria can lead to debilitating anxiety and depression, as well as serious incidents of self-harm, including self-mutilation, suicide attempts, and suicide.

22. Appropriate medical care, including mental health services, hormone therapy, and gender confirmation surgeries can help alleviate gender dysphoria. Gender confirmation surgeries, which bring a person's body into better alignment with their gender identity, have been shown to be a safe and effective treatment for gender dysphoria.

Gender Confirming Surgeries are Standard, Medically Accepted, and Medically Necessary Treatments for Gender Dysphoria for Transgender People

23. It is my professional opinion, supported by the prevailing consensus of the medical community, that surgical procedures used to treat gender dysphoria are medically necessary treatments for many transgender people. Decades of clinical practice and peer-reviewed research have demonstrated that these procedures are safe and effective treatments for gender dysphoria.

Applicable Standards of Care for Treating Gender Dysphoria

24. WPATH is a non-profit professional and educational organization devoted to transgender health. WPATH's mission is "to promote evidence-based care, education, research, advocacy, public policy, and respect in transgender health."[4] As described above, WPATH publishes the Standards of Care, which are based on the best available scientific evidence and expert professional consensus.[5] WPATH published the first version of the Standards of Care in 1979. Since that time, the guidelines have been updated through eight versions, reflecting the significant advances made in the understanding, management, and care of transgender individuals. The Standards of Care are widely recognized guidelines for the clinical management of transgender people with gender dysphoria. Most surgeons who are actively involved in academic training and research in the field and regularly treat people experiencing gender dysphoria, including myself, practice in accordance with the Standards of Care.

25. As indicated in the Standards of Care, medically necessary gender affirming treatments include mental health care, puberty suppression, hormone therapy, and various surgical procedures to align a person's primary and/or

[4] WPATH, Mission and Vision, https://www.wpath.org/about/mission-and-vision.
[5] *See* Standards of Care at S247-251 (describing the methodology used to develop the Standards of Care).

secondary sex characteristics with the person's gender identity.[6] Surgery is often the last and most considered of the treatment options for gender dysphoria in transgender people. Not every transgender person may undergo every available surgical procedure. As highlighted in the seventh version of the Standards of Care, and as now well-accepted, "[t]he number and sequence of surgical procedures may vary from patient to patient, according to their clinical needs."[7] Evidence shows that while some transgender people do not require surgery, "for many others surgery is essential and medically necessary to alleviate their gender dysphoria. For the latter group, relief from gender dysphoria cannot be achieved without modification of their primary and/or secondary sex characteristics to establish greater congruence with their gender identity."[8]

26. The Endocrine Society—the leading professional organization devoted to research on hormones and the clinical practice of endocrinology—has also issued clinical guidelines for the treatment of transgender people.[9] The

[8] *Id*. at 199. *See also* Standards of Care at S18.
[9] Hembree, W.C. et al. (2017). Endocrine Treatment of Gender-Dysphoric/Gender-Incongruent Persons: An Endocrine Society Clinical Practice Guideline, J. Clin. Endocrinology & Metabolism, 102(11): 3869-3903, doi: 10.1210/jc.2017-01658.

guidelines indicate, that for transgender people, gender confirming surgeries often are necessary and effective treatments.[10]

27. The broader medical community, including the American Medical Association, American Academy of Pediatrics, American Psychological Association, American Psychiatric Association, American College of Obstetricians and Gynecologists, American Academy of Family Physicians, and World Health Organization, recognizes that gender confirming surgeries are standard, appropriate, and often necessary treatments for adults and adolescents with gender dysphoria.

Surgical Treatments for Gender Dysphoria

28. Surgical treatment options that are generally accepted in the medical community and are consistent with the Standards of Care include, but are not limited to:

- Breast/chest surgery: augmentation (breast implants) and mastectomy/liposuction (chest masculinizing);
- Genital surgeries: phalloplasty and/or metoidioplasty (creation of the penis and/or scrotum), vaginoplasty, and/or vulvoplasty (creation of the vulva and/or vagina, including the labia minora and majora);

[10] *Id.*

- Gonadectomy: hysterectomy (removal of the uterus), orchiectomy (removal of the testes);
- Other surgical interventions: gender affirming facial surgery, body contouring, voice surgery, thyroid cartilage reduction, and hair reconstruction, among others.

29. The Standards of Care set forth criteria for initiation of any gender affirming medical treatment, including surgery. For adults, the criteria for surgery are:

- The patient's experience with gender incongruence is marked and sustained.
- In regions where a diagnosis is necessary to access health care (as it is in the United States), the patient fulfills the diagnostic criteria for gender incongruence.
- Other possible causes of apparent gender incongruences have been identified and excluded prior to the initiation of treatment.
- Any physical or mental health conditions "that could negatively impact the outcome" of treatment were assessed, "with risks and benefits discussed, before a decision was made regarding treatment."

- The patient has the capacity to consent for the specific gender affirming treatment.
- The patient understands "the effect of the treatment on reproduction" and has explored reproductive options.
- "[P]rofessionals who have competencies in the assessment of transgender and gender diverse people wishing gender-related medical treatment consider[ed] the role of social transition" with the patient.
- The patient has a recommendation for the initiation of the treatment "from a professional who has competencies in the assessment of transgender and gender diverse people wishing gender-related medical and surgical treatment."
- Prior to genital reconstruction surgery, the patient has received a minimum of 6 months of hormone therapy as appropriate to their gender goals prior to undergoing the surgery.[11]

30. The Standards of Care recognize that chest masculinization surgery "can be considered in minors when clinically and developmentally appropriate

[11] Standards of Care at S32; *see also id*. at S256.

as determined by a multidisciplinary team experienced in adolescent and gender development"[12] They also indicate that breast augmentation may be needed by adolescents. In addition, while it is rare to perform genital surgeries on adolescents, the Standards of Care recognize that studies suggest that some adolescents may benefit from vaginoplasty procedures.[13] They recommend that clinicians undertake a "comprehensive biopsychosocial assessment of adolescents" seeking gender-affirming treatment "to guide treatment decisions and optimize outcomes."[14] As they do for adults, the Standards of Care set forth criteria for initiation of surgery in adolescents.[15]

Gender Confirmation Surgeries Are Medically Necessary

31. The medical community and insurance providers recognize a distinction between surgery which is medically necessary, and cosmetic surgery, which generally is not. No particular procedure is inherently cosmetic or inherently medically necessary; rather, the underlying diagnosis determines whether the procedure is considered cosmetic or medically necessary.

[12] *Id.*at S66.
[13] *Id.*
[14] *Id.* at S50.
[15] *Id.* at S48, S256.

32. With respect to surgical treatments for gender dysphoria, the medical community generally considers those surgeries to be medically necessary. This is true even though the same surgical procedures might be considered cosmetic when performed on someone without gender dysphoria (e.g., a cisgender woman obtaining a breast augmentation for aesthetic reasons). Gender confirming surgeries are not cosmetic because, when performed in accordance with the Standards of Care, they are clinically indicated to treat the underlying medical condition of gender dysphoria. Because these medically necessary procedures help transgender people live and present in a manner more consistent with their gender identity and therefore reduce and/or treat their gender dysphoria, the professional medical consensus is that these are appropriately categorized as medically necessary.

33. Dr. Lappert asserts that distinguishing "cosmetic breast surgery from 'medically necessary' surgery is based upon the diagnosis of the underlying pathology."[16] I agree. What Dr. Lappert fails to acknowledge, however, is that

[16] Lappert Assessment at 13.

breast augmentation or mastectomy may be medically indicated for the treatment of gender dysphoria, in addition to other pathologies.[17]

34. Dr. Lappert misunderstands that gender dysphoria is a medical condition for which there are effective medical and surgical treatments. While plastic surgeons may encounter individuals with mental health conditions, such as body dysmorphic disorder, surgery for this condition is highly ineffective. This is in contrast to surgery as treatment for gender dysphoria; where medically indicated, surgical procedures for gender dysphoria are both safe and medically effective.

35. Dr. Lappert also wrongly suggests that a mastectomy performed to treat gender dysphoria is cosmetic because it results in a "complete loss of function" that is "two fold (breast feeding and erotic sensibility)."[18] Here, he makes several incorrect assumptions. First, he fails to recognize that for many transgender people (especially transgender men), nipple sensation is rarely a source of erotic sensibility, and the presence of breasts may interfere with romantic relationships. In fact, my research, as well as my clinical experience,

[17] Dr. Lappert incorrectly refers to breast growth in transgender women as "gynecomastia." Gynecomastia refers to enlargement of the male breast, not to breast growth in transgender women.
[18] Lappert Assessment at 10.

shows that gender-affirming mastectomy is associated with an increase in sexual satisfaction.[19] What is more, Dr. Lappert ignores that a mastectomy performed to treat breast cancer or a breast reduction performed in a cisgender woman to relieve symptoms of breast hypertrophy or macromastia may also result in the loss of nipple sensation. A mastectomy performed to treat breast cancer will likewise result in the loss of the ability to breast feed. So, his assertion that any procedure that causes a loss of function is cosmetic cannot be correct. As another example, a prostatectomy performed to treat prostate cancer in a cisgender man may result in the loss of erectile function and impotence.

Gender Confirming Surgeries Are Safe and Effective

36. The prevailing peer-reviewed clinical research, as well as my own clinical expertise as a plastic surgeon specializing in gender confirmation surgeries for nearly three decades, shows that surgical procedures for gender dysphoria are safe, effective, and medically accepted. Indeed, many of these procedures are analogous to surgical procedures used to treat other medical conditions.

[19] *See, e.g.*, Agarwal, C.A. et al. (2018). Quality of Life Improvement After Chest Wall Masculinization in Female-To-Male Transgender Patients: A Prospective Study Using the BREAST-Q and Body Uneasiness Test, J. Plastic, Reconstructive & Aesthetic Surgery, 71(5): 651-657, doi: 10.1016/j.bjps.2018.01.003.

Safety

37. It is my professional opinion that gender confirmation surgeries are safe. My opinion is informed in part by my experience as the former Chair of the Patient Safety Committee for the American Society of Plastic Surgeons and the current Patient Safety Officer for the Division of Plastic Surgery at Rush University Medical Center. Notably, when performing gender confirmation surgeries, surgeons use many of the same procedures that they use to treat other medical conditions. The fact that the medical community deems these analogous procedures sufficiently safe to treat conditions other than gender dysphoria is by itself more than sufficient to support the safety of those surgeries to treat gender dysphoria. There is no medical basis to conclude that the same surgical procedures are more or less safe simply because they are used to treat gender dysphoria, versus other underlying medical conditions.

38. For example, surgeons regularly perform mastectomies and chest/breast reconstruction, hysterectomies/salpingo-oophorectomies (which includes removal of the fallopian tubes and ovaries), and orchiectomies to treat individuals with cancer, or a genetic predisposition to cancer (BRCA 1, 2 genes in the case of prophylactic mastectomy or oophorectomy). Similarly, surgeons perform procedures to reconstruct external genitalia for individuals who have

certain medical conditions (e.g., cancer) or who have suffered traumatic injuries or disabling infections to their genitalia. This would include procedures to correct conditions such as hypospadias (a disorder in which the urinary opening is not in the typical location on the glans penis), epispadias (a condition where the urethra is not properly developed), exstrophy (where the bladder develops outside the fetus), fournier's gangrene (where tissue dies because of an infection), penile webbing, or buried penis (which can occur as a result of obesity, diabetes, or recurrent infections). This would also include procedures to correct conditions such as congenital absence of the vagina or reconstruction of the vagina/vulva following oncologic resection, traumatic injury, or infection.

Notably, Dr. Lappert concedes that chest reconstructive surgery in the form of a mastectomy is "very safe, and typically performed in the outpatient setting."[20] Dr. Lappert also concedes that "[s]urgical enhancement procedures are exactly the same in both men and women."[21]

[20] Lappert Assessment at 13.
[21] *Id*.

Efficacy

39. It is my professional opinion that standard surgical treatments for gender dysphoria are effective when performed in accordance with the Standards of Care.

40. Peer-reviewed studies find that transgender women who undergo one or more gender confirmation surgeries report positive health outcomes.[22] For example, a peer-reviewed study of transgender women found that those who underwent breast reconstruction surgeries experienced statistically significant improvements in their psychosocial well-being.[23] In a study published in 2019 by Miller, et al., 100% of transgender women who underwent breast augmentation reported improvement in their gender dysphoria and "would undergo the operation again."[24] Another peer-reviewed study of transgender women who had vaginoplasty found that study participants' mean improvement in quality of life

[22] *See* Standards of Care at S128-129 (gathering studies on breast augmentation and vaginoplasty).
[23] Weigert, R. et al. (2013). Patient Satisfaction with Breasts and Psychosocial, Sexual, and Physical Well-Being after Breast Augmentation in Male-to-Female Transsexuals. Plastic and Reconstructive Surgery, 132(6): 1421-1429. doi: 10.1097/01.prs.0000434415.70711.49.
[24] Miller. T.J. et al. (2019). Breast Augmentation in Male-to-Female Transgender Patients: Technical Considerations and Outcomes. JPRAS Open, 21: 63-74, doi: 10.1016/j.jpra.2019.03.003.

after surgery was 7.9 on a scale from one to ten.[25] Another study of transgender women found that surgical interventions were highly correlated with alleviating gender dysphoria.[26] A recent literature review concluded that in appropriately selected individuals, gender confirmation surgery is effective at improving quality of life, overall happiness, and sexual functioning in transgender women who are diagnosed with gender dysphoria.[27] Another recent post-operative and six-month follow-up survey of transgender female patients found improvements in quality of life in a significant majority of patients.[28]

41. The available peer-reviewed literature likewise concludes that when performed in accordance with the prevailing standards of care, male chest reconstruction surgery is safe and effective in alleviating gender dysphoria.[29] For example, one study found that transgender men who received chest reconstruction experienced few clinical complications and were overwhelmingly

[25] Horbach, S. E. R. et al. (2015). Outcome of Vaginoplasty in Male-to-Female Transgenders: A Systematic Review of Surgical Techniques. J. Sexual Medicine, 12(6): 1499-1512, doi: 10.1111/jsm.12868.

[29] *See* Standards of Care at 128 (gathering studies).

satisfied with their surgical outcomes.[30] Another peer-reviewed study of transgender men who received chest reconstruction found that the procedure improved psychosocial well-being and physical well-being among participants.[31] A 2021 study using a validated quality of life assessment tool demonstrated significant improvements in quality of life among transgender men up to one year following chest surgery.[32] The authors indicated that "the effect sizes were large and…exhibited excellent internal validity." The authors report that "every patient surveyed at 1 year reported that gender-affirming surgery changed their life for the better" and that, "every patient surveyed after surgery said they would choose it [surgery] again knowing what they know." Numerous other studies have reached similar conclusions.[33]

42. These findings extend to adolescents; for example, a recent study in JAMA Pediatrics concluded that: "Chest dysphoria was high among presurgical transmasculine youth, and surgical intervention positively affected both minors and young adults."[34] In addition, a 2022 study in JAMA Pediatrics found that in transgender and nonbinary adolescents and young adults, top surgery is associated with low complication rates and improved chest dysphoria, gender congruence, and body image satisfaction.[35]

43. In my clinical experience, the overwhelming majority of patients who obtain gender confirmation surgery in a manner consistent with the Standards of Care are both satisfied and experience a reduction of gender dysphoria. For the vast majority of transgender people who seek such surgery, the surgery is successful at treating gender dysphoria and alleviating a lifelong struggle to find peace of mind and comfort with their bodies.

Gender Confirmation Surgeries Are Not Experimental

44. It is my professional medical opinion that Dr. Lappert's contention that gender-confirming surgeries are experimental is unsupported by the professional medical consensus and prevailing standards of care for treating gender dysphoria. To the contrary, the prevailing consensus of the medical community recognizes that procedures used to treat gender dysphoria are medically necessary and not experimental or investigational.

45. Surgical care is not considered experimental when it uses accepted techniques and has demonstrative benefits. The techniques used in gender affirming care are employed in other surgeries and are well-established. For example, urethroplasties, orchiectomies, skin grafts, and mastectomies are all accepted techniques for congenital, oncological, and traumatic conditions. They are not experimental simply because they are applied to the well-established diagnosis of gender dysphoria.

46. Gender affirming surgery has been performed for almost 100 years, utilizes accepted surgical techniques, and yields demonstrated benefits for patients. Sir Harold Gilles, the 'father' of plastic surgery performed a phalloplasty on a transgender man in 1946. Sir Harold Gilles also performed a vaginoplasty on a patient in the 1950s. Subsequent to that, the gynecologist

Georges Borou in Casablanca, developed the pedicled flap for vaginoplasty. This technique remains the mainstay of modern procedures. In fact, pioneering work in gender affirming surgery was performed at Eastern Virginia Medical School in Norfolk, Virginia, where Dr. Lappert was noted to have a faculty appointment. The Center for Gender Reassignment was established in 1984 at Eastern Virginia Medical School. The founder of the program, Dr. David Gilbert, indicated that by 1992, he and his colleagues had performed more than 50 microsurgical phalloplasty procedures. Many of the techniques used in gender affirming surgery were developed in Norfolk, including the 'Norfolk Glansplasty' used in gender affirming phalloplasty.

47. In addition, gender affirming surgeries are: 1) part of the core curriculum in plastic surgery resident education; and 2) a component of both the written and oral board exams in plastic surgery. I have given presentations at multiple professional societies—including, the American Society of Plastic Surgeons, American Association of Plastic Surgeons, American Society for Reconstructive Microsurgery, American College of Surgeons—and none of those societies consider gender affirming surgery experimental. In the disclosures required to give presentations of this kind there is no requirement that they be called experimental. It is widely accepted by professional surgical societies that

gender affirming surgeries are not experimental. Indeed, gender affirming surgery is part of the standard resident education in plastic surgery and is included in both the written and oral exams (in order to obtain board certification).

The Opinions of Dr. Lappert Are Inconsistent With the Mainstream Medical Consensus and Scientific Literature and Are Fatally Flawed

Qualifications of Dr. Lappert

48. Based on the disclosures in Dr. Lappert's Assessment, he appears to lack the requisite qualifications to offer his opinions. Dr. Lappert's board certification with the American Board of Plastic Surgery is expired. Dr. Lappert is neither board-certified in plastic surgery, nor does he appear to hold any board-certification from a member board of the American Board of Medical Specialties.

49. Dr. Lappert is not a member of the American Society of Plastic Surgeons (ASPS), despite its role as the largest plastic surgery specialty organization in the world. ASPS represents 92% of all board-certified plastic surgeons in the United States, and more than 11,000 plastic surgeons worldwide.[36] Dr. Lappert does not appear to be a member of any other major or relevant surgical organization, such as the American College of Surgeons.

[36] *See* American Society of Plastic Surgeons, About ASPS, plasticsurgery.org/about-asps (2023).

50. Dr. Lappert lists no current hospital affiliations, nor does he appear to perform surgical procedures any longer. Dr. Lappert has no recent or relevant scientific publications pertaining to the field of gender-affirming surgery. Dr. Lappert references having performed an unspecified number of surgeries for patients who previously identified as transgender, however, he does not disclose any experience in treating individuals in a manner consistent with the Standards of Care.

51. Additionally, Dr. Lappert is not a member of WPATH, which is recognized by the mainstream medical community as the authoritative entity that has established comprehensive Standards of Care in this field.

Quality of Evidence

52. Dr. Lappert repeatedly contends that the body of evidence supporting gender affirming surgery is low-quality, and as a result, the treatment is considered experimental. But that is incorrect. The quality of the evidence supporting gender affirming surgeries is comparable to that supporting many surgeries and clinical procedures. Prospective, randomized, double-blind, placebo-controlled studies cannot be used to evaluate many clinical procedures, especially surgical procedures. For example, there are simply inherent limitations to our ability to conduct such studies in clinical medicine. First, it is unethical to

withhold medically necessary care. As such, in many situations, clinicians cannot conduct a study that uses a control group who is deprived of the treatment being studied. Practice guidelines published in 2013 by the Royal College of Psychiatrists indicated that a randomized controlled study to evaluate feminizing vaginoplasty would be "impossible to carry out."[37] The withholding of medically necessary care that would be required for such a comparison would be considered unethical.

53. Second, it is not possible to perform a double-blind study of surgeries that modify body parts, nor is there a placebo that can mimic such a surgery – unlike studies that use placebo drug regimens, for example, people will know if they have had an operation or not. Third, for relatively uncommon conditions like gender dysphoria, sample sizes of individuals with the condition who are available to participate in a clinical study tend to be small. This is especially true where treatment for a condition has not been covered by insurance programs and plans, and where additional barriers (such as ongoing stigmatization) prevent patients from accessing care. That very lack of access to

[37] Good Practice Guidelines for the Assessment and Treatment of Adults with Gender Dysphoria, Royal College of Psychiatrists, at 50 (2013).

the procedure results in there being fewer people who have received treatment and who can participate in a prospective study of that treatment's effect.

54. Put simply, the scientific literature pertaining to gender affirming surgical interventions is similar to that of other accepted plastic surgery procedures. For example, Dr. Lappert points to his experience performing surgery to treat cleft palate and craniofacial differences.[38] However, there are only a small number of Level 1 (randomized controlled trials) for that treatment.[39] Scientific ratings of evidence generally employ extremely high standards that are not satisfied for many commonly-prescribed treatments and procedures.[40] Such ratings do not mean that the treatment is unsupported in the literature and clinical practice, or that it is not medically necessary.

55. The recommendation for ongoing research is a standard recommendation in many, if not most or all clinical scenarios. This recommendation for ongoing study in a particular clinical area does not mean that surgical care is withheld.

---

[39] *See, e.g.*, Bekisz, J.M. (2018). A Review of Randomized Controlled Trials in Cleft and Craniofacial Surgery. J. Craniofacial Surgery, 29(2): 293-301, doi: 10.1097/SCS.0000000000004100.

[40] *See, e.g.*, Lee, B.T., et al. (2017). Evidence-Based Clinical Practice Guideline: Autologous Breast Reconstruction with DIEP or Pedicled TRAM Abdominal Flaps, Plastic and Reconstructive Surgery. 140(5): 651e-664e, doi: 10.1097/PRS.0000000000003768.

56. In addition, Dr. Lappert is wrong to suggest that studies are the only way for surgeons to determine the appropriate course of treatment for a particular condition. Critical review of the scientific literature is certainly an important component as to how surgeons evaluate whether a particular procedure is generally safe and effective and whether it is appropriate or recommended for an individual patient. But in addition to considering the literature en masse, we must also account for our own clinical experience and that of our colleagues, as well as our patients' experiences and input. Here, the existing literature, taken as a whole, combined with my own experience and that of many colleagues, indicates that gender affirming surgery is a safe and effective treatment for individuals with gender dysphoria.

57. In fact, in his effort to discredit the research on gender affirming surgery, Dr. Lappert reveals that his lack of experience in the area of gender affirming care is coloring his ability to properly interpret the results of the relevant studies. For example, he suggests that flaws in the methodology of one study could be masking significant numbers of patients who had poor outcomes or regretted having surgery.[41] If significant numbers of patients were having poor outcomes or experiencing regret, those of us who regularly perform gender

[41] *See* Lappert Assessment at 7-8.

affirming procedures, consult with our colleagues in the field, and attend lectures and conferences on gender affirming care would know about it. We would see many transgender patients requesting revision surgery. That is simply not happening. In contrast, I am aware that some cisgender women who undergo implant-based breast reconstruction subsequently request implant removal.

58. Finally, while criticizing the existing body of research on gender affirming surgical procedures, neither the GAPMS Report nor Dr. Lappert point to any research demonstrating a safe and effective alternative to gender affirming treatment for gender dysphoria.

Informed Consent

59. Dr. Lappert appears to assert that patients cannot provide informed consent for surgical procedures to treat gender dysphoria because of the purported insufficiency of the evidence supporting this care.[42] Dr. Lappert misunderstands informed consent, both generally and in the context of gender-affirming surgery. And, his view directly contradicts that of the American Society of Plastic Surgeons, which offers documents for surgeons to use to memorialize the process of obtaining informed consent for gender affirming care.

[42] Lappert Assessment at 4.

60. Gender affirming surgeries are not experimental, as discussed above. Gender affirming surgical procedures have been shown beneficial by multiple surgeons, in multiple countries, over many decades. The risks of gender affirming surgical procedures are well-known and well-described in the literature.[43]

61. The Standards of Care specifically discuss the importance of a shared decision-making approach (between the patient and the surgeon) that is multidisciplinary and includes a discussion of the patient's goals and expectations, the surgical options and associated risks and benefits, and a plan for care after surgery.[44] For adolescents, these discussions include the caregiver or parents who must consent as well.[45]

62. The process of securing informed consent is done in a multidisciplinary way. The health care team, which could consistent of a mental health professional, a primary care provider, an endocrinologist, and a surgeon, must assess the ability of the patient to provide informed consent.[46] And, as noted

[43] *See, e.g.*, Schechter, L.S. (2009). The Surgeon's Relationship with the Physician Prescribing Hormones and the Mental Health Professional: Review for Version 7 of the World Professional Association for Transgender Health's Standards of Care. Int'l J. of Transgenderism, 11(4): 222-225, doi: 10.1080/15532730903439468.
[44] *See* Standards of Care at S130-132.
[45] *See id.* at S57-58.
[46] *See id*. at S38-39, S61-62.

above, a competent health care professional must assess a patient seeking gender affirming surgery prior to the initiation of the treatment. This represents a clinical standard which exceeds the threshold to perform many surgical interventions to treat conditions other than gender dysphoria, including those that are sterilizing. However, this kind of multidisciplinary approach is not unique to gender affirming care. A psychosocial assessment is often performed in other areas of surgery, including transplantation and bariatrics, and has been shown to improve patient outcomes.

Few Patients Experience Regret When Gender Confirming Surgery is Provided in Accordance with the Standards of Care

63. Dr. Lappert suggests that gender confirming surgery is not safe and effective because some patients could later regret their transition and the procedure.[47] All available research—as well as my own clinical experience—indicates that very few patients experience regret when gender confirming surgery is provided in accordance with the Standards of Care and by a qualified surgeon. Regret of any kind is rare (0.6% in transgender women and 0.3% in transgender men),[48] but "true regrets," as opposed to regrets due to lack of social

[47] *See, e.g.*, Lappert Assessment at 7-8, 10-11.
[48] Wiepjes, C.M. et. al. (2018). The Amsterdam Cohort of Gender Dysphoria Study (1972-2015): Trends in Prevalence, Treatment, And Regrets. J. of Sexual Medicine, 15(4): 582-590. doi: 10.1016/j.jsxm.2018.01.016.

or familial acceptance, comprise an even smaller percentage (approximately half this group, roughly 0.3% in transgender women and 0.15% in transgender men).[49] Having performed gender confirming surgeries for over 20 years, I have only seen two individuals who have requested a reversal of gender affirming surgery.

64. In a recent study I co-authored regarding regret following gender affirming surgery, Narayan, et al. queried 154 surgeons surgically treating between 18,125 to 27,325 individuals.[50] The rate of regret was found to be between 0.2-0.3%, consistent with previous literature.

65. Moreover, issues pertaining to regret following surgical procedures are not limited to gender-affirming surgical interventions.[51] Some cisgender women experience regret following breast reconstruction (40%)[52], prophylactic

[49] *Id*. at 585, 587 (Researchers classified transgender women as having "social regrets" when they still identified as women, but reported feeling "ignored by surroundings" or they regretted loss of relatives. Researchers classified "true regrets" as those experienced by individuals who "thought gender affirming treatment would be a 'solution' for, for example, homosexuality or [lack of] personal acceptance, but, in retrospect, regretted the diagnosis and treatment.").

[50] Narayan, S.K. et al. (2021). Guiding the Conversation—Types of Regret After Gender-Affirming Surgery and Their Associated Etiologies. Annals of Translational Medicine, 9(7): 605-616, doi: 10.21037/atm-20-6204.

[51] *See, e.g.*, Christie, D.R.H. et al. (2015). Why do patients regret their prostate cancer treatment? A systematic review of regret after treatment for localized prostate cancer. Psycho-Oncology 24(9): 1002-1011. doi: 10.1002/pon.3776.

[52] Zhong, T. et al. (2013). Decision regret following breast reconstruction: the role of self-efficacy and satisfaction with information in the preoperative period. Plastic and Reconstructive Surgery, 132(5): 724e-734e, doi: 10.1097/PRS.0b013e3182a3bf5d.

mastectomy (6%),[53] and prophylactic oophorectomy (7%).[54] A study of breast cancer survivors found that five years after diagnosis, 24% expressed regret about primary surgery, and nearly 18% expressed regret about reconstruction.[55]

66. Even if we were to assume that some small percentage of patients who undergo gender-affirming surgery will experience regret, that does not mean that the surgery should never be performed. For example, some patients who undergo an appendectomy are found to have a normal appendix. No one would suggest that surgeons stop performing this procedure altogether. Rather, the appropriate response is to further refine our ability to accurately determine who is most likely to benefit from the procedure.

67. Finally, Dr. Lappert fails to consider that regret can be bidirectional. In other words, a patient may regret not having surgery. In my practice, it is far more common to see a patient who regretted not having access to surgery due to lack of insurance coverage than a patient who regretted having gender affirming surgery.

Patient Self-Reporting

68. Dr. Lappert claims that gender confirming surgeries are based on "the patient's subjective report of dysphoria."[56] Dr. Lappert misrepresents the preoperative process and multidisciplinary assessment that occurs prior to gender affirming surgical interventions.[57] He demonstrates a lack of familiarity with both the assessment process done before the transgender patient is eligible for surgery and the role and responsibility of the surgeon in providing this care.

69. When a person is referred to a surgeon to receive gender confirming surgery, the surgeon receives in writing one or more assessments from one or more health professionals outlining the patient's diagnosis and the medical necessity of the care, as required under the Standards of Care.[58] But that is only one step in the assessment for surgical interventions. Contrary to Dr. Lappert's suggestions, the surgeon remains ultimately responsible for deciding whether a particular surgical intervention is medically indicated. The surgeon evaluates the patient and makes the final decision about whether it is safe and medically indicated to proceed. This includes an evaluation of the patient's understanding

[56] Lappert Assessment at 13.
[57] *See* Standards of Care at S133; Schechter, L.S., *supra* note 43.
[58] The Standards of Care recommend that health care professionals assessing patients for gender-affirming surgical care have specific qualifications. *See* Standards of Care at S33-35.

of the condition, their self-awareness, and their goals and expectations for the intervention. The surgeon also evaluates other factors that would affect the patient's fitness for the surgery, such as obesity or smoking, and determines whether additional information might be required, such as x-rays or laboratory work. The surgeon also typically obtains an assessment from the person's primary care physician about their overall health. In my own clinical practice, I have declined to perform a requested intervention based on my exercise of professional judgment.

70. What is more, his reliance on "objective" tests is misplaced. What he considers to be objective tests – an x-ray, pathology report or lab value – are open to interpretation. It is not uncommon to have conflicting opinions regarding an x-ray or a pathology report. In addition, while various tests may be considered in regards to establishing a diagnosis, the tests are usually interpreted within the clinical context. For example, x-ray reports typically include the phrase "clinical correlation is recommended."

71. Finally, Dr. Lappert ignores that once a diagnosis is established, treatment then depends on a discussion with the patient. That discussion includes information from the literature, but also includes other clinical considerations,

such as the patient's values, preferences, choices, and autonomy, which Dr. Lappert disregards.

72. Finally, Dr. Lappert also suggests that the difference between reconstructive surgery (which he states that insurance will cover) and cosmetic surgery (which he states that insurance will not) turns on pathology reports, using surgery to treat gynecomastia as an example.[59] Similarly, he alleges that the need for breast reduction surgery is determined by objective tests, including the weight of the specimen which is removed.[60] But, for both of those procedures, the American Society of Plastic Surgeons states that symptomatology – not pathology reports or the weight of the specimen which is removed – is the important determinant for insurance coverage.[61]

The GAPMS Report Misrepresents the Literature in Medical Necessity, Safety, and Effectiveness

73. The overwhelming weight of the scientific and medical literature supports the benefits of gender affirming surgical interventions. Gender

[59] *See* Lappert Assessment at 9.
[60] *Id*. at 10.
[61] *See* American Society of Plastic Surgeons, ASPS Recommended Insurance Coverage Criteria for Third-Party Payers, Reduction Mammaplasty (2021), https://www.plasticsurgery.org/documents/Health-Policy/Reimbursement/insurance-2021-reduction-mammaplasty.pdf; American Society of Plastic Surgeons, ASPS Recommended Insurance Coverage Criteria for Third-Party Payers, Gynecomastia, https://www.plasticsurgery.org/documents/Health-Policy/Positions/Gynecomastia_ICC.pdf.

affirming interventions have been performed for decades, and the safety and efficacy of these procedures have been reported by multiple surgeons practicing at different institutions in different countries and continents.

74. The GAPMS Report cites a study by Dhejne, et al. to imply that because individuals who received gender confirming surgeries had higher morbidity and mortality rates compared to the general population, the surgeries are not effective.[62] The Agency misunderstands that study. First, while the study itself clearly states that it is not intended to evaluate whether gender affirming surgeries are "an effective treatment or not," it did conclude that surgeries alleviate gender dysphoria. Second, the study found that those who receive medically necessary surgery generally have reduced morbidity and mortality compared to those with the same condition who do not, even if morbidity and mortality for both groups is higher than average. Third, the study includes patients who had surgery prior to the development of the current standards of care. Finally, the fact that gender confirming surgeries do not entirely resolve all possible causes of morbidity and mortality among transgender individuals is completely unsurprising. While surgery can treat gender dysphoria by aligning transgender people's bodies with their gender identity, surgery alone cannot fully

[62] GAPMS Report at 24-25.

eliminate the stigma and discrimination that transgender people face. Surgery does not occur in a vacuum. The Standards of Care specifically recognize the need for patients to receive continued social and medical support after surgery.[63]

75. Moreover, it is rare for any surgery to eliminate morbidity and mortality. For example, people who have surgery to remove a cancerous tumor may still experience higher rates of morbidity and mortality than the general population, but that does not mean that they should not undergo the surgery. In addition, individuals suffering from other medical conditions (including chronic conditions and traumatic injuries such as burns) are also at elevated risk of suicide. The increased risk of suicide does not preclude treatment of burn patients.[64]

76. The fact that surgery does not always reduce morbidity for everyone who receives it does not mean that the surgery is not safe or effective, particularly given the number of potential confounding factors that can impact

[63] *See* Standards of Care at S131 (recommending that prior to surgery, surgeons inform patients about aftercare requirements, travel and accommodations, and the importance of postoperative follow-up care), S133 (recommending that surgeons encourage life-long urological follow-up for patients who have undergone metoidioplasty/phalloplasty), S134 (recommending surgeons encourage patients who have undergone vaginoplasty follow-up with their primary surgeon, primary care physician, or gynecologist).

[64] Lerman, S.F. et al. (2021). Suicidality After Burn Injuries: A Systematic Review. J. of Burn Care & Research, 42(3): 357-364, doi: 10.1093/jbcr/irab014.

morbidity. Similarly, the continued existence of elevated morbidity and mortality rates, compared to the population at large, say nothing about whether a treatment is a safe and effective way to treat a particular condition. Moreover, while suicide is not necessarily the correct marker for efficacy of treatment, in the Dhejne study, suicide attempts in the years 1989-2003 were reduced (and death by suicide during that time is listed as NA). Additionally, the number of mental health visits following surgical care is not a marker for treatment efficacy. For example, people receiving care for cancer will continue to see their oncologist – this does not imply that care received for the treatment of cancer was not successful. We continue to provide care to patients with cancer even though treatments may be "temporary" (i.e., some forms of care may extend the lifespan of a patient with cancer for several years). This does not suggest that withholding medically necessary care is appropriate for patients with cancer, any more than it is for transgender people.

77. The GAPMS Report also misunderstands Medicare policy on coverage of gender-affirming surgery. In 2014, an impartial adjudicative board in the Department of Health & Human Services concluded, based on decades of studies, that surgical care to treat gender dysphoria is safe, effective, and

medically necessary.[65] As a result, the Centers for Medicare & Medicaid Services (CMS) within HHS started covering surgical care for gender dysphoria and continues to provide that coverage, including for patients in my practice.

78. In 2016, CMS decided not to issue national standards (called a National Coverage Determination or "NCD") for determining under what circumstances Medicare will cover gender confirming surgical care because "the clinical evidence . . . was inconclusive *for the Medicare population*."[66] The result of CMS's review of the evidence is not applicable to other population groups. For the most part, the Medicare population consists of individuals over the age of 65. While the number of older adults who have gender affirming surgery is increasing, most individuals who undergo gender affirming surgery are under age 65, meaning that fewer older adults have been included in studies assessing the effectiveness of the treatment. That was a significant factor in CMS's decision. As CMS articulated, "older adults may respond to health care treatments

[65] *See* Dep't of Health & Human Servs., Departmental Appeals Bd., Appellate Div., Decision No. 2676 (May 30, 2014), hhs.gov/sites/default/files/static/dab/decisions/board-decisions/2014/dab2576.pdf. That decision also discussed the quality of data demonstrating the efficacy of surgical care to treat gender dysphoria, noting regardless of whether the studies were randomized double-blind trials, there was sufficient evidence to prove "a consensus among researchers and mainstream medical organizations that transsexual surgery is an effective, safe and medically necessary treatment for [gender dysphoria]." *Id.* at 20.

[66] Ctrs. for Medicare & Medicaid Servs., *Decision Memo for Gender Dysphoria and Gender Reassignment Surgery* (Aug. 30, 2016) (emphasis added) [hereinafter "CMS Decision Memo"].

differently than younger adults. These differences can be due to, for example, multiple health conditions or co-morbidities, longer duration needed for healing, metabolic variances, and impact of reduced mobility."[67]

79. What is more, CMS acknowledged that gender confirming surgery may be necessary for certain Medicare beneficiaries and concluded that the appropriateness of surgical care for this population should continue to be determined on a case-by-case basis, as is already required by the Standards of Care. Many widely accepted surgical procedures and surgical conditions do not have NCDs under Medicare. The fact that gender confirming surgery does not have an NCD is not unusual.

80. Notably, I have performed gender confirming surgeries on a number of Medicare beneficiaries in recent years, and Medicare has covered the cost of that care. Indeed, most medical and surgical care provided to patients should be individualized, taking into account each patient's unique clinical circumstances. In contrast, the exclusion challenged in this case does not evaluate the medical necessity of surgical care for gender dysphoria on a case-by-case basis. It categorically excludes all coverage regardless of an individualized showing of medical necessity.

[67] *Id*. at 57.

Summary of Opinions and Conclusions

81. Based on over 28 years of clinical experience performing gender confirmation procedures and caring for transgender people, my knowledge of the Standards of Care and relevant peer-reviewed literature, and my discussions and interactions with experts throughout the world, it is my professional opinion that gender confirmation surgeries are safe, effective, and medically necessary treatments for gender dysphoria in transgender people. Gender affirming surgeries are not experimental or investigational. In my experience, the overwhelming number of individuals who undergo gender confirmation procedures describe relief and/or reduction of their gender dysphoria and improvement in their quality of life and overall functioning.

82. Furthermore, based on my clinical and professional experience and my ongoing review of the literature, it is my professional opinion that the denial of necessary medical care is likely to perpetuate gender dysphoria and create or exacerbate other medical issues, such as depression and anxiety, leading to an increased possibility of self-harm, negative health outcomes, and even suicide.

83. In conclusion, it is my professional opinion that the categorical exclusion of transition-related surgical care in Florida's Medicaid program is: 1) inconsistent with the Standards of Care for treating transgender individuals

diagnosed with gender dysphoria; 2) inconsistent with the peer-reviewed scientific and medical research demonstrating that gender confirmation surgeries are safe and effective; and 3) inconsistent with expert medical and surgical consensus. To the extent the exclusion is premised on the conclusion in the GAPMS Report that gender confirming surgical care is experimental and not medically necessary, that conclusion is wrong. The Standards of Care confirm, based on clinical evidence, that gender confirmation surgeries are medically necessary to help people alleviate the often serious and life-threatening symptoms of gender dysphoria.

I declare under penalty of perjury under the laws of the United States of America that the foregoing is true and correct.

Executed this 16th day of February, 2023.

American Board of Plastic Surgery, Guest Oral Board Examiner

WPATH Ethics Committee

American College of Radiology Committee on Appropriateness Criteria Transgender Breast Imaging Topic, Expert Panel on Breast Imaging: Transgender Breast Cancer Screening Expert Panel on Breast Imaging

American Society of Plastic Surgeons, Finance and Investment Committee

Board of Directors, at-large, The World Professional Association for Transgender Health

PlastyPac, Board of Governors

Medicare Carrier Advisory Committee

OTHER:

American Board of Plastic Surgery-Oral Board Guest Examiner (2020, 2021)

Guest Reviewer, Pain Management

Guest Reviewer, Plastic and Aesthetic Research

Guest Reviewer, European Medical Journal

Guest Reviewer, Open Forum Infectious Diseases

Guest Reviewer, The Journal of The American College of Surgeons

Guest Book Reviewer, Plastic and Reconstructive Surgery

Editorial Board, Transgender Health

Editorial Board (Associate Editor), International Journal of Transgenderism

Fellow of the Maliniac Circle

Guest Reviewer, Journal of Reconstructive Microsurgery

Guest Reviewer, Journal of Plastic and Reconstructive Surgery

Guest Reviewer, Journal of Sexual Medicine

Guest Editor, Clinics in Plastic Surgery, Transgender Surgery (Elsevier Publishing)

Guest Reviewer, The Journal of Plastic and Reconstructive Surgery

PREVIOUS EDITORIAL ROLE:

Guest Reviewer, EPlasty, online Journal

Module Editor for Patient Safety, Plastic Surgery Hyperguide

Editorial Advisory Board, Plastic Surgery Practice

Guest Reviewer, International Journal of Transgenderism

Guest Reviewer, Pediatrics

PREVIOUS ACADEMIC APPOINTMENT:

Clinical Professor of Surgery, The University of Illinois at Chicago

Visiting Clinical Professor in Surgery, The University of Illinois at Chicago

Chief, Division of Plastic and Reconstructive Surgery, Chicago Medical School, Rosalind Franklin University of Medicine and Science

Associate Professor, Physician Assistant Program, College of Health Professionals, Rosalind Franklin University

Associate Professor of Surgery, The College of Health Professionals, Rosalind Franklin University

Clinical Associate in Surgery, The University of Chicago

PREVIOUS HOSPITAL COMMITTEES:

Director, Center for Gender Confirmation Surgery, Louis A. Weiss Memorial Hospital

Division Director, Plastic Surgery, Lutheran General Hospital

Division Director, Plastic Surgery, St. Francis Hospital

Medical Staff Executive Committee, Secretary, Advocate Lutheran General Hospital

Credentials Committee, Lutheran General Hospital

Pharmacy and Therapeutics Committee Lutheran General Hospital

Operating Room Committee, St. Francis Hospital

Cancer Committee, Lutheran General Hospital
-Director of Quality Control

Risk and Safety Assessment Committee, Lutheran General Hospital

Nominating Committee, Rush North Shore Medical Center

Surgical Advisory Committee, Rush North Shore Medical Center

Section Director, Plastic Surgery, Rush North Shore Medical Center

PREVIOUS SOCIETY COMMITTEES:

PlastyPac, Chair, Board of Governors

Chair of the Metro Chicago District #2 Committee on Applicants, American College of Surgeons

American Society of Plastic Surgery, Health Policy Committee

American Society of Plastic Surgery, Patient Safety Committee

American Society of Plastic Surgeons, Coding and Payment Policy Committee

American Society of Plastic Surgeons, Practice Management Education Committee

Board of Governors, Governor-at-large, The American College of Surgeons

American College of Surgeons, International Relations Committee

Chair, Government Affairs Committee, American Society of Plastic Surgeons

President, The Metropolitan Chicago Chapter of The American College of Surgeons

2012 Nominating Committee, American Society of Plastic Surgeons

Program Committee, The World Society for Reconstructive Microsurgery, 2013 Bi-Annual Meeting

President, Illinois Society of Plastic Surgeons

Vice-President, The Illinois Society of Plastic Surgeons (formerly the Chicago Society of Plastic Surgery)

Vice-President, The Metropolitan Chapter of the American College of Surgeons

American Society of Plastic Surgery, Chairman, Patient Safety Committee

2006-2007 Pathways to Leadership, The American Society of Plastic Surgery

2005 & 2006 President, The University of Chicago Plastic Surgery Alumni Association

2003 Leadership Tomorrow Program, The American Society of Plastic Surgery

Senior Residents Mentoring Program, The American Society of Plastic Surgery

American Society of Maxillofacial Surgery, Education Committee

Alternate Councilor, Chicago Medical Society

American Society of Aesthetic Plastic Surgery, Electronic Communications Committee

American Society of Aesthetic Plastic Surgery, Intranet Steering Committee

American Society of Aesthetic Plastic Surgery, International Committee

Membership Coordinator, The Chicago Society of Plastic Surgeons
The Illinois State Medical Society, Governmental Affairs Council

The Illinois State Medical Society, Council on Economics

Chicago Medical Society, Physician Review Committee
-Subcomittee on Fee Mediation

Chairman, Chicago Medical Society, Healthcare Economics Committee

Secretary/Treasurer, The Metropolitan Chicago Chapter of the American College of Surgeons

Scientific Committee, 2007 XX Biennial Symposium WPATH

Local Organizing Committee 2007 WPATH

Secretary, The Chicago Society of Plastic Surgeons

Treasurer, The Chicago Society of Plastic Surgeons

Council Member, The Metropolitan Chicago Chapter of the American College of Surgeons

INTERNATIONAL MEDICAL SERVICE:

Northwest Medical Teams
Manos de Ayuda (Oaxaca, Mexico)

Hospital de Los Ninos (San Juan, Puerto Rico)

COMMUNITY SERVICE:

Alumni Council, The University of Chicago Medical and Biological Sciences Alumni Association

The University of Minnesota Presidents Club Chancellors Society

Board of Directors, Chicago Plastic Surgery Research Foundation

National Center for Gender Spectrum Health Advisory Council

PREVIOUS COMMUNITY SERVICE:

Board of Directors, Committee on Jewish Genetic Diseases, Jewish United Fund, Chicago, Illinois

Governing Council, Lutheran General Hospital, Park Ridge, Il

Lutheran General Hospital Development Council, Park Ridge, Il

Lutheran General Hospital Men's Association, Park Ridge, Il

Advisory Board, Committee on Jewish Genetic Diseases, Cancer Genetics Subcommittee, Jewish United Fund, Chicago, Illinois

Health Care Advisory Board, Congressman Mark Kirk, 10th Congressional District, Illinois

Major Gifts Committee, Saint Francis Hospital Development Council, Evanston, Il

Visiting Professor:

1. University of Utah, Division of Plastic Surgery, November 6-8, 2014.
2. Northwestern University, Division of Plastic Surgery, April 21-22, 2016.
3. The University of North Carolina, Division of Plastic Surgery, March 28-29, 2017
4. Georgetown University, Department of Plastic Surgery, May 17-18, 2017

5. The University of Basel, Basel, Switzerland, August 31-September 1, 2018

6. The Ochsner Health System, New Orleans, LA January 28-January 30, 2019

7. The University of Toronto, Toronto, Ontario, Canada, February 21-22, 2019

8. The University of Michigan, October3-4, 2019, Ann Arbor, MI

9. Georgetown University, Department of Plastic Surgery, July 21, 2022

Invited Discussant:

1. Department of Defense, Military service by people who are transgender, Invitation from Terry Adirim, M.D., M.P.H.Deputy Assistant Secretary of Defense for Health Services Policy & Oversight, The Pentagon, November 9, 2017

2. Aesthetic Surgery Journal, Invited Discussant May 7, 2019, Journal Club. "What is "Nonbinary" and What Do I need to Know? A Primer for Surgeons Providing Chest Surgery for Transgender Patients."

Honorary Lecture:

1. 2023 Arthur D. Bevan Lectureship, The Chicago Surgical Society, February 2, 2023, Chicago, Il

Research Interests:

1. Role of Omental Stem Cells in Wound Healing (Grant: Tawani Foundation)

2. Robotic-Assisted Bilateral Prophylatic Nipple Sparing Mastectomy with Immediate Tissue Expander/Implant Reconstruction (Pending submission to the FDA for Investigational Device Exemption in association with Intuitive Surgical)

3. Transgender Health and Medicine Research Conference, National Institutes of Health, Bethesda, MD May 7-8, 2015

4. Uterine Transplantation, Rush University Medical Center (IRB pending)

5. Gender Affirmation Surgery Prospective Surveys (Rush University-IRB approved)

6. National Network for Gender Affirming Surgeries: Canadian Institute of Health Research, Training Grant – LGBQT 2S Stigma Reduction & Life Course Mental Wellness (application in process)

79. Wpath GEI, Foundations course for the Illinois Dept of Corrections, Ethical considerations in Transgender Healthcare, May 21, 2021

80. WPATH GEI, Online GEI Foundations Course, Moderator, August 31, 2021.

81. WPATH Health Plan Provider (HPP) Training, Q&A Panel, September 13, 14, 21 2021, via Zoom

82. WPATH, GEI Advanced Medical Course, Upper and Lower Surgery (via zoom), December 9, 2021

83. I want to be a gender surgeon: where do I even start, American Society for Reconstructive Microsurgery, Annual Meeting, January 17, 2022, Carlsbad, CA

84. Faculty Instructor, Upper Extremity Flaps and Lower Extremity Trauma, 1st Annual Rush University – University of Chicago Cadaver Lab, June 11, 2022

85. WPATH Health Plan Provider (HPP) Training, Q&A Panel, July 12, 2022, via Zoom

86. Nonbinary Workshop, WPATH GEI, July 23, 2022, via Zoom

87. WPATH GEI Advanced Ethics workshop (2022-2023), September 17-18, 2022, Montreal, Canada

SYMPOSIA:

1. Program Director, 2011 Chicago Breast Symposium, October 15, 2011, The Chicago Plastic Surgery Research Foundation and The Chicago Medical School at Rosalind Franklin University, North Chicago, IL,

2. Fundamentals of Evidence-Based Medicine & How to Incorporate it Into Your Practice, Challenging Complications in Plastic Surgery: Successful Management Strategies, The American Society of Plastic Surgeons, July 13-14, 2012 Washington, DC

3. Understanding Outcome Measures in Breast & Body Contouring Surgery, Challenging Complications in Plastic Surgery: Successful Management Strategies, The American Society of Plastic Surgeons, July 13-14, 2012 Washington, DC

4. Benchmarking Complications: What We Know About Body Contouring Complication Rates from Established Databases, Challenging Complications in Plastic Surgery: Successful Management Strategies, The American Society of Plastic Surgeons, July 13-14, 2012 Washington, DC

5. Special Lecture: VTE Prophylaxis for Plastic Surgery in 2011, Challenging Complications in Plastic Surgery: Successful Management Strategies, The American Society of Plastic Surgeons, July 13-14, 2012 Washington, DC

6. Nipple Sparing Mastectomy: Unexpected Outcomes, Challenging Complications in Plastic Surgery: Successful Management Strategies, The American Society of Plastic Surgeons, July 13-14, 2012 Washington, DC

7. Program Director, 2011 Chicago Breast Symposium, October 13-14, 2012, The Chicago Plastic Surgery Research Foundation and The Chicago Medical School at Rosalind Franklin University, North Chicago, Il

8. Practice Strategies in a Changing Healthcare Environment, Moderator, Midwestern Association of Plastic Surgeons, April 27-28, 2013, Chicago, Il

9. Moderator: Breast Scientific Paper Session, The Annual Meeting of The American Society of Plastic Surgery, October 12, 2014, Chicago, Il.

10. Moderator: The World Professional Association for Transgender Health, Tuesday, June 21, Surgical Session (0945-1045), June 18-22, 2016, Amsterdam, Netherlands

11. Course Director: Transmale Genital Surgery: WPATH Gender Education Initiative, October 21-22, 2016 Chicago, Il

12. Co-Chair and Moderator: Surgeon’s Only Session, USPATH, Los Angeles, CA, Feb. 2, 2017

13. Vascular Anastomosis: Options for Lengthening Vascular Pedicle, Surgeon’s Only Session, USPATH, Los Angeles, CA, Feb. 2, 2017

14. Transgender Healthcare Mini-Symposium, Chicago Medical School of Rosalind Franklin University, North Chicago, Il March 10, 2017.

15. Moderator: Penile Transplant: Genito-urinary trauma/penile cancer, The European Association of Urologists, Meeting of the EAU Section of Genito-Urinary Reconstructive Surgeons (ESGURS), London, United Kingdom, March 23-26, 2017

16: 25th WPATH Symposium, November 2-6, 2018, Buenos Aires, Argentina, Mini-Symposium: A Comprehensive Approach to Gender Confirming Surgery

17. Program Director, 2nd Annual Live Surgery Conference for Gender Affirmation Procedures, Ichan School of Medicine at Mt. Sinai, NY, NY February 28, 2019-March 2, 2019.

18. Moderator, "Genital Reassignment for Adolescents: Considerations and Conundrums," Discussions on gender affirmation: surgery and beyond, Dignity Health Saint Francis Memorial Hospital and WPATH GEI, San Francisco, CA, May 30-June 1, 2019

19. Moderator, "Reconstructive Urology and Genitourinary Options in Gender Affirming Surgery," Discussions on gender affirmation: surgery and beyond, Dignity Health Saint Francis Memorial Hospital and WPATH GEI, San Francisco, CA, May 30-June 1, 2019

20. Moderator, "Complications in Masculinizing Genital Reconstruction Surgery," Dignity Health Saint Francis Memorial Hospital and WPATH GEI, San Francisco, CA, May 30-June 1, 2019

21. Moderator, "Preparing for Surgery and Recovery," Dignity Health Saint Francis Memorial Hospital and WPATH GEI, San Francisco, CA, May 30-June 1, 2019

22. Discussant, "WPATH Standards of Care Version 8 Preview," Dignity Health Saint Francis Memorial Hospital and WPATH GEI, San Francisco, CA, May 30-June 1, 2019

23. Program Coordinator, Surgeon's Only Course, USPATH, September 5, 2019, Washington, DC

24. Master Series in Transgender Surgery 2020: Vaginoplasty and Top Surgery, course co-director, Mayo Clinic, Rochester, MN, August 7-8, 2020

25. WPATH 2020 Surgeons' Program, Co-Chair, November 6-7, 2020, Virtual Symposium (due to covid-19 cancellation of Hong Kong meeting)

26. WPATH Journal Club #3, Uterine Transplantation and Donation in Transgender Individuals; Proof of Concept, December 13, 2021 (Zoom)

27. Program Coordinator and Moderator, Surgeon's Only Course, WPATH 27th Scientific Symposium, September 16-17, 2022, Montreal, Canada

Poster session presented at: American Society for Reconstructive Microsurgery Annual Meeting, 2018 Jan 13-16; Phoenix, AZ.

13. Whitehead DM, Kocjancic E, Iacovelli V, Morgantini LA, **Schechter LS**. An Innovative Technique: Single Stage Urethral Reconstruction in Female-to-Male Patients. Poster session presented at: American Society for Reconstructive Microsurgery Annual Meeting, 2018 Jan 13-16; Phoenix, AZ.

14. Whitehead, DM Inflatable Penile Prosthesis Implantation Post Phalloplasty: Surgical Technique, Challenges, and Outcomes, MAPS 2018 Annual Scientific Meeting, April 14, 2018, Chicago, Il

15. Whitehead, DM, Inverted Penile Skin With Scrotal Graft And Omission of Sacrospinal Fixation: Our Novel Vaginoplasty Technique MAPS 2018 Annual Scientific Meeting, April 14, 2018, Chicago, Il

16. S. Marecik, J. Singh. **L. Schechter**, M. Abdulhai, K. Kochar, J. Park, Robotic Repair of a Recto-Neovaginal Fistula in a Transgender Patient Utilizing Intestinal Vaginoplasty, The American College of Surgeons Clinical Congress 2020, October 7, 2020

17. Natalia Whitney, Randi Ettner, **Loren Schechter**, Sexual Function Expectations, Outcomes, and Discussions for Patients Undergoing Gender-Affirming Surgery, 2022 Trainee Research Day, Rush University Medical Center, The Irwin Press Patient Experience Research Poster Award

18. Natalia Whitney, Randi Ettner, **Loren Schechter**, Sexual Function Expectations, Outcomes, and Discussions for Patients Undergoing Gender-Affirming Surgery, 2022 Trainee Research Day, Rush University Medical Center, Peoples Choice-Third Place Poster Presentation

19. Adam Steur, Christy Ciesla, Clarion Mendes, Loren Schechter, The Need for a Comprehensive Interprofessional Postsurgical Rehabilitation Pathway: Initial Recommendations and Future Visions, The World Professional Association for Transgender Health, 27th Scientific Symposium, Surgeon's Only Program September 16-17, 2022, Montreal Canada

Keynote Address:

1. University of Utah, Gender Confirmation Surgery, Transgender Provider Summit, November 8, 2014

INVITED LECTURES:

1. Management of Soft Tissue Injuries of the Face, Grand Rounds, Emergency Medicine, The University of Chicago, August, 1999

2. Case Report: Excision of a Giant Neurofibroma, Operating Room Staff Lecture Series, Continuing Education Series, St. Francis Hospital, Evanston, Il March 2000

3. Wounds, Lincolnwood Family Practice, Lincolnwood, Il April 2000

4. The Junior Attending, Grand Rounds, Plastic and Reconstructive Surgery, The University of Chicago, June 2000

5. Case Report: Excision of a Giant Neurofibroma, Department of Medicine Grand Rounds, St. Francis Hospital, Evanston, Il June 2000

6. Facial Trauma, Resurrection Medical Center Emergency Medicine Residency, September 2000

7. Plastic Surgery of the Breast and Abdomen, Grand Rounds, Dept. of Obstetrics and Gynecology, Evanston Hospital, September, 2000

8. Change of Face; Is Cosmetic Surgery for You?, Adult Education Series, Rush North Shore Medical Center, October, 2000

9. Reconstructive Surgery of the Breast, Professional Lecture Series on Breast Cancer, St. Francis Hospital, October, 2000

10. Plastic Surgery of the Breast and Abdomen, Grand Rounds, Dept. of Obstetrics and Gynecology, Lutheran General Hospital, December, 2000

11. Change of Face; Is Cosmetic Surgery for You?, Adult Education Series, Lutheran General Hospital and The Arlington Heights Public Library, December, 2000

12. Updates in Breast Reconstruction, The Breast Center, Lutheran General Hospital, January 2001

13. Abdominal Wall Reconstruction, Trauma Conference, Lutheran General Hospital, February 2001

14. Wound Care, Rush North Shore Medical Center, March 2001

15. Breast Reconstruction, Diagnosis and Treatment Updates on Breast Cancer, Lutheran General Hospital, April 2001

16. Wound Care and V.A.C. Therapy, Double Tree Hotel, Skokie, Il October 2001

17. The Role of the V.A.C. in Reconstructive Surgery, LaCrosse, WI November 2001

18. Dressing for Success: The Role of the V.A.C. in Reconstructive Surgery, Grand Rounds, The University of Minnesota Section of Plastic and Reconstructive, Minneapolis, MN January, 2002

19. The Vacuum Assisted Closure Device in the Management of Complex Soft Tissue Defects, Eau Claire, WI February, 2002

20. The Vacuum Assisted Closure Device in Acute & Traumatic Soft Tissue Injuries, Orland Park, Il March, 2002

21. Body Contouring After Weight Loss, The Gurnee Weight Loss Support Group, Gurnee, Il April, 2002

22. An Algorithm to Complex Soft Tissue Reconstruction With Negative Pressure Therapy, Owensboro Mercy Medical Center, Owensboro, Ky, April, 2002

23. Breast and Body Contouring, St. Francis Hospital Weight Loss Support Group, Evanston, Il April, 2002

24. The Wound Closure Ladder vs. The Reconstructive Elevator, Surgical Grand Rounds, Lutheran General Hospital, Park Ridge, Il, May, 2002.

25. An Algorithm for Complex Soft Tissue Reconstruction with the Vacuum Assisted Closure Device, The Field Museum, Chicago,Il, May, 2002

26. The Role of Negative Pressure Wound Therapy in Reconstructive Surgery, Kinetic Concepts, Inc. San Antonio, Texas, July 31, 2002

27. Management of Complex Soft Tissue Injuries of the Lower Extremity, Chicago Trauma Symposium, August 2-5, 2002, Chicago, Illinois:

28. Wound Bed Preparation, Smith Nephew, Oak Brook, Il, August 6, 2002

29. Getting Under Your Skin...Is Cosmetic Surgery for You?, Rush North Shore Adult Continuing Education Series, Skokie, Il August 28, 2002.

30. The Role of Negative Pressure Therapy in Complex Soft Tissue Wounds, Columbia/St. Mary's Wound, Ostomy, and Continence Nurse Program, Milwaukee, Wi, September 17, 2002

31. A Systematic Approach to Functional Restoration, Grand Rounds, Dept. of Physical Therapy and Rehabilitation Medicine, Lutheran General Hospital, September 19, 2002

32. The Role of Negative Pressure Wound Therapy in Reconstructive Surgery, Ann Arbor, Mi September 26, 2002

33. Dressing for Success: The Role of the Vaccuum Assisted Closure Device in Plastic Surgery, Indianopolis, In November 11, 2002

34. The Wound Closure Ladder Versus the Reconstructive Elevator, Crystal Lake, Il November 21, 2002

35. A Systematic Approach to Functional Restoration, Grand Rounds, Dept. of Physical Therapy, Evanston Northwestern Healthcare, Evanston, Il February 13, 2003

36. Case Studies in Traumatic Wound Reconstruction, American Association of Critical Care Nurses, Northwest Chicago Area Chapter, Park Ridge, Il February 19, 2003

37. Reconstruction of Complex Soft Tissue Injuries of the Lower Extremity, Podiatry Lecture Series, Rush North Shore Medical Center, Skokie, Il March 5, 2003

38. The Use of Negative Pressure Wound Therapy in Reconstructive Surgery, Kalamazoo, Mi March 19, 2003

39. Updates in Breast Reconstruction, The Midwest Clinical Conference, The Chicago Medical Society, Chicago, Il March 21, 2003

40. Updates of Vacuum Assisted Closure, Grand Rounds, The Medical College of Wisconsin, Department of Plastic Surgery, Milwaukee, Wi March 26, 2003

41. Breast Reconstruction, Surgical Grand Rounds, Lutheran General Hospital, Park Ridge, Il March 27, 2003

42. Decision-Making in Breast Reconstruction: Plastic Surgeons as Members of a Multi-Disciplinary Team, 1st Annual Advocate Lutheran General Hospital Breast Cancer Symposium, Rosemont, Il, April 11, 2003

43. The Wound Closure Ladder Versus The Reconstructive Elevator, Duluth, Mn, April 24, 2003

44. Dressing For Successs: The Role of The Wound VAC in Reconstructive Surgery, Detroit, Mi, May 9, 2003

45. Plastic Surgery Pearls, Grand Rounds Orthopedic Surgery Physician Assistants Lutheran General Hospital and Finch University of Health Sciences, Park Ridge, Il, June 5, 2003

46. A Systematic Approach to Complex Reconstruction, 12th Annual Vendor Fair "Surgical Innovations," October 18, 2003, Lutheran General Hospital, Park Ridge, Il 2003

47. Dressing For Success: The Role of the Wound VAC in Reconstructive Surgery, American Society of Plastic Surgery, October 26, 2003, San Diego, CA

48. Beautiful You: From Botox to Weekend Surgeries, 21st Century Cosmetic Considerations, March 21, 2004 Hadassah Women's Health Symposium, Skokie, Il

49. Updates in Breast Reconstruction, The 2nd Annual Breast Cancer Symposium, Advocate Lutheran General, Hyatt Rosemont, April 2, 2004

50. Head and Neck Reconstruction, Grand Rounds, The University of Illinois Metropolitan Group Hospitals Residency in General Surgery, Advocate Lutheran General Hospital, May 6, 2004

51. Abdominal Wall Reconstruction, Surgeons Forum, LifeCell Corporation, May 15, 2004, Chicago, Il

52. 4th Annual Chicagoland Day of Sharing for Breast Cancer Awareness, Saturday, October 2, 2004, Hoffman Estates, Il

53. Abdominal Wall Reconstruction, University of Illinois Metropolitan Group Hospitals Residency in General Surgery, November 19, 2004, Skokie, Il

54. Advances in Wound Care, Wound and Skin Care Survival Skills, Advocate Good Samaritan Hospital, Tuesday, February 8, 2005, Downer's Grove, Il

55. Plastic Surgery: A Five Year Perspective in Practice, Grand Rounds, The University of Chicago, May 18, 2005, Chicago, Il

56. New Techniques in Breast Reconstruction, The Cancer Wellness Center, October 11, 2005 Northbrook, Il

57. Principles of Plastic Surgery; Soft Tissue Reconstruction of the Hand, Rehab Connections, Inc., Hand, Wrist, and Elbow Forum, October 28, 2005, Homer Glen, Il

58. Principles of Plastic Surgery, Lutheran General Hospital Quarterly Trauma Conference, November 9, 2005, Park Ridge, Il

59. Principles of Plastic Surgery, Continuing Medical Education, St. Francis Hospital, November 15, 2005, Evanston, Il

60. Dressing for Success: A Seven Year Experience with Negative Pressure Wound Therapy, Kinetic Concepts Inc, November 30, 2005, Glenview, Il.

61. Breast Reconstruction: The Next Generation, Breast Tumor Conference, Lutheran General Hospital, May 9, 2006.

62. Complex Wound Care: Skin Grafts, Flaps, and Reconstruction, The Elizabeth D. Wick Symposium on Wound Care, *Current Concepts in Advanced Healing: An Update*, Rush North Shore Medical Center, November 4, 2006.

63. An Approach to Maxillofacial Trauma: Grand Rounds, Lutheran General Hospital/Univ. of Illinois Metropolitan Group Hospital Residency in General Surgery, November 9, 2006.

64. "From Paris to Park Ridge", Northern Trust and Advocate Lutheran General Hospital, Northern Trust Bank, June 7, 2007.

65. "Private Practice Plastic Surgery: A Seven Year Perspective," Grand Rounds, The University of Chicago, Section of Plastic Surgery.

66. "Meet the Experts on Breast Cancer," 7th Annual Chicagoland Day of Sharing, Sunday, April 13th, 2008

67. Gender Confirmation Surgey: Surgical Options and Decision-Making, The University of Minnesota, Division of Human Sexuality, May 10, 2008, Minneapolis, Minnesota.

68. "Private Practice Plastic Surgery: A Seven Year Perspective," Grand Rounds, Loyola University, 2008 Section of Plastic Surgery.

69. "Management of Lower Extremity Trauma," Grand Rounds, The University of Chicago, Section of Plastic Surgery, October, 8, 2008.

70. "Concepts in Plastic Surgery: A Multi-Disciplinary Approach," Frontline Surgical Advancements, Lutheran General Hospital, November 1, 2008

IN THE UNITED STATES DISTRICT COURT
FOR THE NORTHERN DISTRICT OF FLORIDA
Tallahassee Division

AUGUST DEKKER, et al., *Plaintiffs*, v. JASON WEIDA, et al., *Defendants*.	Case No. 4:22-cv-00325-RH-MAF

CORRECTED EXPERT REBUTTAL REPORT OF E. KALE EDMISTON, PH.D.

I, E. Kale Edmiston, Ph.D., hereby declare and state as follows:

1. I am over the age of eighteen and submit this expert rebuttal report based on my expert opinion.

2. I have been retained by counsel for plaintiffs as an expert in connection with the above referenced litigation. The opinions expressed herein are my own and do not express the views or opinions of my employer.

3. I have actual knowledge of the matters stated herein. If called to testify, I would testify truthfully based on my expert opinion.

Background and Qualifications

4. I am an Associate Professor of Psychiatry at the University of Massachusetts Chan Medical School. Prior to this appointment, I was an Assistant

Professor of Psychiatry at the University of Pittsburgh from 2019 to 2022. I have more than 15 years of experience conducting psychiatric neuroimaging research, with a focus on adolescence and young adulthood, mood and anxiety disorders, and impulsivity and emotional regulation. My methodological expertise lies in neuropsychological assessment, multimodal neuroimaging, psychophysiological measures such as heart rate variability, and measures of neuroendocrine function across adolescent development.

5. I completed a bachelor's degree from Hampshire College in 2007, where I studied cognitive science. I received postbaccalaureate training in psychiatric neuroimaging at the Yale School of Medicine. I earned a PhD in neuroscience from Vanderbilt University in 2015, as well as a graduate certificate in medical humanities, with a focus on bioethics and medical decision-making. I then completed post-doctoral training at China Medical University and the University of Pittsburgh.

6. In 2014, I co-founded the Trans Buddy Program at Vanderbilt University Medical Center, a peer navigator and support program for transgender people seeking healthcare. As a part of this program, my work primarily focused on supporting transgender adolescents experiencing mental health crisis. At this time, I also served as the Co-Director for the Vanderbilt University Program for LGBTI

Health. I later replicated the Trans Buddy Program at the University of Pittsburgh Department of Adolescent Medicine.

7. From 2018-2022, I served as a chapter author for the Assessment chapter of the World Professional Association for Transgender Health's *Standards of Care for the Health of Transgender and Gender Diverse People, Version 8*.

8. I have authored over 100 peer-reviewed manuscripts, book chapters, and conference proceedings in psychiatric neuroscience and transgender health.

9. Further information about my professional background and experience is outlined in my curriculum vitae, a true and accurate copy of which is attached as **Exhibit A** to this report.

Prior Testimony

10. I have not testified as an expert at trial or by deposition within the last four years.

Compensation

11. I am being compensated for my time at a rate of $175/hour. My compensation is in no way contingent on the conclusions reached as a part of my testimony or on the outcome of this case.

Basis for Opinions

12. In preparing this report, I have reviewed: the Complaint in this case; Florida Administrative Code 59G-1.050(7) (the "Challenged Exclusion"); the document titled "Florida Medicaid: Generally Accepted Professional Medical Standards Determination on the Treatment of Gender Dysphoria," published by the Florida Agency for Health Care Administration in June 2022, and its attachments; the expert reports of Drs. Armand Antommaria, Dan Karasic, Johanna Olson-Kennedy, Loren Schechter, and Dr. Daniel Shumer, submitted by plaintiffs; and the expert reports Drs. Michael Biggs, G. Kevin Donovan, Paul Hruz, Kristopher Kaliebe Michael Laidlaw, Patrick Lappert, Stephen Levine, Sophie Scott, and Joseph Zanga, submitted by defendants.

13. My opinions are based on my years of research and academic experience, as well as my professional knowledge, as set out in my curriculum vitae (**Exhibit A**) and the materials listed therein; my knowledge of the peer-reviewed literature relating to neuropsychological assessment and brain development; my knowledge of the clinical practice guidelines for the treatment of gender dysphoria, including my work as a contributing author of WPATH SOC 8; and my review of any of the materials cited herein.

14. I have also reviewed the materials listed in the bibliography attached as **Exhibit B**. I may rely on those documents as additional support for my opinions.

15. The materials I have relied upon in preparing this report are the same types of materials that experts in my field of study regularly rely upon when forming opinions on the subject. I may wish to supplement these opinions or the bases for them as a result of new scientific research or publications or in response to statements and issues that may arise in my area of expertise.

Adolescent Brain Development

16. Dr. Scott's report stating that adolescents are more likely to engage in risky behaviors relative to adults fails to include the specific context in which this is true. That is, the literature indicates that there are *highly specific circumstances* in which adolescents are more likely to engage in risky or impulsive behavior. Indeed, Dr. Scott lists some of these circumstances in her testimony: driving, drinking alcohol, getting a tattoo. However, none of these examples are relevant to the issue at hand: protracted medical decision-making made in the context of adult guidance and consultation with a medical professional.

17. Dr. Scott fails to cite the large body of evidence indicating that adolescents are capable of deliberative decision making in the presence of adults (i.e., healthcare providers and caregivers) and when decision making occurs over a protracted period. This is the exact context in question: decisions about accessing gender-affirming medical care, such as gonadotropin releasing hormone agonists

(GnRHa) and hormone treatment, are made jointly among the adolescent patient, their caregiver(s), and medical professionals. These decisions are also made over time; data show that the typical time between an adolescent realizing they are transgender and coming out to an adult is three years (Bauer et al., 2022). Furthermore, once an adolescent discloses their identity to a supportive adult, they will then have to schedule a healthcare appointment and undergo assessment prior to accessing treatment. This process typically takes months and for some, even years.

18. Dr. Scott misrepresents the literature on adolescent decision making by generalizing findings made in "hot" contexts to those made in "cold" contexts. Indeed, the Blakemore and Robbins review from 2012 that she cites explicitly states that the literature concludes that adolescents demonstrate adult-typical decision-making abilities in cold contexts. It is not that adolescence is associated with a failure to engage cognitive control networks, but rather, that cognitive control networks are engaged with greater variability during this time than during adulthood. Decision-making is a multifactorial process that includes valuation of both risk and reward. While adolescents are more likely to overvalue reward and underestimate risk when peers are present or when decisions must be made quickly, they demonstrate deliberative and appropriate consideration of reward and risk valuation in the absence of peers, in the presence of adults, and when decisions are made over time.

This important difference in the contextual nature of decision-making in adolescence is an established finding that has been replicated across multiple studies (Chein et al., 2011; O'Brien et al., 2011; Simons-Morton et al., 2011; Smith et al., 2014; Weigard et al., 2014; Hartley & Somerville, 2015; Guassi Moreira & Telzer, 2018). Indeed, deliberative decision making in contexts without pressure to decide quickly has been repeatedly shown in adolescents (Byrnes, 2002; Figner et al., 2009; Wolff & Crockett, 2011; Icenogle & Cauffman, 2021).

19. Dr. Scott also states that "at 18yrs old, the connections to the frontal lobes are not myelinated[1] like a mature adult brain, and this is likely to affect frontal lobe functions." This is an oversimplification of an extremely complex literature. A study of over 10,000 participants has shown quite the opposite: that by the age of 18, adult-level cognition is established (Tervo-Clemmens et al., 2022), while other studies have shown mature integration of functional networks by late adolescence (Marek et al., 2015) and fractional anisotropy of prefrontal white matter (Lebel & Beaulieu, 2011, fractional anisotropy is an indirect measure of myelination). Even though, on average, there are developmental differences in prefrontal myelination,

[1] Myelin is a protein sheath that covers the axons of neurons. The axons comprise white matter in the brain, and bundles of these fibers transmit signals from region to region in the brain. When an axon is myelinated, the signal can travel faster down the axon.

there is not strong evidence that these differences are associated with an inability to make deliberative decisions with the support of caregivers and expert clinical guidance.

20. Furthermore, there is a great deal of variation in the timing of development between different prefrontal white matter tracts, as well as a great deal of variation between individuals. Indeed, in Lebel & Beaulieu's longitudinal study of over 100 individuals from childhood to young adulthood, many individuals showed decreases or no changes in fractional anisotropy (FA) during adolescence, and these differences also varied by prefrontal white matter tract (2011). This literature represents differences in group averages and should not be used to predict the behavior or development of an individual adolescent; we cannot draw conclusions about all 18-year-olds from these studies. This is why the WPATH SOC 8 recommends an individualized approach to joint decision-making regarding healthcare.

There is Little Evidence to Support Defendants' Designated Experts' Speculation about Negative Effects of GnRHas on Cognition

21. Dr. Scott cites a 2016 study by Wojniusz and colleagues as evidence of the negative effects of GnRHas on emotional reactivity in a sample of girls with central precocious puberty. This is puzzling because the authors of this paper explicitly state the opposite interpretation: "Overall, our findings do not provide firm

conclusions with regard to differences in emotional processing between the GnRHa treated CPP girls and age-matched controls." (pp13).

22. Perhaps Dr. Scott has misinterpreted the nature of the emotional flanker task. This task asks participants to determine if two simultaneously presented houses are the same or different. The houses are presented at the center of a screen, and emotional or neutral face distractors flank them. The outcome of interest is the reaction time for the determination of whether the houses are the same or different. The idea here is that people with poor emotional regulation will be more distracted during the emotional face condition and therefore take longer to respond. This interpretation can only be made when reaction times are increased in both the emotional face conditions. In this study, the CPP girls showed longer reaction time than controls during the emotional face condition only when the houses were different, but not when the houses were the same. Thus, the findings do not indicate an issue with emotional regulation. More likely, the results are incidental and due to statistical issues regarding false discovery rate correction, an argument that the authors of the paper themselves make.

23. The authors do find reduced heart rate and elevated heart rate variability (HRV) during the emotional task. HRV is distinct from heart rate and is a measure of cardiac vagal tone. HRV is a proxy for parasympathetic system or "rest and

digest" function. Thus, elevated HRV is associated with increased regulatory capacity and is a marker of health. Thus, these findings are a sign of *optimal* emotional regulation. Indeed, the authors state, "…the lower HR and higher HRV could suggest that treated CPP girls have better emotion regulation capacity and higher adaptability to changing contexts than controls" (pp13).

24. Dr. Scott then points out that, in a separate commentary on the article, Dr. Hayes states that there were "notably" lower scores on IQ measures in the CPP group relative to controls. However, Dr. Hayes's comment, and Dr. Scott's reliance on it, is not supported by the findings of the study. Specifically, none of the differences in IQ were statistically significant, and the mean IQ scores for both groups were within the normal range. Furthermore, the mean difference between groups in this study is within the realm of variation that may occur from repeated administration of the WISC-III, i.e., although scores for an individual tend to remain relatively stable over time, there is fluctuation that occurs even within an individual and small differences in IQ (Watkins & Smith, 2013), as reported in this study, are not only not statistically significant, they are not clinically significant. Dr. Scott has, again, offered a misrepresentation of the literature.

25. Dr. Levine cites a single case study as evidence for an effect of GnRHa treatment on IQ. Case studies are the lowest quality of evidence. Case studies can

provide important evidence for future areas of study or to provide an illustrative example of a common clinical phenomenon, but they should not be used to make general conclusions or policy positions. Putting aside the low quality of evidence typical of case studies in general, this case study does not even provide sufficient support for Dr. Levine's opinion as it describes a transgender girl who, prior to initiation of treatment, already had below average IQ. While Dr. Levine highlights the lack of change in fractional anisotropy values over the course of the study in this case, this could be due to developmental delays that are independent of treatment and are instead related to her low IQ. Therefore, the findings of this case study are simply not generalizable to the broader population.

26. Dr. Michael Biggs, a sociologist, also offers speculation regarding cognitive effects of GnRHa treatment as well, describing it as "…stopping normal sexual and cognitive development…" This statement regarding cognitive development appears to be pure speculation as he offers no citation regarding evidence for deleterious effects of GnRHa treatment on cognition. In reviewing the literature, including through specific searches, I have been unable to find compelling evidence of this. I was able to identify two studies that showed no effect of GnRHa treatment on executive function (Soleman et al., 2016; Staphorsius et al., 2015). The

lack of evidence for these effects is itself compelling, given that these medications have been used in adolescents with central precocious puberty for decades.

Evidence for Effects of GnRHa treatment on the Brain

27. Both Dr. Levine and Dr. Laidlaw state that the effects of GnRHa treatment on the brain are both "unknown" and "likely negative." They do not cite any original research that supports this conclusion and thus it is unclear to me how they concluded that the effects are likely negative in the absence of evidence. Dr. Laidlaw even goes so far as to speculate on the individual brain maturation of three specific transgender individuals. Both Levine and Laidlaw admit that there is no evidence from the neuroimaging literature on negative effects of these treatments on brain development, but even if there was, any neuroimaging study that compares group averages would not support an inference about the brains of individual people. There is a great deal of variation between and within individuals in many commonly used neuroimaging measures. For this reason, neuroimaging methods commonly used in research, such as fMRI, cannot be used diagnostically for individual people in the absence of organic brain disease (Schleim & Roise, 2019).

28. Dr. Hruz also speculates in his testimony that there are negative effects of GnRHa treatment on the brain: "A possible effect of blocking normally timed puberty is alteration of normal adolescent brain maturation". Dr. Hruz then cites a

2013 review paper that describes typical adolescent brain maturation but does not mention or describe any effects of blocking or delaying puberty on the brain (Arain et al., 2013). Dr. Hruz therefore has not cited any support for his conclusion, and I have not identified any studies relating to the evidence of negative longitudinal effects on brain development related to GnRHa treatment in central precocious puberty or in transgender adolescents, even after targeted searches for it.

29. There is not a large literature on the effects of GnRHa treatment on the brain in humans, but this does not render such care experimental. GnRHa treatments have been in used for decades, including for the treatment of gender dysphoria. That said, there are a few cross-sectional studies on this issue, and it is significant that none of the experts (nor the GAPMS memo) cited this literature in their testimonies. In a study that compared transgender adolescent boys and girls taking GnRH agonists to cisgender boys and girls, there were differences in brain function in some brain regions that would indicate congruence with gender identity and other differences that would indicate congruence with sex assigned at birth. However, there were no between-group differences in network function on the basis of GnRHa treatment. Furthermore, the authors searched for relationships between duration of GnRHa treatment in the transgender adolescents and brain function and *were unable to find any effects*. In a diffusion tensor imaging study of fractional anisotropy

values, an index of white matter myelination, *again there was no significant association between fractional anisotropy values and GnRHa treatment* (van Heesewijk et al., 2022). Similarly, in an fMRI study comparing cisgender boys and girls to transgender boys and girls, there were no significant differences in brain activity between transgender and cisgender adolescents during a verbal fluency task, and no deficits in verbal ability in transgender youth (Soleman et al., 2013). In a study of transgender individuals receiving GnRHa treatment and cisgender people, there were differences in brain activity between groups, but these differences were not associated with hormone levels, leading the authors to conclude that these differences are associated with group differences that predate GnRHa treatment (Soleman et al., 2016). In summary, to my knowledge, there have been three studies of brain structure and function of transgender adolescents receiving GnRHa treatment, and none of them have found any significant effects of treatment on the brain.

30. A recent primate study provides evidence for some regional neuroprotective effects of GnRHa treatment, although the results are complex (Godfrey et al., 2023). In this study, the authors compared dominant and subordinate adolescent rhesus monkeys. These monkeys form social hierarchies much like human adolescents, and subordinate monkeys are subjected to aggression from the

more dominant monkeys. Both dominant and subordinate monkeys were randomly assigned to a GnRHa treatment or control group and then followed longitudinally. In the primates exposed to chronic social subordination stress, GnRHa treatment rescued the negative effect of stress on regional brain volume over time. These differences were seen in brain regions such as the amygdala that are well-established in the pathophysiology of depression and anxiety. There were also effects of GnRHa treatment in general; treatment in both social groups was associated with smaller hippocampal volume than control animals. Regarding the prefrontal cortex, a critical region during adolescent development, GnRHa treatment was associated with greater prefrontal grey matter volume prepubertally but this difference decreased by adolescence. There was an effect of GnRHa treatment early in puberty on prefrontal white matter volume; however, this difference was no longer present by the end of the study. Importantly, there are species-specific differences in prefrontal volume changes across puberty; the generalizability of the prefrontal findings to humans should be made with caution. Finally, the authors also assessed social behavior in both submissive and dominant primates over time and were able to determine that, at prepuberty, submissive primates were more socially isolated, but that GnRHa-treated subordinate animals had normalized social behavior (reduced time spent alone) and normalized cortisol response to threat (cortisol is a stress hormone

associated with the hypothalamic pituitary adrenal axis). The authors conclude that "…delayed puberty and estrogen suppression may be protective against the impact of social stress" (pp12). This study provides strong evidence that GnRHa treatment normalizes brain structure, physiological stress reactivity, and social behavior in adolescent primates subjected to social subordination, an ecologically valid non-human primate model of the psychosocial environment for transgender youth.

31. There is a small body of literature on the effects of gender affirming hormone care on the brain in transgender adolescents. In a study comparing transgender boys receiving testosterone therapy and those who were not, testosterone treatment was associated with reductions in mood and anxiety symptoms, as well as reductions in body image dissatisfaction. Gender affirming hormone care was associated with an increase of functional coupling between the amygdala and prefrontal cortex while research participants viewed threatening emotional faces, likely indicating improved emotional regulation of the amygdala in the boys who were treated with testosterone. Indeed, in the boys who were treated with testosterone, greater coupling between these two regions was associated with lower anxiety symptom severity (Grannis et al., 2021). Another study of transgender boys receiving testosterone found that testosterone caused a shift in amygdala

activation, such that it became more typical of cisgender boys than cisgender girls (Beking et al., 2020).

32. 17. Both Dr. Scott and Dr. Biggs cite studies from the animal literature regarding the "side effects" of GnRHa treatment on the brain and behavior. However, they misinterpret or misrepresent the meaning of the term "side effect" in this context. Pharmacological agents have effects. The determination of what is a side effect and what is a desired effect is contextual. For example, Scott cites a 2021 rodent study of GnRHa treatment as an example of the "side effects" associated with GnRHa treatment (Anacker, et al., 2021). If one were to read the abstract of the study and not the full text, it may lead some to come to such a conclusion. However, what the study shows is that, prior to GnRHa treatment, there are sex differences in rodent behavior. Following GnRHa treatment, those sex differences are no longer present. This is the expected and desired outcome of GnRHa treatment, not a side effect. For example, female mice show greater locomotion behavior than male mice. Following GnRHa treatment, male mice show greater locomotion behavior than untreated male mice. Similarly, in a test of social interaction, GnRHa-treated males showed differences in the time spent with male versus female mice relative to untreated male mice, but not relative to untreated female mice. In both force-swim tests and a test of feeding behavior, female GnRHa-treated mice differed from control female mice,

but not from male mice. This is a consistent pattern across behavioral assays performed in the study, and this pattern was present in biological assays as well. GnRHa-treated male mice showed greater corticosterone stress response to novelty than control male mice but did not differ from female mice. GnRHa treatment increased neural activity in the hippocampus of female mice, but this activity increase did not differ from male mice. This is not a compelling study of the side effects of GnRHa treatment, but rather, a study that shows us exactly what we would expect: that blocking sex hormones decreases sex differences, the intended outcome for transgender youth.

33. Dr. Scott and Dr. Biggs cite a series of studies of GnRHa effects on sheep from a specific laboratory. One study from this group did show sex-specific changes in feeding behavior and HRV following GnRHa treatment. While Dr. Biggs opts to highlight changes in behavior in the female sheep that could be interpreted as an increase in anxiety-like behavior, he fails to mention that GnRHa treatment was associated with *improvements* in these behaviors in the treated male sheep (Wojniusz et al., 2011). They also fail to mention that other studies from this group show no effects of GnRHa treatment on cognition (Nuruddin et al., 2013; Wojniusz et al., 2013), and, like the Anacker study, brain differences are best explained by an expected reduction of sex differences following treatment (Nuruddin et al., 2013).

This issue of inappropriate reference group is a common problem in the GnRHa animal literature and its extrapolation to transgender youth (Edmiston & Juster, 2022). While the literature regarding the effects of GnRHa treatment on sheep behavior from this research group is complex, it by no means offers compelling evidence of negative effects of GnRHa treatment. Furthermore, Dr. Biggs highlights a negative effect from one study- an increase in anxiety-like behavior in female sheep only. However, we know from studies of transgender youth and young adults that anxiety and depression symptoms decrease with treatment (de Vries et al., 2014; Dhejne et al., 2016; Aldridge et al., 2021; Chen et al., 2023). This is more compelling evidence than a single animal study, as sheep do not have the complex psychosocial identities that humans do.

Evidence for Negative Consequences of Depression and Anxiety on the Developing Brain

34. The brain is more plastic during adolescence than during adulthood. This means that adolescents are particularly vulnerable and at increased risk for the onset of mood and anxiety disorders, and, if untreated, that the onset of mood and anxiety symptoms can permanently alter the developmental trajectory of the brain into adulthood (Holder & Blaustein, 2014). Termed the "kindling effect", the concept here is that, as the efficiency of neural circuits is reinforced over time (i.e., "neurons that fire together wire together"), each depressive episode or

environmental stressor increases the risk for later depressive episodes. This effect may be amplified during adolescence because of the greater plasticity of the brain.

35. There are well-documented disparities in mental health outcomes in transgender youth that are caused by minority stress (for review, see White Hughto et al., 2015). This includes evidence that transgender people who live in areas with more accepting political climates show reduced biological stress markers and fewer mental health symptoms than transgender people who live in less accepting areas (DuBois & Juster, 2022). Others have shown an association between decreased social support and biological markers of stress in transgender adolescents (McQuillan et al., 2021). Given that transgender adolescents report high chronic stress and high rates of depression, anxiety, and suicidality, transgender adolescents are particularly vulnerable to the effects of stress on brain development, stress system regulation, and long-term mental health outcomes (DuBois et al., 2021; Potter et al., 2021; Randall et al., 2022).

36. In Dr. Levine's testimony, he quotes the Hippocratic Oath, "Above All Do No Harm". He makes this argument on the assumption that GnRHa treatment must necessarily cause harm because it is an intervention. This assumes that the psychosocial environment and biology of transgender youth is like that of cisgender youth. There is a great deal of evidence that this is not the case. Instead, in my

opinion not offering an intervention to transgender individuals that require treatment actually does harm.

37. In this case, puberty blockers have demonstrated efficacy in reducing symptoms of depression in transgender adolescents (de Vries et al., 2011), and therefore may in fact be neuroprotective to the cumulative effects of stress caused by gender dysphoria.

Conclusion

38. There is little to support the Defendants' designated experts' speculation about the negative effects of GnRHa treatment on the brain. In contrast, there is a great deal of evidence supporting the mental health benefits of GnRHa treatment for transgender adolescents. Furthermore, it is well-known that transgender adolescents face higher rates of psychosocial stress than their cisgender peers, and there is clear evidence for the negative effects of psychosocial stress and poor mental health on brain development. While the effects of GnRHa treatment on the brain are an important area for future research, this does not render such care experimental. To the contrary, this is treatment that has existed for decades and arguments that a purported lack of evidence is equivalent to known harm are spurious, particularly when there is a large literature indicating benefits of treatment and harm of withholding treatment.

I declare under penalty of perjury under the laws of the United States of America that the foregoing is true and correct.

Executed this 22 day of March 2023.

HONORS, AWARDS, AND FELLOWSHIPS:

American College of Neuropsychopharmacology Travel Award	2021
Society of Biological Psychiatry Early Career Investigator Travel Award	2019
NYC tDCS Fellowship City University of New York, New York, NY	2018
Trainee, T32 MH018951 Child and Adolescent Mental Health Research University of PIttsburgh, Pittsburgh, PA	2018-2019
Research Day Department of Psychiatry Outstanding Poster Award	2018
PLOS One Travel Award	2017
Fellow, Winter School in the Neuroscience of Consciousness Canadian Institute For Advanced Research	2017
Trainee, T32 MH16804 Transformative Discovery in Psychiatry	2016-2018

University of Pittsburgh, Pittsburgh, PA

WPATH Outstanding Student Award 2015
International honor for contributions to transgender health research

The Trans 100 2015
National honor for excellence in the transgender community

Point Foundation Scholar 2014-2015
One of 20 selected nationally for program that funds education of LGBT students

Vanderbilt Brain Institute Student Leadership and Service Award 2014

Graduate Student Travel Grant, Vanderbilt University 2013

Fellow, Summer Program in Neuroscience Ethics and Success 2013
Marine Biology Laboratory, Woods Hole, MA

Clinical Neuroscience Scholar for Translational Research 2012-2015
Dan Marino Foundation

Neurobiology of Social Behavior Travel Award 2011
Emory University, Atlanta, GA

President's Scholarship 2003-2005
Case Western Reserve University, Cleveland, OH

TEACHING AND MENTORSHIP

SELECTED TALKS:

Invited Speaker: *Neuroscience in Service of Our Community:* 2023
How Research Rooted in Empathy and Humility Makes Us Better Scientists
Neuroscience Diversity Seminar
University of Maryland School of Medicine

Invited Speaker: *Visual Cortex Distinguishes Anxiety and Depression* 2023
Fournier Group Lab Meeting
The Ohio State Medical School

Presenter: *Assessing Visual Perception in Depression and Anxiety* 2023
Department of Psychiatry Faculty Meeting
UMass Chan Medical School

Invited Speaker: *Neuroimaging Studies of Transgender People* 2022
The Friedman Brain Institute and oSTEM
The Icahn School of Medicine at Mount Sinai

Invited Speaker: *Impulsivity and Reward-related Activity:* 2022
A Stable Marker for Bipolar Disorder risk
STEP Seminar
Truman State University

Invited Speaker: *Assessing Relationships Among impulsivity, Reward Circuitry, and Risk for Psychopathology* Magnetic Resonance Research Center Forum Yale School of Medicine	2019
Presenter: *Fusiform Gyrus Alterations During Emotion Processing: Predicting the Future in Anxiety Disorders* Center for the Neural Basis of Cognition Seminar University of Pittsburgh and Carnegie Mellon University	2018
Panelist: *Setting the Research Agenda in Transgender Health* 27th Annual Issues in Medical Ethics Conference The Icahn School of Medicine at Mount Sinai	2017
Panelist: *Neuroimaging in Child and Adolescent Mental Disorders* Chinese Society of Psychiatry 14th Annual Meeting	2016
The Trans Buddy Program: An Innovative Model for Healthcare Access Medicine Health and Society Colloquium Series Vanderbilt University	2015
Panel Organizer: *Intra-community Stigma in LGBT Populations* 615Thrive Conference Tennessee Department of Health	2015
Transgender Health: Provider Considerations Department of Hearing and Speech Sciences Grand Rounds Vanderbilt University	2014
Sexual and Reproductive Health in LGBT Populations Sarah Fogel, PhD Department of Nurse Midwifery Vanderbilt University School of Nursing	2014, 2015
Panelist: *(Im)Possible Politics: Intersectional Trans Organizing* Ben Singer, PhD; Dean Spade, JD; Lisa Guenther PhD Department of Women and Gender Studies Vanderbilt University	2014
Plenary Speaker: *Creating Change for LGBTI Health* Gay and Lesbian Medical Association Annual Meeting	2013
Invited Speaker: *Threat Detection, Visual Cortex, and Anxiety* Department of Radiology Beijing Normal University	2013
Invited Speaker: *Threat Detection, Visual Cortex, and Anxiety* Department of Psychiatry China Medical University	2013

MEDICAL STUDENT TEACHING EXPERIENCE:

Guest Lecturer: *Neuromodulatory Interventions in Mood Disorders* 2022
Neuroscience Area of Concentration Seminar Series
University of Pittsburgh School of Medicine

Guest Lecturer: *Building Trust with your Transgender Patients* 2021,2022
Texas Christian University School of Medicine

Instructor of Record: *Introduction to Scientific Writing* 2016
China Medical University

Guest Lecturer: *Clinical and Biobehavioral Features of Autism* 2016
Clinical Medicine 400
China Medical University

Guest Lecturer: *Building an Inclusive Practice for LGB and T Patients* 2015
First Year Seminar
Meharry Medical College

Guest Lecturer: *Community Models for Improving Trans Healthcare* 2015
Intercession Course
Meharry Medical College

Guest Lecturer: *Providing Excellent Care for LGBT People* 2015
Capstone Series
Meharry Medical College

GRADUATE AND UNDERGRADUATE TEACHING EXPERIENCE:

Guest Lecturer: *Neuromodulation interventions for threat sensitivity* 2022
Biomedical Sciences First Year Seminar
Graduate School of Biomedical Sciences
UMass Chan Medical School

Guest Lecturer: *Impulsivity and reward-related activity: Predicting mania* 2021
Undergraduate Research Methods
Department of Psychology
University of California San Diego

Guest Lecturer: *Transgender people and neuroimaging: a critical review* 2021
Department of Psychology
Mount Holyoke College

Instructor of Record: PSY0205 Psychopathology 2021
Department of Psychology
University of Pittsburgh

Guest Lecturer: *Transgender People and Healthcare Systems* 2015
MHS 2110: American Medicine and the World

Laura Stark, PhD, Vanderbilt University

Guest Lecturer: *Transgender People and Healthcare Systems* 2015
MHS 3890: Documenting the Body
Odie Lindsey, PhD, Vanderbilt University

Guest Lecturer: *Introduction to Social Neuroscience* 2014
PSY3609: Educational Cognitive Neuroscience
Sasha Key, PhD, Vanderbilt University

Guest Lecturer: *Imagining Transgender Bodies in Healthcare* 2013
WGS 290: Theories of the Body
Aimi Hamraie, PhD, Vanderbilt University

Introduction to Cognitive Neuroscience 2013-2014
Vanderbilt Neuroscience Graduate Program Boot Camp

The Center for Teaching, Vanderbilt University 2013
Scholarship of Teaching and Learning Certificate

Teaching Assistant: NSC201 Introduction to Neuroscience 2011
Department of Neuroscience, Vanderbilt University

TRAINEE MENTORSHIP, CERTIFICATION, AND SUPERVISION:

Culturally Aware Mentorship Workshop 2022
University of Wisconsin Madison School of Medicine

Tiffany Nhan (post bac lab assistant) 2022-present

M. Ali Aslam (undergraduate lab assistant) 2022

Paloma Rueda (undergraduate lab assistant) 2020-2021

Shelby Gardner (undergraduate lab assistant) 2020

Kristie Mak (undergraduate lab assistant) 2019-2020

Taylor Pagliosotti, BA (graduate student, Department of Public Health) 2018-2019

Zhiqiang Sha, PhD (post doc, Mood and Brain Laboratory, PI: Phillips) 2019

Alicyn Simpson, BA (research assistant, Adolescent Medicine) 2018-2019

Hana Choi, BA (intern, The Trans Buddy Program) 2016

William Horn, BA (intern, The Trans Buddy Program) 2015

RJ Robles, BA (student worker, Program for LGBTI Health) 2015-2016

Keanan Gottlieb, BA (summer intern, The Trans Buddy Program) 2014

Cameron Donald, BA (summer intern, Program for LGBTI Health) 2014

Jamieson Jann, BA (summer intern, Program for LGBTI Health) 2014

IN THE UNITED STATES DISTRICT COURT
FOR THE NORTHERN DISTRICT OF FLORIDA
Tallahassee Division

AUGUST DEKKER, et al., *Plaintiffs*, v. JASON WEIDA, et al., *Defendants*.	Case No. 4:22-cv-00325-RH-MAF

EXPERT REBUTTAL REPORT OF ARON JANSSEN, M.D.

I, Aron Janssen, M.D., hereby declare and state as follows:

1. I am over 18 years of age, of sound mind, and in all respects competent to testify.

2. I have been retained by counsel for Plaintiffs as an expert in connection with the above-captioned litigation. The opinions expressed herein are my own and do not express the views or opinions of my employer.

3. I have actual knowledge of the matters stated herein. If called to testify in this matter, I would testify truthfully and based on my expert opinion.

BACKGROUND AND QUALIFICATIONS

A. Qualifications

4. I am the Vice Chair of the Pritzker Department of Psychiatry and Behavioral Health at the Ann and Robert H. Lurie Children's Hospital of Chicago

("Children's Hospital"), where I also serve as Clinical Associate Professor of Child and Adolescent Psychiatry. I maintain a clinical practice in Illinois where I treat patients from Illinois and the surrounding states.

5. I received my medical degree from the University of Colorado School of Medicine and completed by residency in psychiatry and fellowship in child and adolescent psychiatry at New York University Langone Medical Center.

6. In 2011, I founded the Gender and Sexuality Service at New York University, for which I served as Clinical Director. I also previously served as Co-Director of the New York University Pediatric Consultation Liaison Service for the New York University Department of Child and Adolescent Psychiatry.

7. I am board certified in Child and Adolescent Psychiatry and Adult Psychiatry.

8. I have been treating children and adolescents with gender dysphoria for over 12 years. I have seen and treated over 500 children and adolescents with gender dysphoria during my medical career. Currently, approximately 90 percent of the patients in my clinical practice are transgender children and adolescents.

9. As part of my practice, I stay current on medical research and literature relating to the care of transgender persons and patients with gender dysphoria. I am an Associate Editor of the peer-reviewed publication *Transgender Health* and a

reviewer for *LGBT Health* and *Journal of the American Academy of Child and Adolescent Psychiatry*, both of which are peer-reviewed journals.

10. I am the author or co-author of 16 articles on care for transgender patients and am the co-editor of *Affirmative Mental Health Care for Transgender and Gender Diverse Youth: A Clinical Casebook* (Springer Publishing, 2018), which is the first published clinical casebook on the mental health treatment for children and adolescents with gender dysphoria. I have also authored or co-authored numerous book chapters on treatment for transgender adults and youth.

11. I have been a member of the World Professional Association for Transgender Health ("WPATH") since 2011. I was actively involved in the revision of WPATH's *Standards of Care for the Health of Transgender and Gender Diverse People* ("Standards of Care"), serving as a member of revision committees for both the child and adult mental health chapters of version 8 of WPATH's Standards of Care (SOC 8), published in 2022.

12. In addition to the above, I am involved in training other medical and mental health providers in the treatment of children and adolescents with gender dysphoria. I have conducted trainings for over 1,000 medical and mental health providers and have given dozens of public addresses, seminars, and lectures on the treatment of gender dysphoria in children and adolescents.

13. I am also involved in a number of international, national, and regional committees that contribute to the scholarship and provision of care to transgender people. I am the Chair of the American Academy of Child and Adolescent Psychiatry's Sexual Orientation and Gender Identity Committee. I serve as a member of the Transgender Health Committee for the Association of Gay and Lesbian Psychiatrists. I was the Founder of the Gender Variant Youth and Family Network.

14. Further information about my professional background and experience is outlined in my curriculum vitae, a true and accurate copy of which is attached as **Exhibit A** to this report.

B. Prior Testimony

15. Within the last four years, I testified as an expert at trial or by deposition in: *B.P.J. v. W. Va. Bd. of Educ.*, Case No. 2:21-cv-00316 (S.D. W.Va.); and *L.E. v. Lee*, Case No. 3:21-CV-00835 (M.D. Tenn.).

C. Compensation

16.I am being compensated for my work on this matter at a rate of $400 per hour for preparation of this report and for time spent preparing for and giving local deposition or trial testimony. In addition, I would be compensated $2,500 per day for deposition or trial testimony requiring travel and $300 per hour for time spent

travelling, plus reasonable expenses. My compensation does not depend on the outcome of this litigation, the opinions I express, or the testimony I may provide.

D. Bases for Opinions

17. In preparing this report, I reviewed: the Complaint in this case; Florida Administrative Code 59G-1.050(7) (the "Challenged Exclusion"); the document titled "Florida Medicaid: Generally Accepted Professional Medical Standards Determination on the Treatment of Gender Dysphoria," published by the Florida Agency for Health Care Administration in June 2022, and its attachments; the expert reports of Drs. Armand Antommaria, Dan Karasic, Johanna Olson-Kennedy, Loren Schechter, Daniel Shumer, and Kellan Baker, submitted by plaintiffs; and the expert reports Drs. Michael Biggs, G. Kevin Donovan, Paul Hruz, Kristopher Kaliebe Michael Laidlaw, Patrick Lappert, Stephen Levine, Sophie Scott, and Joseph Zanga, submitted by defendants.

18. My opinions are based on: (1) my clinical experience as a psychiatrist treating patients with gender dysphoria, including transgender children, adolescents, and adults; (2) my knowledge of the peer-reviewed research, including my own, regarding the treatment of gender dysphoria, which reflects advancements in the field of transgender health; my knowledge of the clinical practice guidelines for the treatment of gender dysphoria, including my work as a contributing author of WPATH SOC 8; and (4) my review of any of the materials cited herein.

19. I have also reviewed the materials listed in the bibliography attached as **Exhibit B**. I may rely on those documents as additional support for my opinions.

20. In addition, I have relied on my years of research and clinical experience in child, adolescent, and adult psychiatry, as well as my professional knowledge, as set out in **Exhibit A** and the materials listed therein.

21. The materials I have relied upon in preparing this report are the same types of materials that experts in my field of study regularly rely upon when forming opinions on the subject. I may wish to supplement these opinions or the bases for them as a result of new scientific research or publications or in response to statements and issues that may arise in my area of expertise.

22. I have not met or spoken with the Plaintiffs in this case.

SUMMARY OF OPINIONS

23. As with all of medicine, transgender medicine is a continuously evolving field. But this does not make medical treatment for gender dysphoria experimental or investigational. To the contrary, such treatment is well-established and large body of evidence (more so than exists for other non-experimental medical interventions) documents that safety and efficacy of these medical interventions.

24. Transgender people have always existed and the provision of medical care to address transgender people's gender incongruence/gender dysphoria goes back decades. In fact, the field of transgender medicine was built to increase

oversight around patient care, and often requires consent processes that go above and beyond what is expected for other medical decisions.

25. There is robust evidence demonstrating the value of social, medical and surgical interventions for children, adolescents, and adults when in the context of an appropriate psychosocial evaluation. And to be clear, no medical or surgical interventions are recommended or provided to anyone until after the onset of puberty, meaning such care is only available to adolescents and adults.

26. The Defendants and their designated experts spent much time arguing about hypothetical concerns, for which there is no proof, and the limitations of particular studies. But Defendants and their designated experts completely ignore that the evidence-base for the safety and efficacy for gender-affirming care is not based on any one particular study. Rather, as is the norm in all of science and medicine, we look at the entire body of research surrounding gender-affirming care. When one does so, the conclusion that gender-affirming medical care for the treatment of gender dysphoria in transgender adolescents and adults is safe and effective becomes inescapable. Decades on clinical experience further support this conclusion.

27. Defendants and their designated experts further ignore the robust evidence for the potential harm faced by transgender individuals when barred access to medically necessary gender-affirming care.

28. Defendants and their designated experts also ignore every transgender adult was once a child. The Defendants' designated experts focus on children and adolescents, but the Challenged Exclusion bans coverage for all care for an already vulnerable population, including adults. None of them explain why this case is experimental for transgender adults.

29. While there can be debate about the techniques and modalities of care to support transgender youth, it is important to keep in mind that the opposite of substandard care is excellent care, not no care. To be clear, however, gender-affirming care is safe and effective, it is not substandard or experimental.

30. Understanding patients' experience of distress around gender is a vital component of being an expert in this field. Without understanding the distress transgender patients face – as well as the joy and resilience they experience when they get the care they need – one is only spouting unmoored and unfounded opinions. Medicine and science demand more than just personal opinions, it demands study and experience in the field. For the most part, Defendants' designated experts lack both.

EXPERT OPINIONS

A. Defendants' experts lack the experience and/or training to opine on the diagnosis, assessment, and treatment of gender dysphoria of transgender children and adolescents.

Dr. Levine

31. Because Dr. Levine does not appear to be board certified in child and adolescent psychiatry, he lacks the related experience and training in specific developmental considerations for children and adolescents that is critical for working with transgender youth and their families.

32. Moreover, Dr. Levine repeatedly acknowledges in his report that he has no firsthand knowledge of how gender-affirming mental health care is actually provided to children and adolescents. His descriptions are based on second-hand conversations and often sensationalized media reports. (*See*, *e.g.*, Levine Report, at ¶49 (offering opinions based on anecdotal reports from the internet)). He speaks in his report with authority on developmental and family factors that shape identity development in youth despite lacking the requisite training and experience and even ascribes reasons for why boys and girls may pursue social transition despite no clinical experience in the relevant population.

Dr. Kaliebe

33. Similarly, Dr. Kaliebe is not qualified to opine as an expert on the care of transgender children and adolescents. There is a difference between having an

interest in a topic and having expertise in a clinical or research domain. Dr. Kaliebe's report of the number of transgender patients he has seen is consistent with what many of our child psychiatry trainees are exposed to in their residency, and is not consistent with the volume of patients necessary to demonstrate expertise on the clinical nuance of the field. In addition to a lack of clinical expertise, Dr. Kaliebe's report calls into question his expertise in research methods or ethics. As an example, throughout his report Dr. Kaliebe makes claims about the quality of the evidence for gender affirming care while describing unscientific survey questions asked outside of the IRB process as having the same weight as data published in a peer-reviewed journal. Furthermore, nowhere in his CV does it describe a history of expertise in evolutionary biology or early human behavior, but this doesn't stop him from making unsubstantiated and uncited assertions about adaptive behaviors in "ancient evolutionary environments."

Defendants' other experts

34. Expertise in mental health care requires specialized training and ongoing work in the field with appropriate certification and licensure. To my knowledge, and based on a review of their respective CV's, Drs. Hruz, Laidlaw, Lappert, Biggs, Donovan, and Zanga have neither had the training nor the certification and licensure to weigh in as experts on the appropriateness of a mental health assessment or treatment plan. This lack of expertise, however, has not

stopped them from making broad generalizations about mental health care that bear little resemblance to the care as typically delivered. As such, their characterizations of the practice of mental health care should be seen as a lay opinion based on secondhand knowledge at best. Furthermore, expertise in the treatment of transgender individuals requires experience in the care of transgender individuals, a characteristic in short supply with the aforementioned experts.

B. Gender Identity

35. At birth, infants are assigned a sex, either male or female, based on the appearance of their external genitalia. For most people, their sex assigned at birth, or assigned sex, matches that person's gender identity. For transgender people, their assigned sex does not align with their gender identity.

36. Gender identity is a person's core sense of belonging to a particular gender, such as male or female.

37. Gender identity is one of a person's multiple sex-related characteristics, which also include, among others, internal reproductive organs, external genitalia, chromosomes, hormones, and secondary sex characteristics.

38. In their reports, Defendants' designated experts state repeatedly that sex is binary and conditions of sexual differentiation are not a "third sex." This simplistic view, however, ignores that there is great variance among the multiple sex-related characteristics that a person possesses, including gender identity, and that such

variance is a natural phenomenon with biological underpinnings. While conditions of sexual differentiation (i.e., intersex conditions) are not a "third sex," they are indicative of the natural variance regarding certain sex-related characteristics. These are rare conditions with an estimated aggregate incidence of 0.1- 0.5% of live births (Arboleda, et al., 2013). What is more, many people cannot make either eggs or sperm, yet are recognized as female or male based on other sex-related characteristics.

39. Every person has a gender identity and it is not a personal decision, preference, or belief. A transgender boy cannot simply turn off his gender identity like a switch, any more than a nontransgender boy or anyone else could.

40. Living in a manner consistent with one's gender identity is critical to the health and wellbeing of any person, including transgender people.

41. The lack of evidence demonstrating that gender identity can be altered, either for transgender or for nontransgender individuals, further underscores the innate nature and immutability of gender identity. Past attempts to "cure" transgender individuals by using talk therapy, and even aversive therapy, to change their gender identity to match their birth-assigned sex were ineffective and caused extreme psychological damage.

42. A recent study found that experiencing those conversion efforts was associated with greater odds of attempting suicide, especially for those had those

experiences in childhood (Turban, et al., 2020b). That conclusion is further supported by the extensive evidence that rejection of a young person's gender identity from family and peers are the strongest predictors for adverse mental health outcomes. Every leading medical and mental health organization has issued clear statements that those practices are discredited, harmful, and ineffective, including the American Medical Association (2022), the American Psychiatric Association (2018), the American Academy of Child & Adolescent Psychiatry (2018), the American Psychological Association (2021), and the American Academy of Pediatrics (Rafferty, et al., 2018), among others.

43. Dr. Levine notes in his report "it is widely agreed that the therapist should not directly challenge a claimed transgender identity in a child." (Levine Report, at ¶50). This characterization mischaracterizes gender affirming therapy and calls into question his understanding of conversion efforts in the context of pre-pubertal youth. Within the model of gender affirming care, challenging assumptions based on stereotypes of gender and encouraging a child to build nuance around identity is inherent to the process of care. However, what Dr. Levine seems to be arguing for is not to encourage a psychotherapeutic process that helps a child come to a clear and nuanced sense of self, whatever the gender identity may be, but instead recommending a psychotherapeutic intervention that privileges a non-transgender identity as inherently preferred. While Dr. Levine focuses much of his report on

children who desist during puberty, inherent in the literature on desistance includes the substantial portion of prepubertal youth who persist in a transgender identity through puberty and into adulthood. By foreclosing the possibility of a healthy transgender identity and instead encouraging these transgender youth who will persist into transgender adults to strive towards a cisgender outcome, as Defendants and their experts argue, one is, by definition, practicing conversion therapy.

44. There is no one way by which people experience their gender identity development from early questioning to consolidation and affirmation. Though it is common for transgender youth to come out at puberty, for other transgender persons this is not true, and it may take them longer to come to recognize and acknowledge their gender identity. For the latter group, this is not due to some "late onset" of dysphoric feelings or sudden understanding themselves as transgender, it is the result of a long and difficult process toward accepting and understanding themselves in a social context where being transgender is still a difficult reality due to external stigma, fears of family and social rejection, and even internalized transphobia (Pullen Sansfaçon, et al., 2020).

45. Dr. Levine, Dr. Kaliebe, and Defendants' other designated experts devote a great deal of space to discussing a theory that an increasing number of people who are assigned female at birth are suddenly identifying as males in mid-to-late adolescence as a result of peer pressure and social contagion. (*See*, *e.g.*, Levine

Report, at ¶¶ 38, 96; Kaliebe Report, at ¶¶30-31, 40-43; Laidlaw Report, at ¶29; Hruz Report, at ¶¶ 117, 131). The theory that some adolescents experience "rapid-onset gender dysphoria" as a result of social influences is based almost exclusively on one highly controversial study (Littman, 2018). Although purporting to provide a basis for Dr. Levine's speculations, the study was based on an anonymous survey, allegedly of parents, about the etiology of their child's gender dysphoria. Participants were recruited from websites promoting this social contagion theory, and the children were not surveyed or assessed by a clinician. Those serious methodological flaws render the study meaningless. The only conclusion that can be drawn from that study is that a self-selected sample of anonymous people recruited through websites that predisposed participants to believe transgender identity can be influenced by social factors do, in fact, believe those social factors influence children to identify as transgender.[1]

46. Dr. Kaliebe seems to argue that the fact that transgender adolescents find other transgender adolescents online is proof of a "social contagion." He cites to no scientific study to support this speculation, other than Littman study discussed above. But Dr. Kaliebe ignores that online spaces often provide a safe place for transgender youth to come out and be themselves, allowing them to explore their

[1] Aside from these serious methodological flaws, Littman's hypothesis of "rapid onset gender dysphoria" focuses specifically on gender dysphoria in boys who are transgender and were assigned a female sex at birth.

identity. This is no different from a host of other affinity-type groupings one can find on social media. Just like many other minoritized youth, adolescents often search out groups that share core characteristics. Dr. Kaliebe's assertion that social media is a leading cause of the increased prevalence of transgender identifying youth is not demonstrated in the extant literature, and it is also beside the point. Part of an assessment of gender dysphoria includes an inquiry into the social context of the patient – this includes online spaces and potential positive and negative reinforcing factors, including social group status online. This also includes assessing for the concerns Dr. Kaliebe describes that assigned females at birth often face at puberty.

47. Notwithstanding the above, Dr. Kaliebe goes on to assert that "psychiatrists believe social media has significantly contributed to the rise in gender dysphoria." In support thereof, Dr. Kaliebe references conversations as his evidence and further asserts that "most child psychiatrists admit to me they will not speak publicly on this subject due to how sensitive the topic is." But such anecdotal evidence is not the type of evidence one would look to in answering scientific question nor whether a particular form of care is experimental or investigative. (Kaliebe Report, at ¶41). Dr. Kaliebe then cites not one but two unscientific polls of attendees to a particular session at a conference as support for the bold assertion that such data "confirm[] that the vast majority of a group of child and adolescent psychiatrists acknowledge social contagion is a major contributor to the rise in

gender dysphoria." But this is not how scientific study is conducted in medicine. There is no plausible basis for Dr. Kaliebe to extrapolate the poll results of an unscientific survey of attendees to a panel as proof that a "majority of a group of child and adolescent psychiatrists acknowledge social contagion is a major contributor to the rise in gender dysphoria." To the contrary, what Dr. Kaliebe is doing can hardly be considered science and illustrates how D. Kaliebe does not understand what selection bias is nor what a study is.

C. Gender Dysphoria and Its Diagnostic Criteria

48. The term "gender dysphoria" is the distress related to the incongruence between one's gender identity and one's sex assigned at birth.

49. Gender dysphoria is the clinical diagnosis for the significant distress that results from the incongruity between one's gender identity and sex assigned at birth. It is a serious medical condition, and it is codified in the American Psychiatric Association's in the *Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition, Text Revision* (DSM-5-TR) (DSM-5 released in 2013 and DSM-5-TR released in 2022).

50. The DSM-5 defines gender dysphoria as a: "marked difference between the individual's expressed/experienced gender and the gender others would assign him or her, and it must continue for at least six months. In children, the desire to be of the other gender must be present and verbalized. This condition causes clinically

significant distress or impairment in social, occupational, or other important areas of functioning."

51. The DSM-5 also states that: "gender dysphoria is manifested in a variety of ways, including strong desires to be treated as the other gender or to be rid of one's sex characteristics, or a strong conviction that one has feelings and reactions typical of the other gender."

52. "Gender Dysphoria in Children" is a diagnosis applied only to pre-pubertal children in the DSM-5. The DSM-5 has a separate diagnosis of "Gender Dysphoria in Adolescents and Adults." The diagnostic criteria for these diagnoses are distinct. Understanding that children have less capacity to articulate abstract concepts about the sense of self as well as a reflection of what can be a lack of specificity of gender nonconforming behaviors in childhood, there are more nuanced criteria to make the diagnosis for children. Furthermore, prepubertal youth are not eligible for medical or surgical intervention while the diagnosis of gender dysphoria in adolescents/adults is required for medical and/or surgical treatments,

53. Simply being transgender or gender diverse is not a medical condition or pathology to be treated. As the DSM-5 recognizes, diagnosis and treatment are "focus[ed] on dysphoria as the clinical problem, not identity per se." (DSM-5, at 451). The DSM-5 unequivocally repudiated the outdated view that being transgender is a pathology by revising the diagnostic criteria (and name) of gender

dysphoria to recognize the clinical distress as the focus of the treatment, not the patient's transgender status.

54. When untreated, gender dysphoria can cause significant distress including increased risk of depression, anxiety, and suicidality. This is noted both in adolescents and adults. However, these risks decline when transgender individuals are supported and live according to their gender identity. Not only is this documented in scientific literature and published data, but I witness this each time I see my patients being supported by their community, family, school, and medical providers.

D. The Guidelines for the Treatment of Gender Dysphoria Are Evidence-Based.

55. The World Professional Association of Transgender Health (WPATH) has issued Standards of Care for the Health of Transgender and Gender Diverse People ("WPATH Standards of Care") since 1979. The current version is SOC 8, published in 2022. The WPATH Standards of Care provide guidelines for multidisciplinary care of transgender individuals, including children and adolescents, and describes criteria for medical interventions to treat gender dysphoria, including hormone treatment and surgery when medically indicated, for adolescents and adults.

56. The SOC 8 is based upon a rigorous and methodological evidence-based approach. (Coleman, et al., 2022). Its recommendations are evidence-based,

informed by a systematic review of evidence and an assessment of the benefits and harms of alternative care options, as well as expert consensus via a Delphi procedure. The process for development of SOC 8 incorporated recommendations on clinical practice guideline development from the National Academies of Medicine and The World Health Organization. Its recommendations were graded using a modified GRADE methodology (Guyatt, et al., 2011), considering the available evidence supporting interventions, risks and harms, and feasibility and acceptability.

57. A clinical practice guideline from the Endocrine Society (the Endocrine Society Guidelines) provides similar protocols for the medically necessary treatment of gender dysphoria. (Hembree, et al., 2017).

58. Each of these guidelines are evidence-based and supported by scientific research and literature, as well as extensive clinical experience.

59. Each of these guidelines also provides distinct guidance for age-appropriate care for children, adolescents, and adults with gender dysphoria. And none of these guidelines recommend medical treatment for prepubertal children, meaning no medical treatment is recommended until after the onset of puberty.

60. The protocols and policies set forth by the WPATH Standards of Care and the Endocrine Society Guidelines are endorsed and cited as authoritative by the major professional medical and mental health associations in the United States, including the American Medical Association, the American Academy of Pediatrics,

the American Psychiatric Association, the American Psychological Association, the American College of Obstetrics and Gynecology, the American College of Physicians, and the World Medical Association, among others.

E. Assessment and Treatment of Gender Dysphoria in Children

61. Defendants' experts spend substantial portions of their expert reports to criticizing gender-affirming care for prepubertal transgender children. For example, according to Dr. Levine, studies have indicated that gender dysphoria in prepubertal gender diverse children may desist by the time the children reach puberty, and thus medical professionals should adopt a "watchful waiting" approach and avoid affirming a prepubertal child's gender identity.

62. However, with regards to prepubertal gender diverse children, the Standards of Care state that prepubertal gender diverse children "are not eligible to access medical intervention," and therefore focuses on developmentally appropriate psychosocial practices. However, this case concerns coverage of medical treatment, namely, puberty delaying medications, hormones, and surgery, and none of those treatments are recommended for transgender youth until *after* the onset of puberty (i.e., until adolescence), and even then it is only a subset of those, when it is medically necessary, age appropriate, and the legal caregivers consent.

63. As such, many of Dr. Levine's and Defendants' other designated experts' litany of criticisms is largely irrelevant to the population of people affected

by the Challenged Exclusion. For example, a significant number of Dr. Levine's and Defendants' other designated experts' arguments relate to prepubertal children who "desist" from expressing a transgender identity once they reach puberty. While the statements being made about this population are erroneous, they are also largely irrelevant.

64. That said, to avoid any confusion, I address some of Dr. Levine's and Defendants' other designated experts' arguments pertaining to transgender youth prepubertal here.

65. As with all health care, treatment of prepubertal gender diverse children is individualized based on the needs of the child and the family and other psychosocial considerations and is decided upon only after a discussion of possible benefits and risks (Hidalgo, et al., 2013). As part of those discussions, the child and their family are advised that prepubertal gender diverse children do not always go on to identify as transgender when they reach adolescence, and that children are encouraged to continue developing an understanding of their gender identity without expectation of a specific outcome even after social transition takes place (American Psychological Association, 2015; Edwards-Leeper and Spack, 2012).

66. The term "gender diverse" includes transgender children as well as children who will ultimately not identify as transgender later in life (Coleman, et al., 2022).

67. Dr. Levine and Defendants' other designated experts present a caricatured description of prevailing standards of care that reflects a profound misunderstanding of the subject with respect to prepubertal gender diverse children. Mental health providers cannot change a prepubertal child's gender identity or prevent them from being transgender, just as mental health providers cannot change a cisgender child's gender identity. Furthermore, it is far from the standard of care for clinicians to blindly support a child's potential social transition without careful assessment and a thorough discussion of the risks, benefits and alternatives of this intervention.

68. Prepubertal children who "desist" are children with nonconforming gender expression who realize with the onset of puberty that their gender identity is consistent with their sex assigned at birth. Their understanding of their gender identity changes with the onset of puberty, but their gender identity does not. We cannot definitively determine which prepubertal children will go on to identify as transgender when they reach adolescence, but we know that children with gender dysphoria who persist into puberty are more likely to have expressed a consistent, persistent, and insistent understanding of their gender identity from a young age (Steensma, et al., 2013).

69. The focus of gender-affirming care and SOC 8 is thus in supporting the overall health and wellbeing of the child. In this manner, the primary goal of

gender-affirming care is to help a child understand their own gender identity and build resilience and mental wellness in a child and family, without privileging any one outcome over another.

70. Important considerations in deciding whether social transition is in a child's best interest include: whether there is a consistent, stable articulation of a gender different from the child's sex assigned at birth, which should be distinguished from merely dressing or acting in a gender non-conforming manner; whether the child is expressing a strong desire or need to transition; the degree of distress the child is experiencing as a result of the gender dysphoria; and whether the child will be emotionally and physically safe during and following transition (Coleman, et al., 2022; American Psychological Association, 2015).

71. A treatment plan is informed by a psychosocial assessment, which may vary greatly depending on the patient's presentation and the complexity of the issues the patient is navigating. Further, in conducting that assessment, the mental health provider is drawing from their professional training and experience in working with transgender young people, exercising professional judgment, and tailoring the assessment to each individual patient.

72. There is also no requirement that prepubertal children who socially transition receive mental health therapy. Many prepubertal children who express a gender identity different from their sex assigned at birth do not experience any co-

occurring conditions or other psychological distress requiring treatment (Coleman, et al., 2022; de Vries, et al., 2011a). Mental health therapy may be useful for some prepubertal children but is not necessary or appropriate for everyone. Forcing children to undergo therapy when it is not medically indicated is both harmful and unethical.

73. What makes gender-affirming care "gender affirming" is that it does not presume that being transgender is incompatible with a young person's short- and long-term health and wellbeing. It is also important to note that clinicians utilizing gender affirming care do not assume that all children asserting a gender identity incongruent with their sex assigned at birth are inherently transgender. A clinician doing a careful assessment and recommending a child not socially transition or an adolescent not pursue medical care is fully aligned with this treatment paradigm.

74. Dr. Levine and Defendants' additional designated experts seem to think social transition is a single decision that irrevocably alters a child's trajectory over time. This belief belies their lack of clinical experience in working with gender diverse pre-pubertal youth. Clinically, social transition is often a series of steps taken gradually with feedback from the child, the family, and the clinician elicited over time. It is false that allowing prepubertal transgender children to socially transition puts these children on a path to becoming transgender adolescents and adults. Rather, the evidence shows that the same prepubertal children who are likely to have

a stable transgender identity into adolescence are the children who are most likely to articulate a strong and consistent need to socially transition (Steensma, et al., 2013). For example, a recent study found that a group of transgender children who transitioned before puberty and a group of transgender children who waited to transition until after puberty both showed the same intensity of cross-gender identification. In other words, socially transitioning before puberty did not increase children's cross-gender identification, and deferring transition did not decrease cross-gender identification (Rae, et al., 2019).

75. Intense cross-gender identification and a strong, persistent desire to transition is simply an indicator that a child is more likely to be transgender and not merely gender nonconforming.

F. Assessment and Treatment of Gender Dysphoria in Adolescents

76. WPATH SOC 8 recommends that health care professionals working with transgender and nonbinary adolescents be licensed, hold a postgraduate degree in relevant clinical field, have received training and developed expertise in working with children and adolescents, and have received training and developed expertise in gender identity and diversity in youth and in the ability of youth to assent/consent to care (Coleman, et al., 2022).

77. The Standards of Care also recommend a "comprehensive biopsychosocial assessment" for adolescents "prior to any medically necessary

medical or surgical intervention" for gender dysphoria. The assessment should include gender identity development, social development and support, diagnostic assessment of co-occurring mental health or developmental concerns, and capacity for decision-making (Coleman, et al., 2022). So do the Endocrine Society Guidelines (Hembree, et al., 2017).

78. Defendants' experts point to the rates of co-occurring psychiatric diagnoses among youth presenting with gender identity concerns. But not only are some of these co-occurring diagnoses, like anxiety and depression, often associated with dysphoria, but because youth experiencing gender identity concerns present for care before mental health providers more often, it is easier to diagnose other co-occurring diagnoses that would otherwise often go undiagnosed. In any event, it is precisely because of these co-occurring mental health diagnoses that specialized training is required to do a comprehensive biopsychosocial assessment that takes into account the possibility of diagnoses that may lead a child to experience confusion around gender identity that is inconsistent with a diagnosis of gender dysphoria. However, once properly assessed and the other conditions are properly managed, the presence of these diagnoses is not a contraindication to provide medical care to adolescents with gender dysphoria.

79. For transgender adolescents, the onset of puberty is often a painful and sometimes traumatic experience that brings increased dysphoria and the

potential development of a host of comorbidities including depression, anxiety, substance abuse, self-harming behaviors, social isolation, high-risk sexual behaviors, and increased suicidality. It is notable that Dr. Levine acknowledges that many transgender adults have derived significant benefit from gender affirming medical and surgical care but fails to recognize that all transgender adults were once adolescents and that much of the stigma faced by transgender adults that he recognizes as a source of distress and dysfunction would be avoided had they had access to this care during adolescence.

80. Some transgender people who do not come forward until adolescence may have experienced symptoms of gender dysphoria for long periods of time but have been uncomfortable disclosing those feelings to parents. Other transgender people do not experience distress until they experience the physical changes accompanying puberty. In either case, gender-affirming care requires a comprehensive assessment and evidence of persistent, sustained gender dysphoria before medical treatment is recommended.

81. Gender-affirming treatment also requires a careful and thorough assessment of a patient's mental health, including co-occurring conditions, history of trauma, and substance use, among many other factors (Olson-Kennedy, et al., 2019; Edwards-Leeper and Spack, 2012). As a result, I have had patients who presented with some symptoms of gender dysphoria, but who ultimately did not meet

the diagnostic criteria for a variety of reasons, and therefore I recommended treatments other than transition to alleviate their psychological distress. I have also seen patients that did meet the diagnostic criteria for gender dysphoria but had mental health impairments that precluded proceeding with gender affirming hormonal and surgical care.

82. Studies on transgender young people have long reported data on co-occurring conditions, including some of my own (e.g., Janssen, et al., 2019; Olson, et al., 2015; Reisner, et al., 2015; Spack, et al., 2012; Mustanski, et al., 2010).

83. The existence—and prevalence—of co-occurring conditions among transgender young people is unsurprising. Transgender young people must cope with many stressors, from the fear of rejection by family and peers to pervasive societal discrimination. Not to mention, their underlying gender dysphoria can cause significant psychological distress which, if left untreated, can result in or exacerbate the co-occurring conditions identified in studies on transgender young people (van der Miesen, et al., 2020; Turban, et al., 2021). And, given that transgender young people typically delay disclosing their transgender status or initially experience family rejection following disclosure, it is not uncommon for transgender young people to engage with psychological or psychiatric care for other reasons prior to being diagnosed with gender dysphoria.

84. Transgender young people, however, are not outliers in this regard. Research and clinical experience show that most psychiatric conditions are highly correlated with other co-occurring psychiatric conditions. For example, young people with depression are very likely to have at least one other diagnosable condition, most often anxiety (Costello, et al., 2003). Likewise, a study on children diagnosed with Attention-Deficit/Hyperactivity Disorder found between 74-79% participants had additional co-occurring psychiatric conditions (Wilens, et al., 2002).

85. Requiring that a transgender patient resolve all co-occurring conditions, many of which are chronic with no reasonable expectation that they be "resolved," prior to receiving gender-affirming care is not possible, nor is it ethical. No relevant organizations cite the need for co-occurring mental health conditions to be resolved before a patient may receive gender-affirming care. Rather, such conditions should be reasonably well-controlled and not impair the ability of the patient to make an informed decision or interfere with the accuracy of the diagnosis of gender dysphoria. Indeed, some co-occurring conditions (for example, Attention Deficit Hyperactivity Disorder and Autism Spectrum Disorder, to name a few) could be chronic disorders where complete resolution is impossible and the goal of treatment is mitigating harm and improving functioning.

86. WPATH SOC 8 recommends that "mental health professionals address mental health symptoms that interfere with a person's capacity to consent to gender-

affirming treatment before gender-affirming treatment is initiated," but note that "mental health symptoms such as anxiety or depressive symptoms that do not affect the capacity to give consent should not be a barrier for gender-affirming medical treatment, particularly as this treatment has been found to reduce mental health symptomatology" (Coleman, et al., 2022). Indeed, SOC 8's chapter on adolescents specifically notes that "while addressing mental health concerns is important during the course of treatment, it does not mean all mental health challenges can or should be resolved completely" (Coleman, et al., 2022).

87. The Endocrine Society Guidelines similarly provide that because gender dysphoria "may be accompanied with psychological or psychiatric problems," "in cases in which severe psychopathology" "interfere[s] with diagnostic work or make[s] satisfactory treatment unlikely, clinicians should assist the adolescent in managing these other issues" (Hembree, et al., 2017). The Guidelines thus require that these issues be managed, not resolved.

88. Gender dysphoria, by definition, is accompanied by clinically significant psychological distress. That distress can take on many different forms (e.g., anxiety, mood disorders, and depression) and vary greatly in severity, resulting in co-occurring conditions. Because psychological distress is not easily compartmentalized, the distress associated with gender dysphoria can also amplify co-occurring conditions that developed independently of the gender dysphoria. In

either situation, gender dysphoria limits the effectiveness of treatment of any co-occurring mental health conditions. Thus, treating the underlying gender dysphoria is essential to alleviating the psychological distress associated with co-occurring conditions.

G. Efficacy of Gender-Affirming Treatment for Gender Dysphoria in Adolescents

89. "For some youth, obtaining gender-affirming medical care is important while for others these steps might not be necessary." (Coleman, et al., 2022). In my clinical experience, some adolescent patients have a critical need for medical interventions at or at some point after the onset of puberty and others do not. As with all medical interventions, it is highly individualized and responsive to the particular medical and mental health needs of each patient as well as the understanding and preferences of the legal guardians who ultimately make these healthcare decisions.

90. The criticisms of gender-affirming care for adolescents by Dr. Levine and Defendants' other designated experts reflect a distorted interpretation of the relevant scientific literature and what gender-affirming care is. Despite Dr. Levine's and Defendants' other designated experts' suggestion to the contrary, there is no "watchful waiting" approach for transgender adolescents. Even practitioners who oppose social transition in childhood provide gender-affirming care for transgender

adolescents, including puberty-delaying medication and gender-affirming hormone treatments for gender dysphoria (Turban, et al., 2018; Ehrensaft, 2017).

91. Dr. Levine and Defendants' other designated experts criticize the methodology of studies supporting gender-affirming care while proposing a "therapy only" treatment without any empirical or scientific support whatsoever. They also fail to understand that not all patients in a gender-affirming model of care will initiate medical or surgical care. The difference is that in the affirming care model, those decisions are made in concert with the young person and their family.

92. Adolescents with gender dysphoria who have entered puberty may be prescribed puberty-delaying medications (GnRHa) to prevent the distress of developing permanent, unwanted physical characteristics that do not align with the adolescent's gender identity. Puberty-delaying medications allow the adolescent time to better understand their gender identity, while delaying distress from the progression of the development of secondary sex characteristics such as breasts or facial hair.

93. Prior to initiation of puberty-delaying medications, providers counsel patients and their families extensively on potential benefits and risks. The intended benefit of treatment is to reduce the risk of worsening gender dysphoria and mental health deterioration. More specifically, use of puberty-delaying medications in transmasculine adolescents allows for decreased chest development, reducing the

need for breast binding and surgical intervention in adulthood. For transfeminine adolescents, puberty-delaying medications limit facial and body hair growth, voice deepening, and masculine bone structure development, which greatly reduce distress both at the time of treatment and later in life and reduce the need for later interventions such as voice therapy, hair removal, and facial feminization surgery. The goal in using puberty-delaying medications is to minimize the patient's dysphoria related to progression of puberty and allow for later initiation of puberty consistent with gender identity. The pubertal stage and individual needs of the patient direct conversations regarding care options.

94. A growing body of evidence, including peer-reviewed cross-sectional and longitudinal studies, demonstrates the positive impact of pubertal suppression in adolescents with gender dysphoria on psychological functioning and quality of life, including a decrease in behavioral and emotional problems, a decrease in depressive symptoms, and improvement in general functioning (e.g., Achille, et al., 2020; Turban, et al., 2020a; van der Miesen, et al., 2020; Costa, et al., 2015; de Vries, et al., 2011b). Furthermore, studies show improvements in body satisfaction with gender-affirming treatment, and the extant literature recognizes that the body satisfaction is a mediator for improved quality of life and mental health outcomes. (Chen, et al., 2023).

95. In my own practice, I have had patients describe pubertal suppression as life saving and a vast majority have experienced a great deal of relief when the treatment is initiated. In contrast to Dr. Levine's assertion that starting pubertal suppression is a one-way road to hormones, I have also had patients who, through gender affirming psychotherapy, came to understand their gender identity to be congruent with their sex assigned at birth and discontinued this treatment with a resumption of puberty. While each patient and each family is unique, a thorough assessment and a clear discussion of the risks, benefits and alternatives of this interventions is consistent among all of my patients.

96. After ongoing work with mental health professionals and when the adolescent has lived in accordance with their gender identity for a significant period of time, they may start treatment with hormones (testosterone for transgender boys, estrogen and testosterone suppressants for transgender girls), if and when medically indicated.

97. There is no credible basis for Dr. Levine's assertion that an adolescent's decision to begin puberty-blocking medication "act[s] as a psychosocial 'switch,' decisively shifting many children to a persistent transgender identity." (Levine Report, ¶133). Studies showing that a high percentage of transgender adolescents who receive puberty blockers ultimately decide to move forward with gender-affirming hormone therapy more likely reflect the fact that participants were

rigorously screened and had demonstrated sustained, persistent gender dysphoria before receiving medical treatment.

98. Eligibility and medical necessity are determined case-by-case, based on an assessment of the adolescent's unique cognitive and emotional maturation and ability to provide a knowing and informed assent in addition to the informed consent of the legal medical decision maker, most often the parent or guardian. The decision would be made only after a careful review with the youth and parents/guardians of the potential risks and benefits of hormone therapy.

99. Under SOC 8 and the Endocrine Society Clinical Guidelines, hormone therapy is an appropriate treatment for transgender adolescents with gender dysphoria when the experience of dysphoria is marked and sustained over time, the adolescent demonstrates emotional and cognitive maturity required to provide and informed consent/assent for treatment, other mental health concerns (if any) that may interfere with diagnostic clarity and capacity to consent have been addressed, and the adolescent has discussed reproductive options with their provider. SOC 8 also highlights the importance of involving parent(s)/guardian(s) in the assessment and treatment process for minors (Coleman, et al., 2022; Hembree, et al., 2017).

100. As with puberty-delaying medications, the risks and benefits of hormone treatment are discussed with the patient and their families, prior to initiation of gender affirming hormone therapy.

101. And, as with the use of puberty-delaying medications, treatment of gender dysphoria with testosterone or estrogen is highly beneficial for both short-term and long-term psychological functioning of adolescents with gender dysphoria and withholding treatment from those who need it is harmful (e.g., Achille, et al., 2020; Allen, et al., 2019; Chen, et al., 2023; de Lara, et al., 2020; de Vries, et al., 2014; Grannis, et al., 2021; Green, et al., 2022; Kaltiala, et al., 2020; Kuper, et al., 2020).

102. In my own practice, I have seen youth with severe gender dysphoria who avoided all social contacts who were able to thrive with the initiation of gender affirming hormones and feel confident with the changes seen as they developed secondary sex characteristics aligned with their gender identity. I have seen my patients start hormones and find themselves more able to build social and romantic relationships, and begin to address underlying co-occurring psychiatric disorders.

103. For some older transgender adolescents, surgery may be provided prior to age 18 if medically indicated (typically, chest surgery for transgender male adolescents). Peer-reviewed research has also shown improvements in mental health following gender-affirming chest surgery for transgender males with gender dysphoria where medically indicated (Mehringer, et al., 2021; Olson-Kennedy, et al., 2018).

104. As part of the treatment process for gender dysphoria, adolescent patients provide assent to their care, while their parents or guardians provide informed consent. In addition, a treating doctor will not offer gender-affirming medical treatments unless they have concluded after weighing the risks and benefits of care for the specific patient that treatment is appropriate. The risks and benefits of care are discussed with the adolescent patient and their family. This process is no different than the informed consent process for other medical treatments. However, for gender-affirming medical care, there is the additional safeguard of the recommended assessments by a mental health care professional, who must not only be experienced in the assessment of gender dysphoria, but also in the assessment of a patient's capacity to consent/assent to treatment and ability to understand the risks and benefits of treatment. Indeed, SOC 8 notes that mental health professionals are the best positioned practitioners to conduct these assessments for adolescents and also recommends that a mental health professional address any mental health issues that may interfere with a patient's ability to consent prior to the initiation of gender-affirming care.

105. Dr. Levine and Dr Kaliebe fail to discuss many of the studies documenting the benefits of puberty-delaying medication and gender-affirming hormone therapy (Chen, et al., 2023; de Vries, 2023). When viewed as a comprehensive body of research, the weight of the evidence and the experience of

clinicians as well as from the experience of patients has demonstrated that puberty-delaying medication and hormones have been associated with a variety of mental health benefits across different contexts (Chen, et al., 2023).

106. Dr. Levine and Dr. Kaliebe also criticize the quality of evidence supporting treatment of gender dysphoria. (*See*, *e.g.*, Levine Report, at ¶¶136-141; Kaliebe Report, at 45-70). But treatments for gender dysphoria have the same or similar level of evidentiary support as many other well-established treatment protocols in psychiatry—and other disciplines of medicine. The evidentiary basis for those treatment protocols is developed, and regularly updated, using a combination of peer-reviewed research and the extensive clinical experience of providers who regularly treat patients with that condition. Those treatment protocols are considered the standard of care and are safe and effective for the conditions they are intended to treat.

107. Dr. Levine also suggests that the lack of FDA approval of gender-affirming medical treatments for these specific uses indicates that the treatments are not supported by evidence of safety. (*See*, *e.g.*, Levine Repport, ¶179). But off-label use of medication is common in medicine, especially treatments for children and adolescents. For example, in children, Zoloft is FDA approved to treat Obsessive-Compulsive Disorder, but is also regularly used to treat depression and anxiety, such that the use of Zoloft is considered the standard of care for children who require

medication to treat those conditions despite the lack of FDA approval for those indications.

108. In their reports, Dr. Levine and Dr. Kaliebe present a distorted picture of the gender affirming model of care where they imply that gender-affirming care requires the unquestioned and automatic affirmation of an adolescent's desires. But gender-affirming medical care such as GAH is only provided to an adolescent after working with the adolescent and their parents/guardians, who are the ones who provide the informed consent. Indeed, in my practice, I have had patients with unrealistic expectations of the impact of testosterone or estrogen including on a belief that initiation of gender affirming medical care would eradicate any co-occurring psychiatric disorders despite many of these being chronic and predating any symptoms of gender dysphoria. But in accordance with SOC 8 and Endocrine Society Guidelines, the gender-affirming model of care requires that these patients be provided with additional psychotherapy and psychoeducation to determine the appropriateness of moving forward, and for some of these youth a delay in initiation of hormones, or even potentially a recommendation to not pursue hormones, is aligned with the gender affirming model of care.

H. Assessment and Treatment of Gender Dysphoria in Adults

109. In the DSM-5, the diagnostic criteria for Gender Dysphoria are shared by adolescents and adults. The assessment and treatment of a gender dysphoric adolescent is very similar to the assessment of the gender dysphoric adult.

110. As with any condition that typically presents with symptoms in childhood or adolescence, collateral information from caregivers, partners, employers, etc. is often useful in informing the initial diagnostic assessment. For children and adolescents, the legal structures of consent and assent as well as best practice and ethics of care require parental involvement in ongoing mental health care, and standard practice is to gather history of the child from the parent and guardian. For adults, the individual patient can make decisions about whom they want involved in their care. That said, the assessment process of gathering a detailed history and developing a biopsychosocial assessment takes the same factors into account as one does with adolescents. And similar to adolescents, the risks, benefits and alternatives to social transition, hormonal care and surgical options are weighed in collaboration with the patient prior to making any recommendations. The evidence supporting this process of assessment and care is documented in the plaintiffs' experts' reports.

111. Despite that the Challenged Exclusion impacts the ability of both adolescent and adult Medicaid beneficiaries to get coverage, and therefore get

access, to medical treatment for gender dysphoria, neither Drs. Levine nor Kaliebe address the impact of losing access to medical care for transgender adults in the state of Florida. This same flaw characterizes all of the defendants' designated experts' reports, as well as the GAPMS Memo itself.

112. Their reports focus primarily on pre-pubertal youth, which are not subject to this ban, and seek to call into question practices in assessing and treating transgender adolescents. This report seeks to rebut their mischaracterization of the current standard of care for transgender adolescents as well as the mischaracterization of the current standard of care for transgender adults. However, neither expert in their report sought to undermine the evidence base for the treatment of transgender adults and Dr. Levine even acknowledges the benefit of hormonal and surgical care for some adults.

I. Additional Responses to Defendants' Designated Experts

113. In his report, Dr. Kaliebe states that the Chen et al. study did not address the suicides in the study population and that "the most research shows a much higher than expected rate of suicide in the condition of affirmative hormone treatment." (Kaliebe Repport, at ¶70). This is not true. For one, the Chen et al. study looked at the study population at baseline (pre-intervention), which shows that 66% endorsed lifetime suicidal ideation; 29% endorsed lifetime suicidal ideation with a plan, and a full 25% had reported having already had at least one suicide attempt prior to

engaging in care. This is not much different from the suicide completion rate in the Ghent clinic (5/235) compared to the NIH 4 site (2/315). For another, Dr. Kaliebe compares the study population in Chen et al. to apparent suicides of transgender youth purportedly associated with the Gender Identity Development Service (GIDS) in the United Kingdom. For these numbers, Dr. Kaliebe cites to a letter to the editor from a sociologist, not a peer-reviewed study or a letter from someone experienced in this care. But two of the GIDS youth never saw a doctor for gender-affirming care, and there is no evidence the two others were receiving care. What is more, even the letter to the editor Dr. Kaliebe cites states: "One final caveat is that these data shed no light on the question of whether counseling or endocrinological interventions—gonadotropin-releasing hormone agonist or cross-sex hormones—affect the risk of suicide." (Biggs, 2022).

114. Defendants' designated experts, including several who are not mental health professionals, continue to misconstrue the practice of psychiatry and misunderstand what occurs in a mental health assessment. They indicate that mental health clinicians believe without scrutiny what a patient is telling them on face value. In fact, mental health professionals are trained to assess not just the words being said, but also to recognize behaviors, gather collateral data from other informants, and assess the meaning of the inherent disparities between these various data points to help understand the patient's experience. These assessments require training and

skill which the non-mental health providers lack. As an example, it is not uncommon for a patient to deny suicidal intent despite having clear risk factors – this denial occurs even after some have been discovered post-suicide attempt. To argue that highly trained clinicians simply believe everything a patient says is a farce. Furthermore, many of the defendants' experts attempt to invalidate Gender Dysphoria, as well as nearly all psychiatric diagnoses because these diagnoses rely on a patient's description of their symptoms to make the diagnosis. Every mental condition, and many physical conditions, rely on the patient's self-expressed disclosure of phenomenology. Do migraines not exist because they require patient self-report? Is depression not a cause of disability unless there is a blood test to diagnose it? Did auto-immune encephalitis not exist as a phenomenon until the antibody test was developed? Mental health providers, as well as all physicians rely on patient reports of symptoms and an exercise of independent judgment based on training and experience to make a diagnosis.

115. Dr. Kaliebe criticizes AACAP for purportedly being inconsistent about the capacity of minors, suggesting there is a discrepancy between their arguments protecting adjudicated youth vis-à-vis the ability of transgender youth to obtain care. But this criticism has no basis and is more indicative of Dr. Kaliebe's lack of experience and familiarity with this field. In its amicus brief, AACAP argued the U.S. Supreme Court should have taken adolescents' mental capacity into account

when evaluating the question of whether adjudicated youth should be sentenced to life without the possibility of parole. Not only is the context of gender-affirming medical care entirely inapposite, but in such context, adolescents do not make decisions on their own. In order to access gender-affirming medical care, the adolescents work in conjunction with their parents/legal guardians and their doctors. And while adolescents provide assent to care, it is their parents/legal guardians who provide consent.

116. There appears to be a consistent lack of understanding of the consent process for pediatric medical care among the defendants' designated experts. This is most starkly demonstrated in Dr. Hruz's report. In his report, he highlights many potential reasons why adolescents may be unable to provide consent to gender affirming care. However, he neglects to understand that minors do not consent to gender affirming care. Parents/legal caregivers and at time the state maintain the capacity to consent on behalf of the adolescent, who depending on their age may provide assent. While his arguments are spurious, they are also irrelevant to the matter at hand.

117. Furthermore, there are also misstatements about the impact of psychiatric diagnoses on the capacity to consent. In Dr. Hruz's report, he notes "individuals with transgender identity who also have clinical depression or other serious psychiatric comorbidity may have limited capacity to objectively weigh

proposed clinical interventions with potentially irreversible consequences and would therefore fail to meet psychological abilities criteria." (Hruz Report, at ¶ 103). His reference justifying this sentence is an ethics analysis of participation in clinical research not in clinical care, and makes no reference to "psychological abilities criteria," which may sound official but has no bearing on evidence-based assessments of capacity to consent. Dr. Hruz further mischaracterizes Helmchen's paper which speaks specifically about excluding patients with "suicidal intentions" which is a separate phenomenology than clinical depression.

118. Similarly, Dr. Lappert reports "as is known by all surgeons, it is considered imprudent to obtain informed consent from patients suffering from psychological conditions that provoke the patient to acts of self-harm, or to suicidal ideation." (Lappert Report, at ¶69). This uncited assertion is drawn from ignorance about the capacity to consent to care for psychiatric patients. First, capacity to consent is specific to the intervention at hand. While a patient with suicidal ideation may lack capacity to end life-saving medical care, they may still retain capacity to consent to an appendectomy. To assume that all patients with psychiatric illness lack capacity to consent across all contexts is both unfounded and unethical.

119. Even in the context of clinical research, when the question of retention of capacity is actually studied as opposed to assumed it is of concern, individuals with both severe depression and schizophrenia demonstrate relatively high-decision

making capacity as measured by the MacArthur Competence Assessment Tool-Clinical Research (Cohen, et al., 2004).

120. Dr. Kaliebe makes an assertion that medical academies are delegitimizing and politicizing care by convening expert committees to advise the organization on a topic. But this is well within the norms of academic medicine and speaks to a wish to be informed by experts in the field; it is not evidence of malfeasance. Speaking from personal experience as a member of several committees on transgender health, professional disagreements and debates about approaches, practices and priorities for care and research are commonplace, and dissenting opinions are welcomed, particularly when informed by their own expertise and a fair review of the literature.

121. Dr. Laidlaw makes many of the same mistakes about consent as the other experts, namely mistaking that children consent to gender affirming medical and surgical care. But he goes further and notes that in his opinion, even parents are unable to provide consent because the full accounting of the potential risks is, according to him, unknown. If Dr. Laidlaw's rubric were to be applied to the rest of medicine, medicine would never evolve. There are inherent unknown risks to every intervention, and it is the role of the provider to incorporate what is known and what is not known about these risks into a discussion about informed assent and informed consent. Moreover, the fact that we do not know *everything* about an intervention

does not make that intervention experimental. In medicine and in science, every day we discover something and with the advent of new techniques or investigative tools we are able to learn new information about the effects of well-established and longstanding medical interventions. None of this renders a medical intervention to be experimental.

122. Additionally, Dr. Laidlaw spends much of his report opining on the appropriateness of the psychiatric care of the patients involved in this case. However, Dr. Laidlaw is not a psychiatrist and has no authority to comment on the psychiatric care of either patient. It is unethical for him to do so.

J. Prohibiting Access to Gender-Affirming Care Harms Transgender People

123. Defendants' experts completely ignore the harms associated with prohibiting access to gender-affirming care to adolescents and adults with gender dysphoria for whom it is necessary and appropriate. They also ignore the harmful effects of governmental like the Challenged Exclusion adopted by Defendants.

124. The overarching goal of treatment for gender dysphoria is to eliminate clinically significant distress. For some, this is achieved by aligning an individual patient's body and presentation with their internal sense of self. The denial of medically indicated care to transgender adolescents and adults not only frustrates this goal and results in the prolonging of their gender dysphoria, but also causes

additional distress and poses other health risks, such as depression, trauma, self-harm, and suicidality.

125. Defendants and their designated experts not only ignore the volumes of data showing the efficacy of gender-affirming medical care, but they also cannot deny that there are transgender adolescents that persist into transgender adults and who benefit from this care. But notwithstanding this latter undeniable fact neither Defendants nor their designated experts are interested in a nuanced discussion about prevalence, process, or technique, instead they advocate for a complete bar to the coverage of this safe, efficacious, and medically necessary care for *all* transgender adolescents and adults.

126. Lack of access to gender-affirming care therefore directly contributes to poorer mental health outcomes for transgender people (Owen-Smith, et al., 2018).

127. It is also well documented that experiencing discrimination has negative impacts on people's mental health and wellbeing. For example, a 2019 study found that experiencing discrimination in health care settings posed a unique risk factor for heightened suicidality among transgender individuals, a population already at heightened risk compared with the general population (Herman, et al., 2019). And of note, the 2022 National Survey on LGBTQ Youth Mental Health found that LGBTQ youth who had experienced discrimination based on sexual

orientation or gender identity had attempted suicide in the past year at nearly three times the rate as those who had not (19% vs. 7%) (The Trevor Project, 2022).

128. In addition, the 2022 National Survey on LGBTQ Youth Mental Health found that 93% of transgender and nonbinary youth said that they have worried about transgender people being denied access to gender-affirming medical care due to state or local laws (The Trevor Project, 2022).

129. Research has shown that the mere introduction, debate, and adoption of discriminatory laws and policies like the Challenged Exclusion negatively affects the mental health of transgender youth. A prospective study with sexual minority populations found that living in states with discriminatory policies was associated with a statistically significant increase in the number of psychiatric disorder diagnoses (Hatzenbuehler, et al., 2010). Other studies "shown that restrictive laws and policies are related to destructive health behaviors on the part of transgender individuals" (Cunningham, et al., 2022; Du Bois, et al., 2018).

130. Recent studies show the negative toll that anti-LGBTQ measures, like the Challenged Exclusion, and debates surrounding them have had on the mental health of transgender youth. For example, in a survey of youth in November 2022, 86% of transgender and nonbinary youth said that the debates about anti-transgender bills had negatively impacted their mental health (Movement Advancement Project, 2023; The Trevor Project and Morning Consult, 2023). And a study from 2022,

though with limitations, showed that the passage of anti-transgender bills is linked with Internet searches related to depression and suicide (Cunningham, et al., 2022).

131. Perhaps, more poignantly, those of us with clinical experience hear from our patients about how it feels to be targeted with this kind of legislation. As two of my transgender patients expressed to me within the past few weeks, "why does everyone hate me just for existing?" and "it's a hard time to be transgender right now."

CONCLUSION

132. By denying coverage and therefore access to necessary, safe, and effective medical care as treatment for gender dysphoria, the Challenged Exclusion endangers the mental health and well-being of transgender Medicaid beneficiaries in Florida.

133. Defendants and their designated experts, who for the most part have no experience in transgender health, not only ignore the robust evidence for the potential harm faced by transgender individuals when barred access to medically necessary gender-affirming care, but they also mischaracterize, misapprehend, and even ignore the robust body of evidence showing that gender-affirming medical care is safe, effective, and not experimental or investigational.

I declare under penalty of perjury under the laws of the United States of America that the foregoing is true and correct.

Executed this 9th day of March 2023.

Personal Data

Born	Papillion, Nebraska
Citizenship	USA

Academic Appointments

2011-2017	Clinical Assistant Professor of Child and Adolescent Psychiatry
2011-2019	Founder & Clinical Director, NYU Gender and Sexuality Service Director, LGBT Mental Health Elective, NYULMC
2015-2019	Co-Director, NYU Pediatric Consultation Liaison Service New York University Department of Child and Adolescent Psychiatry
2017-present	Clinical Associate Professor of Child and Adolescent Psychiatry
2019-present	Vice Chair, Pritzker Department of Psychiatry and Behavioral Health Ann and Robert H. Lurie Children's Hospital of Chicago
2020-present	Medical Director, Outpatient Psychiatric Services Ann and Robert H. Lurie Children's Hospital of Chicago

Education

Year	Degree	Field	Institution
6/97	Diploma		Liberty High School
5/01	B.A.	Biochemistry	University of Colorado
5/06	M.D.	Medicine	University of Colorado

Postdoctoral Training

2006-2009	Psychiatry Residency	Ze'ev Levin, M.D.	NYU Department of Psychiatry
2009-2011	Child and Adolescent Psychiatry Fellowship – Fellow and Clinical Instructor		
		Jess Shatkin, M.D.	NYU Dept of Child/Adolescent Psychiatry

Licensure and Certification

2007-2018	New York State Medical License
2017-present	Illinois Medical License
2011-present	Certification in Adult Psychiatry, American Board of Psychiatry and Neurology
2013-present	Certification in Child and Adolescent Psychiatry, ABPN

Academic Appointments

2009-2011	Clinical Instructor, NYU Department of Child and Adolescent Psychiatry
2011-2017	Clinical Asst Professor, NYU Dept of Child and Adolescent Psychiatry
2017-2019	Clinical Assoc Professor, NYU Dept of Child and Adolescent Psychiatry
2011-2019	Clinical Director, NYU Gender and Sexuality Service
2015-2019	Co-Director, NYU Pediatric Consultation-Liaison Service
2019-present	Associate Professor of Child and Adolescent Psychiatry, Northwestern University
2019-present	Vice Chair of Clinical Affairs, Pritzker Department of Psychiatry and Behavioral Health, Lurie Children's Hospital of Chicago

Major Committee Assignments

International, National and Regional

2021-present	Sexual Orientation and Gender Identity Committee, Chair, AACAP
2019-present	WPATH Standards of Care Revision Committee, Children
2019-present	WPATH Standards of Care Revision Committee, Adult Mental Health
2015-2019	Department of Child Psychiatry Diversity Ambassador
2013-2021	Sexual Orientation and Gender Identity Committee Member, AACAP
2012-2019	Founder and Director, Gender Variant Youth and Family Network
2012-present	Association of Gay and Lesbian Psychiatrists, Transgender Health Committee
2012-2019	NYULMC, Chair LGBTQ Advisory Council
2012-2019	NYULMC, Child Abuse and Protection Committee
2013-2015	NYULMC, Pediatric Palliative Care Team
2003-2004	American Association of Medical Colleges (AAMC), Medical Education Delegate
2004-2006	AAMC, Western Regional Chair

Psychiatry Residency

2006-2009	Resident Member, Education Committee
2007-2008	Resident Member, Veterans Affairs (VA) Committee

Medical School

2002-2006	Chair, Diversity Curriculum Development Committee
2002-2006	AAMC, Student Representative
2003-2004	American Medical Student Assoc. (AMSA) World AIDS Day Coordinator
2003-2004	AMSA, Primary Care Week Coordinator
2004-2006	Chair, Humanism in Medicine Committee

Memberships, Offices, and Committee Assignments in Professional Societies

2006-present	American Psychiatric Association (APA)
2009-present	American Academy of Child and Adolescent Psychiatry (AACAP)
2011-present	World Professional Association for Transgender Health (WPATH)
2011-2019	Director, Gender Variant Youth and Family Network, NYC
2013-2019	Chair, NYU Langone Medical Center LGBTQ Council

Editorial Positions

2016-2018	Clinical Assistant Editor, *Transgender Health*
2014-present	Ad Hoc Reviewer, *LGBT Health.*
2016-present	Ad Hoc Reviewer, *JAACAP*
2018-present	Associate Editor, *Transgender Health*
2020-present	Ad Hoc Reviewer, *Pediatrics*

Principal Clinical and Hospital Service Responsibilities

2011-2019	Staff Psychiatrist, Pediatric Consultation Liaison Service
2011-2019	Faculty Physician, NYU Child Study Center
2011-2019	Founder and Clinical Director, NYU Gender & Sexuality Service
2015-2019	Co-Director, Pediatric Consultation Liaison Service
2019-present	Vice Chair, Pritzker Dept of Psychiatry and Behavioral Health
2019-present	Chief Psychiatrist, Gender Development Program

2020-present Medical Director, Outpatient Psychiatry Services

Relevant Program Development

Gender and Sexuality Service

-founded by Aron Janssen in 2011, who continues to direct the service
-first mental health service dedicated to transgender youth in NYC
-served over 200 families in consultation, with 2-3 referrals to the gender clinic per week
-trained over 500 mental health practitioners in transgender mental health – 1 or 2 full day trainings in partnership with the Ackerman Institute's Gender and Family Project (GFP) and with WPATH Global Educational Initiative (GEI)
-New hires in Adolescent Medicine, Psychology, Plastic Surgery, Urology, Gynecology, Endocrinology, Social Work, Department of Population Health with focus on transgender care has led to expansion of available services for transgender youth at NYULMC in partnership with the Gender and Sexuality Service
-development of partnerships with Ackerman Institute, Callen-Lorde Health Center – both institutions have been granted access to our IRB and have agreed to develop shared research and clinical priorities with the Gender and Sexuality Service.
-multiple IRB research projects underway, including in partnership with national and international clinics
-model has been internationally recognized

Clinical Specialties/Interests

Gender and Sexual Identity Development
Co-Occurring Mental Health Disorders in Transgender children, adolescents and adults
Pediatric Consultation/Liaison Psychiatry
Psychotherapy
-Gender Affirmative Therapy, Supportive Psychotherapy, CBT, MI

Teaching Experience

2002-2006 Course Developer and Instructor, LGBT Health (University of Colorado School of Medicine
2011-2019 Instructor, Cultural Competency in Child Psychiatry (NYU Department of Child and Adolescent Psychiatry) – 4 hours per year
2011-2019 Course Director, Instructor "Sex Matters: Identity, Behavior and Development" – 100 hours per year
2011-2019 Course Director, LGBT Mental Health Elective (NYU Department of Psychiatry) - 50 hours of direct supervision/instruction per year
2011-2019 Course Director, Transgender Mental Health (NYU Department of Child and Adolescent Psychiatry – course to begin in Spring 2018.
2015-2019 Instructor, Gender & Health Selective (NYU School of Medicine) – 4 hours per year.

Academic Assignments/Course Development

New York University Department of Child and Adolescent Mental Health Studies

-Teacher and Course Director: "Sex Matters: Identity, Behavior and Development." A full semester 4 credit course, taught to approximately 50 student per year since 2011, with several students now in graduate school studying sexual and gender

identity development as a result of my mentorship.

NYU Department of Child and Adolescent Psychiatry
-Instructor: Cultural Competency in Child and Adolescent Psychiatry
-Director: LGBTQ Mental Health Elective
World Professional Association of Transgender Health
-Official Trainer: Global Education Initiative – one of two child psychiatrists charged with training providers in care of transgender youth and adults.

Invited Academic Seminars/Lectures

1. April 2006: "How to Talk to a Gay Medical Student" – presented at the National AAMC Meeting.
2. March 2011: "Kindling Inspiration: Two Model Curricula for Expanding the Role of Residents as Educators" – workshop presented at National AADPRT Meeting.
3. May 2011: Janssen, A., Shuster, A., "Sex Matters: Identity, Behavior and Development," Grand Rounds Presentation, NYU Department of Child and Adolescent Psychiatry.
4. March 2012: Janssen, A., Lothringer, L., "Gender Variance in Children and Adolescents," Grand Rounds Presentation, NYU Department of Child and Adolescent Psychiatry.
5. June 2012: Janssen, A., "Gender Variance in Childhood and Adolescence," Grand Rounds Presentation, Woodhull Department of Psychiatry
6. October 2012: "Advocating for the mental health of Lesbian, Gay, Bisexual and Transgender (LGBT) population: The Role of Psychiatric Organizations." Workshop for the American Psychiatric Association Institute of Psychiatric Services Annual Meeting.
7. March 2013: "Gender Variance in Childhood and Adolescence," Sexual Health Across the Lifespan: Practical Applications, Denver, CO.
8. October 18th, 2013: "Gender Variance in Childhood and Adolescence," Grand Rounds Presentation, NYU Department of Endocrinology.

9. October, 2014: GLMA Annual Conference: "Theory of Mind and Intolerance of Ambiguity: Two Case Studies of Transgender Individuals with High-Functioning ASD," Invited Presentation
10. October 2014: New York Transgender Health Conference: "Mental Health Assessment in Gender Variant Children," Invited Presentation.
11. November, 2014: Gender Spectrum East: "Affirmative Clinical Work with Gender-Expansive Children and Youth: Complex Situations."
12. October 2015: "Gender Dysphoria and Complex Psychiatric Co-Morbidity," LGBT Health Conference, Invited Speaker
13. October 2015: "Transgender Health Disparities: Challenges and Opportunities," Grand Rounds, Illinois Masonic Department of Medicine
14. November 2015: "Autism and Gender Variance," Gender Conference East, Invited Speaker
15. February 2016: "Working with Gender Variant Youth," New York State Office of Mental Health State Wide Grand Rounds, Invited Speaker
16. March, 2016: "Working with Gender Variant Youth," National Council for Behavioral Health Annual Meeting, Invited Speaker
17. March 2016: "Gender Variance Among Youth with Autism: A Retrospective Chart Review and Case Presentation," Working Group on Gender, Columbia University, Invited Speaker.
18. September, 2016: "Best Practices in Transgender Mental Health: Addressing Complex Issues for Gender Dysphoric and Non-Conforming Youth," DeWitt Wallace Institute for the History of Psychiatry, Weill Cornell.
19. October, 2016: "LGBTQ Youth Psychiatric Care," Midwest LGBTQ Health Symposim
20. October, 2016: "Gender Fluidity and Gender Identity Development," NYU Health Disparities Conference.
21. February, 2017: "Best Practices in Transgender Mental Health," Maimonides Grand Rounds
22. March, 2017: "Transgender Health: Challenges and Opportunities," Invited speaker, Center for Disease Control STD Prevention Science Series.
23. September 2017: "Autism and Gender Dysphoria," Grand Rounds, NYU Department of Neurology.
24. November 2017: "Consent and Assent in Transgender Adolescents," Gender Conference East.
25. November 2017: "Transgender Mental Health: Challenges and Opportunities," Grand Rounds, Lenox Hill Hospital.
26. April 2018: "Gender Trajectories in Childhood and Adolescent Development and Identity," Sex, Sexuality and Gender Conference, Harvard Medical School.
27. September 2019: "Social and Psychological Challenges of Gender Diverse Youth," Affirmative Mental Health Care for Gender Diverse Youth, University of Haifa.
28. October 2019: "Best Practices in Transgender Mental Health," Grand Rounds, Rush Department of Psychiatry.
29. February 2020: "The Overlap of Autism and Gender Dysphoria," Grand Rounds, Northwestern University Feinberg School of Medicine Department of Psychiatry
30. February 2020: "Gender Dysphoria and Autism," Grand Rounds, University of Illinois at Chicago Department of Psychiatry
31. September 2021: "Gender Diversity and Autism," Grand Rounds, Kaiser Permanente Department of Pediatrics

32. October 2021: Gender Dysphoria and Autism," Grand Rounds, Case Western Reserve University Department of Psychiatry.

Selected Invited Community Seminars/Lectures

1. April 2012: "Gender and Sexuality in Childhood and Adolescence," Commission on Race, Gender and Ethnicity, NYU Steinhardt Speakers Series.
2. February 2013: "Supporting Transgender Students in School," NYC Independent School LGBT Educators Panel, New York, NY.
3. June 2013: "LGBT Health," Presentation for Neuropsychology Department
4. August 2013: "Chronic Fatigue Syndrome: Etiology, Diagnosis and Management," invited presentation.
5. September 2013: Panelist, "LGBTQ Inclusive Sex Education."
6. April 2015: Transgender Children, BBC News, BBCTwo, invited expert
7. January 2016: Gender Dysphoria and Autism – Ackerman Podcast - http://ackerman.podbean.com/e/the-ackerman-podcast-22-gender-dysphoria-autism-with-aron-janssen-md/
8. February 2016: "Best Practices in Transgender Mental Health," APA District Branch Meeting, Invited Speaker.
9. May 2016: "Best Practices in Transgender Mental Health," Washington D.C., District Branch, APA, Invited Speaker
10. July 2016: "Transgender Youth," Union Square West
11. November 2017: "Understanding Gender: Raising Open, Accepting and Diverse Children," Heard in Rye, Conversations in Parenting.
12. January 2018: "The Emotional Life of Boys," Saint David's School Panel, Invited Speaker
13. June 2018: "Supporting Youth Engaged in Gender Affirming Care," NYU Child Study Center Workshop.
14. October 2018: "Medicine in Transition: Advances in Transgender Mental Health," NYCPS HIV Psychiatry and LGBT Committee Meeting.
15. October 2018: "Understanding Gender Fluidity in Kids," NYU Slope Pediatrics.
16. October, 2021: Issues of Ethical Importance: Health Care for Pediatric LGBTQ+ Patients, American Medical Association, Invited Talk

Major Research Interests

Gender and Sexual Identity Development
Member, Research Consortium for Gender Identity Development
Delirium: Assessment, Treatment and Management
Suicide Prevention

Research Studies

Study Title	IRB Study#	Dates
Suicide Attempts Identified in a Children's Hospital Before and During COVID-19	2021-4428	2/26/21-present
Lurie Children's Sex & Gender Development Program Clinical Measure Collection	2019-2898	2019-present

Adolescent Gender Identity Research Study (principal investigator) - unfunded	s15-00431	4/15-5/19
Co-Occurrence of Autism Spectrum Disorders and Gender Variance: Retrospective Chart Review (principal investigator) - unfunded	s14-01930	10/14-5/19
Expert Consensus on Social Transitioning Among Prepubertal Children Presenting with Transgender Identity and/or Gender Variance: A Delphi Procedure Study (principal investigator) - unfunded	s13-00576	3/16-5/19
Co-Occurrence of ADHD/Gender Dysphoria (principal investigator) - unfunded	s16-00001	1/16-5/19
PICU Early Mobility- unfunded	s16-02261	12/16-5/19
Metformin for Overweight and Obese Children and Adolescents with Bipolar Spectrum Disorders Treated with Second-Generation Antipsychotics – Funded by PCORI	s16-01571	8/16-5/19

Other

Grant Funding:
Zero Suicide Initiative, PI Aron Janssen, M.D.
Awarded by Cardinal Health Foundation, 9/2020
Total amount: $100,000

Catalyst Fund, PI Aron Janssen, M.D.
Suicide Prevention in Pediatric Primary Care
Total amount: $750,000

Selected Media Appearances:

Guest Expert on Gender Identity on Anderson, "When Your Husband Becomes Your Wife," Air Date February 8th, 2012
Guest Host, NYU About Our Kids on Sirius XM, 2011

WPATH
WORLD PROFESSIONAL ASSOCIATION FOR TRANSGENDER HEALTH

Establishing the soc8 Revision committee and meet the chairs and lead evidence team

2.1 Establishing SOC Revision Committee Process

The Standards of Care 8 revision started by identifying a multidisciplinary team of clinicians, researchers and stakeholders using a clearly defined process. The following steps were followed to select the members of the SOC8 review committee:

2.1.1 Establish Guideline Steering Committee

The WPATH Guideline Steering Committee provided oversight of the guideline development process for all chapters of the Standards of Care. Except for the Chair (Dr Eli Coleman) who was selected by WPATH to provide continuity from previous SOC, the two co-chairs were selected by the WPATH Board from WPATH members applying for these positions. The Chairs of the Guideline Steering Committee:

- Appointed the Chapter Leads and Members for each chapter
- Selected topics for the chapters

The Guideline Steering Committee (chairs and Co-chairs) provided general oversight of the guideline development process. The Committee reviewed all chapters of the Standards of Care to confirm adherence to the WPATH guideline methodology and to ensure consistency of statements across the Standards of Care.

2.1.2 Nomination Procedures and selection for Co-Chairs

- A member of WPATH proposed a candidate for co-chair by sending a letter of nomination and the address of the recommended co-chair, to the Executive Director of the Society.
- A Member of WPATH could self-nominate, by sending a letter of self-nomination to the Executive Director of the Society.
- The Executive Director (ED) sent a membership application form, including a request for a curriculum vitae, to the nominated individual.
- The ED distributed copies of the nominating letter, completed application, and curriculum vitae to the Board of Directors.
- The BOD discussed each application and assigns a score in a blinded ballot only seen by the office staff across the application criteria with the three top candidates moving to the next round of voting.
- Any conflict of interest was declared and in the case of a conflict of interest, the conflicted person did not vote.
- The BOD discussed the nominees with the Chair, and best fit for the group was chosen.
- The ED corresponded with the candidate and the nominator regarding the action on each nomination.

2.1.2.1 Key Criteria Used for the Selection of Co-Chair on the SOC8 Revision Committee (2 positions)

- Longstanding WPATH Full Member in good standing
- Well recognized advocate for WPATH and the SOC
- Well known expert in transgender health
- Extensive experience in leading consensus building projects and guideline development
- Accomplished clinician, scholar, and researcher in trans health with a publication record
- Able to assess the evidence-based and peer review literature and peer and contribute specific recommendations from an evidence-based perspective
- Able to select and supervise chapter leads

2.1.2.1 Results

A total of 8 individuals applied for two positions and 2 people were selected, Dr. Asa Radix and Dr. Jon Arcelus.

2.1.3 Nomination and selection procedures for Chapter Leads

- A member of WPATH proposed a candidate for a chapter lead by sending a letter of nomination, including address of the recommended chapter lead (and indicated chapter(s)), to the Executive Director (ED) of the Society.
- A member of WPATH could self-nominate by sending a letter of self-nomination to the ED of the Society.
- The ED sent a membership application form, including a request for a curriculum vitae, to the nominated individual.
- The ED distributes copies of the nominating letter, completed application, and curriculum vitae to the Chair and Co-Chairs.
- The Chair and Co-Chairs discussed the applications and assign a score in a blinded ballot only seen by the office staff across the application criteria with the top 2 candidates moving to the next round of voting. The Chair and Co-Chairs discussed the top 2 candidates with the goal of selecting the best fit for the topic and the other members of the workgroup.
- The Chair and Co-Chairs informed the BOD of their decisions.
- The ED corresponded with the candidate and the nominator regarding the action on each nomination.

2.1.3.1 Key Criteria for Chapter Lead on the SOC Revision Committee

- WPATH Full Member in good standing
- Well recognized advocate for WPATH and the SOC
- Well known expert in transgender health
- Accomplished scholar and researcher in trans health with a publication record related to the chapter
- Accomplished clinician, scholar, and researcher in trans health with a publication record
- Able to assess the evidence-based literature and write chapters based on peer review or contribute

2.1.3.2 Results

A total of 39 applicants and 24 were selected.

2.1.4 Nomination Procedures and selection for Chapter Workgroup Members

- A member of WPATH proposed a candidate for a chapter workgroup member by sending a letter of nomination, including address of the recommended new member, to the Executive Director (ED) of the Society
- A member of WPATH could self-nominate, by sending a letter of self-nomination to the ED of the Society
- The ED sent a membership application form, including a request for a curriculum vitae, to the nominated individual.
- The ED distributed copies of the nominating letter, completed application, and curriculum vitae to the Chapter Leads.
- The Chair and Co-Chairs and Chapter Leads discuss the applications and assign a score in a blinded ballot only seen by the office staff across the application criteria with the top 5-7 candidates (number to be determined prior to voting) within each chapter being chosen.
- The Chair, Co-Chairs and Chapter Lead informed the BOD of their decisions.
- The ED corresponded with the candidate and the nominator regarding the action on each nomination.

2.1.4.1 Key Criteria for Chapter Workgroup Member on the SOC8 Revision Committee (5-7 people per chapter)

- WPATH Full Member in good standing
- Well known expert in transgender health
- Accomplished scholar and researcher in trans health with a publication record related to the chapter
- Able to assess the evidence-based literature and write chapters related to peer review or contribute specific recommendations from an evidence-based perspective
- Able and willing to work collaboratively with chapter leads and other committee members
- Applicants could apply to work on more than one workgroup and rank their chapter interests.

2.1.4.2 Results

A total of 149 applicants for workgroup members applied and 127 were selected (link it to a page with names of the chairs, leads)

2.1.5 Nomination and selection procedures for Chapter Stakeholder Members

- A member of WPATH proposed a candidate for a chapter workgroup member by sending a letter of nomination, including address of the recommended new member, to the Executive Director (ED) of the Society
- A person could self-nominate, by sending a letter of self-nomination to the ED of the Society
- The ED sent a committee membership application form, including a request for a curriculum vitae, to the nominated individual.
- The ED distributed copies of the nominating letter, completed application, and curriculum vitae to the Chapter Leads.

- The Chair and Co-Chairs and Chapter Leads discussed the applications and assign a score in a blinded ballot only seen by the office staff across the application criteria with the top 2 candidates (number to be determined prior to voting) per chapter being chosen.
- The Chair, Co-Chairs and Chapter Leads discussed the top 2 candidates and the best fit within each chapter group were chosen.
- The Chair, Co-Chairs and Chapter Lead informed the BOD of their decisions.
- The ED corresponded with the candidate and the nominator regarding the action on each nomination.

2.1.5.1 Key Criteria for Stakeholder Membership on the SOC8 Revision Committee

Our intent was that by involving experts (with or without lived experience) that work outside of the scientific publishing arena, we will be able to provide input from those working directly in community health or in policy making and in NGOs around the globe.

- Associate Members of WPATH (with or without lived transgender experience) and other individuals (with or without lived transgender experience) with expertise due to accomplishments in trans health advocacy and a history of work in the community, or a member of a family that includes a transgender child, sibling, partner, parent, etc.
- Able to review the drafts of the SOC committee and contribute specific recommendations from a community health perspective

2.1.5.2 Results

A total of 57 and 20 were selected.

2.1.6 Selection of the evidence review team

The WPATH Board released a request for proposals (RFP) for the WPATH Standards of Care 8th Version Evidence Review Team. The Board received four complete proposals in response to the RFP. After careful review and discussions of each submitted proposal, the WPATH Board selected and engaged an Evidence Review Team at Johns Hopkins University. Dr Karen Robinson was the lead of the evidence-based review.

Conflict of Interest

Members of the Guideline Steering Committee, Chapter Leads and Members, and members of the Evidence Review Team are asked to disclose any conflicts of interest. Also reported, in addition to potential financial and competing interests or conflicts, were personal or direct reporting relationships with a chair, co-chair or a WPATH Board Member or the holding of a position on the WPATH Board of Directors.

GRADE Handbook

Introduction to GRADE Handbook

Handbook for grading the quality of evidence and the strength of recommendations using the GRADE approach. Updated October 2013.

Editors: Holger Schünemann (schuneh@mcmaster.ca), Jan Brożek (brozekj@mcmaster.ca), Gordon Guyatt (guyatt@mcmaster.ca), and Andrew Oxman (oxman@online.no)

About the Handbook

The GRADE handbook describes the process of rating the quality of the best available evidence and developing health care recommendations following the approach proposed by the Grading of Recommendations, Assessment, Development and Evaluation (GRADE) Working Group (www.gradeworkinggroup.org). The Working Group is a collaboration of health care methodologists, guideline developers, clinicians, health services researchers, health economists, public health officers and other interested members. Beginning in the year 2000, the working group developed, evaluated and implemented a common, transparent and sensible approach to grading the quality of evidence and strength of recommendations in health care. The group interacts through meetings by producing methodological guidance, developing evidence syntheses and guidelines. Members collaborate on research projects, such as the DECIDE project (www.decide-collaboration.eu) with other members and other scientists or organizations (e.g. www.rarebestpractices.eu). Membership is open and free. See www.gradeworkinggroup.org and Chapter The GRADE working group in this handbook for more information about the Working Group and a list of the organizations that have endorsed and adopted the GRADE approach.

The handbook is intended to be used as a guide by those responsible for using the GRADE approach to produce GRADE's output, which includes evidence summaries and graded recommendations. Target users of the handbook are systematic review and health technology assessment (HTA) authors, guideline panelists and methodologists who provide support for guideline panels. While many of the examples offered in the handbook are clinical examples, we also aimed to include a broader range of examples from public health and health policy. Finally, specific sections refer to interpreting recommendations for users of recommendations.

Using the Handbook

The handbook is divided into chapters that correspond to the steps of applying the GRADE approach. The Chapter Overview of the GRADE approach provides a brief overview of guideline development processes and where the GRADE approach fits in. Chapters Framing the health care question and Selecting and rating the importance of outcomes provide guidance on formulating health care questions for guidelines and systematic reviews and for rating the importance of outcomes in guidelines. The Chapter Summarizing the evidence covers evidence summaries produced using the GRADE software. GRADE acknowledges that alternative terms or expressions to what GRADE called quality of evidence are often appropriate. Therefore, we interpret and will use the phrases quality of evidence, strength of evidence, certainty in evidence or confidence in estimates interchangeably. When GRADE uses the phrase "confidence in estimates" it does not refer to statistical confidence intervals, although the width of this interval is part of the considerations for judging the GRADE criterion imprecision. When GRADE refers to confidence in the estimates it refers to the how certain one can be that the effect estimates are adequate to support a recommendation (in the context of guideline development) or that the effect estimate is close to that of the true effect (in the context of evidence synthesis). Chapter Quality of evidence provides instructions for rating the evidence and addresses the five factors outlined in the GRADE approach that may result in rating down the quality of evidence and the three factors that may increase the quality of evidence. Chapter Going from evidence to recommendations deals with moving from evidence to recommendations in guidelines and whether to classify recommendations as strong or weak according to the criteria outlined in the GRADE evidence to recommendation frameworks. The Chapter The GRADE approach for diagnostic tests and strategies addresses how to use the GRADE approach specifically for questions about diagnostic tests and strategies. Finally, the Chapter Criteria for determining whether the GRADE approach was used provides the suggested criteria that should be met in order to state that the GRADE approach was used.

Throughout the handbook certain terms and concepts are hyperlinked to access definitions and the specific sections elaborating on those concepts. The glossary of terms and concepts is provided in the Chapter Glossary of terms and concepts. Where applicable, the handbook highlights guidance that is specific to guideline developers or to systematic review authors as well as important notes pertaining to specific topics. HTA practitioners, depending on their mandate, can decide which approach is more suitable for their goals. Furthermore, examples demonstrating the application of the concepts are provided for each topic. The examples are cited if readers wish to learn more about them from the source documents.

Updating the Handbook

The handbook is updated to reflect advances in the GRADE approach and based on feedback from handbook users. It includes information from the published documents about the GRADE approach, which are listed in the Chapter Articles about GRADE, and links to resources in the Chapter Additional resources.

We encourage users of the handbook to provide feedback and corrections to the handbook editors via email.

Accompanying software: GRADEpro and the Guideline Development Tool (GDT)

This handbook is intended to accompany the GRADE profiler (GRADEpro) – software to facilitate development of evidence summaries and health care recommendations using the GRADE approach –

integrated in the Guideline Development Tool (GDT) "Das tool". Please refer to www.guidelinedevelopment.org for more information.

Reproduction and translation

Acknowledgements

We would particularly like to acknowledge the contributions of Roman Jaeschke, Robin Harbour and Elie Akl to earlier versions of the handbook.

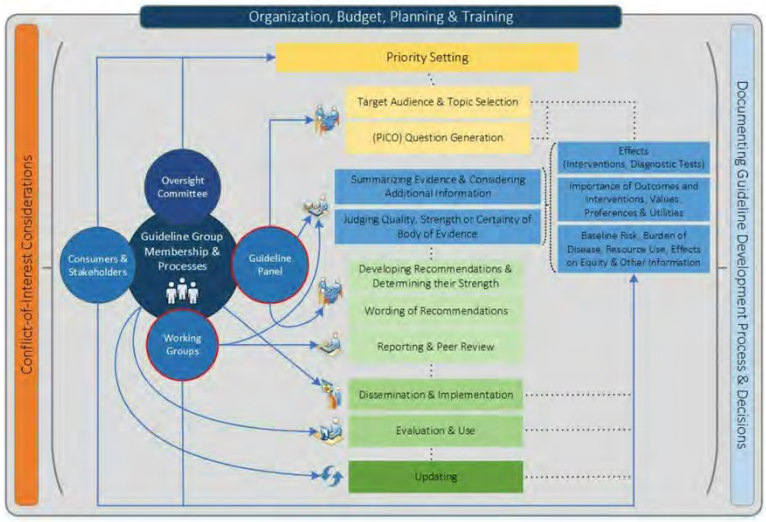
Chapter Authors and Editors

The following authors have made major contributions to the current version of the handbook: Elie Akl, Reem Mustafa, Nancy Santesso Wojtek Wiercioch, and. Many other members of the GRADE Working Group have also contributed to this handbook by providing feedback and through discussion.

1. Overview of the GRADE Approach

The GRADE approach is a system for rating the quality of a body of evidence in systematic reviews and other evidence syntheses, such as health technology assessments, and guidelines and grading recommendations in health care. GRADE offers a transparent and structured process for developing and presenting evidence summaries and for carrying out the steps involved in developing recommendations. It can be used to develop clinical practice guidelines (CPG) and other health care recommendations (e.g. in public health, health policy and systems and coverage decisions).

Figure 1 shows the steps and involvement in a guideline development process (Schünemann H et al., CMAJ, 2013).



Steps and processes are interrelated and not necessarily sequential. The guideline panel and supporting groups (e.g. methodologist, health economist, systematic review team, secretariat for administrative support) work collaboratively, informed through consumer and stakeholder involvement. They typically report to an oversight committee or board overseeing the process. For example, while deciding how to involve stakeholders early for priority setting and topic selection, the guideline group must also consider how developing formal relationships with the stakeholders will enable effective dissemination and implementation to support uptake of the guideline. Furthermore, considerations for organization, planning and training encompass the entire guideline development project, and steps such as documenting the methodology used and decisions made, as well as considering conflict-of-interest occur throughout the entire process.

The system is designed for reviews and guidelines that examine alternative management strategies or interventions, which may include no intervention or current best management as well as multiple comparisons. GRADE has considered a wide range of clinical questions, including diagnosis, screening, prevention, and therapy. Guidance specific to applying the GRADE approach to questions about diagnosis is offered in Chapter The GRADE approach for diagnostic tests and strategies

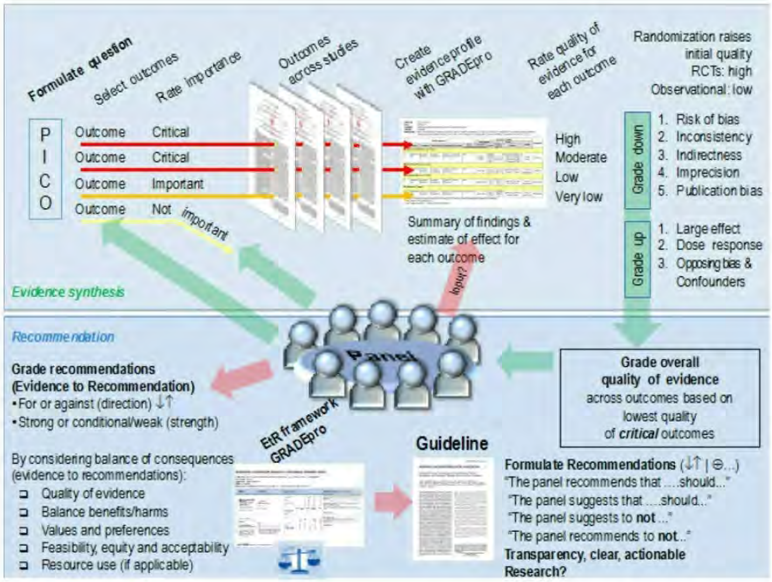
GRADE provides a framework for specifying health care questions, choosing outcomes of interest and rating their importance, evaluating the available evidence, and bringing together the evidence with considerations of values and preferences of patients and society to arrive at recommendations.

Furthermore, the system provides clinicians and patients with a guide to using those recommendations in clinical practice and policy makers with a guide to their use in health policy.

Application of the GRADE approach begins by defining the health care question in terms of the population of interest, the alternative management strategies (intervention and comparator), and all patient-important outcomes. As a specific step for guideline developers, the outcomes are rated according to their importance, as either critical or important but not critical. A systematic search is preformed to identify all relevant studies and data from the individual included studies is used to generate an estimate of the effect for each patient-important outcome as well as a measure of the uncertainty associated with that estimate (typically a confidence interval). The quality of evidence for each outcome across all the studies (i.e. the body of evidence for an outcome) is rated according to the factors outlined in the GRADE approach, including five factors that may lead to rating down the quality of evidence and three factors that may lead to rating up. Authors of systematic reviews complete the process up to this step, while guideline developers continue with the subsequent steps. Health care related related tests and strategies are considered interventions (or comparators) as utilizing a test inevitably has consequences that can be considered outcomes (see Chapter The GRADE approach for diagnostic tests and strategies).

Next, guideline developers review all the information from the systematic search and, if needed, reassess and make a final decision about which outcomes are critical and which are important given the recommendations that they aim to formulate. The overall quality of evidence across all outcomes is assigned based on this assessment. Guideline developers then formulate the recommendation(s) and consider the direction (for or against) and grade the strength (strong or weak) of the recommendation(s) based on the criteria outlined in the GRADE approach. **Figure 2** provides a schematic view of the GRADE approach.

Figure 2: A schematic view of the GRADE approach for synthesizing evidence and developing recommendations. The upper half describe steps in the process common to systematic reviews and making health care recommendations and the lower half describe steps that are specific to making recommendations (based on GRADE meeting, Edingburgh 2009).



For authors of systematic reviews:

Systematic reviews should provide a comprehensive summary of the evidence but they should typically not include health care recommendations. Therefore, use of the GRADE approach by systematic review authors terminates after rating the quality of evidence for outcomes and clearly presenting the results in an evidence table, i.e. an GRADE Evidence Profile or a Summary of Findings table. Those developing health care recommendations, e.g. a guideline panel, will have to complete the subsequent steps.

The following chapters will provide detailed guidance about the factors that influence the quality of evidence and strength of recommendations as well as instructions and examples for each step in the application of the GRADE approach. A detailed description of the GRADE approach for authors of systematic reviews and those making recommendations in health care is also available in a series of articles published in the Journal of Clinical Epidemiology. An additional overview of the GRADE approach as well as quality of evidence and strength of recommendations in guidelines is available in a previously published six-part series in the British Medical Journal. Briefer overviews have appeared in other journals, primarily with examples for relevant specialties. The articles are listed in Chapter 10. This handbook, however, as a resource that exists primarily in electronic format, will include GRADE's innovations and be kept up to date as journal publications become outdated.

1.1 Purpose and advantages of the GRADE approach

Clinical practice guidelines offer recommendations for the management of typical patients. These management decisions involve balancing the desirable and undesirable consequences of a given course of action. In order to help clinicians make evidence-based medical decisions, guideline developers often

grade the strength of their recommendations and rate the quality of the evidence informing those recommendations.

Prior grading systems had many disadvantages including the lack of separation between the quality of evidence and strength of recommendation, the lack of transparency about judgments, and the lack of explicit acknowledgment of values and preferences underlying the recommendations. In addition, the existence of many, often scientifically outdated, grading systems has created confusion among guideline developers and end users.

The GRADE approach was developed to overcome these shortcomings of previous grading systems. Advantages of GRADE over other grading systems include:

- Developed by a widely representative group of international guideline developers
- Clear separation between judging confidence in the effect estimates and strength of recommendations
- Explicit evaluation of the importance of outcomes of alternative management strategies
- Explicit, comprehensive criteria for downgrading and upgrading quality of evidence ratings
- Transparent process of moving from evidence to recommendations
- Explicit acknowledgment of values and preferences
- Clear, pragmatic interpretation of strong versus weak recommendations for clinicians, patients, and policy makers
- Useful for systematic reviews and health technology assessments, as well as guidelines

Note:

Although the GRADE approach makes judgments about quality of evidence, that is confidence in the effect estimates, and strength of recommendations in a systematic and transparent manner, it **does not eliminate** the need for judgments. Thus, applying the GRADE approach does not minimize the importance of judgment or as suggesting that quality can always be objectively determined.

Although evidence suggests that these judgments, after appropriate methodological training, lead to reliable assessment of the quality of evidence (Mustafa R et al., Journal of Clinical Epidemiology, 2013). There will be cases in which those making judgments will have legitimate disagreement about the interpretation of evidence. GRADE provides a framework guiding through the critical components of the assessment in a structured way. By allowing to make the judgments explicit rather than implicit it ensures transparency and a clear basis for discussion.

1.2 Separation of confidence in effect estimates from strength of recommendations

A number of criteria should be used when moving from evidence to recommendations (see Chapter on Going from evidence to recommendations). During that process, separate judgements are required for each of these criteria. In particular, separating judgements about the confidence in estimates or quality of evidence from judgements about the strength of recommendations is important as high confidence in effect estimates does not necessarily imply strong recommendations, and strong recommendations can result from low or even very low confidence in effect estimates (insert link to paradigmatic situations for when strong recommendations are justified in the context of low or very low confidence in effect estimates). Grading systems that fail to separate these judgements create confusion, while it is the defining feature of GRADE.

The GRADE approach stresses the necessity to consider the balance between desirable and undesirable consequences and acknowledge other factors, for example the values and preferences underlying the recommendations. As patients with varying values and preferences for outcomes and interventions will make different choices, guideline panels facing important variability in patient values and preferences are likely to offer a weak recommendation despite high quality evidence. Considering importance of outcomes and interventions, values, preferences and utilities includes integrating in the process of developing a recommendation, how those affected by its recommendations assess the possible consequences. These include patient and carer knowledge, attitudes, expectations, moral and ethical values, and beliefs; patient goals for life and health; prior experience with the intervention and the condition; symptom experience (for example breathlessness, pain, dyspnoea, weight loss); preferences for and importance of desirable and undesirable health outcomes; perceived impact of the condition or interventions on quality of life, well-being or satisfaction and interactions between the work of implementing the intervention, the intervention itself, and other contexts the patient may be experiencing; preferences for alternative courses of action; and preferences relating to communication content and styles, information and involvement in decision-making and care. This can be related to what in the economic literature is considered utilities. An intervention itself can be considered a consequence of a recommendation (e.g. the burden of taking a medication or undergoing surgery) and a level of importance or value is associated with that. Both the direction and the strength of a recommendation may be modified after taking into account the implications for resource utilization, equity, acceptability and feasibility of alternative management strategies.

Therefore, unlike many other grading systems, the GRADE approach emphasizes that weak also known as conditional recommendations in the face of high confidence in effect estimates of an intervention are common because of these factors other than the quality of evidence influencing the strength of a recommendation. For the same reason it allows for strong recommendations on the basis of low or very confidence in effect estimates.

Example 1: Weak recommendation based on high quality evidence

Several RCTs compared the use of combination chemotherapy and radiotherapy versus radiotherapy alone in unresectable, locally advanced non-small cell lung cancer (Stage IIIA). The overall quality of evidence for the body of evidence was rated high. Compared with radiotherapy alone, the combination of chemotherapy and radiotherapy reduces the risk of death corresponding to a mean gain in life expectancy of a few months, but increases harm and burden related to chemotherapy. Thus, considering the values

and preferences patients would place on the small survival benefit in view of the harms and burdens, guideline panels may offer a weak recommendation despite the high quality of the available evidence (Schünemann et al. AJRCCM 2006).

Example 2: Weak recommendation based on high quality evidence

Patients who experience a first deep venous thrombosis with no obvious provoking factor must, after the first months of anticoagulation, decide whether to continue taking the anticoagulant warfarin long term. High quality randomized controlled trials show that continuing warfarin will decrease the risk of recurrent thrombosis but at the cost of increased risk of bleeding and inconvenience. Because patients with varying values and preferences will make different choices, guideline panels addressing whether patients should continue or terminate warfarin should, despite the high quality evidence, offer a weak recommendation.

Example 3: Strong recommendation based on low or very low quality evidence

The principle of administering appropriate antibiotics rapidly in the setting of severe infection or sepsis has not been tested against its alternative of no rush of delivering antibiotics in randomized controlled trials. Yet, guideline panels would be very likely to make a strong recommendation for the rapid use of antibiotics in this setting on the basis of available observational studies rated as low quality evidence because the benefits of antibiotic therapy clearly outweigh the downsides in most patients independent of the quality assessment (Schünemann et al. AJRCCM 2006)..

1.3 Special challenges in applying the the GRADE approach

Those applying GRADE to questions about diagnostic tests, public health or health systems will face some special challenges. This handbook will address these challenges and undergo revisions when new developments prompt the GRADE working group to agree on changes to the approach. Moreover, there will be methodological advances and refinements in the future not only of innovations but also of the established concepts.

1.4 Modifications to the GRADE approach

GRADE recommends against making modifications to the approach because the elements of the GRADE process are interlinked, because modifications may confuse some users of evidence summaries and guidelines, and because such changes compromise the goal of a single system with which clinicians, policy makers, and patients can become familiar. However, the literature on different approaches to ***applying*** GRADE is growing and are useful to determine when pragmatism is appropriate.

2. Framing the health care question

A guideline panel should define the scope of the guideline and the planned recommendations. Each recommendation should answer a focused and sensible health care question that leads to an action. Similarly, authors of systematic reviews should formulate focused health care question(s) that the review will answer. A systematic review may answer one or more health care questions, depending on the scope of the review.

The **PICO** framework presents a well accepted methodology for framing health care questions. It mandates carefully specifying four components:

- **Patient**: the patients or population to whom the recommendations are meant to apply
- **Intervention**: the therapeutic, diagnostic, or other intervention under investigation (e.g. the experimental intervention, or in observational studies the exposure factor)
- **Comparison**: the alternative intervention; intervention in the control group
- **Outcome**: the outcome(s) of interest

A number of derivatives of this approach exist, for example adding a T for time or S for study design. These modifications are neither helpful nor necessary. The issue of time (e.g. duration of treatment, when an outcome should be assessed, etc) is covered in the elements by specifying the intervention(s) and outcome(s) appropriately (e.g. mortality at one year). In addition, the studies, and therefore the study design, that inform an answer are often not known when the question is asked. That is, observational studies may inform a question when randomized trials are no available or not associated with high confidence in the estimates. Thus, it is usually not sensible to define a study design beforehand. A guideline question often involves another specification: the **setting** in which the guideline will be implemented. For instance, guidelines intended for resource-rich environments will often be inapplicable to resource-poor environments. Even the setting, however, can be defined as part of the definition of the population (e.g. women in low income countries or man with myocardial infarction in a primary or rural health care setting).

Errors that are frequently made in formulating the health care question include failure to include all patient-important outcomes (e.g. adverse effects or toxicity), as well as failure to fully consider all relevant alternatives (this may be particularly problematic when guidelines target a global audience).

2.1 Defining the patient population and intervention

The most challenging decision in framing the question is how broadly the patients and intervention should be defined (*see Example 1*). For the patients and interventions defined, the underlying biology should

suggest that across the range of patients and interventions it is plausible that the magnitude of effect on the key outcomes is more or less the same. If that is not the case the review or guideline will generate misleading estimates for at least some subpopulations of patients and interventions. For instance, based on the information presented in Example 1, if antiplatelet agents differ in effectiveness in those with peripheral vascular disease vs. those with myocardial infarction, a single estimate across the range of patients and interventions will not well serve the decision-making needs of patients and clinicians. These subpopulations should, therefore, be defined separately.

Often, systematic reviews deal with the question of what breadth of population or intervention to choose by starting with a broad question but including a priori specification of subgroup effects that may explain any heterogeneity they find. The *a priori* hypotheses may relate to differences in patients, interventions, the choice of comparator, the outcome(s), or factors related to bias (e.g. high risk of bias studies yield different effects than low risk of bias studies).

Example 1: Deciding how to broadly to define the patients and intervention

Addressing the effects of antiplatelet agents on vascular disease, one might include only patients with transient ischemic attacks, those with ischemic attacks and strokes, or those with any vascular disease (cerebro-, cardio-, or peripheral vascular disease). The intervention might be a relatively narrow range of doses of aspirin, all doses of aspirin, or all antiplatelet agents.

Because the relative risk associated with an intervention vs. a specific comparator is usually similar across a wide variety of baseline risks, it is usually appropriate for systematic reviews to generate single pooled estimates (i.e. meta-analysis) of relative effects across a wide range of patient subgroups. Recommendations, however, **may differ across subgroups** of patients at different baseline risk of an outcome, **despite there being a single relative risk** that applies to all of them. For instance, the case for warfarin therapy, associated with both inconvenience and a higher risk of serious bleeding, is much stronger in atrial fibrillation patients at substantial vs. minimal risk of stroke. Thus, guideline panels must often define separate questions (and produce separate evidence summaries) for high- and low-risk patients, and patients in whom quality of evidence differs.

2.2 Dealing with multiple comparators

Another important challenge arises when there are multiple comparators to an intervention. Clarity in choice of the comparator makes for interpretable guidelines, and lack of clarity can cause confusion. Sometimes, the comparator is obvious, but when it is not guideline panels should specify the comparator explicitly. In particular, when multiple agents are involved, they should specify whether the recommendation is suggesting that all agents are equally recommended or that some agents are recommended over others (*see Example 1*).

Example 1: Clarity with multiple comparators

When making recommendations for use of anticoagulants in patients with non-ST elevation acute coronary syndromes receiving conservative (non-invasive) management, fondaparinux, heparin, and enoxaparin may be the agents being considered. Moreover, the estimate of effect for each agent may come from evidence of varying quality (e.g. high quality evidence for heparin, low quality of evidence for fondaparinux). Therefore, it must be made clear whether the recommendations formulated by the guideline panel will be for use of these agents vs. not using any anticoagulants, or also whether they will indicate a preference for one agent over the others or a gradient of preference.

2.3 Other considerations

GRADE has begun to tackle the question of determining the confidence in estimates for prognosis. They are often important for guideline development. For example, addressing interventions that may influence the outcome of influenza or multiple sclerosis will require establishing the natural history of the conditions. This will involve specifying the population (influenza or new-onset multiple sclerosis) and the outcome (mortality or relapse rate and progression). Such questions of prognosis may be refined to include multiple predictors, such as age, gender, or severity. The answers to these questions will be an important background for formulating recommendations and interpreting the evidence about the effects of treatments. In particular, guideline developers need to decide whether the prognosis of patients in the community is similar to those studied in the trials and whether there are important prognostic subgroups that they should consider in making recommendations. Judgments if the evidence is direct enough in terms of baseline risk affect the rating about indirectness of evidence.

2.4 Format of health care questions using the GRADE approach

Defining a health care question includes specifying all outcomes of interest. Those developing recommendations whether or not to use a given intervention (therapeutic or diagnostic) have to consider all relevant outcomes simultaneously. The Guideline Development Tool allows the selection of two different formats for questions about management:

- Should [intervention] vs. [comparison] be used for [health problem]?
- Should [intervention] vs. [comparison] be used in [population]?

As well as one format for questions about diagnosis:

- Should [intervention] vs. [comparison] be used to diagnose [target condition] in [health problem and/or population]?

Example Questions

1. Should manual toothbrushes vs. powered toothbrushes be used for dental health?

2. Should topical nasal steroids be used in children with persistent allergic rhinitis?

3. Should oseltamivir versus no antiviral treatment be used to treat influenza?

4. Should troponin I followed by appropriate management strategies or troponin T followed by appropriate management strategies be used to manage acute myocardial infarction?

3. Selecting and rating the importance of outcomes

Training modules and courses: http://cebgrade.mcmaster.ca/QuestionsAndOutcomes/index.html

Given that recommendations cannot be made on the basis of information about single outcomes and decision-making always involves a balance between health benefits and harms. Authors of systematic reviews will make their reviews more useful by looking at a comprehensive range of outcomes that allow decision making in health care. Many, if not most, systematic reviews fail to address some key outcomes, particularly harms, associated with an intervention.

On the contrary, to make sensible recommendations guideline panels must consider **all outcomes** that are important or critical to patients for decision making. In addition, they may require consideration of outcomes that are important to others, including the use of resources paid for by third parties, equity considerations, impacts on those who care for patients, and public health impacts (e.g. the spread of infections or antibiotic resistance).

Guideline developers must **base the choice of outcomes on what is important, not on what outcomes are measured** and for which evidence is available. If evidence is lacking for an important outcome, this should be acknowledged, rather than ignoring the outcome. Because most systematic reviews do not summarize the evidence for all important outcomes, guideline panels must often either use multiple systematic reviews from different sources, conduct their own systematic reviews or update existing reviews.

3.1 Steps for considering the relative importance of outcomes

Guideline developers must, and authors of systematic reviews are strongly encouraged to specify all potential patient-important outcomes as the first step in their endeavour. Guideline developers will also make a **preliminary classification** of the importance of the outcomes. GRADE specifies three categories of outcomes according to their **importance for decision-making**:

- critical
- important but not critical
- of limited importance.

Critical and important outcomes will bear on guideline recommendations, the third will in most situations not. Ranking outcomes by their relative importance can help to focus attention on those outcomes that are considered most important, and help to resolve or clarify disagreements. **Table 3.1** provides an overview of the steps for considering the relative importance of outcomes.

Guideline developers should first consider whether particular health benefits and harms of a therapy are **important** to the decision regarding the optimal management strategy, or whether they are **of limited importance**. If the guideline panel thinks that a particular outcome is important, then it should consider whether the outcome is critical to the decision, or only important, but not critical.

To facilitate ranking of outcomes according to their importance guideline developers may choose to rate outcomes numerically on a **1 to 9 scale** (7 to 9 – critical; 4 to 6 – important; 1 to 3 – of limited importance) to distinguish between importance categories.

Practically, to generate a list of relevant outcomes, one can use the following type of scales.

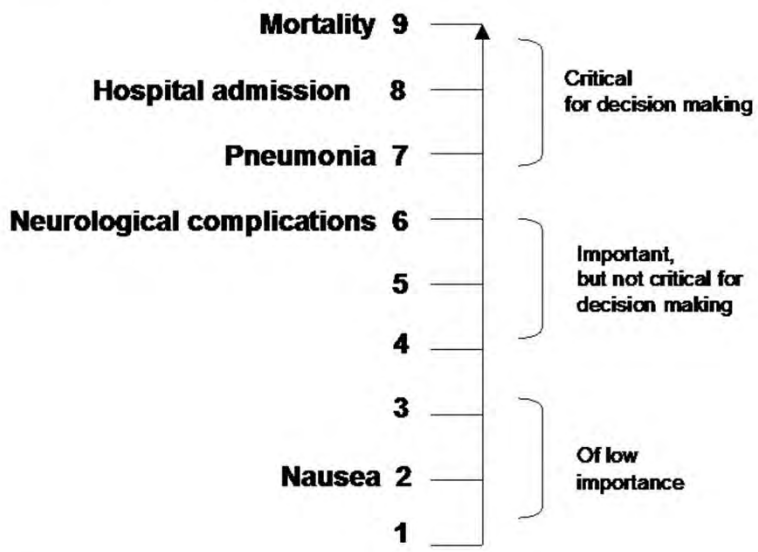
rating scale:								
1	2	3	4	5	6	7	8	9
of **least** importance								of **most** importance
of limited importance for making a decision (not included in evidence profile)			important, but not critical for making a decision (included in evidence profile)			Critical for making a decision (included in evidence profile)		

The first step of a classification of importance of outcomes should occur during protocol of a systematic review or when the panel agrees on the health care questions that should be addressed in a guideline. Thus, it should be done before a protocol is developed. When evidence becomes available a reassessment of importance may be necessary to ensure that important outcomes identified by reviews of the evidence that were not initially considered are included and to reconsider the relative importance of outcomes in light of the available evidence which will be influenced by the relative importance of the outcome. It is possible that there is no association between the outcome and the intervention of interest which supports to not consider that outcome further.

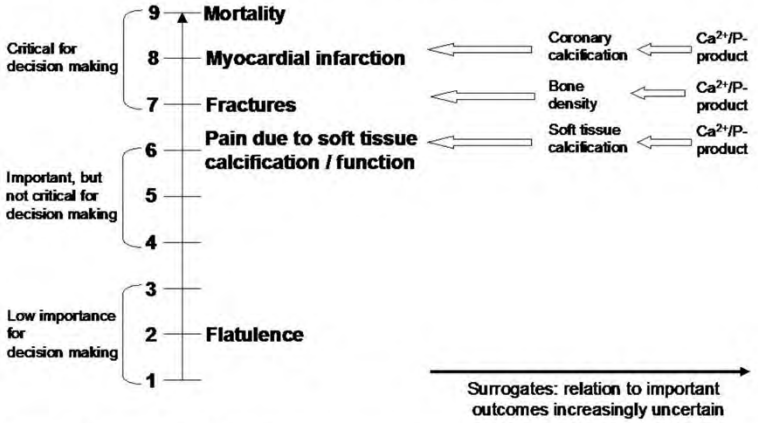
Guideline panels should be aware of the possibility that in some instances the importance of an outcome (e.g. a serious adverse effect) may only become known after the protocol is written, evidence is reviewed or the analyses were carried out, and should take appropriate actions to include these in the evidence tables.

Example 1: Hierarchy of outcomes according to their importance to assess the effect of oseltamivir in patients with H5N1 influenza. Mortality in patients affected with H5N1 is as high as 50%. Patient are usually affected by severe respiratory compromise and require ventilatory support. Complications of a

potentially useful medication, oseltamivir, are suspected to be of temporary neurological nature, other adverse effects such as nausea also occur during treatment.



Example 2. Hierarchy of outcomes according to their importance to assess the effect of phosphate-lowering drugs in patients with renal failure and hyperphosphatemia



Example 3: Reassessment of the relative importance of outcomes

Consider, for instance, a screening intervention, such as screening for aortic abdominal aneurysm. Initially, a guideline panel is likely to consider the intervention's impact on all-cause mortality as critical. Let us say, however, that the evidence summary establishes an important reduction in cause-specific mortality from abdominal aortic aneurysm but fails to definitively establish a reduction in all-cause mortality. The reduction in cause-specific mortality may be judged sufficiently compelling that, even in the absence of a demonstrated reduction in all-cause mortality (which may be undetected because of random error from other causes of death), the screening intervention is clearly worthwhile. All-cause mortality then becomes less relevant and ceases to be a critical outcome.

The relative importance of outcomes should be considered when determining the overall quality of evidence, which may depend on which outcomes are ranked as critical or important (see Chapter Quality of evidence), and judging the balance between the health benefits and harms of an intervention when formulating the recommendations (see Chapter Going from evidence to recommendations)

Only outcomes considered **critical** (rated 7-9) are the primary factors influencing a recommendation and will be used to determine the **overall quality of evidence** supporting a recommendation.

Table 3.1: Steps for considering the relative importance of outcomes

Step	What	Why	How	Evidence
1	Preliminary classification of outcomes as critical, important but not critical, or low importance, before reviewing the evidence	To focus attention on those outcomes that are considered most important when searching for and summarizing the evidence and to resolve or clarify disagreements.	Conducting a systematic review of the relevant literature. By asking panel members and possibly patients or members of the public to identify	These judgments are ideally informed by a systematic review of the literature focusing on what the target population considers as

			important outcomes, judging the relative importance of the outcomes and discussing disagreements.	critical or important outcomes for decision making. Literature about values, preferences or utilities is often used in these reviews, that should be systematic in nature. Alternatively the collective experience of the panel members, patients, and members of the public can be used using transparent methods for documenting and considering them (see Santesso N et al, IJOBGYN 2012). Prior knowledge of the research evidence or, ideally, a systematic review of that evidence is likely to be helpful.
2	Reassessment of the relative importance of outcomes after reviewing the evidence	To ensure that important outcomes identified by reviews of the evidence that were not initially considered are included and to reconsider the relative importance of outcomes in light of the available evidence	By asking the panel members (and, if relevant, patients and members of the public) to reconsider the relative importance of the outcomes included in the first step and any additional outcomes identified by reviews of the evidence	Experience of the panel members and other informants and systematic reviews of the effects of the intervention
3	Judging the balance between the desirable and undesirable health outcomes of an intervention	To support making a recommendation and to determine the strength of the recommendation	By asking the panel members to balance the desirable and undesirable health outcomes using an evidence to recommendation framework that includes a summary of findings table or evidence profile and, if relevant, based on a decision analysis	Experience of the panel members and other informants, systematic reviews of the effects of the intervention, evidence of the value that the target population attach to key outcomes (if relevant and available) and decision analysis or economic analyses (if relevant and available)

3.2 Influence of perspective

The **importance** of outcomes is **likely to vary** within and across cultures or when considered from the **perspective** of the target population (e.g. patients or the public), clinicians or policy-makers. Cultural diversity will often influence the relative importance of outcomes, particularly when developing recommendations for an international audience.

Guideline panels must decide what perspective they are taking. Although different panels may elect to take different perspectives (e.g. that of individual patients or a health systems perspective), the relative importance given to health outcomes should reflect the perspective of those who are affected. When the target audiences for a guideline are clinicians and the patients they treat, the perspective would generally be that of the patient. (see Chapter Going from evidence to recommendations that addresses the issue of perspective from the point of view of resource use)

3.3 Using evidence in rating the importance of outcomes

Guideline developers will ideally review evidence, or conduct a systematic review of the evidence, relating to patients' values and preferences about the intervention in question in order to inform the rating of the importance of outcomes. Reviewing the evidence may provide the panel with insight about the variability in patients' values, the patient experience of burden or side effects, and the weighing of desirable versus undesirable outcomes.

In the **absence of such evidence**, panel members should use their prior experiences with the target population to assume the relevant values and preferences.

3.4 Surrogate (substitute) outcomes

Not infrequently, outcomes of most importance to patients remain unexplored. When important outcomes are relatively infrequent, or occur over long periods of time, investigators often choose to measure substitutes, or surrogates, for those outcomes.

Guideline developers should **consider surrogate outcomes only when evidence about population-important outcomes is lacking**. When this is the case, they should specify the population-important outcomes and, if necessary, the surrogates they are using to substitute for those important outcomes. Guideline developers should not list the surrogates themselves as their measures of outcome. The necessity to substitute the surrogate may ultimately lead to rating down the quality of the evidence because of the indirectness (see Chapter Quality of evidence).

Outcomes selected by the guideline panel should be **included in an evidence profile whether or not information about them is available** (see Chapter Summarizing the evidence), that is an empty row in an evidence profile can be informative in that it identifies research gaps.

4. Summarizing the evidence

A guideline panel should base its recommendation on the **best available body of evidence** related to the health care question. A guideline panel can use already existing high quality **systematic reviews** or conduct its own systematic review depending on the specific circumstances such as availability of high quality systematic reviews and resources, but GRADE recommends that systematic reviews should form the basis for making health care recommendations. One should seek evidence relating to **all patient-important outcomes** and for the **values** patients place on these outcomes as well as related management options.

The endpoint for systematic reviews and for HTA restricted to evidence reports is a summary of the evidence, the quality rating for each outcome and the estimate of effect. For guideline developers and HTA that provide advice to policymakers, a summary of the evidence represents a key milestone on the path to a recommendation. The evidence collected from systematic reviews is used to produce GRADE evidence profile and summary of findings table.

4.1 Evidence Tables

An **evidence table** is a key tool in the presentation of evidence and the corresponding results. Evidence tables are a method for presenting the quality of the available evidence, the judgments that bear on the quality rating, and the effects of alternative management strategies on the outcomes of interest.

Clinicians, patients, the public, guideline developers, and policy-makers require succinct and transparent evidence summaries to support their decisions. While an unambiguous health care question is key to evidence summaries, the requirements for specific users may differ in content and detail. Therefore, the format of each table may be different depending on user needs.

Two approaches (with iterations) for evidence tables are available, which serve different purposes and are intended for different audiences:

- (GRADE) evidence profile
- Summary of Findings (SoF) table

The Guideline Development Tool facilitates the production of both Evidence Profiles and SoF tables. After completing the information to populate the tables, the information will be stored and can be updated accordingly. Different formats for each aproach, chosen according to what the target audience may prefer, are available.

Outcomes considered **important** (rated 4-6) or **critical** (rated 7-9) for decision-making should be included in the evidence profile and SoF table.

4.2 GRADE Evidence Profile

See online tutorials at: cebgrade.mcmaster.ca

The **GRADE evidence profile** contains detailed information about the quality of evidence assessment and the summary of findings for each of the included outcomes. It is intended for review authors, those preparing SoF tables and anyone who questions a quality assessment. It helps those preparing SoF tables to ensure that the judgments they make are systematic and transparent and it allows others to inspect those judgments. Guideline panels should use evidence profiles to ensure that they agree about the judgments underlying the quality assessments.

A GRADE evidence profile allows presentation of key information about all relevant outcomes for a given health care question. It presents **information about the body of evidence** (e.g. number of studies), the **judgments about the underlying quality of evidence**, key **statistical results**, and **the quality of evidence rating for each outcome**.

A GRADE evidence profile is particularly useful for presentation of evidence supporting a recommendation in clinical practice guidelines but also as summary of evidence for other purposes where users need or want to understand the judgments about the quality of evidence in more detail.

The standard format for the evidence profile includes:

- A list of the **outcomes**
- The **number of studies** and **study design(s)**
- Judgements about each of the **quality of evidence factors** assessed; risk of bias, inconsistency, indirectness, imprecision, other considerations (including publication bias and factors that increase the quality of evidence)
- The **assumed risk**; a measure of the typical burden of the outcomes, i.e. illustrative risk or also called baseline risk, baseline score, or control group risk
- The **corresponding risk;** a measure of the burden of the outcomes after the intervention is applied, i.e. the risk of an outcome in treated/exposed people based on the relative magnitude of an effect and assumed (baseline) risk
- The **relative effect**; for dichotomous outcomes the table will usually provide risk ratio, odds ratio, or hazard ratio
- The **absolute effect**; for dichotomous outcomes the number of fewer or more events in treated/exposed group as compared to the control group
- Rating of the **overall quality of evidence** for each outcome (which may vary by outcome)
- Classification of the **importance** of each outcome
- **Footnotes**, if needed, to provide explanations about information in the table such as elaboration on judgements about the quality of evidence

Example 1: GRADE Evidence Profile

[INSERT IMAGE]

4.3 Summary of Findings table

Summary of Findings tables provide a summary of findings for each of the included outcomes and the quality of evidence rating for each outcome in a quick and accessible format, without details of the judgements about the quality of evidence. They are intended for a broader audience, including end users of systematic reviews and guidelines. They provide a concise summary of the key information that is needed by someone making a decision and, in the context of a guideline, provide a summary of the key information underlying a recommendation

The format of SoF tables produced using the Guideline Development Tool has been refined over the past several years through wide consultation, user testing, and evaluation. It is designed to support the optimal presentation of the key findings of systematic reviews. The SoF table format has been developed with the aim of ensuring consistency and ease of use across reviews, inclusion of the most important information needed by decision makers, and optimal presentation of this information. However, there may be good reasons for modifying the format of a SoF table for some reviews.

The standard format for the SoF table includes:

- A list of the **outcomes**
- The **assumed risk**; a measure of the typical burden of the outcomes, i.e. illustrative risk or also called baseline risk, baseline score, or control group risk
- The **corresponding risk;** a measure of the burden of the outcomes after the intervention is applied, i.e. the risk of an outcome in treated/exposed people based on the relative magnitude of an effect and assumed (baseline) risk
- The **relative effect**; for dichotomous outcomes the table will usually provide risk ratio, odds ratio, or hazard ratio
- The **number of participants** and the **number of studies** and their **designs**
- Rating of the **overall quality of evidence** for each outcome (which may vary by outcome)
- **Footnotes or explanations**, if needed, to provide explanations about information in the table
- Comments (if needed)

Systematic reviews that address more than one main comparison (e.g. examining the effects of a number of interventions) will require **separate SoF tables** for each comparison. Moreover, for **each comparison** of alternative management strategies, **all outcomes should be presented** together in one evidence profile or SoF table. It is likely that all studies relevant to a health care question will not provide evidence regarding every outcome. Indeed, there may be no overlap between studies providing evidence for one outcome and those providing evidence for another. Because most existing systematic reviews do not adequately address all relevant outcomes, the GRADE process may require relying on more than one systematic review.

Example 2: GRADE Summary of Findings Table

[INSERT IMAGE]

heparin compared to no heparin for patients with cancer who have no other therapeutic or prophylactic indication for anticoagulation

Bibliography: Akl EA, Gunukula SK, van Doormaal FF, Barba M, Kuipers S, Middeldorp S, Yosuico VE D, Dickinson HO, Schünemann H. Parenteral anticoagulation in patients with cancer who have no therapeutic or prophylactic indication for anticoagulation. Cochrane Database of Systematic Reviews [Year], Issue [Issue].

Outcomes	No of Participants (studies) Follow up	Quality of the evidence (GRADE)	Relative effect (95% CI)	Anticipated absolute effects	
				Risk with No heparin	Risk difference with Heparin (95% CI)
Mortality	2531 (8 studies) 12 months	⨁⨁⨁⊖ **MODERATE**[1,2,3] due to inconsistency	**RR 0.93** (0.85 to 1.02)	**Moderate**	
				649 per 1000	**45 fewer per 1000** (from 97 fewer to 13 more)
Symptomatic VTE	2264 (7 studies) 12 months	⨁⨁⨁⨁ **HIGH**[1]	**RR 0.55** (0.37 to 0.82)	**Moderate**	
				29 per 1000	**13 fewer per 1000** (from 5 fewer to 18 fewer)
Major bleeding	2843 (9 studies) 12 months	⨁⨁⨁⊖ **MODERATE**[1,4] due to imprecision	**RR 1.3** (0.59 to 2.88)	**Moderate**	
				7 per 1000	**2 more per 1000** (from 3 fewer to 13 more)
Minor bleeding	2345 (7 studies) 12 weeks	⨁⨁⨁⊖ **MODERATE**[1,4] due to imprecision	**RR 1.05** (0.75 to 1.46)	**Moderate**	
				27 per 1000	**1 more per 1000** (from 7 fewer to 12 more)
Health related quality of life the Uniscale and the Symptom Distress Scale (SDS); Better indicated by lower values	0 (1 study) 12 months	⨁⨁⊖⊖ **LOW**[5] due to risk of bias, imprecision	Not estimable[6]	See comment	-

*The basis for the **assumed risk** (e.g. the median control group risk across studies) is provided in footnotes. The **corresponding risk** (and its 95% confidence interval) is based on the assumed risk in the comparison group and the **relative effect** of the intervention (and its 95% CI).
CI: Confidence interval; **RR:** Risk ratio;

GRADE Working Group grades of evidence
High quality: Further research is very unlikely to change our confidence in the estimate of effect.
Moderate quality: Further research is likely to have an important impact on our confidence in the estimate of effect and may change the estimate.
Low quality: Further research is very likely to have an important impact on our confidence in the estimate of effect and is likely to change the estimate.
Very low quality: We are very uncertain about the estimate.

[1] Vast majority of studies had allocation concealment, and used blinded outcome and adjudication. We did not downgrade although there was some concern about lack of blinding in some studies, the overall risk of bias was felt to be very low.
[2] There is moderate heterogeneity among studies included in the analysis of death at 12 months (I2=35%). The subgroup analysis for mortality at 12 months was statistically significant and suggested survival benefit in patients with SCLC but not in patients with advanced cancer. Overall we decided to downgrade by one level when considering these issues along with imprecision.
[3] CI interval includes effects suggesting benefit as well as no benefit.
[4] CI includes possibility of both harms or benefits. [5] The scores for the 2 scales were similar for the 2 study groups, both at baseline and at follow-up. [6] High risk of bias and only 138 patients enrolled.

5. Quality of evidence

GRADE provides a specific definition of the quality of evidence that is different in the context of making recommendations and in the context of summarizing the findings of a systematic review.

As GRADE suggests somewhat different approaches for rating the quality of evidence for systematic reviews and for guidelines, the handbook highlights guidance that is specific to each group. HTA practitioners, depending on their mandate, can decide which approach is more suitable for their goals.

For guideline panels:

The quality of evidence reflects the extent to which our **confidence in an estimate of the effect** is adequate to **support a particular recommendation**.

Guideline panels must make judgments about the quality of evidence relative to the specific context for which they are using the evidence.

The GRADE approach involves separate grading of quality of evidence for each patient-important outcome followed by determining an overall quality of evidence across outcomes.

For authors of systematic reviews:

The quality of evidence reflects the extent to which we are **confident that an estimate of the effect is correct**.

Because systematic reviews do not, or at least should not, make recommendations, they require a different definition. Authors of systematic reviews grade quality of a body of evidence separately for each patient-important outcome.

The quality of evidence is rated for each outcome across studies (i.e. for a body of evidence). This does not mean rating each study as a single unit. Rather, GRADE is "**outcome centric**"; **rating is done for each outcome**, and quality may differ - indeed, is likely to differ - from one outcome to another within a single study and across a body of evidence.

Example 1: Quality of evidence may differ from one outcome to another within a single study

In a series of unblinded RCTs measuring both the occurrence of stroke and all-cause mortality, it is possible that stroke - much more vulnerable to biased judgments - will be rated down for risk of bias, whereas all-cause mortality will not. Similarly, a series of studies in which very few patients are lost to follow-up for the outcome of death, and very many for the outcome of quality of life, is likely to result in judgments of lower quality for the latter outcome. Problems with indirectness may lead to rating down

quality for one outcome and not another within a study or studies if, for example, fracture rates are measured using a surrogate (e.g. bone mineral density) but side effects are measured directly.

Although the quality of evidence represents a continuum, the GRADE approach results in an assessment of the quality of a body of evidence in one of **four grades**:

Table 5.1: Quality of Evidence Grades

Grade	Definition
High	We are very confident that the true effect lies close to that of the estimate of the effect.
Moderate	We are moderately confident in the effect estimate: The true effect is likely to be close to the estimate of the effect, but there is a possibility that it is substantially different
Low	Our confidence in the effect estimate is limited: The true effect may be substantially different from the estimate of the effect.
Very Low	We have very little confidence in the effect estimate: The true effect is likely to be substantially different from the estimate of effect

Quality of evidence is a continuum; any discrete categorisation involves some degree of arbitrariness. Nevertheless, advantages of simplicity, transparency, and vividness outweigh these limitations.

5.1 Factors determining the quality of evidence

The GRADE approach to rating the quality of evidence begins with the study design (trials or observational studies) and then addresses five reasons to possibly rate down the quality of evidence and three to possibly rate up the quality. The subsequent sections of the handbook will address each of the factors in detail.

Table 5.2: Factors that can reduce the quality of the evidence

Factor	Consequence
Limitations in study design or execution (risk of bias)	↓ 1 or 2 levels
Inconsistency of results	↓ 1 or 2 levels
Indirectness of evidence	↓ 1 or 2 levels
Imprecision	↓ 1 or 2 levels
Publication bias	↓ 1 or 2 levels

Table 5.3: Factors that can increase the quality of the evidence

Factor	Consequence
Large magnitude of effect	↑ 1 or 2 levels
All plausible confounding would reduce the demonstrated effect or increase the effect if no effect was observed	↑ 1 level
Dose-response gradient	↑ 1 level

While factors influencing the quality of evidence are **additive** – such that the reduction or increase in each individual factor is added together with the other factors to reduce or increase the quality of evidence for an outcome – grading the quality of evidence involves judgements which are not exclusive. Therefore, GRADE is not a quantitative system for grading the quality of evidence. Each factor for downgrading or upgrading reflects **not discrete categories but a continuum** within each category and among the categories. When the body of evidence is intermediate with respect to a particular factor, the decision about whether a study falls above or below the threshold for up- or downgrading the quality (by one or more factors) depends on judgment.

For example, if there was some uncertainty about the three factors: study limitations, inconsistency, and imprecision, but not serious enough to downgrade each of them, one could reasonably make the case for downgrading, or for not doing so. A reviewer might in each category give the studies the benefit of the doubt and would interpret the evidence as high quality. Another reviewer, deciding to rate down the evidence by one level, would judge the evidence as moderate quality. Reviewers should grade the quality of the evidence by considering both the individual factors in the context of other judgments they made about the quality of evidence for the same outcome.

In such a case, you should pick one or two categories of limitations which you would offer as reasons for downgrading and explain your choice in the footnote. You should also provide a footnote next to the other factor, you decided not to downgrade, explaining that there was some uncertainty, but you already downgraded for the other factor and further lowering the quality of evidence for this outcome would seem inappropriate. GRADE strongly encourages review and guideline authors to be **explicit and transparent** when they find themselves in these situations by **acknowledging borderline decisions**.

Despite the limitations of breaking continua into categories, treating each criterion for rating quality up or down as discrete categories enhances transparency. Indeed, the **great merit of GRADE** is not that it ensures reproducible judgments but that it **requires explicit judgment** that is made **transparent to users**.

5.1.1 Study design

Study design is critical to judgments about the quality of evidence.

For recommendations regarding management strategies – as opposed to establishing prognosis or the accuracy of diagnostic tests – **randomized trials** provide, in general, far stronger evidence than observational studies, and rigorous **observational studies** provide stronger evidence than **uncontrolled case series**.

In the GRADE approach to quality of evidence:

- **randomized trials** without important limitations provide **high quality** evidence
- **observational studies** without special strengths or important limitations provide **low quality** evidence

Limitations or special strengths can, however, **modify** the quality of the evidence of both randomized trials and observational studies.

Note:

Non-randomised experimental trials (quasi-RCT) without important limitations also provide high quality evidence, but will automatically be downgraded for limitations in design (risk of bias) – such as lack of concealment of allocation and tie with a provider (e.g. chart number).

Case series and **case reports** are observational studies that investigate only patients exposed to the intervention. Source of control group results is implicit or unclear, thus, they will usually warrant downgrading from low to very low quality evidence.

Expert opinion is not a category of quality of evidence. Expert opinion represents an interpretation of evidence in the context of experts' experiences and knowledge. Experts may have opinion about evidence that may be based on interpretation of studies ranging from uncontrolled case series (e.g. observations in expert's own practice) to randomized trials and systematic reviews known to the expert. It is important to describe what type of evidence (whether published or unpublished) is being used as the basis for interpretation.

5.2 Factors that can reduce the quality of the evidence

The following sections discuss in detail the 5 factors that can result in rating down the quality of evidence for specific outcomes and, thereby, reduce confidence in the estimate of the effect.

5.2.1 Study limitations (Risk of Bias)

Limitations in the study design and execution may bias the estimates of the treatment effect. Our confidence in the estimate of the effect and in the following recommendation decreases if studies suffer from major limitations. The more serious the limitations are, the more likely it is that the quality of evidence will be downgraded. Numerous tools exist to evaluate the risk of bias in randomized trials and observational studies. This handbook describes the key criteria used in the GRADE approach.

Our confidence in an estimate of effect decreases if studies suffer from major limitations that are likely to result in a biased assessment of the intervention effect. For randomized trials, the limitations outlined in **Table 5.4**are likely to result in biased result.

Table 5.4: Study limitations in randomized controlled trials

	Explanation
Lack of allocation concealment	Those enrolling patients are aware of the group (or period in a crossover trial) to which the next enrolled patient will be allocated (a major problem in "pseudo" or "quasi" randomized trials with allocation by day of week, birth date, chart number, etc.).
Lack of blinding	Patient, caregivers, those recording outcomes, those adjudicating outcomes, or data analysts are aware of the arm to which patients are allocated (or the medication currently being received in a crossover trial).
Incomplete accounting of patients and outcome events	Loss to follow-up and failure to adhere to the intention-to-treat principle in superiority trials; or in noninferiority trials, loss to follow-up, and failure to conduct both analyses considering only those who adhered to treatment, and all patients for whom outcome data are available. The significance of particular rates of loss to follow-up, however, varies widely and is dependent on the relation between loss to follow-up and number of events. The higher the proportion lost to follow-up in relation to intervention and control group event rates, and differences between intervention and control groups, the greater the threat of bias.
Selective outcome reporting	Incomplete or absent reporting of some outcomes and not others on the basis of the results.
Other limitations	• Stopping trial early for benefit. Substantial overestimates are likely in trials with fewer than 500 events and that large overestimates are likely in trials with fewer than 200 events. Empirical

	evidence suggests that formal stopping rules do not reduce this bias. • Use of unvalidated outcome measures (e.g. patient-reported outcomes) • Carryover effects in crossover trial • Recruitment bias in cluster-randomized trials

Systematic reviews of tools to assess the methodological quality of non-randomized studies have identified over 200 checklists and instruments. We summarize in **Table 5.5** the key criteria for observational studies that reflect the contents of these checklists.

Table 5.5: Study limitations in observational studies

	Explanation
Failure to develop and apply appropriate eligibility criteria (inclusion of control population)	• Under- or over-matching in case-control studies • Selection of exposed and unexposed in cohort studies from different populations
Flawed measurement of both exposure and outcome	• Differences in measurement of exposure (e.g. recall bias in case-control studies) • Differential surveillance for outcome in exposed and unexposed in cohort studies
Failure to adequately control confounding	• Failure of accurate measurement of all known prognostic factors • Failure to match for prognostic factors and/or adjustment in statistical analysis
Incomplete or inadequately short follow-up	Especially within prospective cohort studies, both groups should be followed for the same amount of time.

Depending on the context and study type, there can be additional limitations than those listed above. Guideline panels and authors of systematic reviews should consider all possible limitations.

Guideline panels or authors of systematic reviews should consider the extent to which study limitations may bias the results (*see Examples 1 to 7*). If the limitations are serious they may downgrade the quality rating by one or even two levels. Moving from risk of bias criteria for each individual study to a judgment about rating down for quality of evidence for risk of bias across a group of studies addressing a particular outcome presents challenges. We suggest the following principles:

1. In deciding on the overall quality of evidence, one does not average across studies (for instance if some studies have no serious limitations, some serious limitations, and some very serious limitations, one does not automatically rate quality down by one level because of an average rating of serious limitations). Rather, judicious consideration of the contribution of each study, with a general guide to focus on the high-quality studies, is warranted.

2. The judicious consideration requires evaluating the extent to which each trial contributes toward the estimate of magnitude of effect. This contribution will usually reflect study sample size and number of outcome events – larger trials with many events will contribute more, much larger trials with many more events will contribute much more.

3. One should be conservative in the judgment of rating down. That is, one should be confident that there is substantial risk of bias across most of the body of available evidence before one rates down for risk of bias.

4. The risk of bias should be considered in the context of other limitations. If, for instance, reviewers find themselves in a close-call situation with respect to two quality issues (risk of bias and, say, precision), we suggest rating down for at least one of the two.

5. Reviewers will face close-call situations. They should both acknowledge that they are in such a situation, make it explicit why they think this is the case, and make the reasons for their ultimate judgment apparent.

For authors of systematic reviews:

Systematic reviewers working within the context of Cochrane Systematic Reviews, can use the following guidance to assess study limitations (risk of bias) in Cochrane Reviews. Chapter 8 of the Cochrane Handbook provides a detailed discussion of study-level assessments of risk of bias in the context of a Cochrane review, and proposes an approach to assessing the risk of bias for an outcome across studies as 'low risk of bias', 'unclear risk of bias' and 'high risk of bias' (Cochrane Handbook Chapter 8, Section 8.7). These assessments should feed directly into the assessment of study limitations. In particular, 'low risk of bias' would indicate 'no limitation'; 'unclear risk of bias' would indicate either 'no limitation' or 'serious limitation'; and 'high risk of bias' would indicate either 'serious limitation' or 'very serious limitation' in the GRADE approach. Cochrane systematic review authors must use their judgment to decide between alternative categories, depending on the likely magnitude of the potential biases.

Every study addressing a particular outcome will differ, to some degree, in the risk of bias. Review authors must make an overall judgment on whether the quality of evidence for an outcome warrants downgrading on the basis of study limitations. The assessment of study limitations should apply to the studies contributing to the results in the Summary of Findings table, rather than to all studies that could potentially be included in the analysis.

Table 5.6: Guidance to assess study limitations (risk of bias) in Cochrane Reviews and corresponding GRADE assessment of quality of evidence

Risk of bias	Across studies	Interpretation	Considerations	GRADE assessment of study limitations

Low	Most information is from studies at low risk of bias.	Plausible bias unlikely to seriously alter the results.	No apparent limitations.	No serious limitations, do not downgrade
Unclear	Most information is from studies at low or unclear risk of bias.	Plausible bias that raises some doubt about the results.	Potential limitations are unlikely to lower confidence in the estimate of effect.	No serious limitations, do not downgrade
			Potential limitations are likely to lower confidence in the estimate of effect.	Serious limitations, downgrade one level.
High	The proportion of information from studies at high risk of bias is sufficient to affect the interpretation of results.	Plausible bias that seriously weakens confidence in the results.	Crucial limitation for one criterion, or some limitations for multiple criteria, sufficient to lower confidence in the estimate of effect.	Serious limitations, downgrade one level
			Crucial limitation for one or more criteria sufficient to substantially lower confidence in the estimate of effect.	Very serious limitations, downgrade two levels

Example 1: Unclear Risk of Bias (Not Downgraded)

A systematic review investigated whether fewer people with cancer died when given anti-coagulants compared to a placebo. There were 5 RCTs. Three studies had unclear sequence generation as it was not reported by authors and one study (contributing few patients to the meta-analysis) had unclear allocation concealment, and incomplete outcome data. In this case, the overall limitations were not serious and the evidence was not downgraded for risk of bias.

Example 2: Unclear Risk of Bias (Downgraded by One Level)

A systematic review of the effects of testosterone on erection satisfaction in men with low testosterone identified four RCTs. The largest trial's results were reported only as "not significant" and could not, therefore, contribute to the meta-analysis. Data from the three smaller trials suggested a large treatment effect (1.3 standard deviations, 95% confidence interval 0.2, 2.3). The authors could not obtain the missing data, and could not be confident that the large treatment effect was certain, therefore, they rated down the body of evidence for selective reporting bias in the largest study.

In another scenario, the review authors did obtain the complete data from the larger trial. After including the less impressive results of the large trial, the magnitude of the effect was smaller and no longer statistically significant (0.8 standard deviations, 95% confidence interval 0.05, 1.63). In that case, the evidence would not be downgraded.

Example 3: High Risk of Bias due to lack of blinding (Downgraded by One Level)

RCTs of the effects of Intervention A on acute spinal injury measured both all-cause mortality and, based on a detailed physical examination, motor function. The outcome assessors were not blinded for any outcomes. Blinding of outcome assessors is less important for the assessment of all-cause mortality, but crucial for motor function. The quality of the evidence for the mortality outcome may not be downgraded. However, the quality may be downgraded for the motor function outcome.

Example 4: High Risk of Bias due to lack of allocation concealment (Downgraded by One Level)

A systematic review of 2 RCTs showed that family therapy for children with asthma improved daytime wheeze. However, allocation was clearly not concealed in the two included trials. This limitation might warrant downgrading the quality of evidence by one level.

Example 5: High Risk of Bias (Downgraded by One Level)

A review was conducted to assess the effects of early versus late treatment of influenza with oseltamivir in observational studies. Researchers found 8 observational studies which assessed the risk of mortality. The statistical analysis in all 8 studies did not adjust for potential confounding risk factors such as age, chronic lung conditions, vaccination or immune status. The quality of the evidence was therefore downgraded from low to very low for serious limitations in study design.

Example 6: High Risk of Bias (Downgraded by Two Levels)

Three RCTs of the effects of surgery on patients with lumbar disc prolapse measured symptoms after 1 year or longer. The RCTs suffered from inadequate concealment of allocation, and unblinded assessment of outcome by potentially biased raters (surgeons) using a non-validated rating instrument. The benefit of surgery is uncertain. The quality of the evidence was downgraded by two levels due to these study limitations quality.

Example 7: High Risk of Bias (Downgraded by Two Levels)

The evidence for the effect of sublingual immunotherapy in children with allergic rhinitis on the development of asthma comes from a single randomized trial with no description of randomization, concealment of allocation or type of analysis, there was no blinding and 21% of children were lost to follow-up. These very serious limitations would warrant downgrading the quality of evidence by two levels, from high to low.

5.2.2 Inconsistency of results

Inconsistency refers to an **unexplained heterogeneity** of results.

True differences in the underlying treatment effect may be likely when there are widely differing estimates of the treatment effect (i.e. heterogeneity or variability in results) across studies. Investigators should explore explanations for heterogeneity, and if they cannot identify a plausible explanation, the quality of evidence should be downgraded. Whether it is downgraded by one or two levels will depend on the magnitude of the inconsistency in the results.

Patients vary widely in their pre-intervention or baseline risk of the adverse outcomes that health care interventions are designed to prevent (e.g. death, stroke, myocardial infarction). As a result, risk differences (absolute risk reductions) in subpopulations tend to vary widely. Relative risk (RR) reductions, on the other hand, tend to be similar across subgroups, even if subgroups have substantial differences in baseline risk. Therefore, when we refer to **inconsistencies in effect size**, we are referring we are **referring to relative measures** (risk ratios and hazard ratios, which are preferred, or odds ratios).

When easily identifiable patient characteristics confidently permit classifying patients into subpopulations at appreciably different risk, absolute differences in outcome between intervention and control groups will differ substantially between these subpopulations. This may well warrant differences in recommendations across subpopulations, rather than downgrading the quality evidence for inconsistency in effect size.

Although there are statistical methods to measure heterogeneity, there are a variety of other criteria to assess heterogeneity, which can also be used when results cannot be pooled statistically. Criteria to determine whether to downgrade for inconsistency can be applied when results are from more than one study and include:

1. Wide variance of point estimates across studies (note: direction of effect is not a criterion for inconsistency)

2. Minimal or no overlap of confidence intervals (CI), which suggests variation is more than what one would expect by chance alone

3. Statistical criteria, including tests of heterogeneity which test the null hypothesis that all studies have the same underlying magnitude of effect, have a low p-value ($p < 0.05$), indicating to reject the null hypothesis

I^2 statistic, which quantifies the proportion of the variation in point estimates due to among-study differences, is large (see note below for decisions based on I^2 statistic)

Note:

While determining what constitutes a large I^2 value is subjective, the following rule-of thumb can be used:

- < 40% may be low
- 30-60% may be moderate
- 50-90% may be substantial
- 75-100% may be considerable

Overlaps in these ranges, and use of "may be" as terminology, illustrate the uncertainty involved in making such judgments. It is also important to note the implicit limitations in this statistic. When individual study sample sizes are small, point estimates may vary substantially, but because variation can be explained by chance, I^2 may be low. Conversely, when study sample sizes are large, a relatively small difference in point estimates can yield a large I^2. Another statistic, τ^2 (tau square) is a measure of the variability that has an advantage over other measures in that it is not dependent on sample size.

All statistical approaches have limitations, and their results should be seen in the context of a subjective examination of the variability in point estimates and the overlap in CIs.

Example 1: Differences in direction, but minimal heterogeneity

Consider the figure below; a forest plot with four studies, two on either side of the line of no effect. We would have no inclination to rate down for inconsistency. Differences in direction, in and of themselves, do not constitute a criterion for variability in effect if the magnitude of the differences in point estimates is small.

[INSERT IMAGE]

Example 2: When inconsistency is large, but differences are between small and large beneficial effects

As we define quality of evidence **for a guideline**, inconsistency is important only when it reduces confidence in results **in relation to a particular decision**. Even when inconsistency is large, it may not reduce confidence in results regarding a particular decision. Consider, the figure below in which variability is substantial, but the differences are between small and large treatment effects.

Guideline developers may or may not consider this degree of variability important. Systematic review authors, much less in a position to judge whether the apparent high heterogeneity can be dismissed on the grounds that it is unimportant, are more likely to rate down for inconsistency.

[INSERT IMAGE]

Example 3: Substantial heterogeneity, of unequivocal importance

Consider the figure below. The magnitude of the variability in results is identical to that of the figure presented in Example 2. However, because two studies suggest benefit and two suggest harm, we would unquestionably choose to rate down the quality of evidence as a result of inconsistency.

[INSERT IMAGE]

Example 4: Test a priori hypotheses about inconsistency even when inconsistency appears to be small

A meta-analysis of randomized trials of rofecoxib looking at the outcome of myocardial infarction found apparently consistent results (heterogeneity p=0.82, I^2=0%). Yet, when the investigators examined the effect in trials that used an external endpoint committee (RR 3.88, 95% CI: 1.88, 8.02) vs. trials that did not (RR 0.79, 95% CI: 0.29, 2.13), they found differences that were large and unlikely to be explained by chance (p=0.01).

Although the issue is controversial, we recommend that meta-analyses include formal tests of whether a priori hypotheses explain inconsistency between important subgroups even if the variability that exists appears to be explained by chance (e.g. high p-values in tests of heterogeneity, and low I^2 values).

If the effect size differs across studies, explanations for inconsistency may be due to differences in:

- **populations** (e.g. drugs may have larger relative effects in sicker populations)
- **interventions** (e.g. larger effects with higher drug doses)
- **outcomes** (e.g. duration of follow-up)
- **study methods** (e.g. RCTs with higher and lower risk of bias).

If inconsistency can be explained by **differences in populations**, **interventions** or **outcomes**, review authors should offer different estimates across patient groups, interventions, or outcomes. Guideline panelists are then likely to offer different recommendations for different patient groups and interventions. If **study methods** provide a compelling explanation for differences in results between studies, then authors should consider focusing on effect estimates from studies with a lower risk of bias.

If large variability in magnitude of effect remains unexplained and authors fail to attribute it to differences in one of these four variables, then the quality of evidence decreases. Review authors and guideline panels should also consider **the extent** to which they are uncertain about the underlying effect due to the inconsistency. Uncertainty relates to how important inconsistency is to the confidence in the result. The extent is used to decide whether to downgrade the quality rating by one or even two levels.

Example 5: Making separate recommendations for subpopulations

When the analysis for benefits of endarterectomy was pooled across patients with stenosis of the carotid artery, there was high heterogeneity. Heterogeneity was explored and was explained by separating out patients who were symptomatic with high degree stenosis (in which endarterectomy was beneficial), and patients who were asymptomatic with moderate degree stenosis (in which surgery was not beneficial). The authors presented and graded the evidence by patient group and did not downgrade the quality of the evidence for inconsistency. Two different recommendations were also made according to patient group by the guideline panel.

5.2.2.1 Deciding whether to use estimates from a subgroup analysis

Finding an explanation for inconsistency is preferable. An explanation can be based on differences in population, intervention, or outcomes which mandate two or more estimates of effect, possibly with separate recommendations. However, subgroups effects may prove spurious and may not explain all the variability in the extent of inconsistency. Indeed, most putative subgroup effects ultimately prove spurious. A cautionary note about subgroup analyses and their presentation is warranted; refer to Sun et al. 2010 and Guyatt et al. 2011 for further reading.

Review authors and guideline developers must exercise a high degree of skepticism regarding potential subgroup effect explanations, paying particular attention to criteria the following 7 criteria:

1. Is the subgroup variable a characteristic specified at baseline or after randomization? (subgroup hypotheses should be developed a priori)
2. Is the subgroup difference suggested by comparisons within rather than between studies?
3. Does statistical analysis suggest that chance is an unlikely explanation for the subgroup difference?
4. Did the hypothesis precede rather than follow the analysis and include a hypothesized direction that was subsequently confirmed?
5. Was the subgroup hypothesis one of a smaller number tested?
6. Is the subgroup difference consistent across studies and across important outcomes?
7. Does external evidence (biological or sociological rationale) support the hypothesized subgroup difference?

The credibility of subgroup effects is not a matter of yes or no, but a **continuum**. Judgement is required to determine how convincing a subgroup analysis is based on the above criteria.

Example 6: Subgroup analysis explaining inconsistency in results

A systematic review and individual patient data meta-analysis (IPDMA) addressed the impact of high vs. low positive end-expiratory pressures (PEEPs) in three randomized trials that enrolled 2,299 adult patients with severe acute lung injury requiring mechanical ventilation.

The results of this IPDMA suggested a possible reduction in deaths in hospital with the higher PEEP strategy, but the difference was not statistically significant (RR 0.94; 95% CI: 0.86, 1.04). In patients with severe disease (labeled acute respiratory distress syndrome), the effect more clearly favored the high PEEP strategy (RR 0.90; 95% CI: 0.81, 1.00; P50.049). In patients with mild disease, results suggested that the high PEEP strategy may be inferior (RR 1.37; 95% CI: 0.98, 1.92).

Applying the seven criteria (see table below), we find that six are met fully, and the seventh, consistency across trials and outcomes, partially: the results of the subgroup analysis were consistent across the three studies, but other ways of measuring severity of lung injury (for instance, treating severity as a continuous variable) failed to show a statistically significant interaction between the severity and the magnitude of effect. In this case, the subgroup analysis is relatively convincing.

[INSERT IMAGE]

Example 7: Subgroup analysis not very likely to explain inconsistency in results

Three randomized trials have tested the effects of vasopressin vs. epinephrine on survival in patients with cardiac arrest. The results show appreciable differences in point estimates, widely overlapping CIs, a p-value for the test of heterogeneity of 0.21 and an *I2* of 35%.

Two of the trials included both patients in whom asystole was responsible for the cardiac arrest and the patients in whom ventricular fibrillation was the offending rhythm. One of these two trials reported a borderline statistically significant benefit - our own analysis was borderline nonsignificant - of

vasopressin over epinephrine restricted to patients with asystole (in contrast to patients whose cardiac arrest was induced by ventricular fibrillation).

It is not very likely that the subgroup analysis can explain the moderate inconsistency in the results. Chance can explain the putative subgroup effect and the hypothesis fails other criteria (including small number of a priori hypotheses and consistency of effect). Here, guideline developers should make recommendations on the basis of the pooled estimate of data from both the groups. Whether the quality of evidence should be rated down for inconsistency is another judgment call; we would argue for not rating down for inconsistency.

[INSERT IMAGE]

5.2.3 Indirectness of evidence

We are more confident in the results when we have direct evidence. Direct evidence consists of research that directly compares the interventions which we are interested in, delivered to the populations in which we are interested, and measures the outcomes important to patients.

Authors of systematic reviews and guideline panels making recommendations should consider the extent to which they are uncertain about the applicability of the evidence to their relevant question and downgrade the quality rating by one or even two levels.

For authors of systematic reviews:

Directness is judged by the users of evidence tables, depending on the target population, intervention, and outcomes of interest. Authors of systematic reviews should answer the health care question they asked and, thus, they will rate the directness of evidence they found. The considerations made by the authors of systematic reviews may be different than those of guideline panels that use the systematic reviews. The more clearly and explicitly the health care question was formulated the easier it will be for the users to understand systematic review authors' judgments.

There are four sources of indirectness:

1. Differences in population (applicability)

Differences between study populations within a systematic review are a common problem for systematic review authors and guideline panels. When this occurs evidence is indirect. The effect on overall quality of evidence will vary depending on how different the study populations are, as a result quality may not decrease, decrease by a one level or decrease by two levels in extreme cases.

The above discussion refers to different human populations, but sometimes the only evidence will be from animal studies, such as rats or primates. In general, we would rate such evidence down two levels for indirectness. Animal studies may, however, provide an important indication of drug toxicity. Although toxicity data from animals does not reliably predict toxicity in humans, evidence of animal toxicity should engender caution in recommendations. Other types of nonhuman studies (e.g. laboratory evidence) may generate high quality evidence

Example 1: Indirectness in Populations (Downgraded by Two Levels)

High-quality randomized trials have demonstrated the effectiveness of antiviral treatment for seasonal influenza. The panel judged that the biology of seasonal influenza was sufficiently different from that of avian influenza (avian influenza organism may be far less responsive to antiviral agents than seasonal influenza) that the evidence required rating down quality by two levels, from high to low, due to indirectness.

Example 2: Non-human studies providing high quality evidence (Not Downgraded)

Consider laboratory evidence of change in resistance patterns of bacteria to antimicrobial agents (e.g. the emergence of methicillin-resistant staphylococcus aureus - MRSA). These laboratory findings may constitute high quality evidence for the superiority of antibiotics to which MRSA is sensitive vs. methicillin as the initial treatment of suspected staphylococcus sepsis in settings in which MRSA is highly prevalent.

2. Differences in interventions (applicability)

Systematic reviewers will make a concerted effort to ensure that only studies with directly relevant interventions are included in their review. However, exceptions may still occur. Generally, when interventions that are indirectly related to the study are included in systematic review, evidence quality will be decreased. In some instances the intervention used will be the same, but may be delivered in differently depending on the setting.

Example 3: Interventions delivered differently in different settings (Downgraded by One Level)

A systematic review of music therapies for autism found that trials tested structured approaches that are used more commonly in North America than in Europe. Because the interventions differ, the results from structured approaches are more applicable to North America and the results of less structured approaches are more applicable in Europe.

Guideline panelists should consider rating down the quality of the evidence if the intervention cannot be implemented with the same rigor or technical sophistication in their setting as in the RCTs from which the data come.

Example 4: Trials of related interventions (Downgraded by One or Two Levels)

Guideline developers may often find the best evidence addressing their question in trials of related, but different, interventions. A guideline addressing the value of colonoscopic screening for colon cancer will find the randomized control trials (RCTs) of fecal occult blood screening that showed a decrease in colon cancer mortality. Whether to rate down quality by one or two levels due to indirectness in this context is a matter of judgment.

Example 5: Indirectness in Interventions (Not Downgraded)

Older trials show a high efficacy of intramuscular penicillin for gonococcal infection, but guidelines might reasonably recommend alternative antibiotic regimes based on current local in vitro resistance patterns, which would not warrant downgrading the quality of evidence for indirectness.

Example 6: Interventions not sufficiently different (Not Downgraded)

Trials of simvastatin show cardiovascular mortality reduction. Suggesting night rather than morning dosing (because of greater cholesterol reduction) would not warrant rating down quality for differences in the intervention.

3. Differences in outcomes measures (surrogate outcomes)

GRADE specifies that both those conducting systematic reviews and those developing practice guidelines should begin by specifying every important outcome of interest. The available studies may have measured the impact of the intervention of interest on outcomes related to, but different from, those of primary importance to patients.

The difference between desired and measured outcomes may relate to time frame (e.g. outcome measured at 3-months vs. at 12-months). Another source of indirectness related to measurement of outcomes is the use of substitute or surrogate endpoints in place of the patient-important outcome of interest.

Table 5.7: Common surrogate measures and corresponding patient-important outcomes

Condition	Patient-important outcome(s)	Surrogate outcome(s)
Diabetes mellitus	Diabetic symptoms, hospital admission, complications (cardiovascular, eye, renal, neuropathic)	Blood glucose, A1C
Hypertension	Cardiovascular death, myocardial infarction, stroke	Blood pressure
Dementia	Patient function, behavior, caregiver burden	Cognitive function
Osteoporosis	Fractures	Bone density
Adult Respiratory Distress Syndrome	Mortality	Oxygenation
End-stage renal disease	Quality of life, morbidity (such as shunt thrombosis or heart failure), mortality	Hemoglobin
Venous thrombosis	Symptomatic venous thrombosis	Asymptomatic venous thrombosis
Chronic respiratory disease	Quality of life, exacerbations, mortality	Pulmonary function, exercise capacity
Cardiovascular disease	Myocardial infarction, vascular events, mortality	Serum lipids, coronary calcification, calcium/phosphate metabolism

In general, the use of a surrogate outcome requires rating down the quality of evidence by one, or even two, levels. Consideration of the biology, mechanism, and natural history of the disease can be helpful in making a decision about indirectness. For surrogates that are far removed in the putative causal pathway from the patient-important endpoints, we would rate down the quality of evidence with respect to this outcome by two levels. Surrogates that are closer in the putative causal pathway to the outcomes warrant rating down by only one level for indirectness.

Example 7: Time differences in outcomes (Downgraded by One Level)

A systematic review of behavioral and cognitive-behavioral interventions for outwardly directed aggressive behavior in people with learning disabilities showed that a program of 3-week relaxation training significantly reduced disruptive behaviors at 3 months. Unfortunately, no eligible trial assessed the review authors' predefined outcome of interest, the long-term impact defined as effect at 9 months or greater. The argument for rating down quality for indirectness becomes stronger when one considers that other types of behavioral interventions have shown an early beneficial effect that was not sustained at 6 months follow-up.

Example 8: Surrogate outcomes (Downgraded by One or Two Levels)

Calcium and phosphate metabolism are far removed in the causal pathway from patient-important outcomes such as myocardial infarction, and warrant rating down the quality of evidence by two levels. Surrogate outcomes that are closer in the causal pathway to the patient-important outcomes such as coronary calcification for myocardial infarction, bone density for fractures, and soft-tissue calcification for pain, warrant rating down quality by one level for indirectness.

Example 9: Uncertainty in the relationship between surrogate and Surrogate outcomes (Downgraded by One or Two Levels)

Investigators examined the "validity" of progression-free survival as a surrogate for overall survival for anthracycline- and taxine-based chemotherapy in advanced breast cancer. They found a statistically significant association between progression-free and overall survival in the randomized trials they analyzed, but predicting overall survival using progression-free survival remained uncertain. Rating down quality by one level for indirectness would be appropriate in this situation.

4. Indirect Comparisons)

Occurs when a comparison of intervention A versus B is not available, but A was compared with C and B was compared with C. Such studies allow indirect comparisons of the magnitude of effect of A versus B. As a result of the indirect comparison, this evidence is of lower quality than head-to-head comparisons of A and B would provide.

The validity of the indirect comparison rests on the assumption that factors in the design of the trial (the patients, co-interventions, measurement of outcomes) and the methodological quality are not sufficiently different to result in different effects (in other words, true differences in effect explain all apparent differences). Some authors refer to this as the "similarity assumption". Because this assumption is always in some doubt, indirect comparisons always warrant rating down by one level in quality of evidence. Whether to rate down two levels depends on the plausibility that alternative factors (population, interventions, co-interventions, outcomes, and study methods) explain or obscure differences in effect.

Example 10: Indirect comparison of low- vs. medium-dose aspirin (Downgraded by One Level)

A systematic review considered the relative merits of low dose vs. medium dose of aspirin to prevent graft occlusion after coronary artery bypass surgery. Authors found five relevant trials that compared aspirin with placebo, of which two tested medium dose and three low-dose aspirin. The pooled relative risk of the likelihood of a graft occlusion was 0.74 (95% CI: 0.60, 0.91) in the low-dose trial and 0.55 (95% CI: 0.28, 0.82) in the medium-dose trials. The RR of medium vs. low dose was 0.74 (95% CI: 0.52, 1.06; P = 0.10) suggesting the possibility of a larger effect with the medium-dose regimens. This comparison is weaker than if the randomized trials had compared the two aspirin dose regimens directly because there are other study characteristics that might be responsible for any differences found.

Example 11: Network meta-analysis (Downgraded by Two Levels)

Investigators conducted a simultaneous treatment comparison of 12 new generation antidepressants. The authors evaluated 117 randomized trials involving over 25,000 patients; their article provides no information about the similarity of the patients, or about co-intervention. In correspondence with the authors, however, they indicated that they excluded trials with treatment-resistant depression, argued that different types of depression have similar treatment responses, and that it is very likely that patients did not receive important co-intervention. With respect to risk of bias, the authors tell us, using the Cochrane collaboration approach to assessing risk of bias that risk of bias in most studies was “unclear”, and 12 were at low risk of bias; presumably a small number was at high risk of bias. This is helpful, although “unclear” represents a wide range of risk of bias. All studies involved head-to-head comparisons between at least two of the 12 drugs; the 117 trials involved 70 individual comparisons (e.g., two comparisons between fluoxetine and fluvoxamine). The authors reported statistically significant differences between direct and indirect comparisons in only three of 70 comparisons of drug response. The power of such tests was, however, not likely high. Overall, we would be inclined to take a cautious approach to this network meta-analysis and rate down two levels for indirectness.

5.2.4 Imprecision

In general, results are imprecise when studies include relatively few patients and few events and thus have a wide confidence interval (CI) around the estimate of the effect. In this case, one may judge the quality of the evidence lower than it otherwise would be considered because of resulting **uncertainty about the results**.

In addition to describing how the 95% confidence interval should be used as the primary criterion to make judgements about imprecision, we introduce theoptimal information size (OIS) as a second, necessary criterion for determining adequate precision.

Because GRADE **defines the quality of evidence differently** for systematic reviews and for guidelines, the criteria for downgrading for imprecision differ in that guideline panels need to consider the context of a recommendation and other outcomes, whereas judgments about specific outcomes in a systematic review are free of that context. The GRADE approach, therefore, suggests separate guidance for determining imprecision as is described in the following sections.

5.2.4.1 Imprecision in guidelines

For guideline panels:

Quality of evidence refers to the extent to which our **confidence in the estimate of an effect is adequate to support a particular decision**. In guidelines **all outcomes are considered together**, with attention to whether they are critical, or important but not critical.

For guideline panels, the decision to rate down the quality of evidence for imprecision is dependent on the threshold that represents the basis for a management decision and consideration of the trade-off between desirable and undesirable consequences. Determining the acceptable threshold inevitably involves judgement that must be made explicit.

For dichotomous outcomes

Guideline developers must consider the context of the particular recommendation to determine whether the results of a dichotomous (binary) outcome are sufficiently precise to support that recommendation. Setting a specific threshold for an acceptable estimate of treatment effect will involve judgement in the context of factors such as side effects, drug toxicity, and cost (*see Example 1*). Examining the lower and upper boundaries of the CI in relation to the threshold set by the guideline panel, then determining whether criteria for the optimal information size are met, will help in deciding whether to rate down for imprecision.

We suggest that guideline developers consider the following steps in deciding whether to rate down the quality of evidence for imprecision in guidelines:

1. First consider whether the boundaries of the CI are on the same side of their decision-making threshold. **Does the CI cross the clinical decision threshold between recommending and not recommending treatment**? If the answer is **yes** (i.e. the CI crosses the threshold), **rate down** for imprecision irrespective of where the point estimate and CI lie. (*see Example 1*)

2. If the threshold is **not crossed**, are criteria for an **optimal information size** met? (*see note on OIS and Example 3*)

3. **Or,**

4. Is the event rate very low and the sample size very large (at least 2000, and perhaps 4000 patients)? (*see Exception note*)

5. If **neither criterion is met**, **rate down** for imprecision.

While confidence intervals mostly capture the extent of imprecision, they can be misleading in certain circumstances because of fragility. Specifically, CIs may appear robust, but small numbers of events may render the results fragile. Confidence intervals assume all patients are at the same risk (i.e. there is prognostic balance), an assumption that is false. Randomization will ameliorate the problem by balancing prognostic factors between intervention and control groups, but we can be confident that a prognostic balance has been achieved only if sample sizes are large. Large treatment effects in the presence of small sample sizes, even in RCTs, may be because of prognostic imbalance and warrant caution.

Early trials addressing a particular question will, particularly if small, substantially overestimate the treatment effect. A systematic review of these trials will subsequently also generate an overestimated treatment effect. Examples of meta-analyses generating apparent beneficial or harmful effects refuted by subsequent larger trials include magnesium for mortality reduction after myocardial infarction, angiotensin-converting enzyme inhibitors for reducing the incidence of diabetes, nitrates for mortality reduction in myocardial infarction, and aspirin for reduction of pregnancy-induced hypertension. A similar circumstance occurs when trials are stopped early for benefit (i.e. prior to reaching the total number of events, or the sample size, needed as was calculated for an adequately powered trial). Simulation studies and empirical evidence suggest that trials stopped early overestimate treatment effects (*see Example 4*). When a treatment effect is overestimated, the CI around the effect may falsely appear suitable to meet the clinical decision threshold criterion by indicating adequate precision.

Therefore, the clinical decision threshold criterion is not completely sufficient to deal with issues of precision, and the second OIS criterion is required.

Note: The Optimal Information Size (OIS)

In order to address the vulnerability of confidence intervals as a criterion for adequate precision, we suggest the "optimal information size" as a **second, necessary criterion** to consider. The OIS is applied as a rule according to the following:

> • If the **total number of patients** included in a systematic review is **less than** the number of patients generated by a **conventional sample size calculation** for a single adequately powered trial, consider **rating down** for imprecision.

Many online calculators for sample size calculation are available. A simple one can be found at http://www.stat.ubc.ca/rollin/stats/ssize/b2.html. As an alternative to calculating the OIS, guideline developers can also consult figures that show the relationship between sample size required, or number of events needed, and effect size. See *Example 2* demonstrating how these figures can be used.

Exception: Low event rates with large sample size, an exception to the need for OIS

When **event rates are low**, CIs around relative effects may be wide, but if sample sizes are sufficiently large, it is likely that prognostic balance has indeed been achieved and CIs around **absolute effects may be narrow**. Under such circumstances, judgment about precision may be based on the CI around the absolute effect and one may **not downgrade** the quality of evidence for imprecision. (*see Examples 5 and 6*)

Example 1: Setting clinical decision thresholds to determine imprecision in guidelines

Refer to the figure below. A hypothetical systematic review of randomized control trials of an intervention to prevent major strokes yields a point estimate of the absolute reduction in strokes of 1.3%, with a 95% CI of 0.6% to 2.0%. This translates to a number needed to treat (NNT) of 77 (100÷1.3) patients for a year to prevent a single stroke. The 95% CI around the NNT is 50 to 167. Therefore, while 77 is our best estimate, we may need to treat as few as 50 or as many as 167 people to prevent a single stroke.

[INSERT IMAGE]

If we consider that the intervention is a drug with no serious adverse effects, minimal inconvenience, and modest cost, we may set a threshold for an absolute reduction in strokes of 0.5%, or NNT=200 (green line in the figure above), as even this small effect would warrant a recommendation. The entire CI (0.6% to 2.0%) lies to the left of the 0.5% threshold and, therefore, excludes any benefit smaller than the threshold. We can conclude that the precision of the evidence is sufficient to support a recommendation and do not rate down the quality of evidence for imprecision.

On the other hand, if the drug is associated with serious toxicity, we may be reluctant to make a recommendation unless the absolute stroke reduction is at least 1%, or NNT=100 (red line in the figure above). Under these circumstances, the precision is insufficient as the CI encompasses treatment effects smaller than this threshold (i.e. as small as 0.6%). A recommendation in favour of the intervention would still be appropriate as the point estimate of 1.3% meets the threshold, but we would rate down the quality of evidence supporting the recommendation by one level for imprecision (e.g. from high to moderate).

Example 2: Using figures to determine Optimal Information Size

As an alternative to calculating the OIS, review and guideline authors can also consult a figure to determine the OIS. The figure below presents the required sample size (assuming α of 0.05, and β of 0.2) for RRR of 20%, 25%, and 30% across varying control group risks. For example, if the best estimate of control group risk was 0.2 and one specifies an RRR of 25%, the OIS is approximately 2000 patients.

[INSERT IMAGE]

Power is, however, more closely related to number of events than to sample size. The figure below presents the same relationships using total number of events across all studies in both treatment and control groups instead of total number of patients. Using the same choices of a control group risk of 0.2 and RRR 25%, one requires approximately 325 events to meet OIS criteria.

[INSERT IMAGE]

Note: Choice of Relative Risk Reduction

We have suggested using RRRs of 20% to 30% for calculating OIS. The choice of RRR is a matter of judgment, and there may be instances in which compelling prior information would suggest choosing a smaller or larger value for the RRR for the OIS calculation.

Example 3: Applying the OIS Criterion

A systematic review of flavonoids for treatment of hemorrhoids examined the outcome of failure to achieve an important symptom reduction. In calculating the OIS, the authors chose a conservative α of 0.01 and RRR of 20%, a β of 0.2, and a control group risk of 50%. The calculated OIS was marginally larger than the total sample size included (1194 vs. 1102 patients).

A more dramatic example comes from a systematic review and meta-analysis of fluoroquinolone prophylaxis for patients with neutropenia. Only one of eight studies that contributed to the meta-analysis met conventional criteria for statistical significance, but the pooled estimate suggested an impressive and robust reduction in infection-related mortality with prophylaxis (RR: 0.38; 95% CI: 0.21, 0.69). The total number of events was only 69 and the total number of patients 1022. Considering the control group risk of 6.9% and setting α of 0.05, β of 0.02, and RRR of 25% results in an OIS of 6400 patients. This meta-analysis fails to meet OIS criteria, and rating down for imprecision may be warranted.

Example 4: Stopping trials early may result in overestimated treatment effects and incorrect judgements about precision

Consider a randomized trial of β blockers in 112 patients undergoing surgery for peripheral vascular diseases that fulfilled preplanned O'Briene-Fleming criteria for early stopping. Of 59 patients given bisoprolol, 2 suffered a death or nonfatal myocardial infarction, as did 18 of 53 control patients. Despite a total of only 20 events, the 95% CI around the RR (0.02 to 0.41) excludes all but a large treatment effect. The CI suggests that the smallest plausible effect is a 59% RRR. A recommendation to administer treatment based on this result would be deemed to have adequate precision.

However, there are reasons to doubt the estimate of the magnitude of effect from this trial. First, it is much larger than what we might expect on the basis of β blockers effects in a wide variety of other situations. Second, the study was terminated early on the basis of the large effect. Third, we have a sense of the fragility of these results as concluding that an RRR less than 59% is implausible on the basis of only 20 events violates common sense. If one moves just five events from the control to the intervention group, the results lose their statistical significance, and the new point estimate (an RRR of 52%) is outside of the original CI.

Example 5: Focusing on absolute effects when event rates are low and sample size is large

A systematic review of seven randomized trials of angioplasty versus carotid endarterectomy for cerebrovascular disease found that a total of 16 of 1482 (1.1%) patients receiving angioplasty died, as did 19 of 1465 (1.3%) undergoing endarterectomy. Looking at the 95% CI (0.43, 1.66) around the point estimate of the RR (0.85), the results are consistent with substantial benefit and substantial harm, suggesting the need to rate down for imprecision.

The absolute difference, however, suggests a different conclusion. The absolute difference in death rates between the two procedures is very small (absolute difference of 0.2% with a 95% CI ranging from -0.5% to 1.0%). Setting a clinical decision threshold boundary of 1% absolute difference (the smallest difference important to patients), the results of the systematic review exclude a difference favoring either procedure. If one accepted this clinical decision threshold as appropriate, one would not rate down for imprecision. One could argue that a difference of less than 1% could be important to patients: if so, one would rate down for imprecision, even after considering the CI around the absolute difference, as the CI would cross that threshold.

Example 6: No need to rate down for imprecision when sample sizes are very large

A meta-analysis of randomized trials of β blockade for preventing cardiovascular events in patients undergoing non-cardiac surgery suggested a doubling of the risk of strokes with β blockers (RR: 2.22; 95% CI: 1.39, 3.56). Most trials in this meta-analysis do not suffer from important limitations, the evidence is direct and consistent, and publication bias is undetected. Given the lower boundary of the CI (an increase in RR of 39%), the threshold for adequate precision would not be crossed if one believed that most patients would be reluctant to use β blockers with an increase in RR of stroke of 39%.

The total number of events (75), however, appears insufficient, an inference that is confirmed with an OIS calculation (α 0.05, β 0.20, using the β-blocker group's 1% event rate as the control, and Δ 0.25, total sample size 43586 in comparison to the 10889 patients actually enrolled). The guidelines for calculating precision we have suggested would, therefore, mandate rating down quality for imprecision.

With a sample size of over 5000 patients per group, however, it is very likely that randomization has succeeded in creating prognostic balance. If that is true, β blockers really do increase the risk of stroke. Not rating down for imprecision in this situation is therefore appropriate. Preliminary information suggests that for low baseline risk (<5%) one will be safe with regard to prognostic balance with a total of 4000 patients (2000 patients per group). Availability of this number of patients would mandate not rating down for imprecision despite not meeting the OIS criterion.

For continuous outcomes

Considerations of rating down quality because of imprecision for continuous variables follow the **same logic as for binary variables**. The process begins by rating down the quality for imprecision if a recommendation would be altered if the lower versus the upper boundary of the CI represented the true underlying effect. If the CI does not cross this threshold, but the evidence fails to meet the OIS criterion, guideline authors should consider rating down the quality of evidence for imprecision. In this instance, judging the OIS criterion will require a sample size calculation for the continuous variable.

In the context of a guideline, the decision-making threshold for an acceptable estimate of treatment requires consideration of the full context of the recommendation, including other outcomes such as all potential benefits and important adverse effects (*see Example 7*).

Example 7: Considering the full context of a recommendation

A systematic review suggests that corticosteroid administration decreases the length of hospital stay in patients with exacerbations of chronic obstructive pulmonary disease (COPD) by 1.42 days (95% CI: 0.65, 2.2). The lower boundary of the CI is 0.65 days, a rather small effect size that may not be considered important to patients.

As it turns out, steroids also reduce the likelihood of treatment failure (variably defined) during inpatient or outpatient follow-up (RR: 0.54; 95% CI: 0.41, 0.71). The best estimate of likelihood of symptomatic deterioration in those not treated with steroids is approximately 30%. By administering steroids to these patients, the risk is reduced from 30% to 16% (30-[0.54x30]), a difference of 14%, and the effect is unlikely to be less than 9% (30-[0.71x30]).

Adverse effects were poorly reported in the studies. The only consistently reported problem was hyperglycemia, which was increased almost sixfold, representing an absolute increase of 15% to 20%. The extent to which this hyperglycemia had consequences important to patients is uncertain. One possible conclusion from this information is that, given the magnitude of reduction in deterioration and lack of evidence suggesting important adverse effects, a benefit of even 0.65 days of reduced average hospitalization would warrant steroid administration. If this were the conclusion, the CI (0.65, 2.2) would not cross the decision-making threshold and the guideline panel would proceed to consider whether the evidence meets the OIS criterion.

5.2.4.2 Imprecision in in systematic reviews

For authors of systematic reviews:

Quality of evidence refers to one's **confidence in the estimates of effect**. In systematic reviews **each outcome is considered separately**.

Authors of systematic reviews should not rate down quality due to imprecision on the basis of the trade-off between desirable and undesirable consequences; it is not their job to make value and preference judgments. Therefore, in judging precision, they should not focus on the threshold that represents the basis for a management decision. Rather, they should consider the optimal information size to make judgements.

For dichotomous outcomes

We suggest that authors of systematic reviews consider the following steps in deciding whether to rate down the quality of evidence for imprecision:

1. If the optimal information size criterion is **not met**, **rate down** for imprecision, unless the sample size is very large (at least 2000, and perhaps 4000 patients).

2. If the OIS criterion is met and the **95% CI excludes no effect** (i.e. CI around RR excludes 1.0), **do not rate down** for imprecision.

3. If OIS criterion is met, and the **95% CI overlaps no effect** (i.e. CI includes RR of 1.0) **rate down for imprecision** if the CI **fails to exclude important benefit or important harm**. (*see Example 8*)

Note:

To be of optimal use to guideline developers, a systematic review may still point out what thresholds of benefit would mandate rating down for imprecision.

Example 8: Meeting threshold OIS may not ensure precision

Although satisfying the OIS threshold in the presence of a CI excluding no effect indicates adequate precision, the same is not true when the point estimate fails to exclude no effect.

Consider the systematic review of β blockers in non-cardiac surgery previously introduced in Example 6 above. For total mortality, with 295 deaths and a total sample size of over 10000, the point estimate and 95% CI for the RR with β blockers were 1.24 (95% CI: 0.99, 1.56). Despite the large sample size and number of events, one might be reluctant to conclude precision is adequate when a small reduction in mortality with β blockers, as well as an increase of 56%, remain plausible. This suggests that when the OIS criteria are met, and the CI includes the null effect, systematic review authors should consider whether CIs include appreciable benefit or harm.

Authors should use their judgment in **deciding what constitutes appreciable benefit and harm** and provide a rationale for their choice. If reviewers fail to find a compelling rationale for a threshold, our suggested default threshold for appreciable benefit and harm that warrants rating down is an RRR or RR increase of 25% or more.

For continuous outcomes

Review authors can calculate the OIS for continuous variables in exactly the same way they can for binary variables by specifying the α and β error thresholds (we have suggested 0.05 and 0.2) and the Δ, and choosing an appropriate population standard deviation based on one of the relevant studies.

Whether you will rate down for imprecision is **dependent on the choice of the difference** (Δ) you wish to detect and the resulting sample size required. Again, the merit of the GRADE approach is not that it ensures agreement between reasonable individuals, but that the judgements being made are explicit.

Example 9: Judgements about imprecision depend on the choice of difference to detect

Consider the systematic review previously introduced in Example 7 above, which suggests that corticosteroid administration decreases the length of hospital stay in patients with exacerbations of chronic obstructive pulmonary disease (COPD) by 1.42 days (95% CI: 0.65, 2.2).

Choosing a Δ of 1.0 (implying a judgment that reductions in stay of more than a day are important) and using the standard deviation associated with hospital stay in the four relevant studies (3.4, 4.5, and 4.9) yields corresponding required total sample sizes of 364, 636, and 754. The 602 patients available for this analysis do not therefore meet the OIS criterion, and one would consider rating down for imprecision.

Had we chosen a smaller difference (e.g. 0.5 days) that we wished to detect, the sample size of the studies would have been unequivocally insufficient. Had we chosen a larger value (e.g. 1.5 days) the sample size of 602 would have met the OIS criterion.

Note: Outcomes reported as a standardized mean difference

A particular challenge in calculating the OIS for continuous variables arises when studies have used different instruments to measure a construct, and the pooled estimate is calculated using a standardized mean difference. Systematic review and guideline authors will most often face this situation when dealing with patient-reported outcomes, such as quality of life. In this context, we suggest authors choose one of the available instruments (ideally, one in which an estimate of the minimally important difference is available) and calculate an OIS using that instrument.

Because it may give false reassurance, we hesitate to offer a rule-of-thumb threshold for the absolute number of patients required for adequate precision for continuous variables. For example, using the usual standards of α (0.05) and β (0.20), and an effect size of 0.2 standard deviations, representing a small effect, requires a total sample size of approximately 400 (200 per group), sample size that may not be sufficient to ensure prognostic balance.

Nonetheless, whenever there are sample sizes that are less than 400, review authors and guideline developers should certainly consider rating down for imprecision. In future, statistical simulations may provide the basis for a robust rule of thumb for continuous outcomes. The limitations of an arbitrary threshold sample size suggest the advisability of addressing precision by calculation of the relevant OIS for each continuous variable.

5.2.4.3 Rating down two levels for imprecision

When there are very few events and CIs around both relative and absolute estimates of effect, that include both appreciable benefit and appreciable harm, systematic reviewers and guideline developers should consider rating down the quality of evidence by two levels.

Example 10: Rating down for imprecision by two levels

A systematic review of the use of probiotics for induction of remission in Crohn's disease found a single randomized trial that included 11 patients. Four of five patients in the treatment group achieved remission, and five of six patients in the control group achieved remission. The point estimate of the risk ratio (0.96) suggests no difference, but the CI includes a reduction in likelihood of remission of almost half, or an increase in the likelihood of over 50% (95% CI: 0.56, 1.69). As there are few events and the CI includes appreciable benefit and harm, one would rate down quality of evidence by two levels for imprecision.

5.2.5 Publication bias

Publication bias is a systematic under-estimation or an over-estimation of the underlying beneficial or harmful effect due to the **selective publication of studies**. Confidence in the combined estimates of effects from a systematic review can be reduced when publication bias is suspected, even when the included studies themselves have a low risk of bias.

Note:

Some systems for assessing the quality of the body of evidence use the term "reporting bias" with 2 subcategories: selective outcome reporting and publication bias. However, GRADE considers *selective outcome reporting* under *risk of bias* (study limitations) since it can be addressed in single studies. In contrast, when an entire study remains unpublished (unreported), one can assess the likelihood of *publication bias* only by looking at a group of studies. Currently, GRADE follows the Cochrane Collaboration's approach and consider *selective outcome reporting* as an issue in risk of bias in individual studies (Cochrane Handbook. Chapter 8.5 The Cochrane Collaboration's tool for assessing risk of bias).

Empirical evidence suggests that studies reporting statistically significant findings are more likely to be accepted for publication than those reporting statistically insignificant findings ("negative studies"). Publication bias arises when entire studies go unreported. Lack of success to identify studies is typically a result of studies either remaining unpublished or obscurely published (e.g. in journals with limited circulation not indexed by major databases, as conference abstracts or theses), thus, methodologists have labeled the phenomenon "publication bias." Authors of systematic reviews may fail to identify studies that are unpublished or that have been published in a non-indexed, limited-circulation journal or in the grey literature even if they employ most rigorous search techniques. If rigorous search techniques are not implemented it is difficult to make the judgement about publication bias since studies might remain unidentified both because of publication bias or because of insufficient effort to identify them.

The risk of publication bias may be higher for systematic reviews of observational studies than for reviews of RCTs. This can occur, especially if observational studies are conducted automatically from patient registries or medical records. In these instances, it is difficult for the reviewer to know if the observational studies that appear in the literature represent all or a fraction (usually those that showed "interesting" results) of the studies conducted.

Table 5.8: Possible sources of publication bias throughout the publication process

Phases of research publication	Actions contributing to or resulting in bias.
Preliminary and pilot studies	Small studies more likely to be "negative" (e.g. those with discarded or failed hypotheses) remain unpublished; companies classify some as proprietary information.
Report completion	Authors decide that reporting a "negative" study is uninteresting; and do not invest the time and effort required for submission.
Journal selection	Authors decide to submit the "negative" report to a nonindexed, non-English, or limited-circulation journal.
Editorial consideration	Editor decides that the "negative" study does not warrant peer review and rejects manuscript.
Peer review	Peer reviewers conclude that the "negative" study does not contribute to the field and recommend rejecting the manuscript. Author gives up or moves to lower impact journal. Publication delayed.
Author revision and resubmission	Author of rejected manuscript decides to forgo the submission of the "negative" study or to submit it again at a later time to another journal (see "journal selection" above).
Report publication	Journal delays the publication of the "negative" study. Proprietary interests lead to report getting submitted to, and accepted by, different journals.

Studies with **small sample sizes** are more likely to remain unpublished or ignored. Discrepancies between results of meta-analyses of small studies and subsequent large trials may occur as often as 20% of the time, and publication bias may be a major contributor to such discrepancies. Therefore, one should suspect publication bias when published evidence is limited to a small number of small trials. This is especially true if many of these small studies show benefits of certain intervention.

Methods to detect the possibility of publication bias in systematic reviews include visual inspection and tests for asymmetry of funnel plots (Cochrane Handbook. Chapter 10.4 Detecting reporting biases). Empirical examination of patterns of results may suggest publication bias if results are asymmetrical about the summary estimate of effect. This can be determined either through visual inspection of a funnel plot (shown below) or from a positive result for a statistical test for asymmetry. As a rule-of-thumb, funnel plot and statistical tests for asymmetry should be used to detect publication bias if there are at least 10 studies included in the meta-analysis (some say at lest 5 studies).

Another test used to detect publication bias is referred to as the "trim and fill" method is an extension of the funnel plot. This trim and fill technique begins by removing small "positive" studies that do not have a negative counterpart, leaving a symmetrical funnel plot. The new supposed true effect is then calculated using the effects of the studies included in the new funnel plot. The next step is to add hypothetical studies which mirror the results of the positive studies, but still retains the new pooled effect estimate. It is important to note that even if asymmetry is detected, it may not be the result of publication bias. For example, in smaller studies, over-estimates of effect may yield an asymmetric funnel plot that could be explained by limitations other than publication bias such as a restrictive study population. To strengthen conclusions regarding publication bias it is recommended that multiple tests be used.

Recursive cumulative meta-analysis, used to detect lag time bias, performs a meta-analysis at the end of each year, noting changes in effect estimates for each progressing year. If effects of an intervention continuously decrease, there is a strong indication of lag time bias.

Regardless of the test used, review authors and guideline developers should be aware such tests can be prone to error and their results should be interpreted with caution. It is extremely difficult to be confident that publication bias is absent and almost as difficult to place a threshold on when to rate down quality of evidence due to the strong suspicion of publication bias. For this reason GRADE suggests rating down quality of evidence for publication bias by a maximum of one level.

Example 1: Trials with positive findings (i.e. statistically significant differences) are more likely to be published than trials with negative or null findings

A systematic review assessed the extent to which publication of a cohort of clinical trials is influenced by the statistical significance, perceived importance, or direction of their results. It found five studies that investigated these associations in a cohort of registered clinical trials. Trials with positive findings were more likely to be published than trials with negative or null findings (odds ratio: 3.9; 95% CI: 2.7 to 5.7). This corresponds to a risk ratio of 1.8 (95% CI: 1.6 to 2.0), assuming that 41% of negative trials are published (the median among the included studies, range = 11% to 85%). In absolute terms, this means that if 41% of negative trials are published, we would expect that 73% of positive trials would be published. Two studies assessed time to publication and showed that trials with positive findings tended to be published after 4 to 5 years compared with those with negative findings, which were published after 6 to 8 years. Three studies found no statistically significant association between sample size and publication. One study found no statistically significant association between either funding mechanism, investigator rank, or sex and publication.

Systematic reviews **performed early** in the development of a body of research may be biased due to the tendency for positive results to be published sooner and for negative results to be published later or withheld. This is referred to as "lag bias" and especially true of industry funded studies.

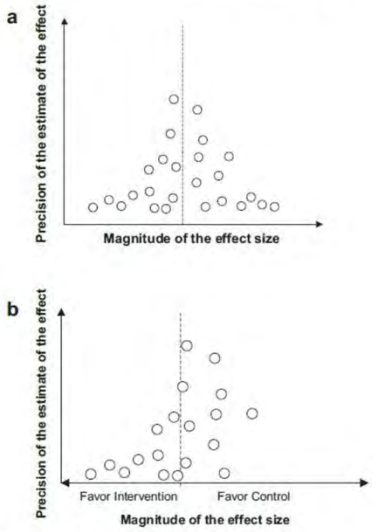
Example 3: Reduced effect estimate in a systematic review as a result of negative studies not being published

An investigation of 74 antidepressant trials with a mean sample size of fewer than 200 patients was submitted to the FDA. Of the 38 studies viewed as positive by the FDA, 37 were published. Of the 36 studies viewed as negative by the FDA, only 14 were published. Publication bias of this magnitude can seriously bias effect estimates.

Example 5: Funnel plots to detect publication bias

In A, the circles represent the point estimates of the trials. The pattern of distribution resembles an inverted funnel. Larger studies tend to be closer to the pooled estimate (the dashed line). In this case, the effect sizes of the smaller studies are more or less symmetrically distributed around the pooled estimate.

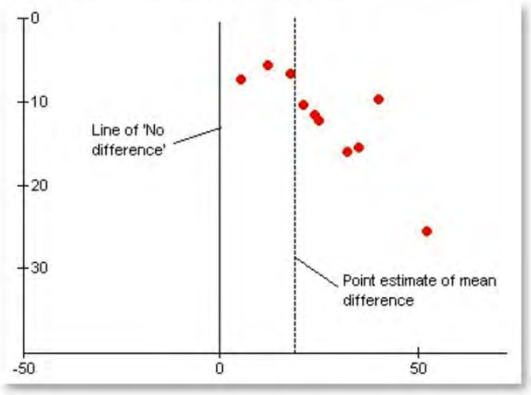
In B, publication bias is detected. This funnel plot shows that the smaller studies are not symmetrically distributed around either the point estimate (dominated by the larger trials) or the results of the larger trials themselves. The trials expected in the bottom right quadrant are missing. One possible explanation for this set of results is publication bias - an overestimate of the treatment effect relative to the underlying truth.



Example 6: Publication bias detected

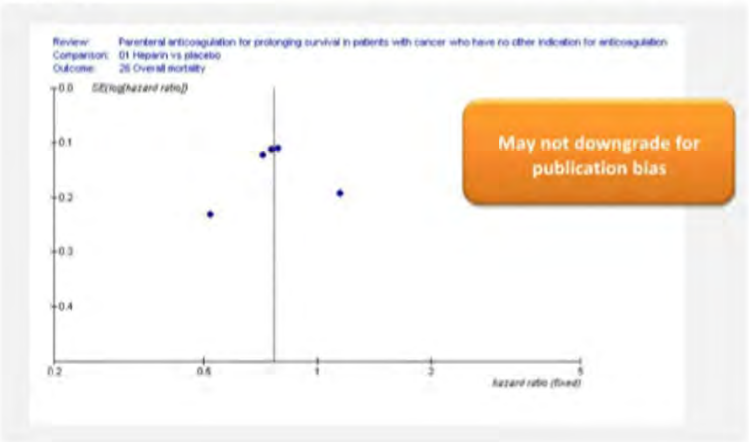
A number of small trials from a systematic review of oxygen therapy in patients with chronic obstructive pulmonary disease showed that the intervention improved exercise capacity, but evaluation of the data suggested publication bias.

The funnel plot of exercise distance shows distance on the x-axis and variance on the y-axis. The red dots represent the mean differences of individual trial estimates and the dotted line the point estimate of the mean effect indicating benefit from oxygen treatment. The distribution of these dots to the right of the dotted line suggests that there may be the equivalent number of 'negative' trials that have not been included in this analysis. Thus, one may downgrade the quality of evidence in this case due to uncertainty resulting from asymmetry in the pattern of results.



Example 8: Publication bias undetected

A systematic review of parenteral anticoagulation for prolonged survival in patients with cancer who had no other indication for anticoagulation shows five RCTs which are symmetrically distributed around the best estimate of effect. Publication bias is undetected in this scenario and thus the evidence should not be downgraded.



When to downgrade the quality of evidence because of suspicion of publication bias

Guideline panels and authors of systematic reviews should consider the extent to which they are uncertain about the magnitude of the effect due to selective publication of studies and they may downgrade the quality of evidence by one level. Consider:

- study design (experimental vs. observational)
- study size (small studies vs. large studies)
- lag bias (early publication of positive results)
- search strategy (was it comprehensive?)
- asymmetry in funnel plot.

5.3. Factors that can increase the quality of the evidence

Consideration of factors reducing quality of evidence must precede consideration of reasons for rating it up. Thus, consideration of all our previously presented criteria for rating down certainty of evidence (risk of bias, imprecision, inconsistency, indirectness, and publication bias) must precede consideration of reasons for rating it up. The decision to rate up should only rarely be made if serious limitations are present in any of these areas. In particular, decisions to rate up because of large or very large effects should consider not only the point estimate but also the width of the CI around that estimate of an effect: one should rarely rate up for large effects if the CI overlaps substantially with effects smaller than the chosen threshold. The following sections discuss in detail the 3 factors that permit rating up the quality of evidence, i.e. increase confidence in an estimate of an effect. Using the GRADE framework, body of evidence from observational studies is initially classified as low quality evidence (i.e. permitting low confidence in the estimated effect). There are times, however, when we have high confidence in the estimate of effect from observational studies (including cohort, case-control, before-after, time series studies, etc.) and to non-randomized experimental studies (e.g. quasi-randomized and non-randomized controlled trials). The circumstances under which the body of evidence from observational studies may provide higher than low confidence in the estimated effects will likely occur infrequently.

Note: Although it is theoretically possible to rate up results from randomized control trials, we have yet to find a compelling example of such an instance.

5.3.1 Large magnitude of an effect

When body of evidence from observational studies not downgraded for any of the 5 factors yield large or very large estimates of the magnitude of an intervention effect, then we may be more confident about the results. In those situations, even though observational studies are likely to provide an overestimate of the true effect, the study design that is more prone to bias is unlikely to explain all of the apparent benefit (or harm). Decisions to rate up quality of evidence because of large or very large effects (Table 5.9) should consider not only the point estimate but also the precision (width of the CI) around that effect: one should rarely and very cautiously rate up quality of evidence because of apparent large effects, if the CI overlaps substantially with effects smaller than the chosen threshold of clinical importance.

Table 5.9. Definitions of large and very large effect

Magnitude of Effect	Definition	Quality of Evidence
Large	RR* >2 or <0.5 (based on direct evidence, with no plausible confounders)	may increase 1 level
Very large	RR* >5 or <0.2 (based on direct evidence with no serious problems with risk of bias or precision, i.e. with (sufficiently narrow confidence intervals)	may increase 2 levels

* Note: these rules apply when effect measure is expressed as relative risk (RR) or hazard ratio (HR). They cannot always be applied when the effect measure is expressed as odds ratio (OR). We suggest converting OR to RR and only then assessing the magnitude of an effect.

One may be more likely to rate up the quality of evidence because of large or very large magnitude of an effect, when:

- effect is rapid
- effect is consistent across subjects
- previous trajectory of disease is reversed
- large magnitude of an effect is supported by indirect evidence

Note: When outcomes are subjective it is important to be cautious when considering upgrading because of observed large effects. This is especially true when outcome assessors were aware which group study subjects belonged to (i.e. were not blinded).

Examples

A systematic review of observational studies examining the relationship between infant sleeping position and sudden infant death syndrome (SIDS) found an odds ratio of 4.1 (95% CI: 3.1, 5.5) of SIDS occurring with front vs. back sleeping positions. Furthermore, “back to sleep” campaigns that were started in the 1980s to encourage back sleeping position were associated with a relative decline in the incidence of SIDS by 50-70% in numerous countries.

5.3.2. Dose-response gradient

The presence of a dose-response gradient has long been recognized as an important criterion for believing a putative cause-effect relationship. The presence of a **dose-response gradient** may increase our confidence in the findings of observational studies and thereby increase the quality of evidence.

Example 1: Dose-response gradient (Upgraded by One Level)

The observation that, in patients receiving anticoagulation with warfarin, there is a dose response gradient between higher levels of the international normalized ratio (INR), an indicator of the degree of anticoagulation, and an increased risk of bleeding increases our confidence that supratherapeutic anticoagulation levels increase bleeding risk.

Example 2: Dose-response gradient (Upgraded by One Level)

The dose-response gradient associated with the rapidity of antibiotic administration in patients presenting with sepsis and hypotension may also be a reason to upgrade the quality of evidence for such a study. There is a large absolute increase in mortality with each hour’s delay of antibiotic administration. This dose-response relationship increases our confidence that the effect on mortality is real and substantial leading to upgrading the quality of the evidence.

5.3.3. Effect of plausible residual confounding

On occasion, **all plausible residual confounding** from observational studies may be working to **reduce the demonstrated effect** or **increase the effect, if no effect was observed**.

Rigorous observational studies will accurately measure prognostic factors associated with the outcome of interest and will conduct an adjusted analysis that accounts for differences in the distribution of these factors between intervention and control groups. The reason that in most instances we consider observational studies as providing only low-quality evidence is that **unmeasured or unknown determinants of outcome** unaccounted for in the adjusted analysis are **likely to be distributed unequally** between intervention and control groups, referred to as “residual confounding” or “residual biases.”

On occasion, all plausible confounders (biases) from observational studies unaccounted for in the adjusted analysis (i.e. residual confounders) of a rigorous observational study would result in an underestimate of an apparent treatment effect. If, for instance, only sicker patients receive an experimental intervention or exposure, yet they still fare better, it is likely that the actual intervention or exposure effect is even larger than the data suggest. A parallel situation exists when observational studies have failed to demonstrate an association.

Example 1: When confounding is expected to reduce a demonstrated effect (Upgraded by One Level)

A rigorous systematic review of observational studies including a total of 38 million patients demonstrated higher death rates in private for-profit versus private not-for-profit hospitals. It is likely, however, that patients in the not-for-profit hospitals were sicker than those in the for-profit hospitals. This would bias results against the not-for-profit hospitals. The second likely bias was the possibility that higher numbers of patients with excellent private insurance coverage could lead to a hospital having more resources and a spill-over effect that would benefit those without such coverage. Since for-profit hospitals are likely to admit a larger proportion of such well-insured patients than not-for-profit hospitals, the bias is once again against the not-for-profit hospitals. Because the plausible biases would all diminish the demonstrated intervention effect, one might consider the evidence from these observational studies as moderate rather than low quality.

Example 2: When confounding is expected to reduce a demonstrated effect (Upgraded by One Level)

In a systematic review investigating the use of condoms in homosexual male relationships as a way of preventing the spread of HIV, five observational studies were identified. The pooled estimate was a relative risk of 0.34 (95%, 0.21 – 0.54) in favour of condom use. The authors failed to adjust in the analysis for the fact that condom users are more likely to have more partners than non-condom users. One would expect that more partners would have increased the risk of acquiring HIV and therefore reduced the resulting relative risk of HIV infection. Therefore, the confidence in this effect, which is still large, would lead to upgrading by one level.

Example 3: When confounding is expected to increase the effect but no effect was observed (Upgraded by One Level)

The hypoglycaemic drug phenformin causes lactic acidosis, and the related agent metformin is under suspicion for the same toxicity. Very large observational studies have failed to demonstrate an association between metformin and lactic acidosis. Given the likelihood that clinicians would have been more alert to lactic acidosis with metformin and would have therefore over-reported its occurrence, and that no association was found, one could upgrade this evidence.

Example 4: When confounding is expected to increase the effect but no effect was observed (Upgraded by One Level)

Consider the early reports associating MMR vaccination with autism. One would think that there would be over-reporting of autism in children given MMR vaccines. However, systematic reviews failed to prove any association between the two. Due to the negative results, despite the potential presence of

confounders which would increase the likelihood of reporting of autism, no association was found. Therefore, we may upgrade the level of evidence by one level.

5.4 Overall quality of evidence

The overall quality of evidence is a combined rating of the quality of evidence across all outcomes considered critical for answering a health care question (i.e. making a decision or a recommendation).

We caution against a mechanistic approach toward the application of the criteria for rating the quality of the evidence up or down. Although GRADE suggests the initial separate consideration of five categories of reasons for rating down the quality of evidence, and three categories for rating it up, with a yes/no decision regarding rating up or down in each case, the final rating of overall evidence quality occurs in a continuum of confidence in the estimates of effects.

For authors of systematic reviews:

Authors of systematic reviews **do not grade the overall quality of evidence** across outcomes. Because systematic reviews do not – or at least should not – make recommendations, authors of systematic reviews rate the quality of evidence only for each outcome separately.

For guideline panels and others making recommendations:

Guideline panels **have to determine the overall quality of evidence** across all the critical outcomes essential to a recommendation they make. Guideline panels provide a single grade of quality of evidence for every recommendation, but the strength of a recommendation usually depends on evidence regarding not just one, but a number of patient-important outcomes and on the quality of evidence for each of these outcomes.

Because the GRADE approach rates quality of evidence separately for each outcome, it is frequently the case that quality differs across outcomes. When determining the overall quality of evidence across outcomes:

1. Consider **only** those outcomes that have been deemed **critical**.

2. If the quality od evidence is the **same** for all critical outcomes, then this becomes the overall quality of the evidence supporting the answer to the question.

3. If the quality of evidence **differs** across critical outcomes, it is logical that the overall confidence in effect estimates cannot be higher than the lowest confidence in effect estimates for any outcome that is critical for a decision. Therefore, the **lowest quality of evidence** for any of the critical outcomes determines the overall quality of evidence.

Example 1: Rating overall quality of evidence based on the importance of outcomes

Several systematic reviews of high-quality randomised trials suggest a decrease in the incidence of infections and, likely, the mortality of ventilated patients in intensive care units receiving selective digestive decontamination (SDD). The quality of evidence on the effect of SDD on the emergence of bacterial antibiotic resistance and its clinical relevance is much less clear. One might reasonably grade the evidence about this feared potential adverse effect as low quality. If those making a recommendation felt that these downsides of therapy were critical, the overall grade of the quality of evidence for SDD would be low. If guideline panel felt that the emergence of bacterial antibiotic resistance was important but not critical, the grade for an overall quality of evidence would be high.

However, which outcomes are critical may depend on the evidence. On occasion, the overall confidence in effect estimates may not come from the outcomes judged critical at the beginning of the guideline development process – judgments about which outcomes are critical to the decision (recommendation) may change when considering the results. Note that such judgments require careful consideration and are probably rare.

There are 2 prototypical situations in which an outcome initially considered critical may cease to be critical once the evidence is summarized:

1. An outcome turns out to be **not relevant** (e.g. a particular adverse event may be considered critical at the outset of the guideline process but, if it turns out that the event occurs very infrequently, the final decision may be that this adverse effect is important but not critical to the recommendation).

2. An outcome turns out to be **not necessary** if, across the range of possible effects of the intervention on that outcome, the recommendation and its strength would remain unchanged. If there is higher quality of evidence for some critical outcomes to support a decision, then one need not rate down quality of evidence because of lower confidence in estimates of effects on other critical outcomes that support the same recommendation.

For instance, consider the following question: should statins vs. no statins be used in individuals without documented coronary heart disease but at high risk of cardiovascular events? Guideline developers are likely to start the process by considering outcomes: death from cardiovascular causes, myocardial infarction, stroke, and adverse effects, as critical to the decision.

A systematic review or randomized trials demonstrated consistent reductions in myocardial infarctions and stroke but nonsignificant reductions in coronary deaths. Serious adverse effects were unusual and readily reversible with drug discontinuation. The guideline authors found that for three of the four outcomes (myocardial infarction, stroke, and adverse effects) there was high quality evidence. For coronary deaths evidence was of moderate quality because of imprecision.

Should the overall quality of evidence across outcomes be high or moderate? The judgments made at the beginning of the process suggest that the answer is "moderate". However, once it is established that the risk of myocardial infarction and stroke decreases with statins, most people would find compelling reason to use statins. Knowing whether coronary mortality also decreases is no longer

necessary for the decision (as long as it is very unlikely that it increases). Considering this, the overall rating of quality of evidence is most appropriately designated as "high".

6. Going from evidence to recommendations

6.1 Recommendations and their strength

The **strength of a recommendation** reflects the extent to which a guideline panel is **confident that desirable effects of an intervention outweigh undesirable effects**, or vice versa, across the range of patients for whom the recommendation is intended.

GRADE specifies **two categories** of the strength of a recommendation. While GRADE suggests using the terms **strong** and **weak** recommendations, those making recommendations may choose different wording to characterize the two categories of strength.

In special cases, guideline panels may recommend an intervention be used **only in research** until more data is generated, which would allow for a more comprehensive recommendation, or not make a recommendation at all.

There are limitations to formal grading of recommendations. Like the quality of evidence, the balance between desirable and undesirable effects reflects a continuum. Some arbitrariness will therefore be associated with placing particular recommendations in categories such as “strong” and “weak.” Most organisations producing guidelines have decided that the merits of an explicit grade of recommendation outweigh the disadvantages.

Strength of recommendation on a continuum: categorical terminology

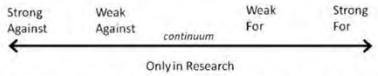


Fig. 1. Strength of recommendation: a continuum divided into categories.

For a guideline panel or others making recommendations to offer a strong recommendation they have to be **certain** about the various factors that influence the strength of a recommendation. The panel also should have the relevant information at hand that supports a clear balance towards either the desirable effects of an intervention (to recommend an action) or undesirable effects (to recommend against an action).

When a guideline panel is **uncertain** whether the balance is clear or when the relevant information about the various factors that influence the strength of a recommendation is not available, a guideline panel should be more cautious and in most instances it would opt to make a weak recommendation.

Figure 3: Balance scales to depict strong vs. weak recommendations.

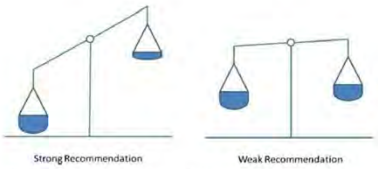

Fig. 2. Balance scales to depict strong vs. weak recommendations.

To aid interpretation GRADE suggests implications of strong or weak recommendations that follow from the recommendations. The advantage of two categories of strength of recommendations is that they provide clear direction to patients, clinicians, and policy-makers.

Table 6.1. Implications of strong and weak recommendations for different users of guidelines

	Strong Recommendation	Weak Recommendation
For patients	Most individuals in this situation would want the recommended course of action and only a small proportion would not.	The majority of individuals in this situation would want the suggested course of action, but many would not.
For clinicians	Most individuals should receive the recommended course of action. Adherence to this recommendation according to the guideline could be used as a quality criterion or performance indicator. Formal decision aids are not likely to be needed to help individuals make decisions	Recognize that different choices will be appropriate for different patients, and that you must help each patient arrive at a management decision consistent with her or his values and preferences. Decision aids may well be useful helping individuals making decisions consistent with their values and preferences. Clinicians should

	consistent with their values and preferences.	expect to spend more time with patients when working towards a decision.
For policy makers	The recommendation can be adapted as policy in most situations including for the use as performance indicators.	Policy making will require substantial debates and involvement of many stakeholders. Policies are also more likely to vary between regions. Performance indicators would have to focus on the fact that adequate deliberation about the management options has taken place.

Individualization of clinical decision-making in weak recommendations remains a challenge. Although clinicians always should consider patients' preferences and values, when they face weak recommendations they may have more detailed conversations with patients than for strong recommendations to ensure that the ultimate decision is consistent with the patient's preferences and values.

Important Note:

Clinicians, patients, third-party payers, institutional review committees, other stakeholders, or the courts should **never view recommendations as dictates**. Even strong recommendations based on high-quality evidence will not apply to all circumstances and all patients.

Users of guidelines may reasonably conclude that following some strong recommendations based on the high quality evidence will be a mistake for some patients. No clinical practice guideline or recommendation can take into account all of the often compelling unique features of individual patients and clinical circumstances. Thus, nobody charged with evaluating clinician's actions, should attempt to apply recommendations by rote or in a blanket fashion.

6.1.1 Strong recommendation

A strong recommendation is one for which guideline panel is confident that the desirable effects of an intervention outweigh its undesirable effects (strong recommendation for an intervention) or that the undesirable effects of an intervention outweigh its desirable effects (strong recommendation against an intervention).

Note: Strong recommendations are not necessarily high priority recommendations.

A strong recommendation implies that most or all individuals will be best served by the recommended course of action.

Example 1: Sample strong recommendations

- Early anticoagulation in patients with deep venous thrombosis for the prevention of pulmonary embolism;
- Antibiotics for the treatment of community acquired pneumonia;
- Quitting smoking to prevent adverse consequences of tobacco smoke exposure;
- Use of bronchodilators in patients with known COPD

6.1.2 Weak recommendation

A weak recommendation is one for which the desirable effects probably outweigh the undesirable effects (weak recommendation for an intervention) or undesirable effects probably outweigh the desirable effects (weak recommendation against an intervention) but appreciable uncertainty exists.

A weak recommendation implies that not all individuals will be best served by the recommended course of action. There is a need to consider more carefully than usual the individual patient's circumstances, preferences, and values. When there are weak recommendations caregivers need to allocate more time to shared decision making, making sure that they clearly and comprehensively explain the potential benefits and harms to a patient.

Alternative names for weak recommendations

Some have been concerned with the term "weak recommendation" experiencing an unintended negative connotation with the word "weak", often also confusing it with "weak" evidence. To avoid confusion, weak recommendations can instead be described using the terms:

- **conditional** (depending on patient values, resources available or setting)
- **discretionary** (based on opinion of patient or practitioner)
- **qualified** (by an explanation regarding the issues which would lead to different decisions).

If any variations are used it is essential that authors exercise consistency across all recommendation in a guideline and across all guidelines they produce.

6.1.3 Recommendations to use interventions only in research

Promising interventions (usually new ones) with thus far insufficient evidence of benefit to support their use may be associated with appreciable harms or costs. Decision makers may worry about providing premature favorable recommendations for their use, encouraging the rapid diffusion of potentially ineffective or harmful interventions, and preventing recruitment to research already under way. They may be equally reluctant to recommend against such interventions out of fear that they will inhibit further investigation. By making recommendations for use of an intervention only in the context of research they may provide an important stimulus to efforts to answer important research questions, thus resolving uncertainty about optimal management.

Recommendations for using interventions only in research are appropriate when three conditions are met:

1. There is thus far insufficient evidence to support a decision for or against an intervention
2. Further research has large potential for reducing uncertainty about the effects of the intervention
3. Further research is thought to be of good value for the anticipated costs.

Recommendations for using interventions only in research should be accompanied by detailed suggestions about the specific research questions that should be addressed, particularly which patient-important outcomes they should measure. The recommendation for research may be accompanied by an explicit strong recommendation not to use the experimental intervention outside of the research context.

6.1.4 No recommendation

There are 3 reasons for which those making recommendations may be reluctant to make a recommendation for or against a particular management strategy, and also conclude that a recommendation to use the intervention only in research is not appropriate.

1. The confidence in effect estimates is so low that the panels feel a recommendation is too speculative (see the US Preventative Services Task Force discussion on the topic [Petitti 2009; PMID: 19189910].
2. Irrespective of the confidence in effect estimates, the trade-offs are so closely balanced, and the values and preferences and resource implications not known or too variable, that the panel has great difficulty deciding on the direction of a recommendation.
3. Two management options have very different undesirable consequences, and individual patients' reactions to these consequences are likely to be so different that it makes little sense to think about typical values and preferences.

The third reason requires an explanation. Consider adult patients with thalassemia major considering hematopoietic cell transplantation (possibility of cure but an early mortality risk of 33%) vs. continued medical treatment with transfusion and iron chelation (continued morbidity and an uncertain prognosis). A guideline panel may consider that in such situations the only sensible recommendation is a discussion between patient and physician to ascertain the patient's preferences.

Users of guidelines, however, may be frustrated with the lack of guidance when the guideline panel fails to make a recommendation. The USPSTF states: "Decision makers do not have the luxury of waiting for certain evidence. Even though evidence is insufficient, the clinician must still provide advice, patients must make choices, and policy makers must establish policies" [Petitti 2009; PMID: 19189910].

Clinicians themselves will rarely explore the evidence as thoroughly as a guideline panel, nor will they devote as much thought to the trade-offs, or the possible underlying values and preferences in the population. GRADE encourages panels to deal with their discomfort and to make recommendations even when confidence in effect estimate is low and/or desirable and undesirable consequences are closely balanced. Such recommendations will inevitably be weak, and may be accompanied by qualifications.

In the unusual circumstances in which panels may choose not to make a recommendation, they should specify the reason for this decision (see above).

6.2 Factors determining direction and strength of recommendations

Four key factors influence the direction and the strength of a recommendation (Table 6.2)

Table 6.2. Domains that contribute to the strength of a recommendation

Domain	Comment
Balance between desirable and undesirable outcomes (trade-offs) taking into account: - best estimates of the magnitude of effects on desirable and undesirable outcomes - importance of outcomes (estimated typical values and preferences)	The larger the differences between the desirable and undesirable consequences, the more likely a strong recommendation is warranted. The smaller the net benefit and the lower certainty for that benefit, the more likely a weak recommendation is warranted
Confidence in the magnitude of estimates of effect of the interventions on important outcomes (overall quality of evidence for outcomes)	The higher the quality of evidence, the more likely a strong recommendation is warranted
Confidence in values and preferences and their variability	The greater the variability in values and preferences, or uncertainty about typical values and preferences, the more likely a weak recommendation is warranted

Resource use	The higher the costs of an intervention (the more resources consumed), the less likely a strong recommendation is warranted

6.2.1 Balance of desirable and undesirable consequences

Deciding about the balance between desirable and undesirable outcomes ("trade-offs") one considers two domains:

1. best estimates of the magnitude of desirable effects and the undesirable effects (summarized in evidence profiles)

2. importance of outcomes – typical values that patients or a population apply to those outcomes ("weight" of outcomes).

6.2.1.1 Estimates of the magnitude of the desirable and undesirable effects

Large relative effects of an intervention consistently pointing in the **same direction** - towards desirable or towards undesirable effects are more likely to warrant a **strong** recommendation. Conversely, large relative effects of an intervention pointing in **opposite directions** - large desirable effects accompanied by large undesirable ones will lead to **weak** recommendations.

Large absolute effects are also more likely to lead to a strong recommendation, than small absolute effects. Baseline risk (control event rate) can influence the balance of desirable and undesirable outcomes. Large baseline risk differences will result in large differences in absolute effects of interventions. The strength of recommendations and its direction, therefore, will likely differ in high- and low-risk groups.

Examples

Large gradient between the desirable and undesirable effects (higher likelihood of a strong recommendation)

1. The very large gradient between the benefits of low dose aspirin on reductions in death and recurrent myocardial infarction and the undesirable consequences of minimal side effects and costs make a strong recommendation very likely.

Small gradient between the desirable and undesirable effects (higher likelihood of a weak recommendation)

1. Consider the choice of immunomodulating agents, namely cyclosporine or tacrolimus, in kidney transplant recipients. Tacrolimus results in better graft survival (a highly valued outcome), but at the important cost of a higher incidence of diabetes (the long-term complications of which can be devastating).

2. Patients with atrial fibrillation typically are more stroke averse than bleeding averse. If, however, the risk of stroke is sufficiently low, the trade-off between stroke reduction and increase in bleeding risk with anticoagulants is closely balanced.

6.2.1.2 Best estimates of values and preferences

Without considering the associated values and preferences, assessing large vs. small magnitude of effects may be misleading. Balancing the magnitude of desirable and undesirable outcomes requires considering weight (importance) of those outcomes that is determined by values and preferences.

Ideally, to inform estimates of typical patient values and preferences, guideline panels will conduct or identify systematic reviews of relevant studies of patient values and preferences. There is, however, paucity of empirical examinations of patients' values and preferences.

Well resourced guideline panels will usually complement such studies with consultation with individual patients and patients' groups. The panel should discuss whose values these people represent, namely representative patients, a defined subset of patients, or representatives of the general population.

Less well-resourced panels, without systematic reviews of values and preferences or consultation with patients and patient groups, must rely on unsystematic reviews of the available literature and their experience of interactions with patients. How well such estimates correspond to true typical values and preferences is likely to be uncertain.

Whatever the source of estimates of typical values and preferences, explicit, transparent statements of the panel's choices are imperative (see 6.3.3 Providing transparent statements about assumed values and preferences).

6.3.2 Confidence in best estimates of magnitude of effects (quality of evidence)

For all outcomes considered, the GRADE process requires a rating describing the quality of evidence. Ultimately, guideline authors will form their recommendations based on their confidence in all effect estimates for each outcome considered critical to their recommendation and the quality of evidence.

Quality of evidence ratings are determined by the eight already discussed; the five criteria that result in rating down the quality of evidence (study limitations, inconsistency, indirectness, imprecision, and publication bias result in rating down the quality of evidence whereas the remaining three criteria, lead to an increase in evidence quality; large magnitude of effect, dose-response gradient and when all plausible biases or confounders increase our confidence in the estimated effect.

Typically, a strong recommendation is associated with high, or at least moderate, confidence in the effect estimates for critical outcomes. If one has high confidence in effects on some critical outcomes (typically benefits), but low confidence in effects on other outcomes considered critical (often long-term harms), then a weak recommendation is likely warranted. Even when an apparently large gradient exists in the balance of desirable vs. undesirable outcomes, panels will be appropriately reluctant to offer a strong recommendation if their confidence in effect estimates for some critical outcomes is low.

For some questions, direct evidence about the effects on some critical outcomes may be lacking (e.g. quality of life has not been measured in any study). In such instances, even if well measured **surrogates** are available, confidence in estimates of effects on patient-important outcomes is very likely to be low.

Low confidence in effect estimates may, rarely, be tied to strong recommendations. In general, **GRADE discourages guideline panels from making strong recommendations when their confidence in estimates of effect for critical outcomes is low or very low**. GRADE has identified five paradigmatic situations in which strong recommendations may be warranted despite low or very low quality of evidence (Table 6.3). These situations can be conceptualized as ones in which a panel would have a low level of regret if subsequent evidence showed that their recommendation was misguided.

Table 6.3. Paradigmatic situations in which a strong recommendation may be warranted despite low or very low confidence in effect estimates

	Condition	Example
1	When low quality evidence suggests benefit in a life threatening situation (evidence regarding harms can be low or high)	1. Fresh frozen plasma or vitamin K in a patient receiving warfarin with elevated INR and an intracranial bleed. Only low quality evidence supports the benefits of limiting the extent of the bleeding. 2. Amphotericin B vs. itraconazole in life threatening disseminated blastomycosis. High quality evidence suggests that amphotericin B is more toxic than itraconazole, and low quality evidence suggests that it reduces mortality in this context.
2	When low quality evidence suggests benefit and high quality evidence suggests harm or a very high cost	Head-to-toe CT/MRI screening for cancer. Low quality evidence of benefit of early detection but high quality evidence of possible harm and/or high cost (strong recommendation against this strategy)
3	When low quality evidence suggests equivalence of two alternatives, but high quality evidence of less harm for one of the competing alternatives	Helicobacter pylori eradication in patients with early stage gastric MALT lymphoma with H. pylori positive. Low quality evidence suggests that initial H. pylori eradication results in similar rates of complete response in comparison with the alternatives of radiation therapy or gastrectomy; high quality evidence suggests less harm/morbidity
4	When high quality evidence suggests equivalence of two alternatives and low quality evidence suggests harm in one alternative	Hypertension in women planning conception and in pregnancy. Strong recommendations for labetalol and nifedipine and strong recommendations against angiotensin converting enzyme (ACE) inhibitors and angiotensin receptor blockers (ARB) all agents have high quality evidence of equivalent beneficial outcomes, with low quality evidence for greater adverse effects with ACE inhibitors and ARBs
5	When high quality evidence suggests modest benefits and low/very low quality evidence suggests possibility of catastrophic harm	Testosterone in males with or at risk of prostate cancer. High quality evidence for moderate benefits of testosterone treatment in men with symptomatic androgen deficiency to improve bone mineral density and muscle strength. Low quality evidence for harm in patients with or at risk of prostate cancer
INR – international normalized ratio; CT – computed tomography; MRI – magnetic resonance imaging; MALT – mucosa-associated lymphoid tissue.		

6.3.3 Confidence in values and preferences

Uncertainty concerning values and preferences or their **variability** among patients may lower the strength of a recommendation.

As noted above, systematic study of patients' values and preferences are very limited. Thus, panels will often be uncertain about typical values and preferences. The greater is the uncertainty, the more likely they will make a weak recommendation. Given the sparse systematic study of patients' values and preferences, one could argue that large uncertainty always exists about the patients' perspective. On the other hand, clinicians' experience with patients may provide considerable additional insight. Indeed, on occasion, panels will, on the basis of clinical experience, be confident regarding typical patient's values and preferences. Pregnant women's strong aversion to even a small risk of important fetal abnormalities may be one such situation.

Large variability in values and preferences may also make a weak recommendation more likely. In such situations, it is less likely that a single recommendation would apply uniformly across all patients, and the right course of action is likely to differ between patients. Again, systematic research about variability in values and preferences is sparse. On the other hand, clinical experience may leave a panel confident that values and preferences differ widely among patients.

Example

1. A hopeful patient may place more emphasis on a small chance of benefit, whereas a pessimistic, risk-averse patient may place more emphasis on avoiding the risks associated with a potentially beneficial therapy. Some patients may have a belief that even if the risk of an adverse event is low, they will be the person who will suffer such an adverse effect. For instance, in patients with idiopathic pulmonary fibrosis, evidence for the benefit of steroids warrants only low confidence, whereas we can be very confident of a wide range of adverse effects associated with steroids. The hopeful patient with pulmonary fibrosis may be enthusiastic about use of steroids, whereas the risk-averse patient is likely to decline.

2. Thromboprophylaxis reduces the incidence of venous thromboembolism in immobile, hospitalized severely ill medical patients. Careful thromboprophylaxis has minimal side effects and relatively low cost while being very effective at preventing deep venous thrombosis and its sequelae. Peoples' values and preferences are such that virtually all patients admitted to a hospital would, if they understood the choice they were making, opt to receive some form of thromboprophylaxis. Those making recommendations can thus offer a strong recommendation for thromboprophylaxis for patients in this setting.

3. A systematic review and meta-analysis describes a relative risk reduction (RRR) of approximately 80% in recurrent DVT for prophylaxis beyond 3 months up to one year. This large effect supports a strong recommendation for warfarin. Furthermore, the relatively narrow 95% confidence interval (approximately 74 to 88%) suggests that warfarin provides a RRR of at least 74%, and further supports a strong recommendation. At the same time, warfarin is associated with an inevitable burden of keeping dietary intake of vitamin K relatively constant, monitoring the intensity of anticoagulation with blood tests, and living with the increased risk of both minor and major bleeding. It is likely, however, that most patients would prefer avoiding another DVT and accept the risk of a bleeding episode. As a result, almost all patients with high risk of recurrent DVT would choose taking warfarin for 3 to 12 months, suggesting the appropriateness of a strong recommendation. Thereafter, there may be an appreciable number of patients who would reject life-long anticoagulation.

6.3.4 Resource use (cost)

Panels may or may not consider resource use in their judgments about the direction and strength of recommendations. Reasons for not considering resource use include a lack of reliable data, the intervention is not useful and the effort of calculating resource use can be spared, the desirable effects so greatly outweigh any undesirable effects that resource considerations would not alter the final judgment, or they have elected (or been instructed) to leave resource considerations up to other decision makers. Panels should be explicit about the decision they made not to consider resource utilization and the reason for their decision.

If they elect to include resource utilization when making a recommendation, but have not included resource use as a consequence when preparing an evidence profile, they should be explicit about what types of resource use they considered when making the recommendation and whatever logic or evidence was used in their judgments.

Cost may be considered just another potentially important outcome – like mortality, morbidity, and quality of life – associated with alternative ways of managing patient problems. In addition to these clinical outcomes, however, an intervention may increase costs or decrease costs. The GRADE approach recommends that important or critical resource use be considered alongside other relevant outcomes in evidence profiles and summary of findings tables. It is important to use natural units when presenting resource use data as these can be applied in any setting.

Special considerations when incorporating resources use (cost) in recommendations:

- What are the differences between costs and other outcomes?
- Which perspective to take?
- Which resource implications to include?
- How to make judgments about the quality of the evidence?
- How to present these implications?
- What is potential usefulness of a formal economic model?
- How to consider resource use in formulating recommendations?

6.3.4.1 Differences between costs and other outcomes

There are several differences between costs and other outcomes:

1. With costs the issue of who pays and who gains is most prominent.
2. Attitudes about the extent to which costs should influence the decision differ depending on who bears the cost.
3. Costs tend to vary widely across jurisdictions and over time.
4. People have different perspectives on the envelope in which they are considering opportunity costs.
5. Resource allocation is a far more political issue than consideration of other outcomes.

1. **With costs the issue of who pays and who gains is most prominent.**

For most outcomes other than costs, it is clear that the patient and, secondarily, the patient's family gains the advantages, and has to live with the disadvantages (this is not true of all outcomes – with vaccinations the entire community benefits from the herd effect, or widespread use of antibiotics may have down-stream adverse consequences of drug resistance). Health care costs are often borne by the society as a whole. Even within a society, who bears the cost may differ depending on the patient's age or situation.

2. **Attitudes about the extent to which costs should influence the decision differ depending on who bears the cost.**

If costs are borne by the government, or a third party payer, some would argue that the physician's responsibility to the patient means that costs should not influence the decision. On the other hand, a clinicians' responsibility when caring for a patient is discharged in a broader context: resources that are used for an intervention cannot be used for something else and can affect the ability of the health system to best meet the needs of those it serves.

3. **Costs tend to vary widely across jurisdictions or even within jurisdictions, and over time.**

Costs of drugs are largely unrelated to the costs of production of those drugs, and more to marketing decisions and national policies. Hospitals or health maintenance organizations may, for instance, negotiate special arrangements with pharmaceutical companies for prices substantially lower than are available to patients or other providers. Even when resource use remains the same, the resource implications may vary widely across jurisdictions. Costs can also vary widely over time (e.g. when a drug comes off patent or a new, cheaper technology becomes available). The large variability in costs over time and jurisdictions requires that guideline panels formulate health care questions as specific as possible when bringing cost into the equation. The choice of comparator can be a particular problem in economic analyses. If the choice of the comparator is inappropriate (for instance, no treatment rather than an alternative though less effective intervention) conclusions may be misleading. Even when resource use remains the same, the resource implications may vary widely across jurisdictions. A year's supply of a very expensive drug may pay a nurse's salary in the United States, six nurses' salaries in Poland, and 30 nurses' salaries in China. Thus, what one can buy with the resources saved if one foregoes purchase of the drug (the "opportunity cost") – and the health benefits achieved with those expenditures - will differ to a large extent.

4. **People have different perspectives on the envelope in which they are considering opportunity costs.**

A hospital pharmacy with a fixed budget considering purchase of an expensive new drug will have a clear idea of what that purchase will mean in terms of other medications the pharmacy cannot afford. People often assume the envelope is public health spending – funding a new drug or program will constrain resources for other public health expenditures. However, one may not be sure that refraining from that purchase really means that equivalent resources will be available for the health care system. Further, one may ask if the public health care is spending the correct envelope.

5. **Resource allocation is a far more political issue than consideration of other outcomes.**

Whether the guideline panel does or does not explicitly consider resource allocation issues, those politics may bear on a guideline panel's function through conflict of interest.

Despite these differences, approaches to cost (resource use) are similar to other outcomes:

- guideline panels need to consider only important resource implications
- decision makers require an estimate of the difference between treatment and control
- guideline panels must make explicit judgments about the quality of evidence regarding incremental resource use.

6.3.4.2 Perspective

GRADE suggests that a broad perspective is desirable.

A recommendation could be intended for a very narrow audience, such as a single hospital pharmacy, an individual hospital or a health maintenance organization. Alternatively it could be intended for a health region, a country or an international audience.

Regardless of how narrow or broad the intended audience, guideline groups that choose to incorporate resource implications must be explicit about the perspective they are taking.

Alternatively a guideline may choose to take a societal perspective, and include all important resource implications, regardless of who bears the costs.

In a publicly funded health system the patient perspective would consider only resource implications that directly affect individual patients (e.g. out of pocket costs) and would ignore most of the costs generated (e.g. costs borne by the government). In European health care systems in which, for the most part, governments bear the cost of health care, expenses borne directly by patients will be minimal. A pharmacy perspective would ignore down-stream cost savings resulting for adverse events (e.g. stroke or

myocardial infarction) prevented by a drug. A hospital perspective would ignore out-patient costs either incurred, or prevented. In the private sector, where disenrollment and loss of insurance can shift the burden of costs from one system to another, estimates of resource use should include the down-stream costs of all treated patients, not just those who remain in a particular health plan.

An even broader perspective, that of society, would include indirect costs or savings (e.g. lost wages). These are difficult to estimate and controversial because they assume that lost productivity will not be replaced by an individual who otherwise would be unemployed or underemployed, and implicitly place lower value on individuals not working (e.g. the retired). Taking a health systems perspective has another advantage. A comprehensive display of the resource use associated with alternative management strategies allows an individual or group – a patient, a pharmacy, or a hospital – to examine the relative merits of the alternatives from their particular perspective.

Clinicians seeing patients who are uncovered by either public or private insurance may need to help these individuals to make decisions taking into account their out of pocket costs. This is particularly true when clinical advantages and disadvantages are closely balanced, and there are substantial out of pocket costs. In these circumstances, if a guideline panel has used the GRADE approach and made evidence profiles available to the guideline users, clinicians can review evidence summaries and ensure that the patients' decision to accept the recommended management strategy is consistent with their values and preferences – either though communicating the information directly to the patient, or by finding out what the patients' situation and values and preferences are.

6.3.4.3 Resource implications considered

Evidence profiles and summary of findings tables should always present resource use, not just monetary values as monetary values for the same resource will vary depending on setting.

We suggest that guideline developers document best estimates of resource use, not best estimate of costs. Costs are a function of resources expended and the cost per unit of resource. Given the wide variability in costs per unit, reporting only total costs across broad categories of resource expenditure leaves users without the information required to judge whether estimates of unit costs apply to their setting. It is therefore recommended that natural units be used to estimate resource use. For example, required number of days stayed in hospital, the cost per night will vary depending on the setting.

Users of guidelines will be best informed if the guideline developers specify resources consumed by alternate management strategies, because they can:

- judge whether the resource use reflects practice patterns in their setting
- focus on the items of most relevance to them
- ascertain whether the unit costs apply in their setting.

Unless resource use is specified, users in settings other than that on which the analysts focus cannot estimate the associated incremental costs of the intervention.

6.3.4.4 Confidence in the estimates of resource use (quality of the evidence about cost)

Evidence of resource use may come from different sources than evidence of health benefits. This may be the case both because trials of interventions do not fully report resource use, because the trial situation may not fully reflect the circumstances (thus the resource use) that we would expect in clinical practice, because the relevant resource use may extend beyond the duration of trial, and because resource use may vary substantially across settings.

For resource use that is reported in the context of trials, criteria for quality assessment are identical to that of other outcomes. Just as for other outcomes of a trial, the quality of evidence may differ across different resources. For example, drug use may be relatively easy to estimate, whereas use of health professionals' time may be more difficult, and the estimate of drug use may therefore be of higher quality.

6.3.4.5 Presentation of resource use

A balance sheet (e.g. evidence profile) should inform judgments about whether the net benefits are worth the incremental costs. Balance sheets efficiently present the raw information required to make informed explicit judgments concerning resource use in guideline recommendations. However, when complex trade-off decisions involving several outcomes need to be made judgments may remain implicit or qualitatively described.

Pooling resource estimates from different studies is seldom as it can be quite controversial and should be carefully considered. However, authors can consider presenting pooled estimates of resource use when they are confident that the outcome in question has a common meaning (i.e. number of nights stayed in hospital) across the studies involved in analysis. Even in this case, it is recommended that authors adjust for geographical and temporal differences in cost.

6.3.4.6 Economic model

Formal economic modeling may – or may not - be helpful.

Formal economic modeling results in cost per unit benefit achieved: cost per natural unit, such as cost per stroke prevented (cost-effectiveness analysis) cost per quality-adjusted life year gained (cost-utility analysis) cost and benefits valued in monetary values (cost-benefit analysis). These summaries can be helpful for informing judgments. Unfortunately, many published cost-effectiveness analyses have a high probability of being flawed or biased, and are setting-specific. When estimates of harms, benefits and resources used are based on low quality evidence, transparency of the economic model will be reduced and the model may be misleading.

Should guideline panels consider developing their own formal economic model?

Creating an economic model may be advisable if:

- guideline groups have the necessary expertise and resources
- difference in resources consumed by the alternative management strategies is large and therefore there is substantial uncertainty about whether the net benefits of an intervention are worth the incremental costs
- quality of available evidence regarding resource consumption is high and it is likely that a full economic model would help inform a decision
- implementing an intervention requires large capital investments, such as building new facilities or purchasing new, expensive equipment.

Modeling – while necessary for taking into account complexities and uncertainties in calculating cost per unit benefit – reduces transparency. Any model is only as good as the data on which it is based. When estimates of benefits, harms, or resources used come from low quality evidence, results of any economic modeling will be highly speculative.

Although criteria to assess the credence to give to results from statistical models of cost-effectiveness or cost-utility are available, these models generally include a large number of assumptions and varying quality evidence for the estimates that are included in the model. For these reasons, GRADE working group recommends not including cost-effectiveness or cost-utility models in evidence profiles. These models may, however, inform judgments of a guideline panel, or those of governments, or third part payers considering whether to include an intervention among their programs' benefits.

6.3.4.7 Consideration of resource use in recommendations

Guideline panel may choose to explicitly consider or not to consider resource use in recommendations.

A guideline panel may legitimately choose to leave considerations of resource use aside, and offer a recommendation solely on the basis of other advantages and disadvantages of the alternatives being considered. Resource allocation must then be considered at the level of the ultimate decision-maker – be it the patient and healthcare professional, an organization (e.g. hospital pharmacy or a health maintenance organization), a third party payer, or a government. Guideline panels should be explicit about the decision to consider or not to consider resource utilization.

If guideline panel considers resource use it should, prior to bringing cost into the equation, first decide on the quality of evidence regarding other outcomes, and weigh up the advantages and disadvantages. Decisions regarding the importance of resource use issues will flow from this first step. For example, resource implications may be irrelevant if evidence of net health benefits is lacking. If advantages of an intervention far outweigh disadvantages, resource use is less likely to be important. Resource use usually becomes important when advantages and disadvantages are closely balanced.

GRADE approach suggests that panels considering resource use should offer only a single recommendation taking resource use into account. Panels should refrain from issuing two recommendations – one not taking resource use into account and a second doing so. Although this would have the advantage of explicitness on which GRADE places a very high value, GRADE working group is concerned that those with interests in dissemination of an intervention would effectively use only the recommendation ignoring resource implications as a weapon in their battle for funds (public funds, in particular).

6.4 Presentation of recommendations

6.4.1 Wording of recommandations

Wording of a recommendation should offer clinicians as many indicators as possible for **understanding and interpretation**.

Recommendations should always answer the initial clinical question. Therefore, they should specify **patients or population** (characterized by the disease and other identifying factors) for whom the recommendation is intended and a recommended **intervention** as specifically and detailed as needed. Unless it is obvious, they should also specify the comparator. Sometimes, the recommendation may include a reference to the setting (e.g. primary or tertiary care, high- or low-income countries, etc.).

In general, it seems preferable to present recommendations in favor of a particular management approach rather than against an alternative. For instance, in considering the addition of aspirin to clopidogrel in patients who have had a stroke, it would be preferable to state: "In patients who have had a stroke, we suggest clopidogrel alone vs. adding aspirin to clopidogrel" rather than: "In patients who have had a stroke and are using clopidogrel, we suggest not adding aspirin". However, when a useless or harmful therapy is in wide use, recommendations against a management approach are appropriate. For instance, "In patients undergoing cardiac surgery who were not previously receiving beta blockers, we suggest not initiating perioperative beta blocker therapy".

Recommendations in the passive voice may lack clarity, therefore, GRADE suggest that guideline developers present recommendations in the active voice.

For **strong recommendations**, the GRADE working group has suggested adopting terminology, such as "**we recommend**..." or "**clinicians should**...", "clinicians should not…" or "Do…", "Don't…"

For **weak recommendations**, the GRADE working group has suggested less definitive wording, such as "**we suggest**..." or "**clinicians might**..." or "We conditionally recommend…" or "We make a qualified recommendation that…".

Wording strong and weak recommendations is particularly important when guidelines are developed by international organizations and/or are intended for patients and clinicians in different regions, cultures, traditions, and usage of language. It is also crucial to explicitly and precisely consider wording when translating recommendations into different languages. Whatever terminology guideline panels choose to

use to communicate the dichotomous nature of a recommendation, it is essential that they inform their users what the terms imply by providing the explanations as in Table 5.9.

Misinterpretation is possible however strength of recommendations is expressed. We suggest guideline developers consider using both words and symbols (which may be less confusing than numbers or letters) to express strength of recommendations.

6.3.2 Symbolic representation

A variety of presentations of quality of evidence and strength of recommendations may be appropriate. Most guideline panels have used letters and numbers to summarize their recommendations. Because of highly variable use of numbers and letters by different organizations this presentation may be confusing. Symbolic representations of the quality of evidence and strength of recommendations are appealing in that they are not burdened with this historical confusion. On the other hand, clinicians seem to be very comfortable with numbers and letters, which are particularly suitable for verbal communication, so there may be good reasons why organizations have chosen to use them.

The GRADE working group has decided to offer preferred symbolic representations, but users of guidelines based on the GRADE approach will often see numbers and letters being used to express the quality of evidence and strength of a recommendation.

Table 6.4. Suggested representations of quality of evidence and strength of recommendations

Quality of Evidence	**Symbol**	**Letter** (varies)
High	⊕⊕⊕⊕	A
Moderate	⊕⊕⊕◯	B
Low	⊕⊕◯◯	C
Very low	⊕◯◯◯	D
Strength of Recommendation	Symbol	Number
Strong for an intervention	↑↑	1
Weak for an intervention	↑?	2
Weak against an intervention	↓?	2
Strong against an intervention	↓↓	1

6.4.3 Providing transparent statements about assumed values and preferences

Ideally, **recommendations should be accompanied by a statement presenting assumptions about the values and preferences** that underlie recommendations. For instance, a guideline addressing issues of thrombosis prevention and treatment in pregnancy noted: "Our recommendations reflect a belief that most women will place a low value on avoiding the pain, cost, and inconvenience of heparin therapy to avoid the small risk of even a minor abnormality in their child associated with warfarin prophylaxis".

In addition to, or in place of, making such general statements, guideline panels may provide **statements associated with individual recommendations**, especially those that are particularly sensitive to values and preferences. In such cases authors should place statements about underlying values and preferences with the recommendation statement rather than in the accompanying text. This prominent positioning of the statements will make it less likely that users of guidelines miss the importance of the values and preference judgments.

Consider, for instance, two groups that were part of a broader guideline effort made apparently contradictory recommendations regarding aspirin vs. clopidogrel in patients with atherosclerotic vascular disease, despite using the same underlying evidence from a trial that enrolled both patients with threatened stroke and those with peripheral vascular disease. One group focusing on stroke prevention recommended clopidogrel over aspirin stating: "This recommendation places a relatively high value on a small absolute risk reduction in stroke rates, and a relatively low value on minimizing drug expenditures". The other group focusing on the peripheral vascular disease recommended aspirin over clopidogrel, stating: "This recommendation places a relatively high value on avoiding large resource expenditures to achieve small reductions in vascular events". These recommendations suggest opposite courses of action. Both are appropriate given the stated values and preferences, which were made explicit in qualifying statements accompanying each recommendation.

Another way to frame values and preferences statements that panels may want to consider is in terms of patients who do not share the values and preferences underlying the recommendation. For instance, one may say: "For most healthy patients with achalasia undergoing an invasive procedure, we suggest minimally invasive surgical myotomy rather than pneumatic dilatation. Patients who prefer to avoid surgery and the high rates of gastroesophageal reflux disease seen after surgery, and who are willing to accept a higher initial failure rate and long-term recurrence rate, can reasonably choose pneumatic dilatation".

6.5 The Evidence-to-Decision framework

Ultimately, guideline panels must integrate these determinants of direction and strength to make a strong or weak recommendation for or against an intervention. Table 6.2 presents the generic Evidence-to-Decision (EtD) table that groups making recommendations may use to facilitate decision making, record judgements, and document the process of going from evidence to the decision. Table 6.3 presents an

example of EtD framework used in development of recommendations about the use of ASA in patients with atrial fibrillation (PDF version).

Evidence to Decisions Framework: explanations

Purpose of the framework
The purpose of this framework is to help panels developing guidelines move from evidence to recommendations. It is intended to:

- Inform panel members' judgements about the pros and cons of each option (intervention) that is considered
- Ensure that important factors that determine a recommendation (criteria) are considered
- Provide a concise summary of the best available research evidence to inform judgements about each criterion
- Help structure discussion and identify reasons for disagreements
- Make the basis for recommendations transparent to guideline users

Development of the framework
The framework is being developed as part of the DECIDE project using an iterative process informed by the GRADE approach for going from evidence to clinical recommendations, a review of relevant literature, brainstorming, feedback from stakeholders, application of the framework to examples, a survey of policymakers, user testing, and trials. DECIDE (Developing and Evaluating Communication Strategies to Support Informed Decisions and Practice Based on Evidence) is a 5-year project (running from January 2011 to 2015) co-funded by the European Commission under the Seventh Framework Programme. DECIDE's primary objective is to improve the dissemination of evidence-based recommendations by building on the work of the GRADE Working Group to develop and evaluate methods that address the targeted dissemination of guidelines.

Description of the framework
The framework includes a ***table*** with the following columns:

- ***Criteria*** (factors that should be considered) for health system or public health recommendations
- ***Judgements*** that the panel members must make in relation to each criterion, which may include draft judgements suggested by the people who have prepared the framework
- ***Research evidence*** to inform each of those judgements, which may include links to more detailed summaries of the evidence
- ***Additional considerations*** to inform or justify each judgement

The framework also includes the following ***conclusions*** that the panel members must reach, which may include draft conclusions suggested by the people who have prepared the framework:

- The ***balance of consequences*** of the option being considered in relation to the alternative (comparison)
- The ***type of recommendation*** (against the option, for considering the option under specified conditions, or for the option)
- The ***recommendation*** in concise, clear and actionable text
- The ***justification*** for the recommendation, flowing from the judgements in relation to the criteria
- Any important ***subgroups considerations*** that may be relevant to guideline users
- Key ***implementation considerations*** (in addition to any that are specified in the recommendation), including strategies to address any concerns about the acceptability and feasibility of the option
- Suggestions for ***monitoring and evaluation*** if the option is implemented, including any important indicators that should be monitored and any needs for a pilot study or impact evaluation
- Any key ***research priorities*** to address important uncertainties in relation to any of the criteria

Flexibility
The framework is flexible. Organisations may elect to modify the terminology (and language) that is used, the criteria, the response options and guidance for using the framework to ensure that the framework is fit for purpose.

Use of the framework
Suggestions for how to use the framework are provided in: Framework for going from evidence to a recommendation – Guidance for health system and public health recommendations, including suggestions for preparing frameworks, supporting use of the framework by guideline panels, and using the framework to support well-informed decisions by guideline users.

The final recommendation made by the guideline panel is a consensus based on the judgements of the panel members, informed by the evidence presented in the framework and the panel members' expertise and experience.

Explanations of the criteria in the framework
Why these criteria?
The criteria included in the framework are ones that have emerged from our literature review, brainstorming, feedback from stakeholders, application of the framework to examples, a survey of policymakers and user testing. It is possible that we will make further modifications based on continuing feedback, applications of the framework and user testing. Guideline developers may also want to make modifications, such as adding or removing criteria that are or are not important for them to consider. However, there is clear and consistent support for routinely including all of these criteria and, up to now, a lack of clear and consistent support for including other potential criteria.

Detailed judgements
The judgements that need to be made are sometimes complex. Guideline panels are likely to find it helpful to make and record detailed judgements for some criteria using ***tables for detailed judgements***. This includes, for example, detailed judgements about the size of the effect for each outcome, the certainty of the evidence of the relative importance of the outcomes and resource use, and important subgroup considerations. Some criteria could be split into two or more separate criteria and some panels may elect to do this in order to highlight key considerations that are of particular importance for their guidelines. For example, there are several reasons why an option may not be acceptable to key stakeholders and these could potentially be considered as separate criteria.

From whose perspective?
Guideline panels should explicitly state the perspective that they are taking when making recommendations. This is especially important for determining which costs (resource use) to consider. It can also influence which outcomes and whose values are considered. For example, out-of-pocket costs are important from the perspective of an individual patient, whereas costs to the government are important from the perspective of the government. Health system and public health decisions are made on behalf of a population and a broad perspective is required. However, because of their mandate, some panels might take the perspective of the ministry of health or health department, whereas other panels might take a societal perspective (including all costs, regardless of who pays). Other perspectives (the distribution of the benefits, harms and costs) should be taken when considering the acceptability of the option to key stakeholders.

Large or small compared to what?

Some of the criteria imply a comparison; for example, the size of effects or resource requirements ***compared to what***? The comparisons or standards that are used are likely to be different for different organisations, guideline panels and jurisdictions. Some organisations or guideline panels may elect to specify the comparisons or standards that they will use. In the absence of such specified comparisons, guideline panel members should consider what their comparisons or standards are when they disagree, for example, about whether resource requirements are large. When the comparison being used is the source of their disagreement, they should agree on an appropriate comparison and include this as an additional consideration in the framework when it is relevant.

Guidance for making judgements
Suggestions for how to make judgements in relation to each criterion are provided in Framework for going from evidence to a recommendation – Guidance for health system and public health recommendations.

For each criterion there are four or five response options, from those that favour a recommendation against the option on the left to ones that favour a recommendation for the option on the right. In addition, most of the options include *varies* as a response option for situations when there is important variation across different settings for which the guidelines are intended and those differences are **substantial enough that they might lead to different recommendations for different settings.**

Questions to consider for each criterion and their relationship to a recommendation
For each criterion we suggest one or more detailed questions to consider when making a judgement and explain the relationship between the criterion and the recommendation.

Criteria	Questions	Explanations
Is the problem a priority?	*Are the consequences of the problem serious (i.e. severe or important in terms of the potential benefits or savings)? Is the problem urgent? Is it a recognised priority (e.g. based on a national health plan)? Are a large number of people affected by the problem?*	The more serious a problem is, the more likely it is that an option that addresses the problem should be a priority (e.g., diseases that are fatal or disabling are likely to be a higher priority than diseases that only cause minor distress). The more people who are affected, the more likely it is that an option that addresses the problem should be a priority.
Is there important uncertainty about how much people value the main outcomes?	*How much do those affected by the option value each of the outcomes in relation to the other outcomes (i.e. what is the relative importance of the outcomes)? Is there evidence to support those value judgements, or is there evidence of variability in those values that is large enough to lead to different decisions?*	The more likely it is that differences in values would lead to different decisions, the less likely it is that there will be a consensus that an option is a priority (or the more important it is likely to be to obtain evidence of the values of those affected by the option). Values in this context refer to the relative importance of the outcomes of interest (how much people value each of those outcomes). These values are sometimes called 'utility values'.
What is the overall certainty[1] of the evidence of effectiveness?	*What is the overall certainty of this evidence of effects, across all of the outcomes that are critical to making a decision?*	The less certain the evidence is for critical outcomes (those that are driving a recommendation), the less likely that an option should be recommended (or the more important it is likely to be to conduct a pilot study or impact evaluation, if it is recommended).
How substantial are the desirable anticipated effects?	*How substantial (large)are the desirable anticipated effects (including health and other benefits) of the option (taking into account the severity or importance of the desirable consequences and the number of people affected)?*	The larger the benefit, the more likely it is that an option should be recommended.
How substantial are the undesirable anticipated effects?	*How substantial (large) are the undesirable anticipated effects (including harms to health and other harms) of the option (taking into account the severity or importance of the adverse effects and the number of people affected)?*	The greater the harm, the less likely it is that an option should be recommended.
Do the desirable effects outweigh the undesirable effects?	*Are the desirable effects large relative to the undesirable effects?*	The larger the desirable effects in relation to the undesirable effects, taking into account the values of those affected (i.e. the relative value they attach to the desirable and undesirable outcomes) the more likely it is that an option should be recommended.
How large are the resource requirements?	*How large an investment of resources would the option require or save?*	The greater the cost, the less likely it is that an option should be a priority. Conversely, the greater the savings, the more likely it is that an option should be a priority.
How large is the incremental cost relative to the net benefit?	*Is the cost small relative to the net benefits (benefits minus harms)?*	The greater the cost per unit of benefit, the less likely it is that an option should be a priority.
What would be the impact on health inequities?	*Would the option reduce or increase health inequities?*	Policies or programmes that reduce inequities are more likely to be a priority than ones that do not (or ones that increase inequities).
Is the option acceptable to key stakeholders?	*Are key stakeholders likely to find the option acceptable (given the relative importance they attach to the desirable and undesirable consequences of the option; the timing of the benefits, harms and costs; and their moral values)?*	The less acceptable an option is to key stakeholders, the less likely it is that it should be recommended, or if it is recommended, the more likely it is that the recommendation should include an implementation strategy to address concerns about acceptability. Acceptability might reflect who benefits (or is harmed) and who pays (or saves); and when the benefits, adverse effects, and costs occur (and the discount rates of key stakeholders; e.g. politicians may have a high discount rate for anything that occurs beyond the next election). Unacceptability may be due to some stakeholders: ● Not accepting the distribution of the benefits, harms and costs ● Not accepting costs or undesirable effects in the short term for desirable effects (benefits) in the future ● Attaching more value (relative importance) to the undesirable consequences than to the desirable consequences or costs of an option (because of how they might be affected personally or because of their perceptions of the relative importance of consequences for others) ● Morally disapproving (i.e. in relationship to ethical principles such as autonomy, nonmaleficence, beneficence or justice)
Is the option feasible to implement?	*Can the option be accomplished or brought about?*	The less feasible (capable of being accomplished or brought about) an option is, the less likely it is that it should be recommended (i.e. the more barriers there are that would be difficult to overcome).

[1] The "certainty of the evidence" is an assessment the likelihood that the effect will be substantially different from what the research found.

Explanations of the conclusions in the framework

Suggestions for how to make judgements in relation to each conclusion are provided in: *Framework for going from evidence to a recommendation – Guidance for health system and public health recommendations*. For each conclusion, we suggest one or more questions to consider when making a judgement and explain what is needed.

Term	Question	Explanation
Overall judgement across all criteria	*What is the overall balance between all the desirable and undesirable consequences?*	An overall judgement whether the desirable consequences outweigh the undesirable consequences, or vice versa (based on all the research evidence and additional information considered in relation to all the criteria). Consequences include health and other benefits, adverse effects and other harms, resource use, and impacts on equity
Type of recommendation	*Based on the balance of the consequences in relation to all of the criteria in the framework, what is your recommendation?*	A recommendation based on the balance of consequences and your judgements in relation to all of the criteria, for example: ● Not to implement the option ● To consider the option only in the context of rigorous research ● To consider the option only with specified monitoring and evaluation ● To consider the option only in specified contexts ● To implement the option
Recommendation (text)	*What is your recommendation in plain language?*	A concise, clear and actionable recommendation
Justification	*What is the justification for the recommendation, based on the criteria in the framework that drove the recommendation?*	A concise summary of the reasoning underlying the recommendation
Subgroup considerations	*What, if any, subgroups were considered and what, if any, specific factors (based on the criteria in the framework) should be considered in relation to those subgroups when implementing the option?*	A concise summary of the subgroups that were considered and any modifications of the recommendation in relation to any of those subgroups
Implementation considerations	*What should be considered when implementing the option, including strategies to address concerns about acceptability and feasibility?*	Key considerations, including strategies to address concerns about acceptability and feasibility, when implementing the option
Monitoring and evaluation considerations	*What indicators should be monitored? Is there a need to evaluate the impacts of the option, either in a pilot study or an impact evaluation carried out alongside or before full implementation of the option?*	Any important indicators that should be monitored if the option is implemented
Research priorities	*Are there any important uncertainties in relation to any of the criteria that are a priority for further research?*	Any research priorities

Explanations of terms used in summaries of findings

Term	Explanation
Outcomes	These are all the ***outcomes*** (potential benefits or harms) that are considered to be ***important*** to those affected by the intervention, and which are important to making a recommendation or decision. Consultation with those affected by an intervention (such as patients and their carers) or other members of the public may be used to select the ***important outcomes***. A review of the literature may also be carried out to inform the selection of the important outcomes. The importance (or value) of each outcome in relation to the other outcomes should also be considered. This is the ***relative importance of the outcome.***
95% Confidence Interval (CI)	A ***confidence interval*** is a range around an estimate that conveys how precise the estimate is. The confidence interval is a guide to how sure we can be about the quantity we are interested in. The narrower the range between the two numbers, the more confident we can be about what the true value is; the wider the range, the less sure we can be. The width of the confidence interval reflects the extent to which chance may be responsible for the observed estimate (with a wider interval reflecting more chance). ***95% Confidence Interval (CI)*** means that we can be 95 percent confident that the true size of effect is between the lower and upper confidence limit. Conversely, there is a 5 percent chance that the true effect is outside of this range.
Relative Effect or RR (Risk Ratio)	Here the ***relative effect*** is expressed as a ***risk ratio (RR).*** Risk is the probability of an outcome occurring. A ***risk ratio*** is the *ratio* between the risk in the intervention group and the risk in the control group. For example, if the risk in the intervention group is 1% (10 per 1000) and the risk in the control group is 10% (100 per 1000), the relative effect is 10/100 or 0.10. If the RR is exactly 1.0, this means that there is no difference between the occurrence of the outcome in the intervention and the control group. If the RR is greater than 1.0, the intervention increases the risk of the outcome. If it is a good outcome (for example, the birth of a healthy baby), a RR greater than 1.0 indicates a desirable effect for the intervention. Whereas, if the outcome is bad (for example, death) a RR greater than 1.0 would indicate an undesirable effect. If the RR is less than 1.0, the intervention decreases the risk of the outcome. This indicates a desirable effect, if it is a bad outcome (for example, death) and an undesirable effect if it is a good outcome (for example, birth of a healthy baby).
Certainty of the evidence (GRADE)2	The ***certainty of the evidence*** is an assessment of how good an indication the research provides of the likely effect; i.e. the likelihood that the effect will be substantially different from what the research found. By ***substantially different*** we mean a large enough difference that it might affect a decision. This assessment is based on an overall assessment of reasons for there being more or less certainty using the ***GRADE*** approach. In the context of decisions, these considerations include the applicability of the evidence in a specific context. Other terms may be used synonymously with *certainty of the evidence*, including ***quality of the evidence***, ***confidence in the estimate***, and ***strength of the evidence***. Definitions of the categories used to rate the certainty of the evidence (***high***, ***moderate***, ***low***, and ***very low***) are provided in the table below.

Definitions for ratings of the certainty of the evidence

Ratings	Definitions
⊕⊕⊕⊕ High	This research provides a very good indication of the likely effect. The likelihood that the effect will be ***substantially different is low.***
⊕⊕⊕◯ Moderate	This research provides a good indication of the likely effect. The likelihood that the effect will be substantially different is moderate.
⊕⊕◯◯ Low	This research provides some indication of the likely effect. However, the likelihood that it will be substantially different (a large enough difference that it might have an effect on a decision) is high.
⊕◯◯◯ Very Low	This research does not provide a reliable indication of the likely effect. The likelihood that the effect will be substantially different (a large enough difference that it might have an effect on a decision) is very high.

7. The GRADE approach for diagnostic tests and strategies

Recommendations concerning diagnostic testing share the fundamental logic of recommendations for therapeutic and other interventions, such as screening. However, diagnostic questions also present unique challenges.

While some tests naturally report positive and negative results (e.g., pregnancy, HIV infection), other tests report their results as ordinal (e.g., Glasgow coma scale or mini-mental status examination) or continuous variable (e.g., metabolic measures), usually with increasing likelihood of disease or adverse events as the test results become more extreme. For simplicity, in this discussion we generally assume a diagnostic approach that ultimately categorizes test results as positive or negative. This also recognizes that many tests ultimately lead to dichotomized decisions to treat or not to treat.

Clinicians and researchers often administer diagnostic tests as a package or strategy composed of several tests. Thus, one can often think of evaluating or recommending a diagnostic strategy rather than a single test.

Examples
1. In managing patients with a diagnosis of cervical intraepithelial neoplasia, a precursor of prevent cervical cancer, based on visual inspection with acetic acid (VIA) clinicians may proceed to treatment directly or apply a strategy of testing for human papilloma virus and VIA.

2. Testing strategy may use an initial sensitive but non-specific test which, if positive, is followed by a more specific test (e.g., testing for HIV includes the use of an ELISA test followed by quantitative HIV RNA determination for those with positive results of the ELISA test; but one could ask the question why quantitative HIV RNA determination alone would not be appropriate).

7.1. Questions about diagnostic tests

The format of the question asked by authors of systematic reviews or guideline developers follows the same principles as the format for management questions:
- Should TEST A vs. TEST B be used in SOME PATIENTS/POPULATION?
- Should TEST A vs. TEST B be used for SOME PURPOSE?

7.1.1. Establishing the purpose of a test

Guideline panels should be explicit about the purpose of the test in question. Researchers and clinicians apply medical tests that are usually referred to as "diagnostic" – including signs and symptoms, imaging, biochemistry, pathology, and psychological testing – for a number of purposes. These applications include identifying physiological derangements, establishing prognosis, monitoring illness and treatment response, screening and diagnosis.

7.1.2. Establishing the role of a test

Guideline panels and authors of systematic reviews should also clearly establish the role of a diagnostic test or strategy. This process should begin with determining the standard diagnostic pathway – or pathways – for the target patient presentation and identify the associated limitations. Knowing those limitations one can identify particular shortcomings for which the alternative diagnostic test or strategy offers a putative remedy. The purpose of a test under consideration may be for (i) **replacement** (e.g., of tests with greater burden, invasiveness, cost, or inferior accuracy), (ii), **triage** (e.g., to minimize use of an invasive or expensive test) or (iii) **add-on** (e.g., to further enhance diagnostic accuracy beyond the existing diagnostic pathway) (Table 7.1) [Bossuyt 2006; PMID: 16675820].

Table 7.1. Possible roles of new diagnostic tests

Replacement	A new test might substitute an old one, because it is more accurate, less invasive, less risky or uncomfortable for patients, organizationally or technically less challenging, quicker to yield results or more easily interpreted, or less costly.
Triage	A new test is added before the existing diagnostic pathway and only patients with a particular result on the triage test continue the testing pathway; triage tests are not necessarily more accurate but usually simpler and less costly.
Add-on	A new test is added after the existing diagnostic pathway and may be used to limit the number of either false positive or false negative results after the existing diagnostic pathway; add-on tests are usually more accurate but otherwise less attractive than existing tests.

7.1.3. Clear clinical questions

Clearly establishing the role or purpose of a test or test strategy will lead to the identification of sensible clinical questions that, similar to other management problems, have four components: patients, diagnostic intervention (strategy), comparison diagnostic intervention (strategy), and the outcomes of interest.

Examples
1: In patients suspected of coronary artery disease (patients) should multi-slice spiral computed tomography (CT) of coronary arteries (intervention) be used as replacement for conventional invasive coronary angiography (comparison) to lower complications with acceptable rates of false negatives associated with coronary events and false positives leading to unnecessary treatment and complications (outcomes)?
This example illustrates one common rationale for a new test – test replacement (coronary CT instead of conventional angiography) to avoid complications associated with a more invasive and expensive alternative for a condition that can effectively be treated. In this situation, the new test would only need to replicate the results of the existing test to demonstrate greater patient net benefit. This assumes that the new test similarly categorizes patients at the same stage of the disease and that the consequences of the test result, i.e. management decisions and outcomes, are similar.

2: In patients suspected of cow's milk allergy (CMA), should skin prick tests rather than an oral food challenge with cow's milk be used for the diagnosis and management of IgE-mediated CMA.
3: In adults cared for in a non-specialized clinical setting, should serum or plasma cystatin C rather than serum creatinine concentration be used for the diagnosis and management of renal impairment.

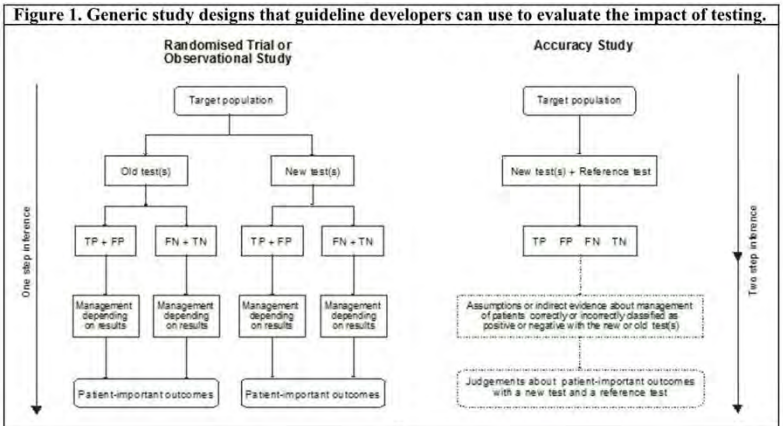
7.2. Gold standard and reference test

The concept of diagnostic accuracy relies on the presence of a so-called **"gold standard"**, i.e. a clearly stated definition of the target disease (i.e. construct of a disease). However, the term "gold standard" is ambiguous and not consistently defined. Moreover, constructs of diseases are constantly changing with progress in understanding biology (e.g. in oncology, with a more molecular understanding of the underlying pathologies or Alzheimer's dementia). We will use the term "gold standard" here as representing the "perfect" approach to defining or diagnosing the disease or condition of interest, even if the approach is theoretical and based on convention. Following from this definition, diagnostic test accuracy (e.g. sensitivity and specificity) as a measurement property is not associated with a "gold standard". We will use the term **"reference standard"** or reference test for the test or test strategy that is the current best and accepted approach to making a diagnosis against which a comparison (with an index test) may be made.

7.3. Estimating impact on patients

It follows that recommendations regarding the use of medical tests require inferences about the **consequences** of falsely identifying patients as having or not having the disease. If a test fails to improve patient-important outcomes there is no reason to use it, whatever its accuracy. Given the uncertainties about both reference and gold standards and the relation between diagnosis and patient or population consequences, the best way to assess a diagnostic test or strategy would be a test-treat randomized controlled trial in which investigators allocate patients to experimental or control diagnostic approaches and measure patient-important outcomes (mortality, morbidity, symptoms, quality of life and resource use).

Figure 1. Generic study designs that guideline developers can use to evaluate the impact of testing.



Example Randomized controlled trials (RCTs) that explored a diagnostic strategy guided by the use of B-type natriuretic peptide (BNP) – designed to aid diagnosis of heart failure – compared with no use of BNP in patients presenting to the emergency department with acute dyspnea. As it turned out, the group randomized to receive BNP spent a shorter time in the hospital at lower cost with no increased mortality or morbidity.	**Example** Consistent evidence from well designed studies demonstrates fewer false negative results with non-contrast helical CT than with intravenous pyelography (IVP) in the diagnosis of suspected acute urolithiasis. However, the stones in the ureter that CT detects but IVP "misses" are smaller, and hence are likely to pass more easily. Since RCTs evaluating the outcomes in patients treated for smaller stones are not available, the extent to which reduction in cases that are missed (false negatives) and follow-up of incidental findings unrelated to renal calculi with CT have important health benefits remains uncertain.
Two generic ways in which one can evaluate a test or diagnostic strategy: a) Patients are randomized to a new test or strategy or, alternatively, to an old test or strategy. Those with a positive test (cases detected) are randomized (or were previously randomized) to receive the best available management (second step of randomization for management not shown in this figure). Investigators evaluate and compare patient-important outcomes in all patients in both groups. b) Patients receive **both** a new test and a reference test (it often, however, is the old or comparator test or strategy). Investigators can then calculate the accuracy of the test compared to the reference test (first step). To make judgments about patient-importance of this information, patients with a positive test (or strategy) in either group are (or have been in previous studies) submitted to treatment or no treatment; investigators then evaluate and compare patient-important outcomes in all patients in both groups (second step).	

When diagnostic intervention studies (RCTs or observational studies) comparing alternative diagnostic strategies with assessment of direct patient-important outcomes are available, guideline panels can use the GRADE approach for other interventions.

If studies measuring the impact of testing on patient-important or population-important outcomes are not available, guideline panels must focus on other studies, such as diagnostic test accuracy studies, and make inferences about the likely impact of using alternative tests on patient-important outcomes. In the latter situation, diagnostic accuracy can be considered a surrogate outcome for patient-important benefits and harms.

Key questions when using test accuracy as a surrogate are:

- what outcomes can those labeled as cases and those labeled as not having a disease expect based on the knowledge about the best available management?
- will there be a reduction in false negatives (cases missed) or false positives and corresponding increases in true positives and true negatives?
- how similar (or different) are people to whom the test is applied and classified accurately by the alternative testing strategies to those evaluated in studies?

7.4. Indirect evidence and impact on patient-important outcomes

A recommendation associated with a diagnostic question follows from an evaluation of the balance between the desirable and undesirable consequences of the diagnostic test or strategy. It should be based on a systematic review addressing the clinical question as well as information about management after applying the diagnostic test.

Inferring from accuracy data that a diagnostic test or strategy improves patient-important outcome usually requires access to effective management. Alternatively, even with no effective treatment being available, using an accurate test may be beneficial, if it reduces adverse effects, cost or the anxiety through excluding an ominous diagnosis, or if confirming a diagnosis improves patient well-being from the prognostic information it imparts. Before drawing such inferences judgments about the confidence in diagnostic accuracy information is required.

7.5. Judgment about the quality of the underlying evidence

As described above, when studies as described in Figure 1a are available, the approach to assessing the confidence in effect estimates (quality of evidence) described for other interventions in prior articles in this series should be used. The rest of the current article focuses on the situation when such direct data on patient-important outcomes are lacking and the body of evidence is derived from DTA studies. Thus, in this article, we will provide guidance for assessing the confidence in estimates for those synthesizing information from DTA studies, e.g. authors of systematic reviews. Summary of findings (SoF) tables and GRADE evidence profiles provide transparent accounts of this information by summarizing numerical information and ratings of the confidence in these estimates.

7.5.1. Initial study design

In a typical test accuracy study, a consecutive series of patients suspected for a particular condition are subjected to the index test (the test being evaluated) and then all patients receive a reference or gold standard (the best available method to establish the presence of the target condition). While in the GRADE approach appropriate accuracy studies (see below) start as high quality evidence about diagnostic accuracy, these studies are vulnerable to limitations and often lead to low quality evidence to support guideline recommendations, mostly owing to indirectness of evidence associated with diagnostic accuracy being only a surrogate for patient outcomes.

7.5.2. Factors that determine and can decrease the quality of evidence

Table 7.2. Factors that decrease the quality of evidence for studies of diagnostic accuracy and how they differ from evidence for other interventions

Factors that determine and can decrease the quality of evidence	Explanations and how the factor may differ from the quality of evidence for other interventions
Study design	Different criteria for accuracy studies Cross-sectional or cohort studies in patients with diagnostic uncertainty and direct comparison of test results with an appropriate reference standard (best possible alternative test strategy) are considered high quality and can move to moderate, low or very low depending on other factors.
Risk of bias (limitations in study design and execution)	Different criteria for accuracy studies 6. Representativeness of the population that was intended to be sampled. 7. Independent comparison with the best alternative test strategy. 8. All enrolled patients should receive the new test and the best alternative test strategy. 9. Diagnostic uncertainty should be given. 10. Is the reference standard likely to correctly classify the target condition?
Indirectness Patient population, diagnostic test, comparison test and indirect comparisons of tests	Similar criteria The quality of evidence can be lowered if there are important differences between the populations studied and those for whom the recommendation is intended (in prior testing, the spectrum of disease or co-morbidity); if there are important differences in the tests studied and the diagnostic expertise of those applying them in the studies compared to the settings for which the recommendations are intended; or if the tests being compared are each compared to a reference (gold) standard in different studies and not directly compared in the same studies. Similar criteria Panels assessing diagnostic tests often face an absence of direct evidence about impact on patient-important outcomes. They must make deductions from diagnostic test studies about the balance

	between the presumed influences on patient-important outcomes of any differences in true and false positives and true and false negatives in relationship to test complications and costs. Therefore, accuracy studies typically provide low quality evidence for making recommendations due to indirectness of the outcomes, similar to surrogate outcomes for treatments.
Important Inconsistency in study results	Similar criteria For accuracy studies unexplained inconsistency in sensitivity, specificity or likelihood ratios (rather than relative risks or mean differences) can lower the quality of evidence.
Imprecise evidence	Similar criteria For accuracy studies wide confidence intervals for estimates of test accuracy, or true and false positive and negative rates can lower the quality of evidence.
High probability of Publication bias	Similar criteria A high risk of publication bias (e.g., evidence only from small studies supporting a new test, or asymmetry in a funnel plot) can lower the quality of evidence.
Upgrading for dose effect, large effects residual plausible bias and confounding	Similar criteria For all of these factors, methods have not been properly developed. However, determining a dose effect (e.g., increasing levels of anticoagulation measured by INR increase the likelihood for vitamin K deficiency or vitamin K antagonists). A very large likelihood of disease (not of patient-important outcomes) associated with test results may increase the quality evidence. However, there is some disagreement if and how dose effects play a role in assessing the quality of evidence in DTA studies.

7.5.2.1. Risk of bias

Several instruments for the evaluation of risk of bias in DTA studies are available. Cochrane Collaboration suggests a selection of the items from the QUADAS [Whiting 2003; PMID 14606960] and QUADAS-2 [Whiting 2011; PMID 22007046] instruments. Authors of systematic reviews and guideline panels can use the criteria from the QUADAS list (Table 7.3) to assess the risk of bias within and across studies.

Serious limitations in a body of evidence that indicate risk of bias, if found, will likely lead to downgrading the quality of evidence by one or two levels.

Table 7.3. Quality criteria of diagnostic accuracy studies derived from QUADAS (Reitsma 2009; http://srdta.cochrane.org/)	
1.	Was the spectrum of patients representative of the patients who will receive the test in practice? (representative spectrum)
2.	Is the reference standard likely to classify the target condition correctly? (acceptable reference standard)
3.	Is the time period between reference standard and index test short enough to be reasonably sure that the target condition did not change between the two tests? (acceptable delay between tests)
4.	Did the whole sample or a random selection of the sample, receive verification using the intended reference standard? (partial verification avoided)
5.	Did patients receive the same reference standard irrespective of the index test result? (differential verification avoided)
6.	Was the reference standard independent of the index test (i.e. the index test did not form part of the reference standard)? (incorporation avoided)
7.	Were the reference standard results interpreted without knowledge of the results of the index test? (index test results blinded)
8.	Were the index test results interpreted without knowledge of the results of the reference standard? (reference standard results blinded)
9.	Were the same clinical data available when test results were interpreted as would be available when the test is used in practice? (relevant clinical information)
10.	Were uninterpretable/intermediate test results reported? (uninterpretable results reported)
11.	Were withdrawals from the study explained? (withdrawals explained)

Table 7.4. Quality criteria of diagnostic accuracy studies derived from QUADAS-2				
Domain	**Patient Selection**	**Index Test**	**Reference Standard**	**Flow and Timing**
Description	Describe methods of patient selection Describe included patients (previous testing, presentation, intended use of index test, and setting)	Describe the index test and how it was conducted and interpreted	Describe the reference standard and how it was conducted and interpreted	Describe any patients who did not receive the index tests or reference standard or who were excluded from the 2 X 2 table (refer to flow diagram) Describe the interval and any interventions between index tests and the reference standard
Signaling questions (yes, no, or unclear)	Was a consecutive or random sample of patients enrolled? Was a case–control design avoided? Did the study avoid inappropriate	Were the index test results interpreted without know- ledge of the results of the reference standard? If a threshold was used, was it pre-	Is the reference standard likely to correctly classify the target condition? Were the reference standard results interpreted without	Was there an appropriate interval between index tests and reference standard? Did all patients receive a reference

	exclusions?	specified?	knowledge of the results of the index test?	standard? Did all patients receive the same reference standard? Were all patients included in the analysis?
Risk of bias (high, low, or unclear)	Could the selection of patients have introduced bias?	Could the conduct or interpretation of the index test have introduced bias?	Could the reference standard, its conduct, or its interpretation have introduced bias?	Could the patient flow have introduced bias?

7.5.2.2. Indirectness of the evidence

Judging indirectness of the evidence presents additional and probably greater challenges for authors of systematic reviews of diagnostic test accuracy and for guideline panels making recommendations about diagnostic tests. First, as with therapeutic interventions, indirectness must be assessed in relation to the population, setting, the intervention (the new or index test) and the comparator (another investigated test or the reference standard). For instance, a judgment of indirectness of the population can result from using a different test setting such as the patients seen in an emergency department may differ from patients seen in a general practitioner office, the patients included in the studies of interest may differ or the target condition of the population is not the same in the studies compared to the question asked.

If the clinical question is about the choice between two tests, neither of which is a reference standard, one needs to assess whether the two tests were compared directly against each other and the reference test in the same study, or in separate studies in which each test was compared separately against the reference standard. For example, a systematic review comparing the diagnostic accuracy of two tests for renal insufficiency – serum creatinine and serum cystatin C – identified a number of studies that performed serum tests for both creatinine and cystatin C and the reference standard in the same patients (Table 7.5).

Table 7.5. Diagnostic accuracy SoF table: cystatin vs. creatinine in diagnosis of renal failure

Population / Setting: Adults and children who were healthy, now suspected to have or had impaired renal function in a non-specialized clinical setting
New Test / Cut-off value: Serum or plasma Cystatin C (Cys C) / 0.82 to 1.64 mg/L [1]
Comparison Test / Cut-off value: Serum Creatinine concentration (S Creat) / 70.7 to 130.74 µmol/L [1]
Reference Test: Glomerular Filtration Rate measured by exogenous inulin, Cr-EDTA, Tc-DTPA, iohexol or I-lothalamate

Test Important Outcome	Results per 1000 patients tested (95% CI)						Number of participants (Studies)	Quality of Evidence	Comment
	Pre-test probability 10%		Pre-test probability 50%		Pre-test probability 90%				
	Cys C	S Creat	Cys C	S Creat	Cys C	S Creat			
True Positive (TP)	81 (76-85)	69 (61-76)	405 (380-425)	345 (305-380)	648 (608-680)	552 (488-608)	2007 (27)	⊕⊕OO Low [3]	Detection of TPs will likely improve mortality and slow progression to ESRD. TPs will have further testing which will increase anxiety, complications and resources use.
TP absolute difference[2]	12 more (9-15 more)		60 more (44-75 more)		96 more (72-120 more)				
False Positive (FP)	108 (81-144)	315 (286-342)	60 (45-80)	175 (160-190)	24 (18-32)	70 (64-76)	2007 (27)	⊕⊕OO Low [3]	FPs will likely have further testing which will increase anxiety, complications and resources use.
FP absolute difference[2]	207 fewer (196-217 fewer)		115 fewer (80-120 fewer)		46 fewer (44-48 fewer)				
True Negative (TN)	792 (756-819)	585 (558-612)	440 (420-455)	325 (310-340)	176 (168-182)	130 (124-136)	2007 (27)	⊕⊕OO Low [3]	TNs will likely be reassured, but will still be retested every year to detect new cases that develop.
TN absolute difference[2]	207 more (196-217 more)		115 more (110-120 more)		46 more (44-48 more)				
False Negative (FN)	19 (15-24)	31 (24-39)	95 (75-120)	155 (120-195)	152 (120-192)	248 (192-312)	2007 (27)	⊕⊕OO Low [3]	FN will likely have progression to ESRD and increased mortality due to delayed diagnosis.
FN absolute difference[2]	12 fewer (9-15 fewer)		60 fewer (45-75 fewer)		96 fewer (70-120 fewer)

**Roos et al. Diagnostic accuracy of cystatin C compared to serum creatinine for the estimation of renal dysfunction in adult and children-A meta analysis. Clinical Biochemistry 40 (2007) 383-391
(1) In these studies, cystatin C was measured using particle-enhanced immunoturbidimetry (PETIA) and particle-enhanced immunonephelometry (PENIA) and creatinine using the standard and modified Jaffe assay, and the enzymatic assay. Studies included in the meta-analysis directly compared Cys C versus S Creat.
(2) Differences calculated as an absolute difference with when cystatin C is done compared to serum creatinine
(3) Low quality evidence is due to very serious indirectness of outcomes in a wide spectrum of patients and indirect comparison of tests and serious imprecision.
(4) Low quality evidence is due to some limitation in the design and very few events noted that affected imprecision.

Unlike for management questions, **if only diagnostic accuracy information is available, the assessment of indirectness requires additional judgments about how the correct and incorrect classification of subjects as having or not having a target condition relates to patient important outcomes.** While authors of systematic reviews will frequently skip this assessment because their interest may relate only to the review of the diagnostic accuracy, guideline panels must always make this judgment – either implicitly or, better, explicitly and transparently.

7.5.2.3. Inconsistency, imprecision, publication bias and upgrading for dose effect, large estimates of accuracy and residual plausible confounding

Although these criteria are applicable to a body of evidence from studies of diagnostic test accuracy, the methods to determine whether a particular criterion is met are less well established compared with the evidence about the effects of therapeutic interventions. Further theoretical and empirical work is required to provide guidance how to assess those criteria.

7.5.3. Overall confidence in estimates of effects

Tables 7.6 and 7.7 show the assessment of the confidence in the estimates and the SoF table of all critical outcomes for the comparison of computed tomography (CT) angiography with an invasive angiography (the reference standard) in patients suspected of coronary artery disease.

Table 7.6. . Quality assessment of diagnostic accuracy studies – example: should multi-slice spiral computed tomography instead of conventional coronary angiography be used for diagnosis of coronary artery disease?

No. of studies	Design	Limitations (RoB)	Indirectness of patients, intervention and comparator	Inconsistency	Imprecision	Other considerations	Quality of evidence
True positives (Patients with coronary artery disease) and False negatives (Patients incorrectly classified as not having coronary artery disease)							
21 studies (1570 patients)	Cross sectional studies[2]	None	None[3]	Serious inconsistency[3]	None	None[4]	⊕⊕⊕◯ Moderate
True negatives (Patients without coronary artery disease) and False Positives (Patients incorrectly classified as having coronary artery disease)							
21 studies (1570 patients)	Cross sectional studies[2]	None	None[3]	Serious inconsistency[3]	None	None [4]	⊕⊕⊕◯ Moderate

[1] A full quality assessment would include a row for each of the patient-important outcomes associated with each possible test result (TP, TN, FP, FN and inconclusive results) as well as test complications and costs (see table 3). We have presented a simplified summary of the quality of evidence for the critical outcomes here.
[2] All patients were selected to undergo conventional coronary angiography and were, therefore, generally presenting with high probability of coronary artery disease (median prevalence in the included studies: 63.5%, Range 6.6% to 100%).
[3] There was statistically significant, unexplained heterogeneity of results for sensitivity (the proportion of patients with positive coronary angiography with a positive CT scan), specificity (the proportion of patients with negative coronary angiography with a negative CT scan), likelihood ratios and diagnostic odds ratios, lowering the quality of evidence for the consequences of TP, TN and FP from high to moderate and for FN test results from moderate to low.[39]
[4] The possibility of publication bias is not excluded but it was not considered sufficient to downgrade the quality of evidence.

Table 7.7. . Summary of findings of all critical outcomes for the comparison of computed tomography (CT) angiography with an invasive angiography (the reference standard) in patients suspected of coronary artery disease.

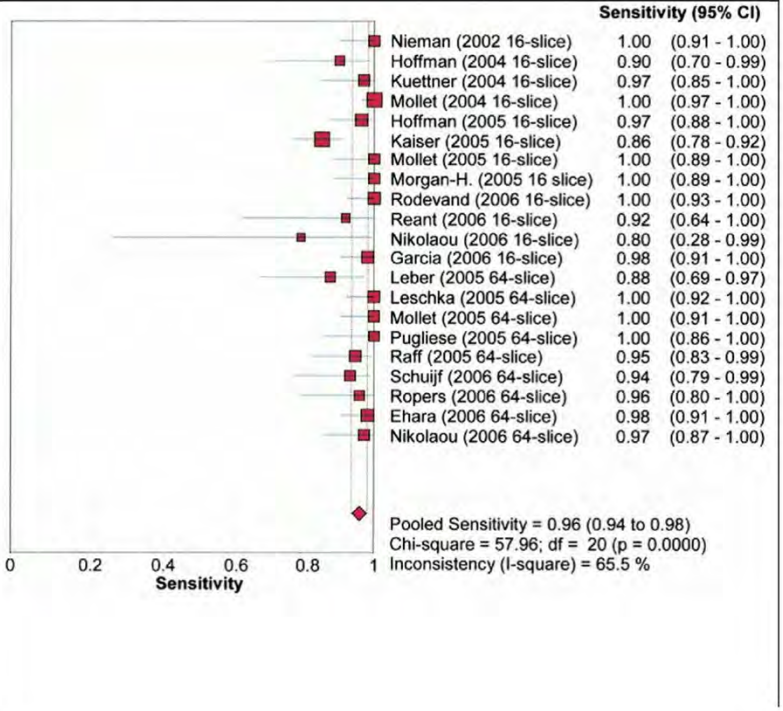
Summary of findings – example. Assumed pre-test probability (prevalence) was 20%.

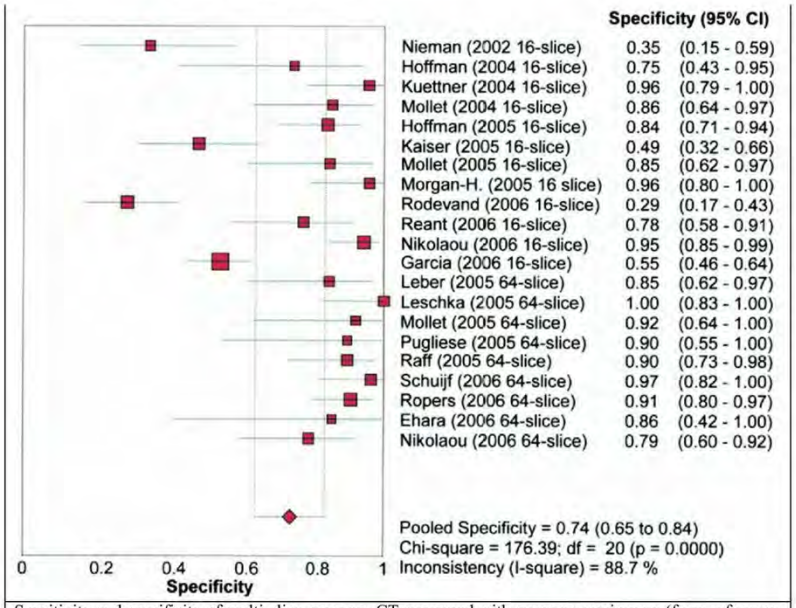
	Test findings		
Pooled sensitivity	0.96 (95% CI: 0.94 to 0.98)		
Pooled specificity	0.74 (95% CI: 0.65 to 0.84)		
	Consequences		
	Number per 1000[1]		Importance
TP[2]	192		8
TN[3]	592		8
FP[4]	208		7
FN[5]	8		9
Inconclusive results[6,7]	–		5
Cost[7]	–		5

[1] all results are given per 1000 patients tested based on the prevalence of 20% and pooled sensitivity and specificity.
[6] inconclusive results are either uninterpretable, indeterminate or intermediate test results
[2] Important because mandates drugs, angioplasty and stents, bypass surgery.
[3] Important because spares patients unnecessary interventions associated with adverse effects.
[4] Important because patients are exposed to unnecessary potential adverse effects from drugs and invasive procedures.
[5] Important because increase risk of coronary events as a result of patients not receiving efficacious treatment.
[6] Uninterpretable, indeterminate, or intermediate test results; important because generate anxiety, uncertainty as to how to proceed, further testing, and possible negative consequences of either treating or not treating.
[7] Although the results for these consequences are not reported because they are not exactly known on the basis of the available data, they are important.

The original accuracy studies were well planned and executed, the results are precise, and one does not suspect relevant publication bias. However, there are problems with inconsistency. Reviewers addressing the relative merits of CT versus invasive angiography for diagnosis of coronary disease found important heterogeneity in the results for the proportion of invasive angiography-negative patients with a positive CT test result (specificity) and in the results for the proportion of angiography-positive patients with a negative CT test result (sensitivity) that they could not explain (Figure 2). This heterogeneity was also present for other measures of diagnostic test accuracy (i.e. positive and negative likelihood ratios and diagnostic odds ratios). Unexplained heterogeneity in the results across studies reduced the quality of evidence for all outcomes.

Figure 2. Example for heterogeneity in diagnostic test results





Sensitivity and specificity of multi-slice coronary CT compared with coronary angiogram (from reference 4). This heterogeneity also existed for likelihood ratios and diagnostic odds ratios.

One of the aims of the GRADE Working Group is to reduce unnecessary confusion arising from multiple systems for grading quality of evidence and strength of recommendations. To avoid adding to this confusion by having multiple variations of the GRADE system we suggest that the criteria below should be met when saying that the GRADE approach was used. Also, while users may believe there are good reasons for modifying the GRADE system, we discourage the use of "modified" GRADE approaches that differ substantially from the approach described by the GRADE Working Group.

However, we encourage and welcome constructive criticism of the GRADE approach, suggestions for improvements, and involvement in the GRADE Working Group. As most scientific approaches to advancing healthcare, the GRADE approach will continue to evolve in response to new research and to meet the needs of authors of systematic reviews, guideline developers and other users.

Checklist: Suggested criteria for stating that the GRADE system was used

1. **Definition of quality of evidence:** The quality of evidence (confidence in the estimated effects) should be defined consistently with the definitions (for guidelines or for systematic reviews) used by the GRADE Working Group.

2. **Criteria for assessing the quality of evidence:** Explicit consideration should be given to each of the eight GRADE criteria for assessing the quality of evidence (risk of bias, directness of evidence, consistency and precision of results, risk of publication bias, magnitude of the effect, dose-response gradient, and influence of residual plausible confounding) although different terminology may be used.

3. **Quality of evidence for each outcome:** The quality of evidence (confidence in the estimated effects) should be assessed for each important outcome and expressed using four categories (e.g. *high, moderate, low, very low*) or, if justified, three categories (e.g. *high, moderate, and low* [*low* and *very low* being reduced to one category]) based on consideration of the above factors (see point 2) with suggested interpretation of each category that is consistent with the interpretation used by the GRADE Working Group.

4. **Summaries of evidence:** Evidence tables or detailed narrative summaries of evidence, transparently describing judgements about the factors in point 2 above, should be used as the basis for judgements about the quality of evidence and the strength of recommendations. Ideally, full evidence profiles suggested by the GRADE Working Group should be used and these should be based on systematic reviews. At a minimum, the evidence that was assessed and the methods that were used to identify and appraise that evidence should be clearly described. In particular, reasons for downgrading and upgrading the quality of evidence should be described transparently.

5. **Criteria for determining the strength of a recommendation:** Explicit consideration should be given to each of the four GRADE criteria for determining the strength of a recommendation (the balance of desirable and undesirable consequences, quality of evidence, values and preferences of those affected, and resource use) and a general approach should be reported (e.g. if and how costs were considered, whose values and preferences were assumed, etc.).

6. **Strength of recommendation terminology:** The strength of recommendation for or against a specific management option should be expressed using two categories (*weak* and *strong*) and the definitions/interpretation for each category should be consistent with those used by the GRADE Working Group. Different terminology to express *weak* and *strong* recommendations may be used (e.g. alternative wording for *weak* recommendations is *conditional*), although the interpretation and implications should be preserved.

7. **Reporting of judgements:** Ideally, decisions about the strength of the recommendations should be transparently reported.

8. Criteria for determining whether the GRADE approach was used

One of the aims of the GRADE Working Group is to reduce unnecessary confusion arising from multiple systems for grading quality of evidence and strength of recommendations. To avoid adding to this confusion by having multiple variations of the GRADE system we suggest that the criteria below should be met when saying that the GRADE approach was used. Also, while users may believe there are good reasons for modifying the GRADE system, we discourage the use of "modified" GRADE approaches that differ substantially from the approach described by the GRADE Working Group.
However, we encourage and welcome constructive criticism of the GRADE approach, suggestions for improvements, and involvement in the GRADE Working Group. As most scientific approaches to advancing healthcare, the GRADE approach will continue to evolve in response to new research and to meet the needs of authors of systematic reviews, guideline developers and other users.

Checklist: Suggested criteria for stating that the GRADE system was used

1. **Definition of quality of evidence:** The quality of evidence (confidence in the estimated effects) should be defined consistently with the definitions (for guidelines or for systematic reviews) used by the GRADE Working Group.
2. **Criteria for assessing the quality of evidence:** Explicit consideration should be given to each of the eight GRADE criteria for assessing the quality of evidence (risk of bias, directness of evidence, consistency and precision of results, risk of publication bias, magnitude of the effect, dose-response gradient, and influence of residual plausible confounding) although different terminology may be used.
3. **Quality of evidence for each outcome:** The quality of evidence (confidence in the estimated effects) should be assessed for each important outcome and expressed using four categories (e.g. *high, moderate, low, very low*) or, if justified, three categories (e.g. *high, moderate, and low* [*low* and *very low* being reduced to one category]) based on consideration of the above factors (see point 2) with suggested interpretation of each category that is consistent with the interpretation used by the GRADE Working Group.
4. **Summaries of evidence:** Evidence tables or detailed narrative summaries of evidence, transparently describing judgements about the factors in point 2 above, should be used as the basis for judgements about the quality of evidence and the strength of recommendations. Ideally, full evidence profiles suggested by the GRADE Working Group should be used and these should be based on systematic reviews. At a minimum, the evidence that was assessed and the methods that were used to identify and appraise that evidence should be clearly described. In particular, reasons for downgrading and upgrading the quality of evidence should be described transparently.
5. **Criteria for determining the strength of a recommendation:** Explicit consideration should be given to each of the four GRADE criteria for determining the strength of a recommendation (the balance of desirable and undesirable consequences, quality of evidence, values and preferences of those affected, and resource use) and a general approach should be reported (e.g. if and how costs were considered, whose values and preferences were assumed, etc.).
6. **Strength of recommendation terminology:** The strength of recommendation for or against a specific management option should be expressed using two categories (*weak* and *strong*) and the definitions/interpretation for each category should be consistent with those used by the GRADE Working Group. Different terminology to express *weak* and *strong* recommendations may be used (e.g. alternative wording for *weak* recommendations is *conditional*), although the interpretation and implications should be preserved.
7. **Reporting of judgements:** Ideally, decisions about the strength of the recommendations should be transparently reported.

9. Glossary of terms and concepts

This glossary is partially based on the glossary of the Cochrane Collaboration and the Users' Guides to the Medical Literature with permission.

Absolute risk reduction (ARR): Synonym of the **risk difference** (RD). The difference in the risk between two groups. For example, if one group has a 15% risk of contracting a particular disease, and the other has a 10% risk of getting the disease, the risk difference is 5 percentage points.

Baseline risk: synonym of control group risk.

Bias: A systematic error or deviation in results or inferences from the truth. In studies of the effects of health care, the main types of bias arise from systematic differences in the groups that are compared (**selection bias**), the care that is provided, exposure to other factors apart from the intervention of interest (**performance bias**), withdrawals or exclusions of people entered into a study (**attrition bias**) or how outcomes are assessed (**detection bias**). Systematic reviews of studies may also be particularly affected by **reporting bias**, where a biased subset of all the relevant data is available.

Burden: ;Burdens are the demands that patients or caregivers (e.g. family) may dislike, such as having to take medication or the inconvenience of going to the doctor's office.

Case series: A study reporting observations on a series of individuals, usually all receiving the same intervention, with no control group.

Case report: A study reporting observations on a single individual. Also called: anecdote, case history, or case study.

Case-control study: An observational study that compares people with a specific disease or outcome of interest (cases) to people from the same population without that disease or outcome (controls), and which seeks to find associations between the outcome and prior exposure to particular risk factors. This design is particularly useful where the outcome is rare and past exposure can be reliably measured. Case-control studies are usually retrospective, but not always.

Categorical data: Data that are classified into two or more non-overlapping categories. Gender and type of drug (aspirin, paracetamol, etc.) are examples of categorical variables.

Clinical practice guideline (CPG): A systematically developed statement to assist practitioner and patient decisions about appropriate health care for specific clinical circumstances.

Cohort study: An observational study in which a defined group of people (the cohort) is followed over time. The outcomes of people in subsets of this cohort are compared, to examine people who were exposed or not exposed (or exposed at different levels) to a particular intervention or other factor of interest. A **prospective** cohort study assembles participants and follows them into the future.
A **retrospective** (or historical) cohort study identifies subjects from past records and follows them from the time of those records to the present.

Comparison: intervention against which new intervention is compared, control group.

Confidence interval (CI): A measure of the uncertainty around the main finding of a statistical analysis. Estimates of unknown quantities, such as the RR comparing an experimental intervention with a control, are usually presented as a point estimate and a 95% confidence interval. This means that if someone were to keep repeating a study in other samples from the same population, 95% of the calculated confidence intervals from those studies would include the true underlying value. Conceptually easier than this definition is to think of the CI as the range in which the truth plausibly lies. Wider intervals indicate less precision; narrow intervals, greater precision. Alternatives to 95%, such as 90% and 99% confidence intervals, are sometimes used.

Confounder: A factor that is associated with both an intervention (or exposure) and the outcome of interest. For example, if people in the experimental group of a controlled trial are younger than those in the control group, it will be difficult to decide whether a lower risk of death in one group is due to the intervention or the difference in ages. Age is then said to be a confounder, or a confounding variable. Randomisation is used to minimise imbalances in confounding variables between experimental and control groups. Confounding is a major concern in non-randomised studies.

Consumer (healthcare consumer): Someone who uses, is affected by, or who is entitled to use a health related service.

Context: The conditions and circumstances that are relevant to the application of an intervention, for example the setting (in hospital, at home, in the air); the time (working day, holiday, night-time); type of practice (primary, secondary, tertiary care; private practice, insurance practice, charity); whether routine or emergency. Also called **clinical situation**.

Continuous data: Data with a potentially infinite number of possible values within a given range. Height, weight and blood pressure are examples of continuous variables.

Control: In a controlled trial a control is a participant in the arm that acts as a comparator for one or more experimental interventions. Controls may receive placebo, no treatment, standard treatment, or an active intervention, such as a standard drug. In an observational study a control is a person in the group without the disease or outcome of interest.

Control Group Risk: observed risk of the event in the control group. Synonym of baseline risk. The control group risk for an outcome is calculated by dividing the number of people with an outcome in control group by the total number of participants in the control group.

Critical appraisal: The process of assessing and interpreting evidence by systematically considering its validity, results, and relevance.

Desirable effect: A desirable effect of adherence to a recommendation can include beneficial health outcomes, less burden and savings.

Dose response gradient: The relationship between the quantity of treatment given and its effect on outcome.

Effect size (ES): A generic term for the estimate of effect of treatment for a study. Sometimes the term is used to refer to the standardized mean difference.

To facilitate understanding we suggest interpretation of the effect size offered by Cohen (Cohen J. Statistical Power Analysis for the Behavioral Sciences. 2nd ed; 1988). According to this interpretation, an effect size or standardized mean difference of around:

- **0.2** is considered a **small** effect
- **0.5** is considered a **moderate** effect
- **0.8** or higher is considered a **large** effect.

Effectiveness: The extent to which an intervention produces a beneficial result under ideal conditions. Clinical trials that assess effectiveness are sometimes called pragmatic or management trials.

Efficacy: The extent to which an intervention produces a beneficial result under ideal conditions. Clinical trials that assess efficacy are sometimes called explanatory trials.

Estimate of effect: The observed relationship between an intervention and an outcome expressed as, for example, a number needed to treat, odds ratio, risk difference, risk ratio, relative risk reduction, standardised mean difference, or weighted mean difference.

External validity: The extent to which results provide a correct basis for generalisations to other circumstances. For instance, a meta-analysis of trials of elderly patients may not be generalizable to children. Also called**generalizability** or **applicability**.

Follow-up: The observation over a period of time of study/trial participants to measure outcomes under investigation.

Hazard ratio (HR): A measure of effect produced by a survival analysis and representing the increased risk with which one group is likely to experience the outcome of interest. For example, if the hazard ratio for death for a treatment is 0.5, then we can say that treated patients are likely to die at half the rate of untreated patients.

Intention to treat analysis (ITT): A strategy for analysing data from a randomised controlled trial. All participants are included in the arm to which they were allocated, whether or not they received (or completed) the intervention given to that arm. Intention-to-treat analysis prevents bias caused by the loss of participants, which may disrupt the baseline equivalence established by randomisation and which may

reflect non-adherence to the protocol. The term is often misused in trial publications when some participants were excluded.

Internal validity: The extent to which the design and conduct of a study are likely to have prevented bias. Variation in methodological quality can explain variation in the results of studies. More rigorously designed (better quality) trials are more likely to yield results that are closer to the truth.

Intervention: The process of intervening on people, groups, entities, or objects in an experimental study. In controlled trials, the word is sometimes used to describe the regimens in all comparison groups, including placebo and no-treatment arms.

Mean difference (MD): the 'difference in means' is a standard statistic that measures the absolute difference between the mean value in the two groups in a clinical trial. It estimates the amount by which the treatment changes the outcome on average. It can be used as a summary statistic in meta-analysis when outcome measurements in all trials are made on the same scale. Previously referred to as weighted mean difference (WMD).

Meta-analysis: The statistical combination of results from two or more separate studies.

Minimally important difference (MID): The smallest difference in score in the outcome of interest that informed patients or informed proxies perceive as important, either beneficial or harmful, and that would lead the patient or clinician to consider a change in the management.

Number needed to treat (NNT): An estimate of how many people need to receive a treatment before one person would experience a beneficial outcome. For example, if you need to give a stroke prevention drug to 20 people before one stroke is prevented, then the number needed to treat to benefit for that stroke prevention drug is 20. It is estimated as the reciprocal of the risk difference.

Number needed to harm (NNH): A number needed to treat to benefit associated with a harmful effect. It is an estimate of how many people need to receive a treatment before one more person would experience a harmful outcome or one fewer person would experience a beneficial outcome.

Observational study: A study in which the investigators do not seek to intervene, and simply observe the course of events. Changes or differences in one characteristic (e.g. whether or not people received the intervention of interest) are studied in relation to changes or differences in other characteristic(s) (e.g. whether or not they died), without action by the investigator. There is a greater risk of selection bias than in experimental studies.

Odds ratio (OR): The ratio of the odds of an event in one group to the odds of an event in another group. In studies of treatment effect, the odds in the treatment group are usually divided by the odds in the control group. An odds ratio of one indicates no difference between comparison groups. For undesirable outcomes an OR that is less than one indicates that the intervention was effective in reducing the risk of that outcome. When the risk is small, the value of odds ratio is similar to risk ratio. When the events in the control group are not frequent, OR and HR can be assumed to be equal to the RR for the application of this criterion.

Optimal information size (OIS): number of patients generated by a conventional sample size calculation for a single trial.

Outcome: A component of a participant's clinical and functional status after an intervention has been applied, that is used to assess the effectiveness of an intervention.

Point estimate: The results (e.g. mean, weighted mean difference, odds ratio, risk ratio or risk difference) obtained in a sample (a study or a meta-analysis) which are used as the best estimate of what is true for the relevant population from which the sample is taken.

Population: The group of people being studied, usually by taking samples from that population. Populations may be defined by any characteristics e.g. geography, age group, certain diseases.

Precision: A measure of the likelihood of random errors in the results of a study, meta-analysis or measurement. The less random error the greater the precision. Confidence intervals around the estimate of effect from each study are one way of expressing precision, with a narrower confidence interval meaning more precision.

Quality of evidence: The extent to which one can be confident that an estimate of effect is correct.

Randomised controlled trial (RCT): An experimental study in which two or more interventions are compared by being randomly allocated to participants. In most trials one intervention is assigned to each individual but sometimes assignment is to defined groups of individuals (for example, in a household) or interventions are assigned within individuals (for example, in different orders or to different parts of the body).

Relative risk (RR): Synonym of risk ratio. The ratio of risks in two groups. In intervention studies, it is the ratio of the risk in the intervention group to the risk in the control group. A risk ratio of one indicates no difference between comparison groups. For undesirable outcomes, a risk ratio that is less than one indicates that the intervention was effective in reducing the risk of that outcome.

Relative risk reduction (RRR): The proportional reduction in risk in one treatment group compared to another. It is one minus the risk ratio. If the risk ratio is 0.25, then the relative risk reduction is 1-0.25=0.75, or 75%.

Review Manager (RevMan): Software used for preparing and maintaining Cochrane systematic reviews. RevMan allows you to write ad manage systematic review protocols, as well as complete reviews, including text, tables, and study data. It can perform meta-analysis of the data entered, and present the results graphically.

Risk: The proportion of participants experiencing the event of interest. Thus, if out of 100 participants the event (e.g. a stroke) is observed in 32, the risk is 0.32. The control group risk is the risk amongst the control group. The risk may sometimes be referred to as the event rate.

Standardised mean difference (SMD): The difference between two estimated means divided by an estimate of the standard deviation. It is used to combine results from studies using different ways of measuring the same continuous variable, e.g. pain. By expressing the effects as a standardised value, the results can be combined since they have no units. Standardised mean differences are sometimes referred to as a d index.

Statistically significant: A result that is unlikely to have happened by chance. The usual threshold for this judgement is that the results, or more extreme results, would occur by chance with a probability of less

than 0.05 if the null hypothesis was true. Statistical tests produce a p-value used to assess this.

Strength of a recommendation: The degree of confidence that the desirable effects of adherence to a recommendation outweigh the undesirable effects.

Surrogate outcome: Outcome measure that is not of direct practical importance but is believed to reflect an outcome that is important; for example, blood pressure is not directly important to patients but it is often used as an outcome in clinical trials because it is a risk factor for stroke and heart attacks. Surrogate outcomes are often physiological or biochemical markers that can be relatively quickly and easily measured, and that are taken as being predictive of important clinical outcomes. They are often used when observation of clinical outcomes requires long follow-up. Also called: intermediary outcomes or surrogate endpoints.

Systematic review: A review of a clearly formulated question that uses systematic and explicit methods to identify, select, and critically appraise relevant research, and to collect and analyse data from the studies that are included in the review. Statistical methods (meta-analysis) may or may not be used to analyse and summarise the results of the included studies.

Undesirable effect: An undesirable effect of adherence to a recommendation can include harms, more burden, and costs.

10. Articles about GRADE

The following is a collection of published documents about the GRADE approach.

Introductory series published in the BMJ (2008)

11. Additional resources

Resources for authors of systematic reviews

The Cochrane Handbook

The Cochrane Handbook includes two principle chapters which provide information on how to create Summary of Findings tables using the information from Cochrane systematic reviews and GRADEing the evidence.

Part 2 Chapter 11: Presenting results and 'Summary of findings' tables

Part 2 Chapter 12: Interpreting results and drawing conclusions

General evidence-based medicine resources

The Cochrane Library

The Cochrane Library contains high-quality, independent evidence to inform healthcare decision-making. It includes reliable evidence from Cochrane and other systematic reviews, clinical trials, and more. Cochrane reviews bring you the combined results of the world's best medical research studies, and are recognised as the gold standard in evidence-based health care.

The Cochrane Handbook

The Cochrane Handbook for Systematic Reviews of Interventions (the Handbook) provides guidance to authors for the preparation of Cochrane Intervention reviews (including Cochrane Overviews of reviews). The Handbook is updated regularly to reflect advances in systematic review methodology and in response to feedback from users.

Users' Guides to the Medical Literature

A complete set of Users' Guides to find, evaluate and use medical literature which were originally published as a series in the Journal of the American Medical Association (JAMA).

Users' Guides to the Medical Literature: A Manual for Evidence-Based Clinical Practice (Interactive) presents the sophisticated concepts of evidence-based medicine (EBM) in unique ways that can be used to determine diagnosis, decide optimal therapy, and predict prognosis. It also offers in-depth expansion of methodology, statistics, and cost issues that emerge in medical research.

Guideline specific resources

Improving the use of research evidence in guideline development (SERIES)

A series of 16 papers published in Health Research Policy and Systems in 2006, Volume 4, Issues 12 to 28 about guideline development. Topics are Guidelines for guidelines, Priority setting, Group composition and consultation process, Managing conflicts of interest, Group processes, Determining which outcomes are important, Deciding what evidence to include, Synthesis and presentation of evidence, Grading evidence and recommendations, Integrating values and consumer involvement, Incorporating considerations of cost-effectiveness, affordability and resource implications, Incorporating considerations of equity, Adaptation, applicability and transferability, Reporting guidelines, Disseminating and implementing guidelines, and Evaluation.

The AGREE instrument

The purpose of the Appraisal of Guidelines Research & Evaluation (AGREE) Instrument is to provide a framework for assessing the quality of clinical practice guidelines.

GRADE Working Group

The Grading of Recommendations Assessment, Development and Evaluation (short GRADE) Working Group began in the year 2000 as an informal collaboration of people with an interest in addressing the shortcomings of present grading systems in health care. Our aim is to develop a common, sensible approach to grading quality of evidence and strength of recommendation.

Guidelines Advisory Committee

The Guidelines Advisory Committee (GAC) is an independent partnership of the Ontario Medical Association and the Ontario Ministry of Health and Long Term Care (MOHLTC). The GACs mission is to promote better health for the people of Ontario by encouraging physicians and other practitioners to use evidence-based clinical practice guidelines and clinical practices based on best available evidence. We identify, evaluate, endorse and summarize guidelines for use in Ontario.

National Guideline Clearing House

The National Guideline Clearinghouse (NGC) is a comprehensive database of evidence-based clinical practice guidelines and related documents. NGC is an initiative of the Agency for Healthcare Research and Quality (AHRQ), U.S. Department of Health and Human Services.

National Library of Guidelines

The National Library of Guidelines is a collection of guidelines for the NHS. It is based on the guidelines produced by NICE and other national agencies. The main focus of the Library is on guidelines produced in the UK, but where no UK guideline is available, guidelines from other countries are included in the collection.

12. The GRADE Working Group

The Grading of Recommendations Assessment, Development and Evaluation (GRADE) Working Group began in the year 2000 as an informal collaboration of more than 60 methodologists, clinicians, systematic reviewers, and guideline developers representing various organizations with the goal to address shortcomings of present grading systems in health care. The aim was to develop a common, sensible approach to grading quality of evidence and strength of recommendations. Based on shared experience, a critical review of other systems, and working through examples and applying the system in guidelines, the Working Group has developed the GRADE approach as a common, transparent and sensible method to grading quality of evidence and strength of recommendations.

Several organizations that are now using or endorsing the GRADE approach in its original format or with minor modifications:

WPATH/USPATH Denounce Florida Department of Health for Harmful Guidelines Targeting Trans Youth

The World Professional Association for Transgender Health (WPATH) and United States Professional Association for Transgender Health (USPATH) denounce guidance from the Florida Department of Health aimed at stopping medically necessary health care for transgender youth. The Florida guidelines were issued in response to a fact sheet on gender-affirming care put forth by the U.S. Department of Health and Human Services.

“Florida’s Health Department should be looking out for the interests of trans youth instead of misrepresenting the science on how to care for them. This so-called guidance is dangerous and will contribute to putting Florida’s trans youth population, their families, and their care providers in harm’s way. It is shameful to see yet another attack from a state that is laser-focused on targeting trans and LGBQ people for political gain.”

World Professional Association for Transgender Health (WPATH) Board of Directors and Ethics Committee Statement Opposing Legislation that Endangers Health

The members of the WPATH Ethics Committee applaud the June 15, 2020 ruling issued from the United States Supreme Court that rejects discrimination based on gender identity or sexual orientation in the workplace. The rationale for this ruling put forth by the majority articulates plainly that a person's gender identity and sexual orientation cannot be parsed from personhood.

We strongly condemn the current **United States Department of Health and Human Services (HHS)** new rule that eliminates protections from discrimination based on gender identity and sexual orientation in the healthcare setting afforded by Section 1557 of the 2010 Affordable Care Act (ACA).

Section 1557 is a civil rights provision in the ACA that prohibits discrimination by covered health programs and activities on the basis of race, color, national origin, sex, age, and disability. The current U.S. Administration's pointed attempt to narrow the definition of sex discrimination to exclude discrimination based on a person's gender identity signals that the HHS Office for Civil Rights will not enforce the ACA to protect transgender people. The elimination of protections from discrimination in healthcare for a vulnerable population is a clear violation of ethical tenets in the medical profession and civil and human rights laws. This HHS rule also eliminates from healthcare the very same civil rights protections recently affirmed by the U.S. Supreme Court in the workplace.

Like this HHS rule, efforts to deny recognition for transgender people are occurring in other countries as well. **The State Duma of Russia** is now considering three bills aimed at preventing transgender people from obtaining consistent documentation of legal gender recognition and preventing them from marrying or adopting children, as well as explicitly forbidding same sex marriage (see https://meduza.io/en/cards/russia-has-a-new-draft-law-with-major-consequences-for-transgender-people).

The Hungarian Parliament recently passed a regressive law defining gender as fixed at birth and dictated by genital structure and chromosomes, which is a belief not supported by science. The law also forbids any change of birth documentation, which denies trans people accurate identification in the healthcare setting and in society at large.

(see https://www.nytimes.com/2020/05/28/world/europe/hungary-transgender-law.html).

In Brazil, pronouncements by President Jair Bolsonaro that invalidate transgender identity and LGBTQ rights and have encouraged parliamentary debate of the already passed Brazilian Federal Council of Medicine's Resolution (CFM-2.265/19), which supports transgender healthcare services for transgender youth ages 16-18. Reversal of this resolution would create extreme suffering for many trans youth. Brazil already has the largest annual murder toll of trans people worldwide. These legislative efforts are clear violations of human rights principles and existing laws, constitutions, and medical guidelines. Further information on global human rights conditions for LGBTQ people can be found at https://www.hrw.org/topic/lgbt-rights# and https://www.amnesty.org/en/what-we-do/discrimination/lgbt-rights/

Just as the global COVID-19 pandemic of 2020 has shown us that our health and wellbeing are intertwined locally, nationally, and globally, so too do the negative healthcare and social impacts of gender- and sexual orientation-based discrimination ultimately affect all of humanity.

The WPATH Board of Directors and the Ethics Committee firmly protests the new U.S. HHS rule which, by pointedly denying civil rights protections to LGBTQ people, openly permits hostile health care providers, institutions, and insurance companies to discriminate on the basis of sexual orientation or gender identity. We also oppose oppressive legislative efforts anywhere in the world. We urge healthcare providers, administrators, government officials, and concerned individuals everywhere to protest the measures highlighted here and *all* discrimination that promotes inequitable treatment and exacerbates health disparities wherever they exist.

Your Excellencies:

The World Professional Association for Transgender Health (WPATH) is the only international, interdisciplinary professional association dedicated to the scientific study of gender dysphoria and the evidence-based best practices in transgender health. We are a non-profit association with over 2200 members in the fields of medicine, mental health, law and ethics, and scientific research. Formed in 1979 for the purpose of bringing scientists and medical providers together to exchange knowledge about the field, we are the creators of the internationally accepted Standards of Care for the Health of Transsexual, Transgender, and Gender-nonconforming People, now in its 7th edition (SOC v7), and available in a Japanese translation[1] on our website: www.wpath.org. We have also advised governments around the world with respect to transgender health and human and civil rights. Our mission is to encourage education and research to ensure that the highest possible standards of health, social services, and justice are available to transgender people around the world.

We, WPATH's leadership, write to encourage Japan to urgently amend the "Gender Identity Disorder Special Cases Act"[2] as it contains some harmful and unscientific elements, and is not in line with international consensus on protecting and promoting the health of transgender people.

In writing this letter, we use the term *transgender* as an adjective to describe all those who identify in a gender other than the one that matches the sex they were assigned at birth. The term, used in this simple way, includes persons who seek gender affirming medical services,

as well as those who do not. It includes persons who identify using labels other than transgender, and who are described by others by way of other terms (for example, by way of the term transsexual or gender-diverse). It includes persons who identify as male or female, as well as those who identify as both or neither, and who therefore find male and female gender markers inadequate in describing who they are.

As you are aware, Japan's law regulating legal recognition for transgender people requires a diagnosis of "Gender Identity Disorder" (GID) before any transgender person can apply to secure legal recognition of their appropriate gender. "GID" is defined in the law as: *A person, despite his/her biological sex being clear, who continually maintains a psychological identity with an alternative gender, who holds the intention to physically and socially conform to an alternative gender.* In addition to providing a certificate attesting to the fact that the individual has been diagnosed with GID, an applicant to the court must meet the following qualifications:

- Be 20-years-old or older;
- Be presently unmarried;
- Not presently have any underage children;
- Not have gonads or permanently lack functioning gonads; and
- Have a physical form that is "endowed with genitalia that closely resemble the physical form of an alternative gender."

All of the above provisions require revision—most urgently, WPATH encourages the government of Japan to eliminate the sterilization requirement and update the diagnosis requirement in line with APA and WHO standards. The GID Special Cases Act, while serving to acknowledge the existence of a population and allowing for their legal recognition, is a formidable barrier for transgender people in Japan. The requirement of a "GID" diagnosis is unscientific and is no longer in use in the medical or mental health care fields in either clinical or research settings. The requirement of single marital status and not having minor children amounts to discrimination; and the requirement of surgeries that sterilize amounts to coerced sterilization—a widely-recognized human rights violation, including in Japan.

As the world's peak professional organization concerned with transgender health, WPATH is aware of the importance that gender recognition can play in facilitating the health and wellbeing of transgender people. We share here the official WPATH Identity Recognition Statement.

WPATH Identity Recognition Statement:

The World Professional Association for Transgender Health (WPATH) recognizes that, for optimal physical and mental health, persons must be able to freely express their gender identity, whether or not that identity conforms to the expectations of others. WPATH further recognizes the right of all people to identity documents consistent with their gender identity, including those documents which confer legal gender status. Such documents are essential to the ability of all people to enjoy rights and opportunities equal to those available to others; to access accommodation, education, employment, and health care; to travel; to navigate everyday transactions; and to enjoy safety. Transgender people, regardless of how they identify or appear, should enjoy the gender recognition all persons expect and deserve. Medical and other barriers to gender recognition for transgender individuals may harm physical and mental health.

WPATH opposes all medical requirements that act as barriers to those wishing to change legal sex or gender markers on documents. These include requirements for diagnosis, counseling or therapy, puberty blockers, hormones, any form of surgery (including that which involves sterilization), or any other requirements for any form of clinical treatment or letters from doctors. WPATH argues that marital and parental status should not be barriers to recognition of gender change, and opposes requirements for persons to undergo periods living in their affirmed gender, or for enforced waiting or 'cooling off' periods after applying for a change in documents. Further, court and judicial hearings can produce psychological, as well as financial and logistical barriers to legal gender change, and may also violate personal privacy rights or needs.

WPATH advocates that appropriate gender recognition should be available to transgender youth, including those who are under the age of majority, as well as to individuals who are incarcerated or institutionalized. WPATH recognizes that there is a spectrum of gender identities, and that choices of identity limited to Male or Female may be inadequate to reflect all gender identities. An option of X, NB (non-binary), or Other (as examples) should be available for individuals who so choose. WPATH urges governments to eliminate barriers to gender recognition, and to institute transparent, affordable and otherwise accessible administrative procedures affirming self-determination, when

WPATH
WORLD PROFESSIONAL ASSOCIATION FOR TRANSGENDER HEALTH

wpath@wpath.org

phone: 1+(847) 752-5328
fax: 1+(224) 633-2166

1061 E Main Street Ste 300
East Dundee, IL 60118

gender markers on identity documents are considered necessary. These procedures should be based in law and protect privacy.

We are aware that in January 2019, the Supreme Court of Japan issued its judgment in the case of Takakito Usui, a 43-year-old transgender man who had brought a case to the court challenging the GID Special Cases Act on the grounds that the requirement of surgery violated Japan's constitution. While the court upheld the GID Special Cases act as constitutional at this time, the justices also stated that, "It cannot be denied that [this law] impinges on freedom from invasion of bodily [integrity]."

Two of the justices in a concurring opinion wrote of the urgency of Usui's case, and the need to reform Japan's law: "The suffering that [transgender people] face in terms of gender is also of concern to society that is supposed to embrace diversity in gender identity." They concluded that for transgender people, being "able to receive rulings of changes in recognition of gender status…is an important, perhaps even urgent, legal benefit."[3]

WPATH recognizes that, for optimal physical and mental health, persons must be able to freely express their gender identity, whether or not that identity conforms to the expectations of others.

WPATH further recognizes the right of all people to identity documents consistent with their gender identity, including those documents which confer legal gender status. Such documents are essential to the ability of all people to enjoy rights and opportunities equal to those available to others; to access accommodation, education, employment, and health care; to travel; to navigate everyday transactions; and to enjoy safety. Transgender people, regardless of how they identify or appear, should enjoy the gender recognition all persons expect and deserve.

Some transgender people want to undergo hormonal treatment, surgical procedures, or other medical interventions as part of their transition. Others do not. Access to gender-affirming healthcare is important;

East Dundee, IL 60118

however mandatory use of medical services as part of the legal recognition process is not recommended on the basis of science or human rights. The decision to undergo invasive medical or surgical procedures of any kind should remain with the individual in consultation with their physician(s).

Medical and other barriers to gender recognition for transgender individuals may harm physical and mental health. WPATH opposes all medical requirements that act as barriers to those wishing to change legal sex or gender markers on documents. These include requirements for diagnosis, counseling or therapy, puberty blockers, hormones, any form of surgery (including that which involves sterilization), or any other requirements for any form of clinical treatment or letters from doctors. People experience their lives under many different circumstances and may lack the means or the opportunity to overcome these barriers, yet their gender identity is an innate characteristic that they deserve to have recognized.

Although WPATH acknowledges that age restrictions are subject to local jurisdiction, we wish to point out that many countries do allow individuals younger than age 20 to transition and to receive identity documents that support their gender identity. Also, most countries that do acknowledge transgender individuals also do not restrict marriage or enforce divorce, nor do they demand that any children of a transgender person must reach the age of majority before a transgender parent may be legally recognized. Clinical and practical experience has shown that requirements such as these imposed by Japan's current law do not serve to protect parties who may be in relationship with a transgender person, but instead interfere with the rights of all parties to enjoy the support of their family members. Further, the physical form of an individual's genitalia in no way describes or defines the individual's gender. Variation in human bodies, whether congenital, accidental, or deliberately achieved should not limit any individual's integrity with respect to their gender identity or their humanity.

Japan has taken some important steps in recent years to respect the rights and protect the health of sexual and gender minorities, including by the Tokyo Metropolitan Government passing a non-discrimination law

with protections for gender identity.[4] The 2020 Olympic Games in Tokyo will be an important moment for the government of Japan to demonstrate to the world that it respects the rights of all people, and WPATH encourages urgent reform of the GID Special Cases act in order to do so. These are complex components of human experience, and we urge Your Excellencies to consider them with due diligence.
Please contact us if we may be of assistance in the process of reforming this law.

Sincerely and respectfully,

Vin Tangpricha, MD
President
on behalf of the WPATH Board of Directors

USPATH and WPATH Respond to NY Times Article "They Paused Puberty, But Is There a Cost?" published on November 14, 2022

The recent *New York Times* article, "They Paused Puberty, But Is There a Cost?", furthers the atmosphere of misinformation and subjectivity that has grown to surround the area of gender affirming medical interventions for transgender youth. The methods of the authors of this piece come up short in their interpretation and application of available data; the article supports inaccurate narratives that puberty blocking medicines are conclusively harmful to long-term bone density or other health outcomes, and that transition reversal/regret is a common outcome for these treatments. Additionally lacking in the article is an explicit statement that any harms which may exist are outweighed by the substantial benefits these treatments confer to transgender youth, and we wish to respond below to certain specific statements and references made in this article.

The cited bone expert from Mayo Clinic, Dr. Sundeep Khosla, MD, is an adult endocrinologist who does not work clinically with transgender youth and has only a single publication on transgender health. This publication is not a research study, but a brief review commentary on the issue of bone density in adult transgender people. Transgender youth are not addressed in the commentary. In this paper, data are reviewed and discussed, and it is concluded that in the context of hormone therapy, "bone mineral density is generally preserved in both trans women and trans men".

The anecdote provided of an adolescent who began, and then stopped pubertal suppression due to bone density loss lacks important details, including age and pubertal stage at initiation of puberty blockers, length of time on blockers, baseline bone density ("Z-score"), and whether the bone density comparison was made to identified gender or birth-assigned sex. Additional important information not provided includes calcium intake, and vitamin D intake and level, as well as level of physical activity, all of which play a substantial role in maintenance of bone mineral density.

The single expert who performed the literature review, Dr. Farid Foroutan, PhD, is an epidemiologist with no experience in clinical medicine, child and identity development, bone density, or any aspect of the field of transgender health. Nearly the entirety of his professional experience lies in population health studies of heart disease. The interpretation of clinical studies, especially those with findings that are nuanced, inconclusive, or have a small effect size, require interpretation through a clinical lens, with clinician-scientists experienced in the

translation of research data into clinical practice. In fact, Dr. Foroutan recently co-authored a paper which highlighted this very concern, so it is unclear why he did not advocate for a more nuanced and clinically grounded analysis, and an expanded roster of expertise on the review team.

We were surprised to see reference to a subjective statement from Dr. Catherine Gordon, MD regarding "getting behind" on bone density, and we question whether this comment was taken out of context. Dr. Gordon is a long-standing advocate for trans youth care, and in her June 2022 single-author commentary published in *Pediatrics*, she stated that, "The duration of pubertal suppression with gonadotropin hormone releasing hormone agonists varies, but can extend up to 4 years for younger patients who are not able to provide consent until age 16 for receipt of gender-affirming therapy. Puberty blockers represent an invaluable intervention for these children and adolescents, to reduce anxiety and 'buy time' until final decisions can be made about gender assignment." A subsequent commentary co-authored by Dr. Gordon and published in November 2022 in JAMA Open Access stated, "Concerns about skeletal losses become less significant in an adolescent with active suicidal ideations. Although the significance of the risks may be unclear, there is strong evidence regarding the benefits of GnRHa in transgender youth: it can be a life-changing and lifesaving treatment for a vulnerable population who is at high risk for anxiety, depression, and suicide."

Anecdotes are provided about two teens who were found to have severe osteoporosis after 1 and 3 years of blocker treatment. In both cases, a baseline bone density test was not done. It is unlikely that such a degree of severe osteoporosis would develop after these short courses of treatment, and there were likely other pre-existing factors at play. The 2017 Endocrine Society Guidelines, co-sponsored by WPATH, as well as the SOC8 recommend baseline bone density assessment prior to initiating blocker therapy, as well as ongoing reassessments, and optimization of calcium and vitamin D.

The blockers themselves do not impact bone density. Bone density is impacted by the fact that sex steroid production is temporarily halted when puberty blockers are initiated. The adolescent in this anecdote was already using estrogen, which promotes bone health. Therefore, the point about stopping blockers due to bone density loss is moot. Many types of blockers are routinely used in combination with estrogen well through adulthood without deleterious effects on bone density. This has been the common practice for treatment of adult transgender individuals for decades. Bone density loss is generally not a concern once hormone therapy has begun. In fact, Dr. Khosla's paper states that, "the skeleton should be relatively well protected, assuming adequate compliance with hormone therapy".

Experts in the field are indeed concerned regarding bone density among youth using puberty blockers. The WPATH SOC8 cautions that, "for adolescents older than 14 years, there are currently no data to inform HCPs whether GnRHas (puberty blocking medication) can be administered as monotherapy (and for what duration) without posing a significant risk to skeletal health." The SOC8 also states that, "When deciding on the duration of GnRHa monotherapy, all contributing factors should be considered, including factors such as pretreatment bone mass..." and, "The clinical course of the treatment, e.g., the development of bone mass during GnRHa treatment and the adolescent's response to treatment, can help to determine the length of GnRHa monotherapy."

The spotlighting of three youth, one of whom continues on treatment, one of whom stopped due to bone density loss under unclear circumstances, and one of whom reversed their transition, is

not a proportionate representation of the actual population. Transition reversal, especially when unrelated to external factors such as discrimination or rejection by family, is rare. In fact, more study is needed on the reasons youth are kept on blockers for extended reasons; what percentage of cases are due to the youth continuing to explore goals, and what percentage involves parental hesitance to support moving forward with hormone therapy?

The findings of the seven citations provided at the end of the paper require a nuanced interpretation by clinician-scientists familiar with this population and subject matter. Many of the studies used sex assigned at birth, rather than identified gender, as the comparitor. Many of the differences found failed to reach statistical significance, and of those that did, many are of questionable clinical significance. Any such risk must also be taken into context with the substantial benefits of treatment, and harms of not accessing such treatment, including high rates of mental health disorders and suicidality.

Finally, the authors of this article suggest that “England’s National Health Service last month proposed restricting use of the drugs for trans youths to research settings.” In fact, the pivot that the National Health Service took was to enroll ALL youth initiating puberty blockers for treatment of gender dysphoria into a prospective research protocol so that more comprehensive data might be collected.

We agree that “less vitriol, more science”, as stated in conclusion by the authors, is needed in this area. This includes responsible reporting that takes into consideration realistic estimates of the prevalence of transition reversal, a nuanced and transparent discussion of all bone health factors, and an overall risk-benefit analysis that includes the substantial risks of delayed or denied treatment. Misinformation about the science behind the care of trans youth, such as presented in this article, can be and has been used to justify political actions or even violence against the trans and gender diverse community. With growing efforts to ban medically necessary gender affirming care for trans youth, and attacks rise such as was recently seen in the mass murder at Club Q in Colorado Springs, CO, measured and responsible journalism is ever the more essential. With the recent release of the WPATH SOC8, USPATH is working to explore quality assurance and fidelity in the provision of this life-saving care in the US, and will report the findings and recommendations of our group once the process is completed.

Signed:

WPATH, ASIAPATH, EPATH, PATHA, and USPATH Response to NHS England in the United Kingdom (UK)

Statement regarding the Interim Service Specification for the Specialist Service for Children and Young People with Gender Dysphoria (Phase 1 Providers) by NHS England*

Following the publication of the interim report of the Cass Review of gender identity services for children and young people in England in March 2022 NHS England has now issued an interim service specification for "Phase 1" services pending establishment of new regional services in England.
See https://www.engage.england.nhs.uk/specialised-commissioning/gender-dysphoria-services/

WPATH, ASIAPATH, EPATH, PATHA, and USPATH have major reservations about this interim service specification.

1. The document fails to state that gender diversity is a normal and healthy aspect of human diversity (Coleman et al., 2022), and that many transgender people experience gender incongruence from childhood or adolescence (James et al., 2016). Transgender and gender diverse (TGD) people have a human right to access the highest achievable standard of health care, including gender-affirming care (World Health Organization, (2017; Yogyakarta Principles.org., 2007). WPATH, ASIAPATH, EPATH, PATHA, and USPATH are concerned that rather than emphasising the importance of equitable access to medically necessary support and treatment for children, adolescents and young adults experiencing

gender incongruence, the service specification appears designed to place unnecessary barriers in their way. Additionally, we state that when gender affirming medical treatment is provided with a standardised multidisciplinary assessment and treatment process, thorough informed consent, and ongoing monitoring and psychosocial support, the rate of regret of gender-affirming medical treatment commenced in adolescence has been observed to be very low and the benefits of treatment in adolescence are potentially greater than the benefits of gender-affirming treatment commenced in adulthood (Coleman et al., 2022). Hence, the harms associated with obstructing or delaying access to wished-for and indicated treatment for the majority, appear greater than the risks of regret for the few (Coleman et al., 2022), when transgender and cisgender people are correctly regarded as equal.

2. The document makes assumptions about transgender children and adolescents which are outdated and untrue, which then form the basis of harmful interventions. Amongst these is the supposition that gender incongruence is transient in pre-pubertal children. This document quotes selectively and ignores newer evidence about the persistence of gender incongruence in children (Olson et al., 2022). Many older studies regarding the stability of gender identity enlisted children who did not have gender incongruence or gender dysphoria, but rather, had culturally non-conforming gender expression. The findings of these older studies should only carefully be applied to children and young people who are presenting to gender identity clinics seeking gender-affirming treatment: it may be a different population (Temple Newhook et al., 2018). The document also makes unsupported statements about the influence of family, social, and mental health factors on the formation of gender identity. WPATH, ASIAPATH, EPATH, PATHA, and USPATH believe that children and young people can have agency and can express their gender identity, and that the best course of action is to work collaboratively with the child or young person and family to support the TGD person (Coleman et al., 2022).
3. The document highlights that there have been approximately 5000 referrals to the NHS GIDS in 2021/2022, an increase from previous years. It states that referrals are currently 8.7 young people per 100,000 population. These figures are not put in context. The referrals to GIDS range between age 3 and 17. There are 10,752,647 young people aged between 3 and 17 in England and Wales, making up 18% of the total population (Office of National Statistics, 2021). Hence, referrals to GIDS are 8.7 young people per 18,000 same age population. This is a rate of 0.048% of this population, or fewer than 5 in 10,000 young people. Population estimates of the proportion of people who are transgender range from 0.3% to 0.5% in adults, and 1.2% to 2.7% in adolescents (Coleman et al., 2022). Hence, referrals to GIDS represent a very tiny fraction of the total population of

young people, and only a small proportion of those who self-identify as transgender. These referrals are likely to be made up of those young people who have the most severe gender incongruence. WPATH, ASIAPATH, EPATH, PATHA, and USPATH strongly recommend that services should be designed that welcome these appropriate referrals, providing expedited access to expert assessment, and treatment where appropriate (Coleman et al., 2022).

4. The document underscores the expectations of the family and parent/carer around the child/young person's gender incongruence. WPATH, ASIAPATH, EPATH, PATHA, and USPATH's position is that while it is important for health professionals to work inclusively with the family and parent/carer to assist children and young people on their gender journey, the needs of the child/young person must be paramount (Coleman et al., 2022). Family acceptance and support is essential for wellbeing (Pariseau et al., 2019; Russell et al., 2018; Simons et al., 2013).
5. This document seems to triage treatment based on an ability of the child or young person to prove the severity of their gender dysphoria. There is a reference to "the clarity, persistence and consistency of gender incongruence…". WPATH, ASIAPATH, EPATH, PATHA, and USPATH believe that each person has a unique gender journey. There can be many reasons why children and young people may have trouble expressing or understanding their own gender incongruence. WPATH, ASIAPATH, EPATH, PATHA, and USPATH believe that all healthcare should be patient-centered and individually tailored (Coleman et al., 2022).
6. This document discourages social transition in pre-pubertal children. This is despite recent evidence pointing to positive mental health and social well-being outcomes in children who are allowed to socially transition in supportive environments before puberty (Durwood et al., 2017; Gibson et al., 2021). The document refers to the so-called "risks of an inappropriate gender transition" but does not name these risks or provide a reference for this statement. There is a section with criteria to support social transition in adolescents; this seems to suggest that adolescents will only be supported to socially transition if they meet the criteria set by the service. This represents an unconscionable degree of medical and State intrusion into personal and family decision-making about simple everyday matters such as clothing, name, pronouns, and school arrangements. Ultimately, social transition in practice is a personal and family decision, led by the young person, and should not require medical permission. WPATH, ASIAPATH, EPATH, PATHA, and USPATH do not support a gatekeeping approach to social transition (Coleman et al., 2022).
7. This document severely limits access to puberty suppression by only allowing treatment in the context of a formal research protocol. The eligibility criteria for

enrolment in this formal research protocol are not specified, but the concern is that they will be restrictive. WPATH, ASIAPATH, EPATH, PATHA, and USPATH disagree with this approach, and emphasise the increasing evidence that access to reversible puberty blockers, and later gender-affirming hormone treatment if wished, is associated with positive mental health and social well-being in adolescents with gender incongruence, and that adolescents are satisfied with these treatments and perceive them as essential and lifesaving (Coleman et al., 2022). We are deeply concerned that the NHS is taking inappropriate approaches to evaluating the established body of evidence and is therefore drawing erroneous conclusions underestimating the effectiveness of puberty suppression. It is ethically problematic to compel adolescents to participate in a research study to access medically necessary treatment; research participation should be voluntary and should not occur under coercive conditions and in clinical research "the safety and wellbeing of the individual prevail over the interests of science and society" (National Health Service Health Research Authority, 2022). It is also deeply concerning that the document does not describe any process for provision of estrogen or testosterone therapies for older adolescents.

8. At several points in the document, there is an emphasis on "careful exploration" of a child or young person's co-existing mental health, neuro-developmental and/or family or social complexities. There is also a suggestion that a "care plan should be tailored to the specific needs of the individual following careful therapeutic exploration…" WPATH, ASIAPATH, EPATH, PATHA, and USPATH are concerned that this appears to imply that young people who have coexisting autism, other developmental differences, or mental health problems may be disqualified, or have unnecessary delay, in their access to gender-affirming treatment. This would be inequitable, discriminatory, and misguided (Coleman et al., 2022). WPATH, ASIAPATH, EPATH, PATHA, and USPATH recommend that puberty suppression, where urgently indicated, can be commenced promptly, and proceed alongside and at the same time as any necessary diagnostic clarification of other conditions, or treatment of other conditions. Whilst careful assessment is imperative, undue delay inherent within a model of care is not a neutral option and may cause significant harm to those accessing services (Coleman et al., 2022).
9. There is an alarming statement in the summary that "the primary intervention for children and young people… is psychosocial (including psychoeducation) and psychological support and intervention." In another section, the document goes on to state that one outcome from the screening process would be "discharge with psychoeducation…" Disturbingly, this decision might be made without speaking directly with the young person or family. Taking No 8 and 9 together, this

document seems to view gender incongruence largely as a mental health disorder or a state of confusion and withholds gender-affirming treatments on this basis. WPATH, ASIAPATH, EPATH, PATHA, and USPATH call attention to the fact that this "psychotherapeutic" approach, which was used for decades before being superseded by evidence-based gender-affirming care, has not been shown to be effective (AUSPATH, 2021; Coleman et al., 2022). Indeed, the denial of gender-affirming treatment under the guise of "exploratory therapy" has caused enormous harm to the transgender and gender diverse community and is tantamount to "conversion" or "reparative" therapy under another name.

10. This document reasserts the outdated "gatekeeping model" of access to gender affirming care. There are many references within the document to patients only being able to access care and be referred to the next intervention down the line if they can meet criteria set by the service. There are clear statements that if adolescents are taking puberty suppression or gender-affirming hormones obtained elsewhere, the service will not provide any care. The purpose of this section seems to be about empowering the service to withhold treatment and health monitoring from children or young people who have obtained medication without the permission of the service. WPATH, ASIAPATH, EPATH, PATHA, and USPATH affirm the human right of self-determination in health care (World Health Organization, 2017). Moreover, such action contravenes the core aspects of the NHS Constitution (Department of Health and Social Care, 2021). Children and adolescents can contribute substantially to their health care decision making, with age-appropriate capacity to weigh the risks and benefits according to their own judgement (Amnesty International, 2020; Steinberg, 2013; Vrouenraets et al., 2021; Weithorn & Campbell, 1982). Furthermore, WPATH, ASIAPATH, EPATH, PATHA, and USPATH recommend a harm-minimisation approach, and encourages doctors to work with people who access treatment from other sources in a non-judgmental manner to help them to maximise their health status (Coleman et al., 2022).
11. The document states that general practitioners would be advised to "initiate local safeguarding protocols" if a child or young person obtains puberty blockers or hormones from another source. This recommendation, which would see families reported to child protection services, is gravely concerning. The draft service specification makes it clear that it will be difficult to obtain prompt access to puberty suppression. Families who are in the position of seeing their young adolescent descend into suicidal distress as they continue to experience incongruent pubertal changes, whilst being unable to access appropriate care from the NHS service, may make the difficult decision to obtain puberty suppression through non-NHS sources, as caring parents affirming their child's identity and supporting health care according to international treatment standards. These

> parents would then be at risk of being reported to child protection services, a ludicrous and dangerous situation; or a general practitioner with a better understanding of gender incongruence might be put at risk of censure for refusing to make such an inappropriate child protection referral, against the recommendations of the specialist service. WPATH, ASIAPATH, EPATH, PATHA, and USPATH believe that the appropriate interim service specification should instead be supporting GPs and families to provide the best evidence-based and compassionate care for children and young people with gender incongruence, including access to puberty suppression and gender-affirming hormones where indicated (Coleman et al., 2022; de Vries et al., 2021).

Overall, WPATH, ASIAPATH, EPATH, PATHA, and USPATH find serious flaws in this document, which sets out a plan for a service for gender diverse children and young people in England that is likely to cause enormous harm and exacerbate the higher rates of suicidality experienced by these young people in the context of ongoing pathologisation and discrimination. WPATH, ASIAPATH, EPATH, PATHA, and USPATH urge NHS England and Wales to reconsider its approach, which is now contrary to the progress being made in many countries around the world and incongruent with statements from the World Health Organization (2017) and the Yogyakarta Principles (2007) relating to the right to the highest attainable standard of health.

WPATH thanks AUSPATH for allowing the use of the content of their Statement issued on 16 November 2022 about the Interim Service Specification for the Specialist Service for Children and Young People with Gender Dysphoria (Phase 1 Providers) by NHS England.

INDEX OF PROCEEDINGS

Thereupon,
the following proceedings began at 10:07 a.m.:

* * *

THE VIDEOGRAPHER: We are now on the record. The time is 10:07 a.m. This is the video-recorded deposition of Dr. Kale Edmiston in the matter of August Dekker et al. versus Jason Weida, et al.

This deposition is being held remotely via Zoom meetings on March 23rd, 2023. The videographer is Randy Wright, and the stenographer is Barbie Gallo, both in association with Lexitas.

Will counsel please announce their appearance for the record.

MR. BEATO: Good morning. This is Michael Beato on behalf of the defense.

MS. RIVAUX: Good morning. This is Shani Rivaux with Pillsbury, Winthrop, Shaw, Pittman on behalf of the plaintiffs, and with me is Gary Shaw.

MR. GONZALEZ: This is Omar Gonzalez on behalf of the plaintiffs. I'm with Lamda Legal.

THE VIDEOGRAPHER: Will the court reporter please swear in the witness.

THE STENOGRAPHER: Do we need an appearance from Mr. Bennington?

If you would, Doctor --

MR. BENNINGTON: I'm --

THE STENOGRAPHER: I'm sorry.

MR. BENNINGTON: That's okay.

Good morning. I'm a paralegal appearing here from Holtzman Vogel.

THE STENOGRAPHER: Dr. Edmiston, do you consent to my administering the oath to you remotely this morning since we are not all in person?

THE WITNESS: Yes.

THE STENOGRAPHER: If you would raise your right hand, I'll swear you in. Do you swear the testimony you're about to give in this matter will be the truth, the whole truth and nothing but the truth so help you God.

THE WITNESS: Yes.

THE STENOGRAPHER: Thank you.

THEREUPON,
E. KALE EDMISTON, Ph.D.,
Being by me first duly sworn to tell the whole truth, as hereinafter certified, testified as follows:

DIRECT EXAMINATION

BY MR. BEATO:

Q. All right. Perfect.

Good morning, Doctor. Again, my name is Michael Beato, and I represent the defendants in this case. Before we begin, let me ask you, have you ever been deposed before?

A. No.

Q. Okay. So let me go over some ground rules. So, number one, for the benefit of the court reporter when answering a question, please verbally state "yes" or "no" if the question so desires instead of nodding "yes" or "no."

A. (Nodding head).

Q. Also, a deposition is not an endurance contest. If you need a break at any time, please let me know, and I think we can accommodate that.

Moreover, for the benefit of the court reporter, we can endeavor to limit crosstalk, so I will not speak when you're speaking and vice versa. And if you don't understand any of my questions, please let me know. I'm more than happy to clarify or restate the question.

With that said, let me ask you some preliminary questions. Are there any notes or

documents in front of you right now?

A. I have my -- my report in front of me right now.

Q. Perfect. Any other documents?

A. I have a tablet, but I can put it away.

Q. I'm just curious.

Have you talked to anyone about this deposition?

MS. RIVAUX: I'm going to object to form.

Go ahead, you can answer.

A. I -- my -- my partner is aware that I'm doing it.

BY MR. BEATO:

Q. Okay. What is your current occupation?

A. I am an associate professor.

Q. At what university?

A. UMass Chan School of Medicine.

Q. When did you start this job?

A. September.

Q. And you are a professor of what area?

A. Psychiatry.

Q. What does your job entail?

A. My job entails conducting research and mentoring students.

Q. What specific research?

A. I conduct research in anxiety and depression.

Q. Where do you currently live?

A. I live in Worcester, Massachusetts.

Q. And could you describe to me your educational background.

A. Yeah, I completed a bachelor's degree at Hampshire College, and from there I worked at a neuroscience or psychiatry lab at the Yale School of Medicine.

Then I went on to earn a Ph.D. in neuroscience from Vanderbilt University. And then after that, I did two post docs, one at China Medical University and the other at university of Pittsburgh.

Q. Thank you, Doctor.

And this is a standard deposition question. Are you taking any medications that would affect your memory today?

A. No.

Q. Perfect. So for the purposes of this deposition I'm going to define the firm "gender-affirming care" as puberty blockers, cross-sex hormones, surgeries and treatments to alter primary or secondary sex characteristics for gender dysphoria. Does that work for you, Doctor?

A. I think those are all very different things, so I would actually appreciate specificity.

Q. Okay. Fair enough. But in terms of the blanket term, it's our understanding that it would incorporate those four different treatments. When greater specificity is warranted, I can clarify.

A. Okay.

Q. Are you a psychiatrist?

A. No.

Q. Are you a neurologist?

A. No.

Q. Are you an endocrinologist?

A. No.

Q. Are you a surgeon?

A. No.

Q. In your medical opinion, what is your definition of gender dysphoria?

A. Well, I don't have a medical opinion because I'm trained as a scientist, not a medical provider.

Q. All right. So what is your going definition of gender dysphoria?

A. I would probably -- probably lean on the language that's used in the DSM-5.

Q. And what is your definition of gender identity?

A. A sense of one's self as being a particular gender.

Q. Can one change one's gender identity throughout one's life?

MS. RIVAUX: Objection. Form.

BY MR. BEATO:

Q. You can answer.

A. I don't really feel that it's my place to determine that for another person.

Q. Fair enough.

So based on your previous answers you haven't diagnosed anyone with gender dysphoria?

A. No.

Q. Never prescribed puberty blockers for an individual with gender dysphoria?

A. No. I have a Ph.D., not an M.D.

Q. So cross-sex hormone surgeries, haven't prescribed or performed that for an individual with gender dysphoria?

A. No.

MS. RIVAUX: Objection. Form.

BY MR. BEATO:

Q. So now I'm going to pull up a document. Hopefully this works. I am not good with technology, so please bear with me, Doctor.

Tell me if you see this document.

A. Yes.

Q. Okay. Perfect. What is this document?

A. That is my rebuttal report.

MR. BEATO: So, court reporter, I'm going to mark this as Exhibit 1.

(Defendants' Exhibit Number 1 for i.d.)

BY MR. BEATO:

Q. So, Doctor, does this document fairly and accurately state your expert opinions in this case?

A. Yes.

Q. Are all of the studies and evidence you relied on contained in the bibliography in this report?

A. Yes.

Q. So I'm scrolling down on page 1. The title says "corrected." Why is this a corrected copy?

MS. RIVAUX: Objection. You can answer.

A. Can you sort of -- can you restate that?

BY MR. BEATO:

Q. Oh, sure. What does the title of this document say?

A. Corrected Expert Rebuttal Report of E. Kale Edmiston, Ph.D.

Q. Thank you, Doctor. And why does it say "corrected"?

A. Because it was corrected.

Q. Did you submit an earlier version of an expert rebuttal report in this case?

A. Yes.

Q. What is the difference between Exhibit 1, the corrected one, and the previous one?

A. The previous one cited a Soleman 2013 study where I should have cited a Soleman 2016 study, and there are two instances where that's the case.

Q. Thank you, Doctor.

Could you just quickly specify, do you recall which paragraphs?

A. Paragraphs 26 and 29.

Q. Okay. Excellent memory, by the way. It's impressive.

So here's another question. Have you conducted any empirical research on gender dysphoria?

A. Can you define what you mean by "empirical"?

Q. What does empirical research mean to you?

A. All -- if you mean by empirical, original research with data than I've collected, I have. But I have not -- my publications have been reviews of the extant literature.

Q. So to clarify, you have original research with data; is that correct?

A. I'm sorry?

Q. I apologize, Doctor. So am I correct so for empirical research on gender dysphoria you have original research with data?

MS. RIVAUX: Objection. Form.

You can answer.

A. I have done studies related to gender dysphoria, but those studies haven't been published to date.

BY MR. BEATO:

Q. So could you -- oh, I apologize, Doctor.

A. I've also -- but I have published studies that have reviewed the literature on specific topics related to gender dysphoria.

Q. Thank you for the clarification. Could you describe those for us?

MS. RIVAUX: Objection. Form.

You can answer.

A. Yeah. What do you mean by "describe"?

BY MR. BEATO:

Q. Can you explain what you are studying in those studies you referenced?

A. So there is review study that I published some years ago that reviews the primary care literature among transgender people. There is a review paper that

is currently in press that reviews the neuro -- the sort of biological basis for a trans identity. And then I have another paper that has been submitted related to adolescent decision making and brain development as it pertains to gender dysphoria.

Q. Thank you. Are those documents mentioned in your bibliography?

A. They are. There's also another paper that I'm revising that's in the bibliography as well that is about development and mental health in trans adolescents.

Q. In your opinion, what makes a treatment experimental?

MS. RIVAUX: Objection. Form.

A. I would say that that designation is outside of -- that's not my responsibility to determine, but I would say that -- I'll leave it at that.

BY MR. BEATO:

Q. Okay. And you collect research, Professor?

A. Yes.

Q. And you deal with -- do you deal with studies that are high quality and low quality?

A. Yes.

MS. RIVAUX: Objection. Form.

BY MR. BEATO:

Q. So what is -- so what makes evidence low quality?

A. There are a lot of different reasons why a study might be low quality. However, all studies have limitations, and so as a scientist my job is to review all of the literature and look at it as a whole because any one study will necessarily have limitations, so you can't look at any one study to sort of draw a definitive conclusion.

Q. So in your answer, Doctor, you mentioned limitations. What are the limitations that you're thinking of?

A. I mean, I think any study can have limitations, and there are so many different sorts of limitations. It can be related to study design or available data. No one study can do everything, so, you know, resources are always finite.

Q. Understood. Could you think of any other limitations besides those two?

A. It -- there are -- I mean, there are numerous possible limitations. That's sort of the nature of science, so I couldn't possibly begin to list every limitation or every possible limitation of a scientific study.

Q. Okay. And, Doctor, how did you learn about this case?

A. I was aware of the law from the news, and I assumed that there would be a challenge to it. And then I was approached by Lambda Legal, and that's how I learned about this specific case.

Q. And in preparing your expert rebuttal report, what defendants' reports did you read?

A. I read Dr. Scott's and Biggs', Dr. Levine's, several others. I don't recall all of them at this time.

Q. So I'm going down on Exhibit 1 to page 3, paragraph 7 which I'm highlighting. Doctor, could you read the highlighting. Don't read the highlight, but can you see the highlighting? It doesn't make the text darker?

A. Yes.

Q. Perfect.

Is that an accurate statement, Doctor?

A. Yes.

Q. Did you rely on the WPATH Standards of Care 8 in making conclusions in your expert report?

MS. RIVAUX: Objection. Form.

A. I relied on my expertise on the topic.

BY MR. BEATO:

Q. Is it your opinion that WPATH sets the professional standards of care for treatments for gender dysphoria?

MS. RIVAUX: Objection. Form.

You can answer.

A. They are one organization. There are other medical organizations that also have standards of care.

BY MR. BEATO:

Q. And what are those medical organizations?

A. Well, the Endocrine Society comes to mind.

Q. Did you review any Endocrine Society documents in making this expert report?

A. No.

Q. In paragraph 7, it states that you were a chapter author for the Assessment chapter; is that correct?

A. Yes.

Q. Does the Assessment chapter involve treatments for adults?

MS. RIVAUX: Objection. Form.

A. The Assessment chapter outlines the assessment process for adults.

BY MR. BEATO:

Q. Does your expert report concern treatment

for adults?
A. No.
MS. RIVAUX: Objection. Form.
BY MR. BEATO:
Q. Do your conclusions reached in the Assessment chapter fairly and accurately describe your opinions and conclusions about gender-affirming care?
MS. RIVAUX: Objection. Form.
A. The Assessment chapter is a consensus document of many experts.
BY MR. BEATO:
Q. Is that a "yes"?
MS. RIVAUX: Objection. Form.
A. I -- you know, my -- I stand by the standards of care as the gold standard for treatment guidelines.
BY MR. BEATO:
Q. Why do you say that?
MS. RIVAUX: Objection. Form.
You can answer.
A. Yeah, because it -- because of the process through which it was created.
BY MR. BEATO:
Q. And what was the process in which it was created?

MS. RIVAUX: Objection. Form.
I'm also going to object to the extent that it would address any issues that are covered by the stay that you -- in this case that you do not go into any of that.
So I'm assuming, Michael, that you're not asking anything that's privileged information as it relates to that.
MR. BEATO: So let me ask you -- let me ask you, Shani, is it plaintiffs' position that I cannot ask any WPATH-specific question to the doctor?
MS. RIVAUX: No, I'm not suggesting you can't ask WPATH questions, but just you can't go into the issues that are currently addressed in the order that stays the discovery relating to internal processes of WPATH. So as long as it's not going into that, it's fine just depending on the question, but I guess that's the concern that I have is just not to violate that court order or to violate any nondisclosure agreement. You can ask anything that's about public information but nothing internal or private to WPATH that would violate that court order or require Dr. Edmiston to violate his

confidentiality agreement.
MR. BEATO: So, for example, asking about how the doctor went about and revised the assessment chapter to Standard of Care 8 I cannot, according to plaintiffs, I cannot ask questions relating to that?
MS. RIVAUX: Ask -- say that again. I'm not sure I understood.
MR. BEATO: Sure. I'll break it down. So in paragraph 7 the doctor states that the doctor was an author for the Assessment chapter for Standards of Care 8. And in revising the standards of care, specifically the Assessment chapter, I cannot ask any questions as to what was the consensus; how did you come up with revisions; what was the process like, I cannot --
MS. RIVAUX: I -- so I think it's going to be tough to -- I'm not giving you any blanket prohibition or objection, so it may be easier just to go question by question.
But I think to the extent it doesn't reveal information that seeks confidential information, then that's fine. So I think the limitation and the instruction is just not to reveal

confidential information.
MR. BEATO: Okay. I'm a little --
MS. RIVAUX: If you want to ask -- ask the question, and then we can, you know -- to the extent it doesn't seek information, my instruction is going to be to the extent it doesn't reveal confidential information or information that would otherwise be barred by the current stay and order, then Dr. -- then Dr. Edmiston can certainly answer the question.
MR. BEATO: Sure. And I'm happy to seek additional court guidance on this particular issue too.
MS. RIVAUX: I'm sorry?
MR. BEATO: I'm happy to seek additional court guidance on this issue too because we believe it goes to credibility.
MS. RIVAUX: Right. Well, I think here really the issue is he's here to take about his expert report, not WPATH. And if there's specific questions that you want to ask about it, you know, we could go about it individually. But, as I mentioned, there's a stay in place as it relates to specific areas relating to WPATH that you're aware of, and, you know, there's a

Page 22

confidentiality agreement. So to the extent that it doesn't violate those, you can ask the questions. And if we need to seek additional guidance from the court, we certainly can do that.

MR. BEATO: Okay. How about -- okay. How about this? I ask my questions. You can instruct the witness not to answer any questions you believe he should not answer.

MS. RIVAUX: Okay.

MR. BEATO: Okay. Perfect.

BY MR. BEATO:

Q. So, Doctor, how does the -- well, let me take a step back before I take a step forward.

Does WPATH standards of care have a process in which those standards of care are revised?

MS. RIVAUX: Objection. Form.

You can answer.

A. What do you mean by "revised"?

BY MR. BEATO:

Q. So in terms of making a new version.

A. Oh. So the shift -- the drafting of version 8?

Q. Precisely. Perfectly.

A. All right. Yes.

Page 23

Q. What is that process?

MS. RIVAUX: Objection. Form.

You can answer to the extent it doesn't violate your confidentiality agreement or the stay entered by the Appellate Court relating to the subpoenas to WPATH.

A. I would refer you to the WPATH SOC8 website which outlines that process.

(Defendant's Exhibit Number 2 for i.d.)

BY MR. BEATO:

Q. So I'm going to pull up another document. I'm mark this as Exhibit 2. So I will scroll down. It's six pages. And I will ask if this document looks familiar to you.

A. No, I have not seen it before.

Q. Could you read the title for me?

A. "Establishing the SOC8 Revision Committee and Meet the Chairs and Lead Evidence Team."

Q. And I can represent that this was on the website.

So I'm going to page 3. Doctor, were you a chapter lead when the Assessment chapter was being revised or reviewed?

MS. RIVAUX: Objection. Form.

A. I was a chapter co-author.

Page 24

BY MR. BEATO:

Q. What's the difference between the two?

A. A chapter lead, I don't believe I can answer a specific question about roles.

Q. Okay. Based on what counsel said?

A. Yes.

Q. Who was the chapter lead during the revision process for the Assessment chapter?

A. Christina. I'm sure she's listed on the website.

(Defendant's Exhibit Number 3 for i.d.)

BY MR. BEATO:

Q. I'm going to pull up another document. This is Exhibit 3. It's a little bit longer than the other one, but I'm going to scroll down. I will also represent that this is from the WPATH website.

Does this document look familiar to you, Doctor?

A. No.

Q. So I'm scrolling down to page 12, and I'll represent that there are individuals under the Assessment Of Adults With Gender Diversity/Dysphoria.

Doctor, do these individuals look familiar to you?

A. Yes.

Page 25

MS. RIVAUX: Objection. Form.

BY MR. BEATO:

Q. How do you know these individuals?

MS. RIVAUX: Objection. Form.

You can answer.

A. I worked with them to write the chapter.

BY MR. BEATO:

Q. Are there any individuals who worked with you who are not listed here?

MS. RIVAUX: Objection. Form. And objection to the extent you can't answer without violating a confidentiality agreement or any stay in this case.

A. The authors list for SOC8 is very long. Many different people were involved in it, and the document was written collaboratively.

BY MR. BEATO:

Q. And earlier in the deposition you said that the standards of care is a consensus document. What does that mean?

A. I would refer you to the process, the consensus process that is outlined on the website.

Q. Can you describe the process just generally?

A. There --

MS. RIVAUX: I'm going to object, again,

only to the extent that you can answer the question -- I mean to the extent the question is asking generalities and not asking specifics into the process or things that would be violated, then that's fine, you can answer.

BY MR. BEATO:

Q. Let me clarify. Generally speaking.

A. Yes, there was a lit review that was conducted externally, and then there were grievance statements, and then the authors all had to build a consensus around the statements.

Q. Understood.

Doctor, are you a member of WPATH?

A. I was. I believe my membership -- I might be overdue on my dues, but, yes, I was at one time.

Q. When did you start being a member of WPATH?

A. I don't recall at this time exactly.

Q. Ballpark range?

A. Probably around probably 2017, I would guess.

Q. And so this is another general question. Looking at Exhibit Number 3 for the individuals listed here -- and, again, you recall working with these individuals?

A. Yes.

Q. Are any of them endocrinologists, to your memory?

MS. RIVAUX: Objection. Form.

A. No.

BY MR. BEATO:

Q. Are any of them surgeons?

MS. RIVAUX: Objection. Form.

A. There are endocrinologists and surgeons involved in SOC8 for the hormone and surgery chapters of SOC8.

BY MR. BEATO:

Q. And how would you describe each of these individual's areas of expertise?

MS. RIVAUX: Objection. Form.

A. I think that the document describes their areas of expertise.

BY MR. BEATO:

Q. Fair enough. So I'm going back to Exhibit Number 2, and I'm scrolling down to page 4, chapter stakeholder members. Again, this is on the public website. Does WPATH when it's revising its standards of care, to your knowledge, employ the help of nonmedical professionals in that process?

MS. RIVAUX: Objection. I'm going to give the same instruction. And also just to the extent that Dr. Edmiston is also not here, doesn't speak on behalf of WPATH. But to the extent that Dr. Edmiston has personal knowledge that doesn't violate any confidentiality agreement or the order, then you may answer.

A. Can you define "medical professional"?

BY MR. BEATO:

Q. Sure. So, for example, an M.D., an endocrinologist, psychiatrist, someone who's gone to medical school.

A. There are certainly people involved in drafting the standards of care who have expertise who did not go to medical school because obviously there are lots of different manners to become educated and gain expertise on this topic.

Q. And this topic is?

A. Transgender healthcare.

Q. And you mentioned or counsel mentioned a confidentiality agreement.

A. Yes.

Q. As a member of WPATH you signed a confidentiality agreement?

A. No, as a --

MS. RIVAUX: Objection. Form. Sorry.

BY MR. BEATO:

Q. I'm sorry.

MS. RIVAUX: I'm raising an objection only to the extent you're not going to violate any agreement.

BY MR. BEATO:

Q. No, do not violate anything. I'm just asking what's with the confidentiality?

A. The chapter authors all signed it.

Q. I see.

A. We were asked to. I don't know what anyone else did.

Q. Understood. So WPATH asked you to sign that confidentiality agreement?

MS. RIVAUX: Objection to form.

A. I signed a confidentiality statement.

BY MR. BEATO:

Q. Understood. And, again, Doctor, we're just building the record. I don't want you to violate anything or make you feel uncomfortable in answering any questions.

So let me scroll up on Exhibit 2. I know, Doctor, you said you weren't a chapter lead. But looking at the criteria for chapter leads, WPATH full member in good standing. What do you think that means?

Page 30

MS. RIVAUX: Objection. Form.
A. I assume it means that you're a member of WPATH.
BY MR. BEATO:
Q. A well-recognized advocate for WPATH and the standards of care?
MS. RIVAUX: Objection. Form.
A. I'm not sure what you're asking me. Are you asking me what a -- like what the word "recognized" means? I'm not sure what you're asking.
BY MR. BEATO:
Q. Sure, what does recognize mean in this context, in your opinion?
MS. RIVAUX: Objection to form.
A. That -- that you are known to people in this area.
BY MR. BEATO:
Q. Understood.
So, Doctor, we're going to move away from the process questions.
So now let me see if I can move this.
(Defendant's Exhibit Number 4 for i.d.)
BY MR. BEATO:
Q. I'm now going to introduce this as Exhibit 4. Doctor, does this look familiar?

Page 31

A. Yes.
Q. What is this document?
A. This is the Standards of Care 8.
Q. Excellent.
So -- well, let me ask you this.
Do you think WPATH is an advocacy organization?
MS. RIVAUX: Objection. Form.
A. No.
BY MR. BEATO:
Q. Why?
MS. RIVAUX: Objection, form.
You can answer.
A. The purpose of WPATH is to gather the scientific evidence and expertise of scientists and clinicians to -- to develop the standards of care and to disseminate research.
BY MR. BEATO:
Q. And what kind of evidence does WPATH collect?
MS. RIVAUX: Objection. Form.
A. So, again, I would refer you to the website which outlines the process for drafting the standards of care.

Page 32

BY MR. BEATO:
Q. And in terms of the chapter that you assisted with authoring, which chapter is that?
MS. RIVAUX: Objection. Form.
A. I am co-author of the Assessment of Adults chapter.
BY MR. BEATO:
Q. And that is Chapter 5?
A. Yes.
Q. I am now going on Exhibit 4 to page 33. I'm scrolling to the -- now I'm on page 34. I'm scrolling to the bottom of page 34. Doctor, I just have a few questions.
If you look at 5.4, it says, "We suggest..." and 5.5, "We recommend..."
A. Um-hum.
Q. Is there a difference between "suggest" and "recommend" here?
A. Yes.
Q. What is that difference?
A. They are different words.
Q. Okay. Do they convey anything differently? So there is -- strike that.
So they're used synonymously?
A. No.

Page 33

Q. So what are their differences?
A. The WPATH document has graded evidence, so the language there is specific to the strength of evidence.
Q. And what kind of evidence grading systems does WPATH use?
A. I'm sorry. Can you repeat the question?
Q. Sure. So what kind of evidence grading system does WPATH use?
So, for example, I believe the Endocrine Society uses the GRADE system.
A. I would refer you to the website for that information.
Q. Understood. So now I'm going to go back to page 33, Doctor. One moment, Doctor.
33, I'm highlighting a section. It begins, "For TGD..." and goes all the way to "... required."
So, Doctor, I highlighted this sentence. Just so the record is clear, what does TGD mean in this chapter?
A. I would suggest that you scroll up to the top. It will be defined there.
Q. Right up here (indicating)?
A. Yes.
Q. Transgender and gender diverse?

Page 34

A. Yes.
Q. So in this highlighted section can you elaborate on that sentence?
MS. RIVAUX: Objection. Form.
A. No.
BY MR. BEATO:
Q. It says what it says?
A. If you have a specific question, I'm happy to, you know -- if you have a specific question. But I -- I don't know what you -- you'll have to ask me a specific question.
BY MR. BEATO:
Q. Sure. So when it says "...less common treatments..." what does less common treatments mean?
MS. RIVAUX: Objection. Form. You can answer.
A. I think if an adult was to ask for an intervention that was nonstandard.
BY MR. BEATO:
Q. As an example, what would that be?
A. I wouldn't really want to speculate.
Q. Can you provide an example, though?
MS. RIVAUX: I'm going to object on the grounds of scope, but you can go ahead and answer.

Page 35

A. Yeah, I mean, it's a -- it is a bit outside of the scope of, you know, my rebuttal. Sometimes people ask for -- they might ask for a surgical intervention that's nonstandard for as an example.
BY MR. BEATO:
Q. And limited research evidence, what does that mean?
MS. RIVAUX: Objection. I'm going to object on both form and scope here, but you can answer.
A. I mean, somebody -- it's -- there's always a possibility that someone might request an intervention that hasn't been researched before or has been researched very little.
BY MR. BEATO:
Q. Can you provide an example, Doctor?
MS. RIVAUX: Objection. Form and scope. You can answer.
A. I think the same -- the same answer. So if someone were to ask -- if an adult were to ask for a nonstandard surgical intervention, for example.
BY MR. BEATO:
Q. Scrolling to page 34, I'm highlighting another sentence beginning with, "The statements below..." and ending with "...consensus of professional best practice."

Page 36

Doctor, what does the phrase "consensus of best" -- strike that -- "consensus of professional best practice" mean?
MS. RIVAUX: Objection. Form and scope. You can answer.
A. Yeah, I mean, again, I would refer you to the WPATH website where they outline a lot of sort of the process and the specific terminology that they use in this document.
BY MR. BEATO:
Q. With that in mind, could you today provide me with what your opinion as an author of this section, what consensus of professional best practice means?
MS. RIVAUX: Objection to both form and scope. You can answer.
A. The consensus of ex -- people with expertise on the topic.
BY MR. BEATO:
Q. And how would you define expertise on the topic?
MS. RIVAUX: Objection. Form and scope. But you can answer.
A. I would, again, refer you to the WPATH website where they talk about the -- they outline the

Page 37

sort of selection process for authors and how they determine expertise.
BY MR. BEATO:
Q. Okay. So I'm going back to Exhibit -- bear with me. This is now Exhibit 3. Again, we're still on page 12 and 13. Do all of these individuals support gender-affirming care?
MS. RIVAUX: Objection. Form; scope. And to the extent it doesn't violate your confidentiality agreement or the stay, you can answer and if you know.
A. These individuals support the care that is -- has an evidence -- that -- you know, your question is very broad because gender-affirming care is very broad.
BY MR. BEATO:
Q. It is.
A. And the SOC8 guidelines recommend an individualized approach to care. So I think everyone involved in -- for those individuals they support quality healthcare.
Q. Going back to Exhibit 4, this sentence, Doctor, "The empirical evidence base for the," scrolling to page 35 -- "assessment of TGD adults is limited."

Page 38

My question is, in the sentence, what does "empirical evidence base" mean?

MS. RIVAUX: Objection. Form and scope. You can answer.

A. So I would have to re-read the chapter in context. I do not want to define what a specific word means in a specific sentence without reading the context in which it occurs.

BY MR. BEATO:

Q. Fair enough. And would that same answer be true for "limited" in this sentence?

A. Yes.

MS. RIVAUX: Objection. Form; scope.

BY MR. BEATO:

Q. Doctor, I apologize. I did not hear an answer.

A. Oh. Yes.

Q. Let's go to the next page. This sentence, Doctor, "Some TGD individuals will have the capacity to grant consent immediately during the assessment."

What does that mean?

MS. RIVAUX: Objection. Form and scope.

A. This is about the assessment of adults and is about the assessment process being individualized.

Page 39

BY MR. BEATO:

Q. So in an individualized scenario, can an individual be given puberty blockers for gender dysphoria after one medical treatment?

MS. RIVAUX: Objection. Form.

A. I would ask you to restate the question with a little bit more specificity.

BY MR. BEATO:

Q. Fair question, Doctor. Fair question.

Let me -- let me go back to these questions.

Scrolling down to the next page, statement 5.3A, Doctor, what does this sentence mean?

MS. RIVAUX: Objection. Form and scope.

A. So this is a sentence from the adult chapter that says "To access GAMSTs, a TGD person's gender incongruence must be marked and sustained."

So that means that part of the assessment process is to determine sort of the duration of the feelings of gender incongruence and the degree to which they are distracting or upsetting or troubling.

BY MR. BEATO:

Q. Scrolling a little bit further down, while marked and sustained gender incongruence is present, going all the way down to access gender-affirming care, Doctor, what does that sentence mean?

Page 40

MS. RIVAUX: I'm going to object to form and scope.

A. That if a person -- it just means that -- it's not -- there's not some threshold of suffering that someone -- you know, that someone needs to suffer a certain amount before they're allowed to access healthcare.

BY MR. BEATO:

Q. Okay. Moving to page --

Well, actually, Doctor, we've been going for about an hour. Would you like a five-minute break?

A. No, I'm okay.

Q. Okay. Okay. And, once again, if you'd like a break at any time, please let me know. More than happy to accommodate.

A. Sure.

Q. So this is on Page 38 highlighting the sentence -- oops, no -- I -- I apologize.

Page 39, "in rare cases..." Doctor, in this sentence what does "rare cases" mean?

MS. RIVAUX: Objection. Form and scope.

A. So in rare cases would mean a nontypical instance.

BY MR. BEATO:

Q. And in the context of this sentence what would that nontypical instance be?

Page 41

MS. RIVAUX: Objection. Form and scope.

A. So I would have to review the Hembree citation there. I mean, one example could be if someone had an estrogen receptor positive cancer.

BY MR. BEATO:

Q. And generally speaking, Doctor, when you were authoring this section, did you read all of these cases that are mentioned in this chapter?

MS. RIVAUX: Objection. Form; scope.

And to the extent it doesn't violate any of the stay order that we discussed or the confidentiality order, you may answer.

A. I have reviewed much of this literature. If you have a specific question about a specific paper, then I would request that you give me a break to review the specific paper.

BY MR. BEATO:

Q. Understood. And perfectly reasonable. I just had a broad general question.

And within the literature that you have reviewed when authoring this chapter, do you know if any of those studies were low evidence?

MS. RIVAUX: Objection. Form; scope.

You can answer.

Page 42

A. I think that you would have to describe what you mean by "low evidence." I recall you asked me that question before, and I answered that all studies have limitations, and that's why we look at the literature as a whole to draw conclusions.

I'm sure you're aware, there's quite a bit of evidence cited in SOC8. I'm not sure off the top of my head how many citations there are, but it's quite a few.

BY MR. BEATO:

Q. So earlier in the deposition I think you provided examples of low-quality evidence or limitations. Do you recall saying study design could lead to evidence being low quality?

MS. RIVAUX: Objection. Form.

A. I believe I said that that is an example of a limitation. I didn't -- I do not think I said that it was an example of low quality.

BY MR. BEATO:

Q. Okay. And -- okay. And as of right now, you do not recall if any of those citations mentioned in Chapter 5 have low-quality evidence?

MS. RIVAUX: Objection. Form; scope.

A. I -- I take -- I sort of -- I challenge the premise of the idea of low quality. I am instead

Page 43

talking about the limitations that occur with any scientific study, which is why we do lots of different studies to draw conclusions.

So I sort of -- or not sort of. I object to the premise of the question.

BY MR. BEATO:

Q. So still on page 39, sentence, "Because of the possible harm..." all the way down to "...is important," Doctor, what does this sentence mean?

MS. RIVAUX: Objection. Form and scope.

A. Again, I would ask that if you want me to discuss specific sentences from a very large document that I would be given time to review the document in its entirety to ensure that I am fully representing the context of any particular sentence.

BY MR. BEATO:

Q. Fair enough. And, again, you authored this document, or at least this chapter in the Standards of Care 8?

MS. RIVAUX:

A. I --

MS. RIVAUX: Objection to form; scope and the other restrictions that we've talked about before relating to your confidentiality agreement and the stay order in place.

Page 44

A. Yes, I was a co-author of SOC8.

BY MR. BEATO:

Q. And this chapter?

A. Yes.

Q. Any other chapters, Doctor?

MS. RIVAUX: Objection. Form; scope; and same objections relating to the confidentiality agreement and the violation of -- and any -- and not to violate the stay in place.

A. I would, again, refer you to the WPATH website which outlines the process by which this document was drafted. It was written via consensus and was drafted collaboratively.

BY MR. BEATO:

Q. Okay. So I don't think you answered my question. Did you -- again, noting the objections, did you contribute in authoring any other chapters in WPATH?

MS. RIVAUX: I'm going to object to form; scope.

Again, do not violate your confidentiality agreement or the stay that's in place.

A. Yeah, that would -- that would -- discussing that would be in violation of the confidentiality agreement.

Page 45

BY MR. BEATO:

Q. All right. I'll move on.

Doctor, to the best of your knowledge in Chapter 5, does Chapter 5 discuss any negative health risks of gender-affirming care?

MS. RIVAUX: Objection. Form; scope.

You can answer.

A. The Assessment chapter discusses the types of assessments that are necessary to determine eligibility and readiness for gender-affirming care.

BY MR. BEATO:

Q. Does it also talk about risks involved?

MS. RIVAUX: Objection. Form and scope.

You can answer.

A. I would ask what you mean by "talk about." It outlines what assessments need to be or should be done to determine the readiness for care.

BY MR. BEATO:

Q. And if I understand this correctly, part of the assessments involve evaluating benefits and risks?

MS. RIVAUX: Objection. Form and scope.

You can answer.

A. Broadly, yes.

BY MR. BEATO:

Q. And in evaluating the risks, does that

Page 46

also -- in evaluating -- sorry.
In evaluating risks, do you also have to weigh irreversible potential medical consequences?
MS. RIVAUX: Objection. Form; scope.
You can answer.
A. This is very standard healthcare. All healthcare interventions have outcomes associated with them, and this is no different from any other type of health intervention.
BY MR. BEATO:
Q. So, Doctor, I would like to take a five-minute break if you don't mind.
A. Sure.
MR. BEATO: Would you mind if we reconvene, just because I like base-five numbers, how about 11:15?
THE WITNESS: Sounds good.
MR. BEATO: Thank you very much.
THE VIDEOGRAPHER: Stand by. We're going off video record. The time is 11:08 a.m.
(A recess was taken from 11:08 a.m. to 11:16 a.m.)
THE VIDEOGRAPHER: We are back on the video record. The time is 11:16 a.m.
BY MR. BEATO:
Q. All right. So, Doctor, let me ask you this.

Page 47

And let me pull up Exhibit 1, the expert rebuttal report. Did you base any of your expert opinions on the WPATH Standards of Care Version 8?
MS. RIVAUX: Objection. Form. You can answer.
MR. BEATO: Counsel, can I have the basis for the objection?
MS. RIVAUX: It was confusing the way you worded the question.
MR. BEATO: Okay. I could rephrase.
BY MR. BEATO:
Q. Doctor, did you use WPATH's Standard of Care Version 8 recommendations as a basis for your expert report opinions?
A. I suppose I would ask what you mean by "use." I have expertise and I reviewed the relevant literature.
Q. So I'm scrolling down to page 4, paragraph 13. I highlight, "My opinions are based..." and I go down to "...including my work as a contributing author of WPATH Standards of Care 8."
Doctor, is paragraph 13 a fair and accurate representation of your opinion?
A. Yes.
Q. Is the confidentiality from WPATH, is that

Page 48

preventing you from answering some of the WPATH questions in this case?
MS. RIVAUX: Objection. Form; scope; and, again, the same objections relating to the confidentiality agreement and the stay order.
A. I'm adhering to the confidentiality agreement that I signed.
BY MR. BEATO:
Q. Understood.
And, Doctor, again, in your expert report do you opine on adult treatment?
A. In the rebuttal.
Q. Right. Apologies. I can be clear. Let me rephrase.
Doctor, in your expert rebuttal report, do you discuss adult treatment?
A. It -- the primary point or one of the primary points of my report was related to adolescent brain development.
Q. Understood. So where specifically do you mention adults in your expert rebuttal report?
A. I would have to review, but I believe by and large the report is regarding adolescents because that is what is pertinent.
Q. And if you need time to review this report,

Page 49

let me know. So, again, your report concerns adolescent treatment; is that correct?
A. Yes.
Q. Now, Doctor, regarding adolescent treatment and gender-affirming care, is there a lot of literature out there on the treatment?
MS. RIVAUX: Objection. Form.
MR. BEATO: Basis for objection?
MS. RIVAUX: It's a really broad, ambiguous question. There's a lot of literature out there. It's just, you know, just a broad, ambiguous question.
BY MR. BEATO:
Q. Okay. Let me rephrase.
Doctor, is there a good, a great deal of evidence on the effects of gender-affirming care on adolescents?
MS. RIVAUX: Objection. Form.
MR. BEATO: Basis, Counsel.
MS. RIVAUX: Same thing. I think it's ambiguous to say whether there's a great deal. I think it's ambiguous. But he may answer.
BY MR. BEATO:
Q. I will scroll down to, we're still on Exhibit 1, page 21.

Doctor, could you read this sentence for me?

A. "In contrast, there is a great deal of evidence supporting the mental health benefits of GnRHa treatment for transgender adolescents."

Q. Doctor, is "great deal," is that vague?

MS. RIVAUX: Objection. Form.

MR. BEATO: Basis?

MS. RIVAUX: What's the relevance?

MR. BEATO: The doctor wrote it.

MS. RIVAUX: Okay. So you can ask him about what he means by it.

BY MR. BEATO:

Q. What do you mean by "a great deal"?

A. So in this instance I'm looking at the literature, the decades of use of GnRHa treatment and the expertise of, my own expertise, the expertise of my colleagues. There's a great deal -- again, there's a great deal of evidence to support this, right. So I'm thinking broadly about evidence from clinical experience of my colleagues as well as the research literature.

Q. Okay. When you say "research literature," what do you mean?

A. Publications like peer-reviewed publications.

Q. Can you provide me examples of those?

A. I would refer to you my bibliography. I think there's quite a few citations.

Q. Can you name one off the top of your head?

A. There's a de Vries paper.

Q. And, again, Doctor, if I'm reading this correctly, "In contrast, there's a great deal of evidence supporting the mental health benefits of GnRHa treatment for transgender adolescents."

Again, that's accurate?

A. Yeah, so the sentence that that is -- so the sentence begins with the phrase, "In contrast." The sentence prior to it says, "There is little to support the defendants' designated experts' speculation about the negative effects of GnRHa treatment on the brain." So I stand by the sentence as written.

Q. Understood. I will scroll up to page 16, paragraph 31. I highlighted the first sentence. Doctor, could you please read that sentence?

A. Yes, "There is a small body of literature on the effects of gender-affirming hormone care on the brain in transgender adolescents."

So am I correct in assuming that you're trying to suggest that these two sentences are in conflict with each other?

Q. No.

A. Oh, okay. Great.

Q. Let's go to paragraph 5. I'm sorry. I misspoke. Page 5. Bear with me, Doctor. Sorry. So in chapter -- strike that. Sorry.

In paragraph 16, I believe you're responding to one of Dr. Scott's statements; is that correct?

A. Yes.

Q. I'm highlighting one sentence, I believe it's the second sentence, "That is, literature indicates that there are highly specific circumstances in which adolescents are more likely to engage in risky or impulsive behavior."

Doctor, my question is, did you provide a citation for that assertion?

A. I do later on.

Q. Where is that?

A. I believe it's -- yeah, paragraph 18.

Q. And all those cases stand for that proposition?

A. So those are references that describe the context -- the contextual nature of decision making and adolescents.

Q. And I'm scrolling back to page 5. Bear with me. The sentence, "However, none of these examples are

relevant to the issue at hand: Protracted medical decision making made in the context of adult guidance and consultation with a medical professional."

Doctor, my question is, what does protracted mean here?

A. Drawn out.

Q. So in this context, what period of time are we talking about?

A. I'm sorry. They're doing some work outside of my office and it's a little loud. Can you repeat the question?

Q. No problem whatsoever. No problem. And, again, if there's like a -- something going on in the background, more than happy to do that.

So in the final sentence of paragraph 16, "However, none of these treatments are relevant to the issue at hand: Protracted medical decision making made in the context of adult guidance and consultation with a medical professional," what does "protracted" mean? Like what kind of -- here's the question. What kind of period of time are we looking at?

A. So it could be -- you know, I think that it varies, which is why SOC8 recommends an individualized approach. It could be eight months or even years for some people.

Page 54

Q. Okay. Do you have a citation or a study or some basis for that proposition?

A. I believe in the next paragraph I cite the, I think it's a Bauer study. Yeah, the Bauer 2022 study which outlines the time between an adolescent realizing that they're trans and then them coming out to a healthcare provider.

Q. All right. So the this sentence -- okay. Understood. So that citation for that's -- okay. Thank you, Doctor. That's all I wanted.

A. Um-hum.

Q. Give me one second.

Let's go to Paragraph 25. I think this is on page 10, still on Exhibit 1. I'm highlighting the second sentence in Paragraph 25, "Case studies are the lowest quality of evidence." Could you elaborate on that, Doctor?

A. Yeah, a case study is a study of a single individual, so they are generally not regarded as the type of evidence that we would want to use to make -- to inform, you know, standards of care policy, you know, the -- because it's just regarding a single person, so generally, you know, we don't think of those as being generalizable.

Q. Understood. And what limitations come with case studies?

Page 55

A. Well, it's a study of a single person, so we don't know if we can extrapolate the findings to the broader population.

Q. Are there any other limitations inherent with case studies, or it's just the focus of an individual on one person, to your knowledge?

A. I would say that's probably the primary limitation of a case study is just the, you know, questionable generalized ability of them.

Q. Understood.

In your knowledge, do you know if WPATH references any case studies in its standards of care?

A. I don't know off the top of my head, but I do know that WPATH cites a large body of literature that includes empirical studies, longitudinal studies, cross-sectional studies, cohort studies, unlike Dr. Levine who did not cite any valid literature.

Q. And in terms of the literature, does it pertain to adolescent treatments with gender dysphoria?

MS. RIVAUX: Objection. Form.

MR. BEATO: Basis?

MS. RIVAUX: I didn't understand the question.

MR. BEATO: Sure, I'll back up. I can take a step back before taking a step forward.

Page 56

BY MR. BEATO:

Q. So, Doctor, you said that in the standards of care, in WPATH there's a lot of longitudinal peer-reviewed literature, correct?

A. I said that there is a variety of different types of evidence that are informing recommendations as a whole, so that could include longitudinal cohort, cross-sectional.

Q. Could that also include case studies?

A. It may, yes.

Q. And in terms of the longitudinal cohort literature that you mentioned, does that literature reference or relate to adolescent treatment concerning gender-affirming care?

A. There have been longitudinal adolescent studies. If you're asking me to speak to a specific one, I would want to take a break and review it.

Q. Understood. Without speaking in depth about it, could you identify them for me off the top of your head, or are they mentioned in your bibliography?

A. They are mentioned in my bibliography.

Q. To your mind, does your bibliography reference all of those longitudinal cohort adolescent related studies that you're thinking of right now?

Page 57

A. I cite the -- so I did a targeted literature review, and I cite the studies that I was -- that I identified that looked at mental health outcomes in transgender youth. I would hesitate to claim that I have cited every longitudinal study of transgender youth, but I did do a thorough literature review.

Q. Fair enough. Fair enough. Are there any additional reports that should be in your bibliography?

A. Not that I'm aware of.

Q. Let me go to paragraph 27 highlighting the first sentence, "Both Dr. Levine and Dr. Laidlaw state that the effects of GnRHa treatment on the brain are both 'unknown' and 'likely negative.'"

Does WPATH comment on the effects of GnRH -- I'm going to get it wrong, Doctor. I apologize.

Does WPATH opine on the effects of GnRHa treatment on the brain?

A. Not that I recall, but I would want to review the entire document before making a definitive statement.

Q. Is there a great deal of evidence on the subject?

A. There is --

MS. RIVAUX: Objection.

THE WITNESS: Sorry.

Page 58

MS. RIVAUX: You can answer.
MR. BEATO: And what's the basis for the objection?
MS. RIVAUX: I'm not sure when you're saying "there's a great deal of evidence on the subject" what the subject in particular you were referring to.
MR. BEATO: The effects of GnRHa treatment on the brain.
MS. RIVAUX: Do you want to rephrase -- the way -- to me, the way it came out was a little -- is a little bit ambiguous. If you want to rephrase it that way, that's fine.
MR. BEATO: No problem whatsoever. I'm just asking for the basis of the objection so I can ask a better question.
MS. RIVAUX: Yeah, that's fine.
MR. BEATO: Perfect.
BY MR. BEATO:
Q. So, Doctor, is there a great deal of evidence on the effects of GnRHa treatment on the brain?
A. There is -- there is evidence. There are studies that look at GnRHa treatment on the brain.
Q. How many studies are you thinking of right now?
A. In humans -- well, also, I guess it would depend. If you mean in humans, in transgender adolescents, I believe there's three neuroimaging studies. There are also animal studies as well.
Q. With, for example, I think, sheep?
A. Yes, there are some studies of sheep.
Q. Sheep and mice?
A. And a primate study also.
Q. And for those -- if I remember this -- please correct me if I'm wrong. For those three human studies, what were the results of those studies?
A. I outlined those in the report. Those studies used different imaging modalities. They found differences in brain structure function that were associated with sex assigned at birth; others that were associated with gender identity.
But when they ran correlations to determine associations between GnRHa treatment and brain structure function, they did not find any -- there were no significant findings.
Q. Okay. So no significant findings of benefits in the treatments?
A. No significant findings of any association.
Q. Understood. And for the animal studies, the sheep, mice and primates, what were the results of those studies?
A. Well, as I outlined in my rebuttal as well as the paper, the review paper that I wrote that I cited, the problem with a lot of the animal literature is that they don't use the correct reference group for comparing. So a lot of those studies report differences with GnRH treatment, but really their difference is between natal sex, so we would expect a medication that delays puberty to have sex-specific effects. That is the desired outcome of the treatment.
Q. And I have no additional questions regarding the report. I do have additional follow-up questions, though.
Earlier in the deposition you stated that you were aware of the law in place in Florida.
A. (Nodding head).
Q. By the way, it's not a law; it's a regulation, but understood, understood.
A. All right.
Q. How did you hear about it, the at-issue regulation?
A. I don't recall.
Q. Understood. If you could think back, was it social media, the news or you don't remember?
A. I don't remember. I don't recall at this time.
Q. And for your expert report, did you review the at-issue regulations?
A. I reviewed, as I believe is stated at the beginning of the report, I reviewed the Florida Medicaid opinion.
Q. The so-called GAPMS report?
A. Yes.
Q. But not the at-issue regulation?
A. No, I did not review the text of it.
Q. But you were aware of the at-issue regulation through something?
A. (Nodding head).
Q. Okay. What is your opinion on the GAPMS report?
MS. RIVAUX: Objection. Scope.
A. I would ask that you just be a little bit more specific.
BY MR. BEATO:
Q. Sure. So in writing this expert report, you reviewed the GAPMS report with the accompanying attachments, correct?
A. Um-hum, yes.
Q. As a professor, as a scientist, what are

Page 62

your opinions of the GAPMS report?
MS. RIVAUX: Objection. Scope.
You can answer.
A. I was surprised that it didn't seem to cite a lot of relevant literature.
BY MR. BEATO:
Q. What literature would you have cited?
A. All the literature that I cited in my rebuttal.
Q. And in hearing about the at-issue regulation, how do you feel about the regulation?
MS. RIVAUX: Objection.
BY MR. BEATO:
Q. What is your opinion as to the regulation?
MS. RIVAUX: Objection. Scope.
A. I believe that healthcare decisions should be made between patients and providers and their families and based on expert medical evidence and standards of care.
MR. BEATO: Doctor, I have no further questions.
Counsel can ask some follow-up questions.
MS. RIVAUX: I don't have any follow-up questions.
MR. BEATO: All right. Doctor, you're done.

Page 63

THE WITNESS: All right. Thank you.
MR. BEATO: Thank you, Doctor. I know you're probably busy. And thank you for making yourself available and taking time to answer these questions. It's really appreciated.
MS. RIVAUX: Do you want to give him the instruction about reading or waiving?
MR. BEATO: Could you do that, Counsel?
MS. RIVAUX: Sure. So, Dr. Edmiston, you have the right to read your report and make any changes to the extent that there were any errors in the transcription or you can waive that. Otherwise, you'd get a copy. If you choose to read it, you'll have 30 days when you get it to review it to make any changes. There will be a form in which you can make any correction. And then that gets sent back and a corrected copy will get circulated to everybody.
THE WITNESS: Yeah, I'd like to read it.
MS. RIVAUX: Okay.
MR. BEATO: And, Doctor, just to be super cautious because I know you have a confidentiality agreement, I don't want to violate that at all. If you said something inadvertently that, you know, maybe you probably

Page 64

shouldn't have said, should this deposition be under seal? We can send the court reporter the protective order. I just want to make sure.
MS. RIVAUX: Yeah, you know what? Why don't we do it that way, and then if there's any reason to unseal it or to seal any specific portion, we can go ahead and do that. And then we can -- you know, if there's anything -- so until Dr. Edmiston has an opportunity to review it, and then we can mark things confidential as appropriate later on. I appreciate that. Thank you.
MR. BEATO: No problem. Doctor, I understand. You're put in a tough position, right. You have -- you got something signed. I respect that. I wasn't trying to make you feel uncomfortable or get around that, so I just want to make sure everything is good.
I will ask, though, for an expedited transcript.
And, Doctor, I want to make sure you have sufficient time to review it, but at the same time we want to get this finalized as soon as possible.
THE WITNESS: I appreciate that.

Page 65

MR. BEATO: So, Zack, are you on there? We can send over the court reporter the protective order.
THE STENOGRAPHER: I just want to remind you we're still on video record.
MR. BEATO: That's fine. This can all be on the record. That's fine.
Okay. I think we're -- I think we're good. Thank you for your time, Doctor.
THE WITNESS: You're welcome.
THE VIDEOGRAPHER: This is the videographer. Would anyone like to order a copy of the video?
MR. BEATO: A copy of the video, I don't need a copy of the video.
THE VIDEOGRAPHER: And Ms. Rivaux?
MS. RIVAUX: I don't -- I don't think we need a copy of the video at this time. But for the transcript, we'd like it at the same time, please.
MR. BEATO: Yes, expedited.
THE VIDEOGRAPHER: Is there a date for that? Just as soon as possible or --
MS. RIVAUX: As soon as possible.
THE VIDEOGRAPHER: Okay.
MR. BEATO: Thank you very much.

THE VIDEOGRAPHER: And then I'll go ahead and take us off the video record. We're going off the record in the video deposition of Dr. Kale Edmiston. We're going off the record on March 23rd, 2023 at 11:43 a.m.

(Thereupon, the proceedings concluded at 11:43 a.m.)

(The witness did not waive signature.)

CERTIFICATE OF OATH

THE STATE OF FLORIDA)

COUNTY OF PALM BEACH COUNTY)

I, the undersigned authority, certify that E. KALE EDMISTON, Ph.D. remotely appeared before me and was duly sworn on the 23rd day of March 2023.

Signed this 23rd day of March 2023.

Barbara Gallo

IN RE: DEKKER vs WEIDA
CASE NO.: CASE NO. 4:22-CV-00325-RH-MAF
Please take notice that on the 23rd day of March 2023, you gave your deposition in the above cause. At that time you did not waive your signature.
The above-addressed attorney has ordered a copy of this transcript and will make arrangements with you to read their copy. Please execute the Errata Sheet, which can be found at the back of the transcript, and have it returned to us for distribution to all parties.
If you do not read and sign the deposition within 30 days, the original, which has already been forwarded to the ordering attorney, may be filed with the Clerk of the Court.
If you wish to waive your signature now, please sign your name in the blank at the bottom of this letter and return it to the address listed below.
Very truly yours,
Barbie Gallo, RMR-CRR
Phipps Reporting, Inc.
1551 Forum Place, Suite 200-E
West Palm Beach, Florida 33401
I do hereby waive my signature.
