1) Exogenous estrogens, like endogenous estrogens, are transformed in the liver. Estradiol is converted reversibly to estrone and both can be converted to estriol, the major urinary metabolite. Additionally, estrogens undergo enterohepatic recirculation via sulfate and glucuronide conjugation in the liver, biliary secretion of conjugates into the intestine, and hydrolysis in the gut which is followed by reabsorption. A significant proportion of the circulating estrogens in postmenopausal women exists as sulfate conjugates, especially estrone sulfate [57].

2) In vitro and in vivo studies indicate that estrogens are partially metabolized by cytochrome P450 3A4 [57].

B) Metabolites

1) Estradiol

a) Estradiol, active [7][13][38][35][8][92][9][11][12][36][14][15][94]

1) Estradiol is the principal intracellular human estrogen and is substantially more potent at the receptor site than its metabolites, estrone and estriol [7][13][38][35][8][92][9][36][14][15][94].

b) Estrone, active [7][13][38][35][8][92][9][36][14][15][94]

c) Estriol, active[7][13][38][35][8][92][9][36][14][15][94]

2) Estradiol Acetate

a) Estradiol, active [170][60]

1) Estradiol is the principal intracellular human estrogen and is substantially more potent at the receptor site than its metabolites, estrone and estriol [170][60].

b) Estrone, active [170][60]

c) Estriol, active[170][60]

3) Estradiol Cypionate

a) Estrone, active [55]

b) Estriol, active[55]

c) Estradiol is the principal intracellular human estrogen and is substantially more potent at the receptor site than its metabolites, estrone and estriol [55].

4) Estradiol Valerate

a) Estrone, active [57]

b) Estriol, active[57]

c) Estradiol is the principal intracellular human estrogen and is substantially more potent at the receptor site than its metabolites, estrone and estriol [57].

Excretion

A) Kidney

1) Estradiol

a) Renal Clearance (rate)

1) Transdermal

a) Transdermal, patch (Alora(R)): 53 to 69 L/hr [8]

The mean clearance of Alora(R) over an 84-hour dosing interval is presented below [8]:

Dose (milligrams/day)	Application Site	N	Dosing	Clearance (liters/hour)
0.05	Abdomen	20	Multiple	54
0.075	Abdomen	20	Multiple	53
0.1	Abdomen	42	Multiple	61
0.05	Abdomen	31	Single	69
0.05	Buttock	31	Single	66
0.05	Hip*	31	Single	62

b) Renal Excretion (%)

1) 5% to 8% unchanged [15]

a) At 4 and 12 weeks after application of estradiol vaginal ring, the mean percent dose that was excreted in the urine as estradiol was 5% and 8%, respectively [15].

2) Estradiol, estrone, and estriol, as well as their glucuronide and sulfate conjugates, are excreted in urine [7][13][38][35][8][92][9][11][12][36][14][15][94].

2) Estradiol Acetate

a) Renal Excretion (%)

1) Estradiol, estrone, and estriol, as well as their glucuronide and sulfate conjugates, are excreted in urine [170][60].

3) Estradiol Cypionate

a) Renal Excretion (%)

1) Estradiol, estrone, and estriol, as well as their glucuronide and sulfate conjugates, are excreted in urine [55].

4) Estradiol Valerate

a) Renal Excretion (%)

1) Estradiol, estrone, and estriol, as well as their glucuronide and sulfate conjugates, are excreted in urine [57].

B) Bile

1) Estradiol

a) Estrogens undergo biliary secretion of conjugates into the intestine [7][13][38][35][8][92][9][11][12][36][14][15][94][502][503][504][505][114][506][507].

2) Estradiol Acetate

a) Estrogens undergo biliary secretion of conjugates into the intestine [170][60][502][503][504][505][114][506][507].

3) Estradiol Cypionate

a) Estrogens undergo biliary secretion of conjugates into the intestine, hydrolyzed and reabsorbed [55][502][503][504][505][114][506][507].

4) Estradiol Valerate

a) Estrogens undergo biliary secretion of conjugates into the intestine, hydrolyzed and reabsorbed [57][502][503][504][505][114][506][507].

Elimination Half-life

A) Parent Compound

1) Transdermal Gel

a) Estrogel(R): 36 hours [13][38]

1) The apparent terminal half-life for estradiol was 36 hours following administration of 1.25 g of Estrogel(R) and 36 hours [13].

b) Divigel(R): 10 hours [38]

1) The apparent terminal half-life of Divigel(R) was about 10 hours [38].

2) Transdermal Patch

a) Alora(R): 1.75 hours [8]

1) The apparent mean serum half-life of estradiol when administered as the Alora(R) transdermal patch was 1.75 +/- 2.87 hours [8].

b) Vivelle(R): 4.4 hours [11]

c) Vivelle-Dot(R): 5.9 to 7.7 hours [12]

B) Metabolites

1) Estradiol Acetate

a) Oral: estradiol, 21.4 hr to 25.9 hr [170]

b) Oral: baseline adjusted estrone, 15.9 hr to 17.6 hr [170]

1) In 18 healthy postmenopausal women, the mean half-life of estradiol and baseline-adjusted estrone after multiple-dose administration of oral estradiol acetate 0.45 milligrams was 25.9 and 15.9 hours, respectively. The mean half-life of estradiol and baseline-adjusted estrone after multiple-dose administration of oral estradiol acetate 0.9 milligrams was 22.2 and 16.1 hours, respectively. The mean half-life of estradiol and baseline-adjusted estrone after multiple-dose administration of oral estradiol acetate 1.8 milligrams was 21.4 and 17.6 hours, respectively [170].

Extracorporeal Elimination

A) Hemodialysis

1) Dialyzable: Total serum estradiol concentrations are higher in postmenopausal women with end stage renal disease (ESRD) receiving maintenance hemodialysis at baseline and following oral doses of estradiol. Therefore, the traditional transdermal doses used in patients with normal renal function may be excessive for patients with ESRD who are receiving hemodialysis[92]

Patient Handouts

A) Estradiol (Absorbed through the skin)
Estradiol

Treats hot flashes and other symptoms of menopause or low estrogen.

When This Medicine Should Not Be Used:
This medicine is not right for everyone. Do not use it if you had an allergic reaction to estradiol, or if you have liver disease, breast cancer, or certain other types of cancer. Do not use it if you have a

history of blood clotting problems, or if you had a heart attack or stroke. Do not use this medicine if you may be pregnant, or if you have unusual vaginal bleeding that has not been checked by your doctor.

How to Use This Medicine:

Liquid Mixture, Gel/Jelly, Spray

Take your medicine as directed. Your dose may need to be changed several times to find what works best for you. This medicine is usually applied once a day, at the same time each day.
Use this medicine only on your skin. Rinse it off right away if it gets on a cut or scrape. Do not get the medicine in your eyes, nose, or mouth.
Read and follow the patient instructions that come with this medicine. Talk to your doctor or pharmacist if you have any questions.
Wash your hands with soap and water before and after you use this medicine.
To use the emulsion:

Apply the emulsion to your legs. The usual daily dose is 2 foil pouches, 1 for each leg.
Cut or tear open the first pouch at the notches near the top. Squeeze out all of the medicine from the pouch onto the top of your left thigh. Rub the medicine thoroughly into your thigh and calf, for about 3 minutes. Repeat these steps to apply the medicine in the second pouch to the right thigh and calf.
Allow the medicine to dry completely before you get dressed. Wait at least 25 minutes before you put on sunscreen.

To use the gel:

Gel pump: You get the correct dose of estradiol each time you press the pump. You may need to prime the pump by pumping 3 times (EstroGel®) or 10 times (Elestrin™) the first time you use it. Follow the patient instructions for the container you use. After you prime the pump, do not press the pump more than 1 time each time you use it.
Apply the gel to clean, dry, and unbroken skin. Spread the gel as thinly as possible over the entire area on the inside and outside of 1 arm from your wrist to your shoulder. Do not apply the medicine directly to your breasts or in or around your vagina.
Do not allow others to come in contact with the area of skin where you applied the gel for at least 1 hour after you use the medicine. Do not allow others to apply the gel for you. Allow the medicine to dry for at least 5 minutes before you get dressed.
Apply sunscreen at least 25 minutes after using Elestrin™ gel. Avoid applying sunscreen on the same application site for 7 days or more.
Gel packet: Cut or tear the Divigel® packet. Squeeze the packet contents onto your upper thigh. Gently spread the gel over your upper thigh, covering a space about the size of 2 palm prints. You do not need to massage or rub in the gel. Allow the gel to dry completely before you put on clothes. Alternate between your right and left upper thigh each day.
Do not allow others to come in contact with the area of skin where you applied the gel for at least 1 to 2 hours after you use the medicine. Do not allow others to apply the gel for you.

To use the spray:

The spray form comes in an applicator that delivers the same amount of estradiol with each spray. You need to prime the pump of a new spray applicator before you use it. Hold the spray upright and pump it 3 times. You only need to prime the pump the first time you use a new spray applicator.
Apply the medicine to clean, dry, and unbroken skin on the inside of your forearm between the elbow and the wrist. Do not apply the medicine directly to your breasts or in or around the vagina.
Allow the medicine to dry for at least 2 minutes before you get dressed. Wait at least 1 hour before you wash your skin.
If your doctor tells you to increase your dose, move the applicator to an area of the skin next to your previous application site before you apply the next dose. Do this for each spray.
Do not rub Evamist® spray into your skin.
Always place the protective cover back on the applicator.
Do not use the applicator for more than 56 sprays.
Apply sunscreen at least 1 hour before you apply Evamist®.

The estradiol gel and spray are flammable. Do not use these medicines near an open flame or while smoking.
Store the medicine in a closed container at room temperature, away from heat, moisture, and direct light.

Drugs and Foods to Avoid:

Ask your doctor or pharmacist before using any other medicine, including over-the-counter medicines, vitamins, and herbal products.

Some foods and medicines can affect how estradiol works. Tell your doctor if you are using St John's wort, carbamazepine, clarithromycin, erythromycin, itraconazole, ketoconazole, phenobarbital, rifampin, ritonavir, thyroid medicine, or a blood thinner (such as warfarin).
Do not put cosmetics or skin care products on the treated skin.
Do not eat grapefruit or drink grapefruit juice while you are using this medicine.

Warnings While Using This Medicine:

Pregnancy after menopause is not likely, but if you think you could be pregnant, tell your doctor. This medicine could harm an unborn baby.
Tell your doctor if you are breastfeeding, or if you have kidney disease, asthma, diabetes, edema (body swelling), endometriosis, epilepsy, migraine headaches, porphyria, lupus, thyroid problems, heart disease, high blood pressure, high cholesterol or triglycerides, inherited angioedema, or a history of cancer. Tell your doctor if you had liver problems caused by pregnancy or estrogen.
This medicine may cause the following problems:

Higher risk of heart attack, stroke, or blood clots
Higher risk of endometrial cancer, breast cancer, or uterine cancer
Gallbladder disease
Higher risk of dementia

Tell any doctor or dentist who treats you that you are using this medicine. This medicine may affect certain medical test results. You may need to stop using this medicine before you have surgery or if you need to stay in bed for a long time.
Your doctor will check your progress and the effects of this medicine at regular visits. Keep all appointments. You should have regular exams and mammograms as directed by your doctor.
Keep all medicine out of the reach of children. Never share your medicine with anyone.
Do not allow children or pets to touch the skin where you applied the medicine. If this happens, wash the child or pet's skin with soap and water.

Possible Side Effects While Using This Medicine:
Call your doctor right away if you notice any of these side effects:

Allergic reaction: Itching or hives, swelling in your face or hands, swelling or tingling in your mouth or throat, chest tightness, trouble breathing
Breast lumps
Chest pain, trouble breathing, or coughing up blood
Loss of vision, double vision, or other vision changes
Numbness or weakness on one side of your body, sudden or severe headache, problems with vision, speech, or walking
Sudden and severe stomach pain, with or without nausea, vomiting, fever, and lightheadedness
Swelling in your hands, ankles, or feet
Unusual vaginal bleeding or heavy bleeding

If you notice these less serious side effects, talk with your doctor:

Changes in weight or hair growth
Headache
Nausea, vomiting, or stomach cramps
Runny or stuffy nose, sore throat, or fever
Skin redness or itching where the medicine is applied
Swollen or tender breasts

If you notice other side effects that you think are caused by this medicine, tell your doctor.
B) Estradiol (By injection)
Estradiol

Treats hot flashes and other symptoms of menopause. Also treats prostate cancer in men, and treats lack of estrogen caused by a disorder of the ovaries in women.

When This Medicine Should Not Be Used:
You should not use this medicine if you have had an allergic reaction to hormone medicines. Do not use this medicine if you are pregnant, or if you have abnormal vaginal bleeding that has not been checked by a doctor. You should not use this medicine if you have a history of cancer of the breast, ovary, or uterus. Do not use if you have liver disease or a history of heart attack, stroke, or blood clots.

How to Use This Medicine:
Injectable

Your doctor will prescribe your exact dose and tell you how often it should be given. This medicine is given as a shot into one of your muscles. You may receive this medicine once a week, once every 2 weeks, or once every 4 weeks.
If you have not had your uterus removed (hysterectomy), you may need to use another hormone medicine together with estradiol. Carefully follow your doctor's instructions about all medicines you are using.
A nurse or other health provider will give you this medicine.
You may be taught how to give your medicine at home. Make sure you understand all instructions before giving yourself an injection. Do not use more medicine or use it more often than your doctor tells you to.
Read and follow the patient instructions that come with this medicine. Talk to your doctor or pharmacist if you have any questions.
Use a new needle and syringe each time you inject your medicine.

If a Dose is Missed:

Call your doctor or pharmacist for instructions.

How to Store and Dispose of This Medicine:

If you store this medicine at home, keep it at room temperature, away from heat and direct light. Do not allow the medicine to get cold.
Throw away used needles in a hard, closed container that the needles cannot poke through. Keep this container away from children and pets.
Ask your pharmacist, doctor, or health caregiver about the best way to dispose of any leftover medicine, containers, and other supplies. Throw away old medicine after the expiration date has passed.
Keep all medicine out of the reach of children. Never share your medicine with anyone.

Drugs and Foods to Avoid:

Ask your doctor or pharmacist before using any other medicine, including over-the-counter medicines, vitamins, and herbal products.

Warnings While Using This Medicine:

It is unlikely that you will become pregnant while you are going through menopause. But, you should know that using this medicine while you are pregnant could harm your unborn baby. If you think you have become pregnant while using the medicine, tell your doctor right away. If you have recently had an infant, tell your doctor if you are breast feeding.
Make sure your doctor knows if you have asthma, epilepsy, migraine headaches, heart disease, or kidney disease. Also tell your doctor if you have endometriosis, gallbladder disease, liver disease, lupus, porphyria, or an underactive thyroid.
This medicine should not be used to treat or prevent heart disease or stroke. In fact, hormone therapy can increase your risk of certain heart or blood vessel problems. Tell your doctor if you have a history of heart attack, stroke, high blood pressure, congestive heart failure, blood clots, or circulation problems.
Your risk of heart disease or stroke from this medicine is higher if you smoke. Your risk is also increased if you have diabetes or high cholesterol, or if you are overweight. Talk with your doctor about ways to stop smoking. If you have diabetes, keep it under control. Ask your doctor about diet and exercise to control your weight and blood cholesterol level.
This medicine may also increase your risk of other medical problems, including certain types of cancer. Talk with your doctor about how these risks might affect you.
Tell any doctor or dentist who treats you that you are using this medicine. You may need to stop using this medicine several days before you have surgery or medical tests. This medicine may also affect the results of certain medical tests.

Possible Side Effects While Using This Medicine:

Call your doctor right away if you notice any of these side effects:

Allergic reaction: Itching or hives, swelling in your face or hands, swelling or tingling in your mouth or throat, chest tightness, trouble breathing
Blistering, peeling, red skin rash.
Breast changes or lumps.
Chest pain, or coughing up blood.
Dark-colored urine or pale stools, yellowing of your skin or the whites of your eyes.
Nausea, vomiting, loss of appetite, pain in your upper stomach.
Numbness or weakness in your arm or leg, or on one side of your body.
Pain in your lower leg (calf).
Shortness of breath, cold sweat, and bluish-colored skin.
Sudden or severe headache, problems with vision, speech, or walking.
Swelling in your hands, ankles, or feet.
Vaginal bleeding or spotting.

If you notice these less serious side effects, talk with your doctor:

Joint pain.
Breast pain or tenderness, discharge from your nipples.
Hair loss, increased hair growth, or skin changes.
Mood changes or depression.
Problems or discomfort when wearing contact lenses.
Vaginal itching or discharge.
Weight gain or loss.

If you notice other side effects that you think are caused by this medicine, tell your doctor.

C) Estradiol (By mouth)

Estradiol

Treats symptoms caused by menopause or removal of the ovaries, and treats prostate or breast cancer. Also prevents osteoporosis.

When This Medicine Should Not Be Used:
You should not use this medicine if you have had an allergic reaction to estrogen medicines, if you are pregnant or breastfeeding, if you have had a blood clot, or if you have vaginal bleeding that has not been checked by a doctor. You should not use this medicine if you have had cancer of the uterus, or in certain cases of breast cancer.

How to Use This Medicine:
Tablet
Your doctor will tell you how much of this medicine to take and how often. Do not take more medicine or take it more often than your doctor tells you to.
You may take your medicine with food or milk to avoid stomach upset.

If a Dose is Missed:
If you miss a dose or forget to take your medicine, take it as soon as you can. If it is almost time for your next dose, wait until then to take the medicine and skip the missed dose.
Do not use extra medicine to make up for a missed dose.

How to Store and Dispose of This Medicine:
Store the medicine at room temperature, away from heat, moisture, and direct light.
Ask your pharmacist, doctor, or health caregiver about the best way to dispose of any outdated medicine or medicine no longer needed.
Keep all medicine out of the reach of children and never share your medicine with anyone.

Drugs and Foods to Avoid:
Ask your doctor or pharmacist before using any other medicine, including over-the-counter medicines, vitamins, and herbal products.
Make sure your doctor knows if you are also using a blood thinner (Coumadin®).

Warnings While Using This Medicine:
Although it is unlikely that a postmenopausal woman might become pregnant, you should know that using this medicine while you are pregnant could harm the unborn baby. If you think you have become pregnant while using the medicine, tell your doctor right away.
Make sure your doctor knows if you have gallbladder disease, diabetes, heart disease, high blood pressure, high levels of calcium in your blood (hypercalcemia), liver disease, asthma, epilepsy, migraine headaches, kidney disease, high cholesterol, or blood clots.
Taking large doses of estrogens over a long period of time may increase your risk of some kinds of cancer. If you have questions about this risk, talk with your doctor.
Your doctor will need to check your progress at regular visits while you are using this medicine (usually every 6 to 12 months). Be sure to keep all appointments.
Make sure any doctor or dentist who treats you knows that you are using this medicine. This medicine may affect the results of certain medical tests.

Possible Side Effects While Using This Medicine:
Call your doctor right away if you notice any of these side effects:
Blistering, peeling, red skin rash
Lumps in breast (women and men)
Numbness or weakness in your arm or leg, pain in your chest or leg (calf)
Severe headache or vomiting, dizziness, slurred speech
Shortness of breath, coughing up blood
Swelling in your hands, ankles, or feet
Vaginal bleeding of unknown cause

If you notice these less serious side effects, talk with your doctor:
Changes in hair growth
Changes in your vision
Nausea, vomiting, stomach cramps, bloated feeling
Swollen and tender breasts (women and men)
Vaginal itching or discharge

If you notice other side effects that you think are caused by this medicine, tell your doctor.
D) Estradiol (Into the vagina)
Estradiol

Treats hot flashes, painful sexual intercourse, and other symptoms of menopause or low estrogen.

When This Medicine Should Not Be Used:
This medicine is not right for everyone. Do not use it if you had an allergic reaction to estradiol, or if

you are pregnant, or have unusual vaginal bleeding that has not been checked by your doctor. Do not use it if you have liver disease, breast or uterine cancer, problems with blood clots, or had a heart attack or stroke.

How to Use This Medicine:

Cream, Insert, Suppository

Your doctor will tell you how much medicine to use. Do not use more than directed.
Read and follow the patient instructions that come with this medicine. Talk to your doctor or pharmacist if you have any questions.
Vaginal cream:

Measure the cream using the marks on the plastic applicator. Make sure you use the correct mark for your specific dose.

Vaginal ring:

Once the ring is in place, you should not be able to feel it. If you feel uncomfortable, the ring may not be inserted far enough. Gently push the ring farther into your vagina. If you feel pain, talk to your doctor.
The ring may move down accidently. This can happen if you strain to have a bowel movement. Gently push the ring back into place. If the ring comes all the way out, rinse it with warm water and put it back in. Call your doctor if the ring comes out several times.
Remove the ring after 90 days and insert a new one as needed.
Do not flush a used vaginal ring down the toilet. Wrap it with tissue or toilet pair and throw it in the trash.

Vaginal insert:

The insert should be used only in your vagina. Do not swallow the insert.
It is best to use this medicine at the same time each day.
Imvexxy™: Push an insert through the foil of the blister package and hold it with the larger end between your fingers. You may choose to put the insert into your vagina using the lying down or standing up position. Put the insert about 2 inches into your vagina, with the smaller end up, using your finger.
Vagifem®: Do not take the insert out of the applicator. If the insert comes out of the applicator when you open it, carefully put it back in. If the insert falls out of the applicator when you try to insert it, throw it away and use a new applicator and insert.

Store the unopened packages of this medicine at room temperature, away from heat, moisture, and direct light.

Drugs and Foods to Avoid:

Ask your doctor or pharmacist before using any other medicine, including over-the-counter medicines, vitamins, and herbal products.

Some medicines can affect how estradiol works. Tell your doctor if you are using carbamazepine, clarithromycin, erythromycin, itraconazole, ketoconazole, phenobarbital, rifampin, ritonavir, St John's wort, or thyroid medicines.
Do not eat grapefruit or drink grapefruit juice while you are using this medicine.
Ask your doctor before you use other products or medicines in your vagina. You may need to remove the ring first.

Warnings While Using This Medicine:

Pregnancy after menopause is not likely, but if you think you could be pregnant, tell your doctor. This medicine could harm an unborn baby.
Tell your doctor if you are breastfeeding, or if you have kidney disease, asthma, diabetes, edema, endometriosis, epilepsy, migraine headaches, porphyria, lupus, thyroid problems, heart disease, high blood pressure, high cholesterol, hereditary angioedema, bone problems, or a history of cancer. Tell your doctor if you had liver problems caused by pregnancy or estrogen. Tell your doctor if you have any problems with your vagina or in your pelvic area, including prolapse. Tell your doctor if you are having a surgery that requires inactivity for a long time.
This medicine may cause the following problems:

Increased risk of heart attack, stroke, or blood clots
Increased risk of endometrial, breast, ovarian, or uterine cancer
Possible risk of dementia (especially in women 65 years of age or older)
Gallbladder disease
Eye or vision problems
High blood pressure
High cholesterol or fats in the blood

Tell any doctor or dentist who treats you that you are using this medicine. This medicine may affect certain medical test results.
Your doctor will check your progress and the effects of this medicine at regular visits. Keep all appointments.
Keep all medicine out of the reach of children. Never share your medicine with anyone.

Possible Side Effects While Using This Medicine:
Call your doctor right away if you notice any of these side effects:

Allergic reaction: Itching or hives, swelling in your face or hands, swelling or tingling in your mouth or throat, chest tightness, trouble breathing
Breast lumps or tenderness
Chest pain that may spread, coughing up blood, trouble breathing
Fever, diarrhea, muscle pain, dizziness, fainting
Numbness or weakness on one side of your body, sudden or severe headache, problems with speech or walking
Redness, pain, burning, or itching in or near your vagina
Sudden and severe stomach pain, nausea, vomiting
Swelling in your hands, ankles, or feet
Unusual vaginal bleeding, spotting, discharge, or itching
Vision changes

If you notice these less serious side effects, talk with your doctor:

If you notice other side effects that you think are caused by this medicine, tell your doctor.

E) Estradiol Patch (Absorbed through the skin)
Estradiol

Treats symptoms of menopause (including hot flashes and vaginal problems) in women with a uterus. Also treats low estrogen levels and prevent osteoporosis after menopause.

When This Medicine Should Not Be Used:
This medicine is not right for everyone. Do not use if you had an allergic reaction to estradiol, or if you have unusual vaginal bleeding that has not been checked by your doctor. Do not use it if you have liver disease, breast cancer, estrogen-dependent tumors, bleeding problems, blood clots, dementia, heart or blood vessel disease, or had a heart attack or stroke.

How to Use This Medicine:
Patch

Your doctor will tell you how many patches to use, where to apply them, and how often to apply them. Do not use more patches or apply them more often than your doctor tells you to.
Read and follow the patient instructions that come with this medicine. Talk to your doctor or pharmacist if you have any questions.
Wash your hands with soap and water before and after applying a patch.
Leave the patch in its sealed wrapper until you are ready to put it on. Tear the wrapper open carefully. NEVER CUT the wrapper or the patch with scissors. Do not use any patch that has been cut by accident.
The patient instructions will show the body areas where you can wear the patch. When putting on each new patch, choose a different place within these areas. Do not put the new patch on the same place you wore the last one. Be sure to remove the old patch before applying a new one.
Place the patch on a clean, dry area of your lower stomach or upper buttock area, where there is no oil, lotion, or powder. Do not apply the patch on or near your breasts, over cut or broken skin, or in a spot where it might rub off (including the waistline).
Press the patch firmly in place with your hand for about 10 seconds.
Change your patch on the same days of each week, to help you remember.
If you have any adhesive left on your skin after you remove the patch, allow it to dry for 15 minutes. Then gently rub the sticky area with oil or lotion to remove the adhesive.
You may take a bath, shower, or swim while wearing a patch.
Fold the used patch in half with the sticky side together. Place it in a sturdy childproof container and throw away, out of the reach of children and pets. Do not flush the patch down the toilet.
Missed dose: If you forget to wear or change a patch, put one on as soon as you can. If it is almost time to put on your next patch, wait until then to apply a new patch and skip the one you missed. Do not apply extra patches to make up for a missed dose.
If a patch falls off, just put it back on a different area. If the patch does not stick completely, put on a new patch, but continue to follow your original schedule for changing to a new one.
Store the patches at room temperature in a closed container, away from heat, moisture, and direct light. Do not open the pouch until you are ready to use the patch.

Drugs and Foods to Avoid:
Ask your doctor or pharmacist before using any other medicine, including over-the-counter medicines, vitamins, and herbal products.

Some foods and medicines can affect how estradiol works. Tell your doctor if you are using carbamazepine, clarithromycin, erythromycin, itraconazole, ketoconazole, phenobarbital, rifampin, ritonavir, St John's wort, thyroid medicine, or a blood thinner (including warfarin).
Do not eat grapefruit or drink grapefruit juice while you are using this medicine.

Warnings While Using This Medicine:

Pregnancy after menopause is not likely, but if you think you could be pregnant, tell your doctor.
This medicine could harm an unborn baby.
Tell your doctor if you are breastfeeding, or if you have kidney disease, asthma, diabetes, endometriosis, seizures, migraine headaches, porphyria, lupus, thyroid problems, hereditary angioedema, edema (swelling), high blood pressure, high cholesterol or triglycerides, obesity, or a history of cancer. Tell your doctor if you have had your uterus (womb) removed (hysterectomy) or if you are having surgery that will require inactivity for a long time.
This medicine may cause the following problems:

Increased risk of heart attack, stroke, or blood clots
Increased risk of endometrial cancer, breast cancer, or uterine cancer
Possible risk of dementia, especially in women 65 years of age and older
Gallbladder disease
Eye or vision problems
High blood pressure
High cholesterol or fats in the blood
Thyroid problems

Tell any doctor or dentist who treats you that you are using this medicine. This medicine may affect certain medical test results.
Your doctor will do lab tests at regular visits to check on the effects of this medicine. Keep all appointments.
Keep all medicine out of the reach of children. Never share your medicine with anyone.

Possible Side Effects While Using This Medicine:
Call your doctor right away if you notice any of these side effects:

Allergic reaction: Itching or hives, swelling in your face or hands, swelling or tingling in your mouth or throat, chest tightness, trouble breathing
Blurred or other changes in vision
Breast lumps or tenderness
Chest pain that may spread,, trouble breathing, or coughing up blood
Dark urine or pale stools, nausea, vomiting, loss of appetite, stomach pain, yellow skin or eyes
Fever, diarrhea, muscle pain, dizziness, fainting
Numbness or weakness on one side of your body, sudden or severe headache, problems with vision, speech, or walking
Rapid weight gain, swelling in your hands, ankles, or feet
Redness, pain, burning, or itching in or near your vagina
Unusual vaginal bleeding or heavy bleeding

If you notice these less serious side effects, talk with your doctor:

Headache
Runny or stuffy nose
Skin redness or itching where the patch is placed

If you notice other side effects that you think are caused by this medicine, tell your doctor.

TOXICOLOGY

Clinical Effects

ABOUT

How Supplied

No results available

Drug Properties

A) Information on specific products and dosage forms can be obtained by referring to the Tradename List (Product Index)

B) Synonyms

Estradiol
Estradiol, Micronized
Estradiol Acetate
Estradiol Benzoate
Estradiol Cyp
Estradiol Cypionate
Estradiol Enanthate
Estradiolum
Estradiol Valerate

C) Orphan Drug Status

1) This drug has one or more orphan drug designations, which may include approval or withdrawal of status: Access citation for FDA Orphan Drug Information [54].

D) Physicochemical Properties

1) Estradiol

a) Molecular Weight

1) 272.39 [757]

b) Solubility

1) Soluble in dioxane; slightly soluble in chloroform and ether; sparingly soluble in alcohol and acetone; and practically insoluble in water [758]

2) Estradiol Acetate

a) Molecular Weight

1) 314.42 [759]

3) Estradiol Valerate

a) Molecular Weight

1) 356.50 [57]

Storage & Stability

A) Estradiol

1) Preparation

a) General Information

1) NIOSH Group 2 Non-antineoplastics [52]

2) NIOSH: Use of single gloves by anyone handling intact tablets or capsules or administering from a unit-dose package is recommended [52].

3) NIOSH: In the preparation of tablets or capsules, including cutting, crushing, or manipulating, or the handling of uncoated tablets, use double gloves and a protective gown. Prepare in a ventilated control device, if possible. Use respiratory protection if not prepared in a control device. During administration, wear single gloves, and wear eye/face protection if the formulation is hard to swallow or if the patient may resist, vomit, or spit up [52].

4) NIOSH: In the compounding and administration of a hazardous topical drug, use double gloves and a protective gown. Prepare in a biological safety cabinet or a compounding aseptic containment isolator, and use eye/face and respiratory protection if not prepared in a control device. During administration, if there is a potential that the substance could splash or if the patient may resist, use eye/face protection, and if there is inhalation potential use respiratory protection [52].

b) Transdermal route

1) Emulsion

a) Apply and rub emulsion into thighs and calves for 3 minutes on each side until thoroughly absorbed. Rub excess on both hands and buttocks and allow to dry completely before covering with clothing. Wash hands after application [35].

2) Gel

a) Divigel(R)

1) Apply entire contents of the single-dose packet to clean, dry skin of left or right upper thigh. The gel should not be applied to face, breasts, in or around vagina, or to irritated skin. Avoid contact with eyes. Allow to dry before dressing and do not wash application site within 1 hour after application. Wash hands with soap and water after application [38].

b) Estrogel(R)

1) Prime the metered dose pump by fully depressing the spout 2 times for the 93 g pump or 3 times for the 50 and 25 g pumps prior to the first use. Collect gel into palm of hand and apply directly onto dry, clean, unbroken skin of the upper arm and shoulder area. The gel should not be applied directly to breast. Apply gel gently from wrist to shoulder and allow to dry for up to 5 minutes before dressing. It is not necessary to massage or rub in the ge. Wash hands with soap and water after application [13].

c) Elestrin(R)

1) To prime the pump, push the head down slowly and allow it to spring back automatically; repeat until gel comes out. Throw away the first amount of gel (not a full dose) into the trash. Once the pump head has come all the way back up, the pump is ready to use [34].

2) If taking a bath or shower or using a sauna, apply dose afterwards. Dry skin completely before application. Apply dose at the same time each day [34].

3) Hold the pump with the tip facing clean, dry, unbroken skin of the application area of the arm, and press the pump firmly and fully for each pump needed. Gently spread the gel over the entire area of the upper arm and shoulder using 2 fingers. Do not apply to the breast or in or around the vagina. Wash hands after application [34].

4) Allow the gel to dry for at least 5 minutes before dressing, and keep the area dry for as long as possible. Avoid fire, flame, or smoking until the gel has dried. Do not allow others to come in contact with the application area for at least 2 hours. If swimming, wait at least 2 hours before going into the water. Do not apply sunscreen to the area where the gel was applied for at least 25 minutes, and do not apply for 7 or more consecutive days [34].

5) If a dose is missed, do not double the dose. If the next dose is less than 12 hours away, wait and apply the dose the next day. If it is more than 12 hours until the next dose, apply the missed dose and resume normal dosing the next day [34].

3) Transdermal System

a) Place system on clean, dry skin, preferably on the lower abdomen, upper quadrant of the buttock, or outer aspect of the hip. Do not apply to the breasts or waistline. Rotate sites of application with 1 week allowed between applications to a particular site [29][19][8][12].

b) Press Climara (R) system firmly in place for at least 10 seconds, making sure there is good contact, especially around the edges [10]

c) If Climara(R) or Minivelle(R) system falls off reapply to different site; if reapplication not possible, apply new patch to another location for remainder of dosing interval [29][19]

d) Swimming, bathing, or using a sauna may decrease the adhesion of the Climara (R) system and the delivery of estradiol [10]

e) Remove Climara(R) system carefully and slowly, fold it in half, and throw it away. If any adhesive remains on the skin, allow the area to dry for 15 minutes, then gently rub with an oil-based cream or lotion to remove residue [10].

4) Spray

a) Prior to initial application, prime pump by spraying 3 sprays with the cover on. With container being held vertically upright, apply to adjacent, nonoverlapping areas on the inner surface of the forearm, starting near the elbow. Allow to dry for 2 minutes before covering with clothing, and do not wash the site for 1 hour after application. Women should cover the application site with clothing if another person may come into contact with that area of the skin after the spray dries [53].

c) Vaginal route

1) Cream

a) The prescribed dose should be measured using the supplied applicator. Gently insert applicator with measured dose deeply into vagina and press plunger downward to original position. Clean the applicator with mild soap and warm water after use [14].

2) Ring

a) The vaginal ring should be inserted as deeply as possible into the upper one-third of the vaginal vault; the exact position is not critical. To remove the ring, hook a finger through the ring and pull. If the ring is removed or falls out any time during the 90-day treatment period, rinse the ring in lukewarm water and reinsert [15].

3) Insert

a) Using the supplied applicator for Vagifem(R), gently insert into the vagina as far as it can comfortably go without force, or until half of the applicator is inside the vagina, whichever is less [16].

b) Insert Imvexxy(TM) intravaginally with the smaller end up for a depth of about 2 inches into the vaginal canal [5].

B) Estradiol Acetate

1) Preparation

a) General Information

1) NIOSH Group 2 Non-antineoplastics [52]

2) NIOSH: Use of single gloves by anyone handling intact tablets or capsules or administering from a unit-dose package is recommended [52].

3) NIOSH: In the preparation of tablets or capsules, including cutting, crushing, or manipulating, or the handling of uncoated tablets, use double gloves and a protective gown. Prepare in a ventilated control device, if possible. Use respiratory protection if not prepared in a control device. During administration, wear single gloves, and wear eye/face protection if the formulation is hard to swallow or if the patient may resist, vomit, or spit up [52].

b) Vaginal route

1) Administration

a) Wash hands thoroughly before and after inserting vaginal ring [59]

b) Press the opposite sides of the vaginal ring and insert into the vagina [59]

c) The patient may reposition estradiol acetate vaginal ring with finger if needed. If the ring is totally expelled from the vagina, it should be rinsed with lukewarm water and reinserted [59].

d) To remove, wash hands and hook finger through ring and gently pull downward [59].

C) Estradiol Cypionate

1) Preparation

a) General Information

1) NIOSH Group 2 Non-antineoplastics [52]

2) NIOSH: In the preparation and administration of injections, use double gloves and a protective gown. Prepare in a biological safety cabinet or a compounding aseptic containment isolator; eye/face and respiratory protection may be needed. Prepare compounds in a closed system drug transfer device. During administration, if there is a potential that the substance could splash or if the patient may resist, use eye/face protection. Administer certain dosage forms via a closed system drug transfer device [52].

b) Intramuscular route

1) Preparation

a) If crystals form because estradiol cypionate vials had been stored at lower temperatures than what is recommended, they may be redissolved by warming and shaking the vial [55].

D) Estradiol Valerate

1) Preparation

a) General Information

1) NIOSH Group 2 Non-antineoplastics [52]

2) NIOSH: In the preparation and administration of injections, use double gloves and a protective gown. Prepare in a biological safety cabinet or a compounding aseptic containment isolator; eye/face and respiratory protection may be needed. Prepare compounds in a closed system drug transfer device. During administration, if there is a potential that the substance could splash or if the patient may resist, use eye/face protection. Administer certain dosage forms via a closed system drug transfer device [52].

b) Intramuscular route

1) Administration

a) Estradiol valerate injection may be administered with a small gauge needle due to its low viscosity. A dry needle and syringe should be used since use of a wet needle or syringe may cause the solution to become cloudy [57].

b) Inject deep into the upper, outer quadrant of the gluteal muscle [57]

c) If crystals form because estradiol valerate vials had been stored at lower temperatures than what is recommended, they may be redissolved by warming [57].

d) Since the 40-milligram vial provides a high concentration in a low volume, particular care should be taken to administer the full prescribed dose [57].

E) Estradiol

1) Oral route

a) Tablet

1) Store at a controlled room temperature, 20 to 25 degrees C (68 to 77 degrees F); protect from light and close lid tightly [62].

2) Topical application route, Transdermal route

a) Gel/Jelly

1) Store at a controlled room temperature, between 20 and 25 degrees C (68 and 77 degrees F); excursions permitted between 15 and 30 degrees C (59 and 86 degrees F) [74][520][65].

3) Transdermal route

a) Patch, Extended Release

1) Store between 20 and 25 degrees C (66 and 77 degrees F). Store in the protective pouch and apply immediately after removal [29][67][66][521][19]. Excursions permitted between 15 and 30

degrees C (59 and 86 degrees F) [29][521][19].

b) Spray

1) Store at room temperature, between 20 and 25 degrees C (68 and 77 degrees F); do not freeze. Excursions permitted between 15 and 30 degrees C (59 and 86 degrees F) [69].

4) Vaginal route

a) Cream

1) Store at room temperature; protect from temperatures above 40 degrees C (104 degrees F) [73].

b) Insert, Extended Release

1) Store at a controlled room temperature between 15 and 25 degrees C (59 and 77 degrees F) [5][142], with excursions permitted between 15 and 30 degrees C (59 and 86 degrees F) [5].

c) Insert, Extended Release

1) Store at a controlled room temperature, 25 degrees C (77 degrees F); do not refrigerate. Excursions permitted between 15 and 30 degrees C (59 and 86 degrees F) [16].

F) Estradiol Acetate

1) Oral route

a) Tablet

1) Store estradiol acetate tablets at 25 degrees Celsius (77 degrees Fahrenheit); excursions permitted to 15 to 30 degrees Celsius (59 to 86 degrees Fahrenheit) [170].

2) Vaginal route

a) Insert, Extended Release

1) Store estradiol acetate vaginal ring at 25 degrees Celsius (77 degrees Fahrenheit); excursions permitted to 15 to 30 degrees Celsius (59 to 86 degrees Fahrenheit) [60].

G) Estradiol Cypionate

1) Intramuscular route

a) Oil

1) Store estradiol cypionate injection at controlled room temperature (20 to 25 degrees Celsius or 68 to 77 degrees Fahrenheit) [55].

H) Estradiol Valerate

1) Intramuscular route

a) Oil

1) Store estradiol valerate injection at room temperature [57].

TAB 175-28

Agency Responses to Plaintiffs' Questions: March 1, 2023

Plaintiffs' Question: *Please provide a complete list of the diagnostic codes (ICD-10 codes) programmed in FMMIS for the following drugs (listed by generic name): estradiol (all formulations and combinations listed in the PDL); testosterone (all formulations listed in the PDL); testosterone cypionate (all formulations listed in the PDL); testosterone enanthate (all formulations listed in the PDL); triptorelin pamoate (both the kit and the vial); leuprolide acetate (all formulations listed in the PDL); Metformin HCL (all formulations listed in the PDL).*

Agency Response: The diagnosis codes for drugs subject to an automatic prior authorization or bypass are located at https://ahca.myflorida.com/medicaid/Prescribed_Drug/drug_criteria_pdf/Automated_PA.pdf. This list includes those established for triptorelin pamoate and leuprolide acetate. For prescription drugs that are not on that list and do not require a prior authorization, the Agency does not verify the diagnosis code prior to paying the claim.

Plaintiffs' Question: *Please answer whether the prescribed drug criteria listed at https://ahca.myflorida.com/6edicaid/prescribed_drug/drug_criteria.shtml is an exhaustive list of the criteria relied upon by AHCA in reviewing whether a prescribed drug is medically necessary. If the above is not an exhaustive list, please provide documents indicating all other criteria on which AHCA relies in determining whether a prescribed drug is medically necessary for a particular patient, either during the prior authorization process, or after a claim has been paid (as described by Mr. Brackett).*

Agency Response: Yes, this is an exhaustive list.

Plaintiffs' Question: *Please answer whether Florida's Medicaid managed care plans are required to cover all drugs included in the PDL and, if so, whether the plans must follow the prior authorization requirements as indicated in the PDL.*

Agency Response: Yes, health plans participating in the Statewide Medicaid Managed Care program must cover all drugs on the Preferred Drug List and cannot be more restrictive when covering drugs that have a specific criteria.

Plaintiffs' Question: *Please identify the person who made edits to the GAPMS report on cross-sex hormone therapy dated May 20, 2022 as well as all individuals who accessed the document.*

Agency Response: The Agency identified the employee as Shantrice Greene, who worked as a senior pharmacist. She is no longer with the Agency.

Plaintiffs' Question: *Please provide the number of individuals who received Medicaid coverage for puberty suppression medications to treat gender dysphoria from January 1, 2015 to August 21, 2022.*

Agency Response: Please refer to the data file that was completed on March 1, 2023.

Plaintiffs' Question: *Please provide the number of grievances and the number of appeals filed with Florida Medicaid managed care plans regarding services excluded pursuant to Fla. Admin. Code R. 59G-1.050(7).*

Agency Response: The Agency found one complaint regarding the coverage of services under the challenged exclusion.

Plaintiffs' Question: *Please state whether, and if so, how many, Medicaid fair hearings have resulted in a reversal of a decision to deny coverage for any of the services listed at 59G-1.050(7), prior to the effective date of the Challenged Exclusion.*

Agency Response: The Agency identified zero fair hearings that were prior to the challenged exclusion.

Plaintiffs' Question: *Please provide the number of Medicaid fair hearings regarding a request for coverage of services listed at 59G-1.050(7) since August 21, 2022 including information about the adverse action being appealed and the final outcome.*

Agency Response: The Agency identified zero fair hearings that occurred after the implementation of the challenged exclusion.

Plaintiffs' Question: *Please identify the Florida Department of Health employee(s) who provided the name "Michelle Cretella" or the name of any other consultant who AHCA relied upon or consulted with in the drafting of the 2022 GAPMS Memo.*

Agency Response: All communication that occurred between the Agency and the Department of Health occurred through verbal conversations. Agency staff that participated in these discussions do not recall the specific Department of Health employee who provided the name.

Plaintiffs' Question: *Please identify all individuals who AHCA considered but decided not to use for assistance with drafting the June 2022 GAPMS report on treatment for gender dysphoria.*

Agency Response: Agency staff engaged in verbal communications with individuals that were referred by Dr. Michelle Cretella and do not recall the names of those individuals that were consulted.

Plaintiffs' Question: *Regarding the emails between AHCA and Magellan dated April 20, 2022 to June 3, 2022 (Def_000145166 to Def 000145169), please answer the following:*

- **Question:** *What does CCM mean?*
- **Agency Response:** Change Control Memo
- **Question:** *What does "gender code = B (Both)" mean?*
- **Agency Response:** That a covered outpatient prescription drug can be prescribed to both males and females.
- **Question:** *What is the "internal Gender Dysphoria criteria?"*
- **Agency Response:** The criteria provided to Magellan to utilize when reviewing prior authorization requests for GnRH antagonists.
- **Question:** *What is meaning of the following paragraph: "This internal document serves for GnRHanalog use to delay puberty in adolescents with Gender Dysphoria, but it does not speak to the use of hormone therapy (i.e.anastrozole, etc.).This document was provided by the Agency due to a fair hearing request received for Lupron for a recipient with this diagnosis. All requests*

required vetting by AHCA before a final determination is made, and MMA will continue to do so as instructed."

- **Agency Response:** This paragraph specifically references the internal prior authorization review criteria for GnRH antagonists and requires Magellan only to review requests for that one drug category and not any that involve hormones such as testosterone or estrogen.

TAB 175-36

AACAP Statement Responding to Efforts to ban Evidence-Based Care for Transgender and Gender Diverse Youth

November 8, 2019

Variations in gender expression represent normal and expectable dimensions of human development. They are not considered to be pathological. Health promotion for all youth encourages open exploration of all identity issues, including sexual orientation, gender identity, and/or gender expression according to recognized practice guidelines (1, 2). Research consistently demonstrates that gender diverse youth who are supported to live and/or explore the gender role that is consistent with their gender identity have better mental health outcomes than those who are not (3, 4, 5).

State-based legislation regarding the treatment of transgender youth that directly oppose the evidence-based care recognized by professional societies across multiple disciplines is a serious concern. Many reputable professional organizations, including the American Psychological Association, the American Psychiatric Association, the American Academy of Pediatrics, and the Endocrine Society, which represent tens of thousands of professionals across the United States, recognize natural variations in gender identity and expression and have published clinical guidance that promotes nondiscriminatory, supportive interventions for gender diverse youth based on the current evidence base. These interventions may include, and are not limited to, social gender transition, hormone blocking agents, hormone treatment, and affirmative psychotherapeutic modalities.

The American Academy of Child and Adolescent Psychiatry (AACAP) supports the use of current evidence-based clinical care with minors. AACAP strongly opposes any efforts – legal, legislative, and otherwise – to block access to these recognized interventions. Blocking access to timely care has been shown to increase youths' risk for suicidal ideation and other negative mental health outcomes. Consistent with AACAP's policy against conversion therapy (2), AACAP recommends that youth and their families formulate an individualized treatment plan with their clinician that addresses the youth's unique mental health needs under the premise that all gender identities and expressions are not inherently pathological.

TAB 175-37

All Policies

Pl. Trial Ex. 037

Care for the Transgender and Gender Nonbinary Patient

The American Academy of Family Physicians (AAFP) recognizes that diversity in gender identity and expression is a normal part of the human existence and does not represent pathology. The AAFP supports access to gender-affirming care for gender-diverse patients, including children and adolescents. Gender-affirming health care is part of comprehensive primary care for many gender-diverse patients, and may include supportive behavioral health care, gender-affirming hormones, puberty blockade, medical procedures, and surgical interventions.

Family physicians are uniquely suited to provide gender-affirming care because of their whole-person focus, ability to create care plans that meet the needs of diverse individuals, and longitudinal relationship with the patient across the entire lifespan. Family physicians who do not provide this care should take steps to ensure that patients requiring gender-affirming services are appropriately referred.

Transgender and gender nonbinary people often face social and economic marginalization, and experience a variety of barriers to healthcare, including overt discrimination, inadequate health insurance coverage, legislative interference in the physician-patient relationship, and poor physicia knowledge of appropriate treatment. The AAFP supports gender-affirming care as an evidence-informed intervention that can promote health equity for gender-diverse individuals, although wide sociopolitical efforts are necessary to further mitigate these barriers and advance equity. The AAF asserts the full spectrum of gender-affirming care should be legal and should remain a treatment decision between a physician and their patient.

The AAFP supports education on gender diversity and gender-affirming care at all levels of medical education, including medical school, residency and continuing professional development. (October 2020 BOD) (July 2022 BOD)

POLICY STATEMENT Organizational Principles to Guide and Define the Child Health Care System and/or Improve the Health of all Children

American Academy of Pediatrics
DEDICATED TO THE HEALTH OF ALL CHILDREN™

Ensuring Comprehensive Care and Support for Transgender and Gender-Diverse Children and Adolescents

Jason Rafferty, MD, MPH, EdM, FAAP, COMMITTEE ON PSYCHOSOCIAL ASPECTS OF CHILD AND FAMILY HEALTH, COMMITTEE ON ADOLESCENCE, SECTION ON LESBIAN, GAY, BISEXUAL, AND TRANSGENDER HEALTH AND WELLNESS

abstract

FREE

As a traditionally underserved population that faces numerous health disparities, youth who identify as transgender and gender diverse (TGD) and their families are increasingly presenting to pediatric providers for education, care, and referrals. The need for more formal training, standardized treatment, and research on safety and medical outcomes often leaves providers feeling ill equipped to support and care for patients that identify as TGD and families. In this policy statement, we review relevant concepts and challenges and provide suggestions for pediatric providers that are focused on promoting the health and positive development of youth that identify as TGD while eliminating discrimination and stigma.

INTRODUCTION

In its dedication to the health of all children, the American Academy of Pediatrics (AAP) strives to improve health care access and eliminate disparities for children and teenagers who identify as lesbian, gay, bisexual, transgender, or questioning (LGBTQ) of their sexual or gender identity.[1,2] Despite some advances in public awareness and legal protections, youth who identify as LGBTQ continue to face disparities that stem from multiple sources, including inequitable laws and policies, societal discrimination, and a lack of access to quality health care, including mental health care. Such challenges are often more intense for youth who do not conform to social expectations and norms regarding gender. Pediatric providers are increasingly encountering such youth and their families, who seek medical advice and interventions, yet they may lack the formal training to care for youth that identify as transgender and gender diverse (TGD) and their families.[3]

This policy statement is focused specifically on children and youth that identify as TGD rather than the larger LGBTQ population, providing brief, relevant background on the basis of current available research

Department of Pediatrics, Hasbro Children's Hospital, Providence, Rhode Island; Thundermist Health Centers, Providence, Rhode Island; and Department of Child Psychiatry, Emma Pendleton Bradley Hospital, East Providence, Rhode Island

Dr Rafferty conceptualized the statement, drafted the initial manuscript, reviewed and revised the manuscript, approved the final manuscript as submitted, and agrees to be accountable for all aspects of the work.

Policy statements from the American Academy of Pediatrics benefit from expertise and resources of liaisons and internal (AAP) and external reviewers. However, policy statements from the American Academy of Pediatrics may not reflect the views of the liaisons or the organizations or government agencies that they represent.

The guidance in this statement does not indicate an exclusive course of treatment or serve as a standard of medical care. Variations, taking into account individual circumstances, may be appropriate.

All policy statements from the American Academy of Pediatrics automatically expire 5 years after publication unless reaffirmed, revised, or retired at or before that time.

TABLE 1 Relevant Terms and Definitions Related to Gender Care

Term	Definition
Sex	An assignment that is made at birth, usually male or female, typically on the basis of external genital anatomy but sometimes on the basis of internal gonads, chromosomes, or hormone levels
Gender identity	A person's deep internal sense of being female, male, a combination of both, somewhere in between, or neither, resulting from a multifaceted interaction of biological traits, environmental factors, self-understanding, and cultural expectations
Gender expression	The external way a person expresses their gender, such as with clothing, hair, mannerisms, activities, or social roles
Gender perception	The way others interpret a person's gender expression
Gender diverse	A term that is used to describe people with gender behaviors, appearances, or identities that are incongruent with those culturally assigned to their birth sex; gender-diverse individuals may refer to themselves with many different terms, such as transgender, nonbinary, genderqueer,[7] gender fluid, gender creative, gender independent, or noncisgender. "Gender diverse" is used to acknowledge and include the vast diversity of gender identities that exists. It replaces the former term, "gender nonconforming," which has a negative and exclusionary connotation.
Transgender	A subset of gender-diverse youth whose gender identity does not match their assigned sex and generally remains persistent, consistent, and insistent over time; the term "transgender" also encompasses many other labels individuals may use to refer to themselves.
Cisgender	A term that is used to describe a person who identifies and expresses a gender that is consistent with the culturally defined norms of the sex they were assigned at birth
Agender	A term that is used to describe a person who does not identify as having a particular gender
Affirmed gender	When a person's true gender identity, or concern about their gender identity, is communicated to and validated from others as authentic
MTF; affirmed female; trans female	Terms that are used to describe individuals who were assigned male sex at birth but who have a gender identity and/or expression that is asserted to be more feminine
FTM; affirmed male; trans male	Terms that are used to describe individuals who were assigned female sex at birth but who have a gender identity and/or expression that is asserted to be more masculine
Gender dysphoria	A clinical symptom that is characterized by a sense of alienation to some or all of the physical characteristics or social roles of one's assigned gender; also, gender dysphoria is the psychiatric diagnosis in the *DSM-5*, which has focus on the distress that stems from the incongruence between one's expressed or experienced (affirmed) gender and the gender assigned at birth.
Gender identity disorder	A psychiatric diagnosis defined previously in the *DSM-IV* (changed to "gender dysphoria" in the *DSM-5*); the primary criteria include a strong, persistent cross-sex identification and significant distress and social impairment. This diagnosis is no longer appropriate for use and may lead to stigma, but the term may be found in older research.
Sexual orientation	A person's sexual identity in relation to the gender(s) to which they are attracted; sexual orientation and gender identity develop separately.

This list is not intended to be all inclusive. The pronouns "they" and "their" are used intentionally to be inclusive rather than the binary pronouns "he" and "she" and "his" and "her." Adapted from Bonifacio HJ, Rosenthal SM. Gender variance and dysphoria in children and adolescents. *Pediatr Clin North Am*. 2015;62(4):1001–1016. Adapted from Vance SR Jr, Ehrensaft D, Rosenthal SM. Psychological and medical care of gender nonconforming youth. *Pediatrics*. 2014;134(6):1184–1192. DSM-5, *Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition*; DSM-IV, *Diagnostic and Statistical Manual of Mental Disorders, Fourth Edition*; FTM, female to male; MTF, male to female.

and expert opinion from clinical and research leaders, which will serve as the basis for recommendations. It is not a comprehensive review of clinical approaches and nuances to pediatric care for children and youth that identify as TGD. Professional understanding of youth that identify as TGD is a rapidly evolving clinical field in which research on appropriate clinical management is limited by insufficient funding.[3,4]

DEFINITIONS

To clarify recommendations and discussions in this policy statement, some definitions are provided. However, brief descriptions of human behavior or identities may not capture nuance in this evolving field. "Sex," or "natal gender," is a label, generally "male" or "female," that is typically assigned at birth on the basis of genetic and anatomic characteristics, such as genital anatomy, chromosomes, and sex hormone levels. Meanwhile, "gender identity" is one's internal sense of who one is, which results from a multifaceted interaction of biological traits, developmental influences, and environmental conditions. It may be male, female, somewhere in between, a combination of both, or neither (ie, not conforming to a binary conceptualization of gender). Self-recognition of gender identity develops over time, much the same way as a child's physical body does. For some people, gender identity can be fluid, shifting in different contexts. "Gender expression" refers to the wide array of ways people display their gender through clothing, hair styles, mannerisms, or social roles. Exploring different ways of expressing gender is common for children and may challenge social expectations. The way others interpret this expression is referred to as "gender perception" (Table 1).[5,6]

These labels may or may not be congruent. The term "cisgender" is used if someone identifies and expresses a gender that is consistent with the culturally defined norms of the sex that was assigned at birth. "Gender diverse" is an umbrella term to describe an ever-evolving array of labels that people may apply when their gender identity, expression, or even perception does not conform

to the norms and stereotypes others expect of their assigned sex. "Transgender" is usually reserved for a subset of such youth whose gender identity does not match their assigned sex and generally remains persistent, consistent, and insistent over time. These terms are not diagnoses; rather, they are personal and often dynamic ways of describing one's own gender experience.

Gender identity is not synonymous with "sexual orientation," which refers to a person's identity in relation to the gender(s) to which they are sexually and romantically attracted. Gender identity and sexual orientation are distinct but interrelated constructs.[8] Therefore, being transgender does not imply a sexual orientation, and people who identify as transgender still identify as straight, gay, bisexual, etc, on the basis of their attractions. (For more information, *The Gender Book*, found at www.thegenderbook.com, is a resource with illustrations that are used to highlight these core terms and concepts.)

EPIDEMIOLOGY

In population-based surveys, questions related to gender identity are rarely asked, which makes it difficult to assess the size and characteristics of the population that is TGD. In the 2014 Behavioral Risk Factor Surveillance System of the Centers for Disease Control and Prevention, only 19 states elected to include optional questions on gender identity. Extrapolation from these data suggests that the US prevalence of adults who identify as transgender or "gender nonconforming" is 0.6% (1.4 million), ranging from 0.3% in North Dakota to 0.8% in Hawaii.[9] On the basis of these data, it has been estimated that 0.7% of youth ages 13 to 17 years (~150 000) identify as transgender.[10] This number is much higher than previous estimates, which were extrapolated from individual states or specialty clinics, and is likely an underestimate given the stigma regarding those who openly identify as transgender and the difficulty in defining "transgender" in a way that is inclusive of all gender-diverse identities.[11]

There have been no large-scale prevalence studies among children and adolescents, and there is no evidence that adult statistics reflect young children or adolescents. In the 2014 Behavioral Risk Factor Surveillance System, those 18 to 24 years of age were more likely than older age groups to identify as transgender (0.7%).[9] Children report being aware of gender incongruence at young ages. Children who later identify as TGD report first having recognized their gender as "different" at an average age of 8.5 years; however, they did not disclose such feelings until an average of 10 years later.[12]

MENTAL HEALTH IMPLICATIONS

Adolescents and adults who identify as transgender have high rates of depression, anxiety, eating disorders, self-harm, and suicide.[13–20] Evidence suggests that an identity of TGD has an increased prevalence among individuals with autism spectrum disorder, but this association is not yet well understood.[21,22] In 1 retrospective cohort study, 56% of youth who identified as transgender reported previous suicidal ideation, and 31% reported a previous suicide attempt, compared with 20% and 11% among matched youth who identified as cisgender, respectively.[13] Some youth who identify as TGD also experience gender dysphoria, which is a specific diagnosis given to those who experience impairment in peer and/or family relationships, school performance, or other aspects of their life as a consequence of the incongruence between their assigned sex and their gender identity.[23]

There is no evidence that risk for mental illness is inherently attributable to one's identity of TGD. Rather, it is believed to be multifactorial, stemming from an internal conflict between one's appearance and identity, limited availability of mental health services, low access to health care providers with expertise in caring for youth who identify as TGD, discrimination, stigma, and social rejection.[24] This was affirmed by the American Psychological Association in 2008[25] (with practice guidelines released in 2015[8]) and the American Psychiatric Association, which made the following statement in 2012:

> *Being transgender or gender variant implies no impairment in judgment, stability, reliability, or general social or vocational capabilities; however, these individuals often experience discrimination due to a lack of civil rights protections for their gender identity or expression.... [Such] discrimination and lack of equal civil rights is damaging to the mental health of transgender and gender variant individuals.*[26]

Youth who identify as TGD often confront stigma and discrimination, which contribute to feelings of rejection and isolation that can adversely affect physical and emotional well-being. For example, many youth believe that they must hide their gender identity and expression to avoid bullying, harassment, or victimization. Youth who identify as TGD experience disproportionately high rates of homelessness, physical violence (at home and in the community), substance abuse, and high-risk sexual behaviors.[5,6,12,27–31] Among the 3 million HIV testing events that were reported in 2015, the highest percentages of new infections were among women who identified as transgender[32] and were also at particular risk for not knowing their HIV status.[30]

GENDER-AFFIRMATIVE CARE

In a gender-affirmative care model (GACM), pediatric providers offer developmentally appropriate care that is oriented toward understanding and appreciating the youth's gender experience. A strong, nonjudgmental partnership with youth and their families can facilitate exploration of complicated emotions and gender-diverse expressions while allowing questions and concerns to be raised in a supportive environment.[5] In a GACM, the following messages are conveyed:

- transgender identities and diverse gender expressions do not constitute a mental disorder;
- variations in gender identity and expression are normal aspects of human diversity, and binary definitions of gender do not always reflect emerging gender identities;
- gender identity evolves as an interplay of biology, development, socialization, and culture; and
- if a mental health issue exists, it most often stems from stigma and negative experiences rather than being intrinsic to the child.[27,33]

The GACM is best facilitated through the integration of medical, mental health, and social services, including specific resources and supports for parents and families.[24] Providers work together to destigmatize gender variance, promote the child's self-worth, facilitate access to care, educate families, and advocate for safer community spaces where children are free to develop and explore their gender.[5] A specialized gender-affirmative therapist, when available, may be an asset in helping children and their families build skills for dealing with gender-based stigma, address symptoms of anxiety or depression, and reinforce the child's overall resiliency.[34,35] There is a limited but growing body of evidence that suggests that using an integrated affirmative model results in young people having fewer mental health concerns whether they ultimately identify as transgender.[24,36,37]

In contrast, "conversion" or "reparative" treatment models are used to prevent children and adolescents from identifying as transgender or to dissuade them from exhibiting gender-diverse expressions. The Substance Abuse and Mental Health Services Administration has concluded that any therapeutic intervention with the goal of changing a youth's gender expression or identity is inappropriate.[33] Reparative approaches have been proven to be not only unsuccessful[38] but also deleterious and are considered outside the mainstream of traditional medical practice.[29,39–42] The AAP described reparative approaches as "unfair and deceptive."[43] At the time of this writing,* conversion therapy was banned by executive regulation in New York and by legislative statutes in 9 other states as well as the District of Columbia.[44]

Pediatric providers have an essential role in assessing gender concerns and providing evidence-based information to assist youth and families in medical decision-making. Not doing so can prolong or exacerbate gender dysphoria and contribute to abuse and stigmatization.[35] If a pediatric provider does not feel prepared to address gender concerns when they occur, then referral to a pediatric or mental health provider with more expertise is appropriate. There is little research on communication and efficacy with transfers in care for youth who identify as TGD, particularly from pediatric to adult providers.

DEVELOPMENTAL CONSIDERATIONS

Acknowledging that the capacity for emerging abstract thinking in childhood is important to conceptualize and reflect on identity, gender-affirmation guidelines are being focused on individually tailored interventions on the basis of the physical and cognitive development of youth who identify as TGD.[45] Accordingly, research substantiates that children who are prepubertal and assert an identity of TGD know their gender as clearly and as consistently as their developmentally equivalent peers who identify as cisgender and benefit from the same level of social acceptance.[46] This developmental approach to gender affirmation is in contrast to the outdated approach in which a child's gender-diverse assertions are held as "possibly true" until an arbitrary age (often after pubertal onset) when they can be considered valid, an approach that authors of the literature have termed "watchful waiting." This outdated approach does not serve the child because critical support is withheld. Watchful waiting is based on binary notions of gender in which gender diversity and fluidity is pathologized; in watchful waiting, it is also assumed that notions of gender identity become fixed at a certain age. The approach is also influenced by a group of early studies with validity concerns, methodologic flaws, and limited follow-up on children who identified as TGD and, by adolescence, did not seek further treatment ("desisters").[45,47] More robust and current research suggests that, rather than focusing on who a child will become, valuing them for who they are, even at a young age, fosters secure attachment and resilience, not only for the child but also for the whole family.[5,45,48,49]

MEDICAL MANAGEMENT

Pediatric primary care providers are in a unique position to routinely inquire about gender development in children and adolescents as part of recommended well-child visits[50] and to be a reliable source of validation, support, and reassurance. They are often the first provider to be aware that a child may not identify as cisgender or that there may be distress related to a gender-diverse identity. The best way to approach gender with patients is to inquire directly and nonjudgmentally about their experience and feelings before applying any labels.[27,51]

Many medical interventions can be offered to youth who identify as TGD and their families. The decision of whether and when to initiate gender-affirmative treatment is personal and involves careful consideration of risks, benefits, and other factors unique to each patient and family. Many protocols suggest that clinical assessment of youth who identify as TGD is ideally conducted on an ongoing basis in the setting of a collaborative, multidisciplinary approach, which, in addition to the patient and family, may include the pediatric provider, a mental health provider (preferably with expertise in caring for youth who identify as TGD), social and legal supports, and a pediatric endocrinologist or adolescent-medicine gender specialist, if available.[6,28] There is no prescribed path, sequence, or end point. Providers can make every effort to be aware of the influence of their own biases. The medical options also vary depending on pubertal and developmental progression.

Clinical Setting

In the past year, 1 in 4 adults who identified as transgender avoided a necessary doctor's visit because of fear of being mistreated.[31] All clinical office staff have a role in affirming a patient's gender identity. Making flyers available or displaying posters related to LGBTQ health issues, including information for children who identify as TGD and families, reveals inclusivity and awareness. Generally, patients who identify as TGD feel most comfortable when they have access to a gender-neutral restroom. Diversity training that encompasses sensitivity when caring for youth who identify as TGD and their families can be helpful in educating clinical and administrative staff. A patient-asserted name and pronouns are used by staff and are ideally reflected in the electronic medical record without creating duplicate charts.[52,53] The US Centers for Medicare and Medicaid Services and the National Coordinator for Health Information Technology require all electronic health record systems certified under the Meaningful Use incentive program to have the capacity to confidentially collect information on gender identity.[54,55] Explaining and maintaining confidentiality procedures promotes openness and trust, particularly with youth who identify as LGBTQ.[1] Maintaining a safe clinical space can provide at least 1 consistent, protective refuge for patients and families, allowing authentic gender expression and exploration that builds resiliency.

Pubertal Suppression

Gonadotrophin-releasing hormones have been used to delay puberty since the 1980s for central precocious puberty.[56] These reversible treatments can also be used in adolescents who experience gender dysphoria to prevent development of secondary sex characteristics and provide time up until 16 years of age for the individual and the family to explore gender identity, access psychosocial supports, develop coping skills, and further define appropriate treatment goals. If pubertal suppression treatment is suspended, then endogenous puberty will resume.[20,57,58]

Often, pubertal suppression creates an opportunity to reduce distress that may occur with the development of secondary sexual characteristics and allow for gender-affirming care, including mental health support for the adolescent and the family. It reduces the need for later surgery because physical changes that are otherwise irreversible (protrusion of the Adam's apple, male pattern baldness, voice change, breast growth, etc) are prevented. The available data reveal that pubertal suppression in children who identify as TGD generally leads to improved psychological functioning in adolescence and young adulthood.[20,57–59]

Pubertal suppression is not without risks. Delaying puberty beyond one's peers can also be stressful and can lead to lower self-esteem and increased risk taking.[60] Some experts believe that genital underdevelopment may limit some potential reconstructive options.[61] Research on long-term risks, particularly in terms of bone metabolism[62] and fertility,[63] is currently limited and provides varied results.[57,64,65] Families often look to pediatric providers for help in considering whether pubertal suppression is indicated in the context of their child's overall well-being as gender diverse.

Gender Affirmation

As youth who identify as TGD reflect on and evaluate their gender identity, various interventions may be considered to better align their gender expression with their underlying identity. This process of reflection, acceptance, and, for some, intervention is known as "gender affirmation." It was formerly referred to as "transitioning," but many view the process as an affirmation and acceptance of who they have always been rather than a transition

TABLE 2 The Process of Gender Affirmation May Include ≥1 of the Following Components

Component	Definition	General Age Range[a]	Reversibility[a]
Social affirmation	Adopting gender-affirming hairstyles, clothing, name, gender pronouns, and restrooms and other facilities	Any	Reversible
Puberty blockers	Gonadotropin-releasing hormone analogues, such as leuprolide and histrelin	During puberty (Tanner stage 2–5)[b]	Reversible[c]
Cross-sex hormone therapy	Testosterone (for those who were assigned female at birth and are masculinizing); estrogen plus androgen inhibitor (for those who were assigned male at birth and are feminizing)	Early adolescence onward	Partially reversible (skin texture, muscle mass, and fat deposition); irreversible once developed (testosterone: Adam's apple protrusion, voice changes, and male pattern baldness; estrogen: breast development); unknown reversibility (effect on fertility)
Gender-affirming surgeries	"Top" surgery (to create a male-typical chest shape or enhance breasts); "bottom" surgery (surgery on genitals or reproductive organs); facial feminization and other procedures	Typically adults (adolescents on case-by-case basis[d])	Not reversible
Legal affirmation	Changing gender and name recorded on birth certificate, school records, and other documents	Any	Reversible

[a] Note that the provided age range and reversibility is based on the little data that are currently available.

[b] There is limited benefit to starting gonadotropin-releasing hormone after Tanner stage 5 for pubertal suppression. However, when cross-sex hormones are initiated with a gradually increasing schedule, the initial levels are often not high enough to suppress endogenous sex hormone secretion. Therefore, gonadotropin-releasing hormone may be continued in accordance with the Endocrine Society Guidelines.[68]

[c] The effect of sustained puberty suppression on fertility is unknown. Pubertal suppression can be, and often is indicated to be, followed by cross-sex hormone treatment. However, when cross-sex hormones are initiated without endogenous hormones, then fertility may be decreased.[68]

[d] Eligibility criteria for gender-affirmative surgical interventions among adolescents are not clearly defined between established protocols and practice. When applicable, eligibility is usually determined on a case-by-case basis with the adolescent and the family along with input from medical, mental health, and surgical providers.[68–71]

from 1 gender identity to another. Accordingly, some people who have gone through the process prefer to call themselves "affirmed females, males, etc" (or just "females, males, etc"), rather than using the prefix "trans-." Gender affirmation is also used to acknowledge that some individuals who identify as TGD may feel affirmed in their gender without pursuing medical or surgical interventions.[7,66]

Supportive involvement of parents and family is associated with better mental and physical health outcomes.[67] Gender affirmation among adolescents with gender dysphoria often reduces the emphasis on gender in their lives, allowing them to attend to other developmental tasks, such as academic success, relationship building, and future-oriented planning.[64] Most protocols for gender-affirming interventions incorporate World Professional Association of Transgender Health[35] and Endocrine Society[68] recommendations and include ≥1 of the following elements (Table 2):

1. Social Affirmation: This is a reversible intervention in which children and adolescents express partially or completely in their asserted gender identity by adapting hairstyle, clothing, pronouns, name, etc. Children who identify as transgender and socially affirm and are supported in their asserted gender show no increase in depression and only minimal (clinically insignificant) increases in anxiety compared with age-matched averages.[48] Social affirmation can be complicated given the wide range of social interactions children have (eg, extended families, peers, school, community, etc). There is little guidance on the best approach (eg, all at once, gradual, creating new social networks, or affirming within existing networks, etc). Pediatric providers can best support families by anticipating and discussing such complexity proactively, either in their own practice or through enlisting a qualified mental health provider.

2. Legal Affirmation: Elements of a social affirmation, such as a name and gender marker, become official on legal documents, such as birth certificates, passports, identification cards, school documents, etc. The processes for making these changes depend on state laws and may require specific documentation from pediatric providers.

3. Medical Affirmation: This is the process of using cross-sex hormones to allow adolescents who have initiated puberty to develop secondary sex characteristics of the opposite biological sex. Some changes are partially reversible if hormones are stopped, but others become

irreversible once they are fully developed (Table 2).

4. Surgical Affirmation: Surgical approaches may be used to feminize or masculinize features, such as hair distribution, chest, or genitalia, and may include removal of internal organs, such as ovaries or the uterus (affecting fertility). These changes are irreversible. Although current protocols typically reserve surgical interventions for adults,[35,68] they are occasionally pursued during adolescence on a case-by-case basis, considering the necessity and benefit to the adolescent's overall health and often including multidisciplinary input from medical, mental health, and surgical providers as well as from the adolescent and family.[69–71]

For some youth who identify as TGD whose natal gender is female, menstruation, breakthrough bleeding, and dysmenorrhea can lead to significant distress before or during gender affirmation. The American College of Obstetrics and Gynecology suggests that, although limited data are available to outline management, menstruation can be managed without exogenous estrogens by using a progesterone-only pill, a medroxyprogesterone acetate shot, or a progesterone-containing intrauterine or implantable device.[72] If estrogen can be tolerated, oral contraceptives that contain both progesterone and estrogen are more effective at suppressing menses.[73] The Endocrine Society guidelines also suggest that gonadotrophin-releasing hormones can be used for menstrual suppression before the anticipated initiation of testosterone or in combination with testosterone for breakthrough bleeding (enables phenotypic masculinization at a lower dose than if testosterone is used alone).[68] Masculinizing hormones in natal female patients may lead to a cessation of menses, but unplanned pregnancies have been reported, which emphasizes the need for ongoing contraceptive counseling with youth who identify as TGD.[72]

HEALTH DISPARITIES

In addition to societal challenges, youth who identify as TGD face several barriers within the health care system, especially regarding access to care. In 2015, a focus group of youth who identified as transgender in Seattle, Washington, revealed 4 problematic areas related to health care:

1. safety issues, including the lack of safe clinical environments and fear of discrimination by providers;
2. poor access to physical health services, including testing for sexually transmitted infections;
3. inadequate resources to address mental health concerns; and
4. lack of continuity with providers.[74]

This study reveals the obstacles many youth who identify as TGD face in accessing essential services, including the limited supply of appropriately trained medical and psychological providers, fertility options, and insurance coverage denials for gender-related treatments.[74]

Insurance denials for services related to the care of patients who identify as TGD are a significant barrier. Although the Office for Civil Rights of the US Department of Health and Human Services explicitly stated in 2012 that the nondiscrimination provision in the Patient Protection and Affordable Care Act includes people who identify as gender diverse,[75,76] insurance claims for gender affirmation, particularly among youth who identify as TGD, are frequently denied.[54,77] In 1 study, it was found that approximately 25% of individuals who identified as transgender were denied insurance coverage because of being transgender.[31] The burden of covering medical expenses that are not covered by insurance can be financially devastating, and even when expenses are covered, families describe high levels of stress in navigating and submitting claims appropriately.[78] In 2012, a large gender center in Boston, Massachusetts, reported that most young patients who identified as transgender and were deemed appropriate candidates for recommended gender care were unable to obtain it because of such denials, which were based on the premise that gender dysphoria was a mental disorder, not a physical one, and that treatment was not medically or surgically necessary.[24] This practice not only contributes to stigma, prolonged gender dysphoria, and poor mental health outcomes,[77] but it may also lead patients to seek nonmedically supervised treatments that are potentially dangerous.[24] Furthermore, insurance denials can reinforce a socioeconomic divide between those who can finance the high costs of uncovered care and those who cannot.[24,77]

The transgender youth group in Seattle likely reflected the larger TGD population when they described how obstacles adversely affect self-esteem and contribute to the perception that they are undervalued by society and the health care system.[74,77] Professional medical associations, including the AAP, are increasingly calling for equity in health care provisions regardless of gender identity or expression.[1,8,23,72] There is a critical need for investments in research on the prevalence, disparities, biological underpinnings, and standards of care relating to gender-diverse populations. Pediatric providers who work with state government and insurance officials can play an essential role in advocating for

stronger nondiscrimination policies and improved coverage.

There is a lack of quality research on the experience of youth of color who identify as transgender. One theory suggests that the intersection of racism, transphobia, and sexism may result in the extreme marginalization that is experienced among many women of color who identify as transgender,[79] including rejection from their family and dropping out of school at younger ages (often in the setting of rigid religious beliefs regarding gender),[80] increased levels of violence and body objectification,[81] 3 times the risk of poverty compared with the general population,[31] and the highest prevalence of HIV compared with other risk groups (estimated as high as 56.3% in 1 meta-analysis).[30] One model suggests that pervasive stigma and oppression can be associated with psychological distress (anxiety, depression, and suicide) and adoption of risk behaviors by such youth to obtain a sense of validation toward their complex identities.[79]

FAMILY ACCEPTANCE

Research increasingly suggests that familial acceptance or rejection ultimately has little influence on the gender identity of youth; however, it may profoundly affect young people's ability to openly discuss or disclose concerns about their identity. Suppressing such concerns can affect mental health.[82] Families often find it hard to understand and accept their child's gender-diverse traits because of personal beliefs, social pressure, and stigma.[49,83] Legitimate fears may exist for their child's welfare, safety, and acceptance that pediatric providers need to appreciate and address. Families can be encouraged to communicate their concerns and questions. Unacknowledged concerns can contribute to shame and hesitation in regard to offering support and understanding,[84] which is essential for the child's self-esteem, social involvement, and overall health as TGD.[48,85–87] Some caution has been expressed that unquestioning acceptance per se may not best serve questioning youth or their families. Instead, psychological evidence suggests that the most benefit comes when family members and youth are supported and encouraged to engage in reflective perspective taking and validate their own and the other's thoughts and feelings despite divergent views.[49,82]

In this regard, suicide attempt rates among 433 adolescents in Ontario who identified as "trans" were 4% among those with strongly supportive parents and as high as 60% among those whose parents were not supportive.[85] Adolescents who identify as transgender and endorse at least 1 supportive person in their life report significantly less distress than those who only experience rejection. In communities with high levels of support, it was found that nonsupportive families tended to increase their support over time, leading to dramatic improvement in mental health outcomes among their children who identified as transgender.[88]

Pediatric providers can create a safe environment for parents and families to better understand and listen to the needs of their children while receiving reassurance and education.[83] It is often appropriate to assist the child in understanding the parents' concerns as well. Despite expectations by some youth with transgender identity for immediate acceptance after "coming out," family members often proceed through a process of becoming more comfortable and understanding of the youth's gender identity, thoughts, and feelings. One model suggests that the process resembles grieving, wherein the family separates from their expectations for their child to embrace a new reality. This process may proceed through stages of shock, denial, anger, feelings of betrayal, fear, self-discovery, and pride.[89] The amount of time spent in any of these stages and the overall pace varies widely. Many family members also struggle as they are pushed to reflect on their own gender experience and assumptions throughout this process. In some situations, youth who identify as TGD may be at risk for internalizing the difficult emotions that family members may be experiencing. In these cases, individual and group therapy for the family members may be helpful.[49,78]

Family dynamics can be complex, involving disagreement among legal guardians or between guardians and their children, which may affect the ability to obtain consent for any medical management or interventions. Even in states where minors may access care without parental consent for mental health services, contraception, and sexually transmitted infections, parental or guardian consent is required for hormonal and surgical care of patients who identify as TGD.[72,90] Some families may take issue with providers who address gender concerns or offer gender-affirming care. In rare cases, a family may deny access to care that raises concerns about the youth's welfare and safety; in those cases, additional legal or ethical support may be useful to consider. In such rare situations, pediatric providers may want to familiarize themselves with relevant local consent laws and maintain their primary responsibility for the welfare of the child.

SAFE SCHOOLS AND COMMUNITIES

Youth who identify as TGD are becoming more visible because gender-diverse expression is increasingly admissible in the media, on social media, and in schools and communities. Regardless of whether a youth with a gender-diverse

identity ultimately identifies as transgender, challenges exist in nearly every social context, from lack of understanding to outright rejection, isolation, discrimination, and victimization. In the US Transgender Survey of nearly 28 000 respondents, it was found that among those who were out as or perceived to be TGD between kindergarten and eighth grade, 54% were verbally harassed, 24% were physically assaulted, and 13% were sexually assaulted; 17% left school because of maltreatment.[31] Education and advocacy from the medical community on the importance of safe schools for youth who identify as TGD can have a significant effect.

At the time of this writing,* only 18 states and the District of Columbia had laws that prohibited discrimination based on gender expression when it comes to employment, housing, public accommodations, and insurance benefits. Over 200 US cities have such legislation. In addition to basic protections, many youth who identify as TGD also have to navigate legal obstacles when it comes to legally changing their name and/or gender marker.[54] In addition to advocating and working with policy makers to promote equal protections for youth who identify as TGD, pediatric providers can play an important role by developing a familiarity with local laws and organizations that provide social work and legal assistance to youth who identify as TGD and their families.

School environments play a significant role in the social and emotional development of children. Every child has a right to feel safe and respected at school, but for youth who identify as TGD, this can be challenging. Nearly every aspect of school life may present safety concerns and require negotiations regarding their gender expression, including name/pronoun use, use of bathrooms and locker rooms, sports teams, dances and activities, overnight activities, and even peer groups. Conflicts in any of these areas can quickly escalate beyond the school's control to larger debates among the community and even on a national stage.

The formerly known Gay, Lesbian, and Straight Education Network (GLSEN), an advocacy organization for youth who identify as LGBTQ, conducts an annual national survey to measure LGBTQ well-being in US schools. In 2015, students who identified as LGBTQ reported high rates of being discouraged from participation in extracurricular activities. One in 5 students who identified as LGBTQ reported being hindered from forming or participating in a club to support lesbian, gay, bisexual, or transgender students (eg, a gay straight alliance, now often referred to as a genders and sexualities alliance) despite such clubs at schools being associated with decreased reports of negative remarks about sexual orientation or gender expression, increased feelings of safety and connectedness at school, and lower levels of victimization. In addition, >20% of students who identified as LGBTQ reported being blocked from writing about LGBTQ issues in school yearbooks or school newspapers or being prevented or discouraged by coaches and school staff from participating in sports because of their sexual orientation or gender expression.[91]

One strategy to prevent conflict is to proactively support policies and protections that promote inclusion and safety of all students. However, such policies are far from consistent across districts. In 2015, GLSEN found that 43% of children who identified as LGBTQ reported feeling unsafe at school because of their gender expression, but only 6% reported that their school had official policies to support youth who identified as TGD, and only 11% reported that their school's antibullying policies had specific protections for gender expression.[91] Consequently, more than half of the students who identified as transgender in the study were prevented from using the bathroom, names, or pronouns that aligned with their asserted gender at school. A lack of explicit policies that protected youth who identified as TGD was associated with increased reported victimization, with more than half of students who identified as LGBTQ reporting verbal harassment because of their gender expression. Educators and school administrators play an essential role in advocating for and enforcing such policies. GLSEN found that when students recognized actions to reduce gender-based harassment, both students who identified as transgender and cisgender reported a greater connection to staff and feelings of safety.[91] In another study, schools were open to education regarding gender diversity and were willing to implement policies when they were supported by external agencies, such as medical professionals.[92]

Academic content plays an important role in building a safe school environment as well. The 2015 GLSEN survey revealed that when positive representations of people who identified as LGBTQ were included in the curriculum, students who identified as LGBTQ reported less hostile school environments, less victimization and greater feelings of safety, fewer school absences because of feeling unsafe, greater feelings of connectedness to their school

community, and an increased interest in high school graduation and postsecondary education.[91] At the time of this writing,* 8 states had laws that explicitly forbade teachers from even discussing LGBTQ issues.[54]

MEDICAL EDUCATION

One of the most important ways to promote high-quality health care for youth who identify as TGD and their families is increasing the knowledge base and clinical experience of pediatric providers in providing culturally competent care to such populations, as recommended by the recently released guidelines by the Association of American Medical Colleges.[93] This begins with the medical school curriculum in areas such as human development, sexual health, endocrinology, pediatrics, and psychiatry. In a 2009–2010 survey of US medical schools, it was found that the median number of hours dedicated to LGBTQ health was 5, with one-third of US medical schools reporting no LGBTQ curriculum during the clinical years.[94]

During residency training, there is potential for gender diversity to be emphasized in core rotations, especially in pediatrics, psychiatry, family medicine, and obstetrics and gynecology. Awareness could be promoted through the inclusion of topics relevant to caring for children who identify as TGD in the list of core competencies published by the American Board of Pediatrics, certifying examinations, and relevant study materials. Continuing education and maintenance of certification activities can include topics relevant to TGD populations as well.

* For more information regarding state-specific laws, please contact the AAP Division of State Government Affairs at stgov@ aap.org.

RECOMMENDATIONS

The AAP works toward all children and adolescents, regardless of gender identity or expression, receiving care to promote optimal physical, mental, and social well-being. Any discrimination based on gender identity or expression, real or perceived, is damaging to the socioemotional health of children, families, and society. In particular, the AAP recommends the following:

1. that youth who identify as TGD have access to comprehensive, gender-affirming, and developmentally appropriate health care that is provided in a safe and inclusive clinical space;
2. that family-based therapy and support be available to recognize and respond to the emotional and mental health needs of parents, caregivers, and siblings of youth who identify as TGD;
3. that electronic health records, billing systems, patient-centered notification systems, and clinical research be designed to respect the asserted gender identity of each patient while maintaining confidentiality and avoiding duplicate charts;
4. that insurance plans offer coverage for health care that is specific to the needs of youth who identify as TGD, including coverage for medical, psychological, and, when indicated, surgical gender-affirming interventions;
5. that provider education, including medical school, residency, and continuing education, integrate core competencies on the emotional and physical health needs and best practices for the care of youth who identify as TGD and their families;
6. that pediatricians have a role in advocating for, educating, and developing liaison relationships with school districts and other community organizations to promote acceptance and inclusion of all children without fear of harassment, exclusion, or bullying because of gender expression;
7. that pediatricians have a role in advocating for policies and laws that protect youth who identify as TGD from discrimination and violence;
8. that the health care workforce protects diversity by offering equal employment opportunities and workplace protections, regardless of gender identity or expression; and
9. that the medical field and federal government prioritize research that is dedicated to improving the quality of evidence-based care for youth who identify as TGD.

ACOG COMMITTEE OPINION

Number 823

(Replaces Committee Opinion 512, December 2011, and Committee Opinion 685, January 2017)

Committee on Gynecologic Practice and Committee on Health Care for Underserved Women

This Committee Opinion was developed by the American College of Obstetricians and Gynecologists' Committee on Gynecologic Practice and Committee on Health Care for Underserved Women in collaboration with committee members Beth Cronin, MD and Colleen K. Stockdale MD, MS.

Health Care for Transgender and Gender Diverse Individuals

ABSTRACT: An estimated 150,000 youth and 1.4 million adults living in the United States identify as transgender. This Committee Opinion offers guidance on providing inclusive and affirming care as well as clinical information on hormone therapy and preventive care; it also cites existing resources for those seeking information on the care of transgender adolescents. The social and economic marginalization of transgender individuals is widespread, which leads to health care inequities and poorer health outcomes for this population. To reduce the inequities experienced by the transgender community, the provision of inclusive health care is essential. Obstetrician–gynecologists should strive to make their offices open to and inclusive for all individuals and should seek out education to address health care disparities, both in their individual practices and in the larger health care system. In order to provide the best care for patients, it is useful to know which health care professionals to include in a referral network for primary care and to have many clinician and surgeon options given the many different therapies available and the different sites at which these therapies are offered. It is important to remember that although hormone therapy is a medically necessary treatment for many transgender individuals with gender dysphoria, not all transgender patients experience gender dysphoria and not everyone desires hormone treatment. Gender-affirming hormone therapy is not effective contraception. Sexually active individuals with retained gonads who do not wish to become pregnant or cause pregnancy in others should be counseled about the possibility of pregnancy if they are having sexual activity that involves sperm and oocytes. Although being knowledgeable about the medications used for gender transition and potential risks and side effects is important, specific certification for prescribing them is not required and should not be a limiting factor in helping patients access care.

Recommendations and Conclusions

The American College of Obstetricians and Gynecologists makes the following conclusions and recommendations regarding health care for transgender and gender diverse individuals:

The American College of Obstetricians and Gynecologists opposes discrimination on the basis of gender identity, urges public and private health insurance plans to cover necessary services for individuals with gender dysphoria, and advocates for inclusive, thoughtful, and affirming care for transgender individuals.

- Obstetrician–gynecologists should make their offices inclusive and inviting to all individuals who need obstetric or gynecologic health care. They should take steps to educate themselves and their medical teams about appropriate language and the health care needs of transgender patients.
- Fertility and parenting desires should be discussed early in the process of transition, before the initiation of hormone therapy or gender affirmation surgery.
- Gender-affirming hormone therapy is not effective contraception. Sexually active individuals with retained gonads who do not wish to become pregnant

or cause pregnancy in others should be counseled about the possibility of pregnancy if they are having sexual activity that involves sperm and oocytes.

- The majority of medications used for gender transition are common and can be safely prescribed by a wide variety of health care professionals with appropriate training and education, including, but not limited to, obstetrician–gynecologists, family or internal medicine physicians, endocrinologists, advanced practice clinicians, and psychiatrists.
- Hysterectomy with or without bilateral salpingo-oophorectomy is medically necessary for patients with gender dysphoria who desire this procedure.
- To guide preventive medical care, any anatomical structure present that warrants screening should be screened, regardless of gender identity.

Background

Transgender and *gender diverse* individuals face harassment, discrimination, and rejection within society. Lack of awareness, knowledge, and sensitivity as well as bias from health care professionals leads to inadequate access to, underuse of, and inequities within the health care system for transgender patients. Throughout this document, the term transgender will be used to refer to anyone who identifies as transgender, gender diverse, and *genderqueer*, while acknowledging that there are vast individual differences and variations in preferred terminology. (See Box 1 for related terminology and definitions.) This Committee Opinion provides guidance for obstetrician–gynecologists on both routine screening and transition care. Obstetrician–gynecologists should be aware of the unique needs of transgender individuals and be prepared to assist them with preventive health care, as well as have knowledge of hormone and surgical therapies. The American College of Obstetricians and Gynecologists opposes discrimination on the basis of *gender identity*, urges public and private health insurance plans to cover necessary services for individuals with gender dysphoria and advocates for inclusive, thoughtful, and affirming care for transgender individuals. Although there is some overlap in clinical and psychosocial care for adolescents and adults, there are some issues specific to adolescents. The American College of Obstetricians and Gynecologists supports the provision of appropriate and evidence-based care for transgender and gender diverse adolescents. For guidance on the medical and surgical care of transgender adolescents, see the World Professional Association for Transgender Health (1), the Endocrine Society (2), and the Pediatric Endocrine Society (3).

It is important for obstetrician–gynecologists and other health care professionals to be familiar with appropriate terminology when caring for patients. *Transgender* is a broad term used for people whose gender identity or *gender expression* differs from their assigned *sex* at birth. For the purposes of clarity, *sex* is

Box 1. Terminology and Definitions

Chestfeeding: Some masculine-identified individuals use this term to describe the act of feeding their child from their chest regardless of whether they have had chest surgery.

Cisgender: A term used to describe a person whose gender identity aligns with those typically associated with the sex assigned to them at birth.

Gender Identity: A person's internal sense of self and how they fit into the world, from the perspective of gender.

Gender Dysphoria: Distress that accompanies the incongruence between one's experienced and expressed gender and one's assigned or natal gender.

Gender Expression: The outward manner in which individuals express or display their gender. This may include choices in clothing and hairstyle or speech and mannerisms. Gender identity and gender expression may differ; for example, a woman (transgender or cisgender) may have an androgynous appearance, or a man (transgender or cisgender) may have a feminine form of self-expression.

Transgender: A person whose gender identity differs from the sex that was assigned at birth. May be abbreviated to trans. A transgender man is someone with a male gender identity and a female birth assigned sex; a transgender woman is someone with a female gender identity and a male birth assigned sex. A nontransgender person may be referred to as cisgender (cis means same side in Latin).

Gender Nonconforming: A person whose gender identity differs from that which was assigned at birth, but may be more complex, fluid, multifaceted, or otherwise less clearly defined than a transgender person.

Genderqueer: Blurring the lines around gender identity and sexual orientation. Genderqueer individuals typically embrace a fluidity of gender identity and sometimes sexual orientation.

Nonbinary: Transgender or gender nonconforming person who identifies as neither male nor female.

Sex: Historically has referred to the sex assigned at birth, based on assessment of external genitalia, as well as chromosomes and gonads. In everyday language is often used interchangeably with gender, however there are differences, which become important in the context of transgender people.

Sexual Orientation: Describes sexual attraction only and is not directly related to gender identity. The sexual orientation of transgender people should be defined by the individual. It is often described based on the lived gender; a transgender woman attracted to other women would be a lesbian, and a transgender man attracted to other men would be a gay man.

Gender Fluidity: Having different gender identities at different times

(Continued)

Agender: "Without gender"; individuals identifying as having no gender identity

Gender Expansiveness: Conveys a wider, more flexible range of gender identity or expression than typically associated with the binary gender system

Transmasculine and Transfeminine: Terms to describe gender nonconforming or nonbinary persons, based on the directionality of their gender identity. A transmasculine person has a masculine spectrum gender identity, with the sex of female listed on their original birth certificate. A transfeminine person has a feminine spectrum gender identity, with the sex of male listed on their original birth certificate. In portions of these Guidelines, in the interest of brevity and clarity, transgender men or women are inclusive of gender nonconforming or nonbinary persons on the respective spectra.

They/Them/Their: Neutral pronouns used by some who have a nonbinary or nonconforming gender identity.

Transsexual: A more clinical term which had historically been used to describe those transgender people who sought medical intervention (hormones, surgery) for gender affirmation. This term is less commonly used in present day; however, some individuals and communities maintain a strong and affirmative connection to this term.

Cross Dresser/Drag Queen/Drag King: These terms generally refer to those who may wear the clothing of a gender that differs from the sex which they were assigned at birth for entertainment, self-expression, or sexual pleasure. Some cross dressers and people who dress in drag may exhibit an overlap with components of a transgender identity. The term *transvestite* is no longer used in the English language and is considered pejorative.

defined as the presence of specific anatomy or chromosomes. Gender is a social construct, made up of attitudes, feelings, and behaviors that a culture associates with either males or females; terminology often varies by geographic region, culture, and individual preference (4) (Box 1). *Gender nonconformity* is the extent to which a person's gender identity, role, or expression differs from the cultural norms described for a specific sex (5). *Sexual orientation* refers to sexual attraction only and is separate from gender identity. It is important to differentiate these concepts and terms when caring for patients (Fig. 1).

An estimated 150,000 youth (aged 13–17 years) and 1.4 million adults (aged 18 years and older) living in the United States identify as transgender (6). Analysis of data collected on adults in 19 states by the Centers for Disease Control and Prevention's Behavioral Risk Factor Surveillance System found that 55% of transgender individuals identified as White, 16% identified as African American or Black, 21% identified as Latino or Hispanic, and 8% identified as another race or ethnicity (7). Although more data on the experiences and needs of the transgender community is now available, there are important gaps in the literature and additional research is needed.

The World Professional Association for Transgender Health (an international, multidisciplinary professional society representing the specialties of medicine, psychology, social sciences, and law) released the following statement in 2010: "the expression of gender characteristics, including identities, that are not stereotypically associated with one's assigned sex at birth is a common and culturally diverse human phenomenon [that] should not be judged as inherently pathological or negative" (8). Although a diagnosis of *gender dysphoria* as defined in the American Psychiatric Association's Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition, currently is the only way for many individuals to obtain insurance coverage for necessary services, many experts agree that gender dysphoria is not a psychological condition and does not necessarily belong in the Diagnostic and Statistical Manual of Mental Disorders (Box 2). Gender dysphoria can result in psychologic dysfunction, depression, suicidal ideation, and even death (9). It is important to remember that although some gender nonconforming people will experience gender dysphoria at some point in their lives, not all will; and for many, dysphoria is not persistent if appropriately addressed. The term "gender incongruence" is slated to replace "gender dysphoria" in the International Classification of Diseases, 11th edition.

The social and economic marginalization of transgender individuals is widespread, which leads to health care inequities and poorer health outcomes for this population. The 2015 National Transgender Discrimination Survey, comprised of 27,715 participants from throughout the United States who identified as transgender, trans, genderqueer, nonbinary, and other identities on the transgender identity spectrum, reported that 29% of respondents were currently living in poverty, compared with 14% of the general U.S. population (10). Thirty percent had experienced homelessness during their lifetime and 12% did so during the past year. Notably, homeless transgender individuals may be denied access to shelters or placed in inappropriate housing because of their gender; 26% of homeless

respondents reported avoiding shelters because of fear of being mistreated, and 70% of those using shelters reported some form of mistreatment. Additionally, 20% of respondents reported experience in sex work, drug sales, and other work currently criminalized (10).

To reduce the inequities experienced by the transgender community, the provision of inclusive health care is essential. Obstetrician–gynecologists should strive to make their offices open to and inclusive for all individuals and should seek out education to address health care disparities, both in their individual practices and in the larger health care system.

Barriers to Health Care

Transgender individuals face substantial barriers to accessing health care, including health care professionals' bias and lack of general knowledge about best practices, as well as the failure of many health insurance plans to cover the cost of hormone therapy and supplies, mental health services, or gender affirmation surgery and restrictions on care imposed by prohibitive health care systems. One in four respondents to the Transgender Discrimination Survey had experienced insurance coverage obstacles, such as coverage denials for care related to gender transition or routine care. More than half (55%) had been denied coverage for transition-related surgery, and 25% were denied coverage for hormone therapy (10). These barriers exist despite evidence that such interventions are safe, effective, and medically necessary. The consequences of inadequate care are substantial. Providing accessible, inclusive, gender-affirming care helps to reduce barriers and allow more individuals to obtain the care they need.

Creating a safe and affirming health care environment for all patients, including transgender individuals, is essential. Transgender individuals face discrimination from health care professionals and staff. One-third of respondents reported having at least one negative experience in a health care office related to being transgender, such as being refused care or verbally harassed or having to teach the health care professional about transgender people in order to get appropriate care. In addition, some respondents have experienced physical or sexual abuse in this setting (10). Even higher rates of negative experiences were reported for transgender individuals with disabilities and American Indian, Middle Eastern, and multiracial transgender individuals. For instance, in 2015, 23% of the respondents did not see a doctor when they needed to because of fear of being mistreated as a transgender person

Box 2. The American Psychiatric Association's Diagnostic Criteria for Gender Dysphoria in Adolescents and Adults

A. A marked incongruence between one's experienced/expressed gender and assigned gender, of at least 6 months' duration, as manifested by at least two of the following:

1. A marked incongruence between one's experienced/expressed gender and primary and/or secondary sex characteristics (or in young adolescents, the anticipated secondary sex characteristics).
2. A strong desire to be rid of one's primary and/or secondary sex characteristics because of a marked incongruence with one's experienced/expressed gender (or in young adolescents, a desire to prevent the development of the anticipated secondary sex characteristics).
3. A strong desire for the primary and/or secondary sex characteristics of the other gender.
4. A strong desire to be of the other gender (or some alternative gender different from one's assigned gender).
5. A strong desire to be treated as the other gender (or some alternative gender different from one's assigned gender).
6. A strong conviction that one has the typical feelings and reactions of the other gender (or some alternative gender different from one's assigned gender).

B. The condition is associated with clinically significant distress or impairment in social, occupational, or other important areas of functioning.

Reprinted from American Psychiatric Association (2013). Diagnostic and statistical manual of mental disorders (5th ed.). Washington, DC.

(10). Individuals concerned about the way they may be treated by a health care professional are more likely to obtain hormones from friends or unlicensed sources, putting them at risk of inappropriate dosing and the subsequent sequelae. Accessing care from an obstetrician–gynecologist is specifically challenging because these offices have generally been very gendered, women-specific environments, which can be perceived and experienced as exclusive.

Creating an Inclusive Environment

Presenting to a health care office can be stressful and anxiety provoking for a transgender individual. Obstetrician–gynecologists and office staff can create an inclusive environment for transgender patients that will encourage patients to be forthcoming with their concerns and confident that they will be able to obtain the care that they need.

Steps to create a more inclusive environment include the following:

- Increase health care professional knowledge of and comfort with providing care for transgender and gender nonconforming individuals. This includes avoiding making assumptions about patients' sexual orientation, sexual practices, and surgeries and being cognizant of what questions are appropriate (eg, is the question relevant to the care being provided?).
- Train and empower front desk staff, nursing staff, phone staff, billing staff, and others who interact with patients on appropriate ways to ask about names and pronouns (Box 3).
- Review the office space to ensure that images chosen for signage, educational materials, and artwork represent all individuals who may seek health care services.
- Ask all patients what pronouns they use (Box 3).
- Clearly post a sign with the office's nondiscrimination policy.
- Ensure that at least one restroom is gender neutral and accessible to all patients.
- Use patient forms that include check boxes for all gender and sexual orientation options, include blanks for patients to write in their responses, or both. Both the Institute of Medicine (now the National Academies of Sciences, Engineering, and Medicine [11]) and the Joint Commission (12) recommend collection of sexual orientation and gender identity data. Studies demonstrate that patients want to be asked these questions because they feel it is important for their health care professionals to have this information (13).

Box 3. Pronouns

Obstetrician–gynecologists should ask patients about their name and which pronouns they use. Asking all patients routinely for their gender identity and gender pronouns normalizes the interaction and allows patients to disclose without being targeted; good practice includes reciprocal disclosure (eg, "Hello, I am Dr. X and I use she/her pronouns. Is the name on your chart what you would like me to call you? What pronouns do you use?").

The patient's pronouns should be documented in the patient chart.

Common choices include (note: this is not an exhaustive list):

- She/her/hers
- He/him/his
- They/them/their: Neutral pronouns used by some who have a nonbinary or diverse gender identity.

Other gender-neutral pronouns include zie (ze) or hir.

- Create a system where names used by patients (if other than their legal names), gender markers (eg, on medical charts), and pronouns are used for every patient every time.
- Examine the electronic health record system available in offices and hospitals to determine a universal process to ease the communication process for all staff. The Fenway Institute has an excellent resource to guide this process. (14). The patient's name, if different from the individual's legal name, and pronouns used should be noted in the electronic health record.
- Train employees how to apologize for mistakes if they happen.

Gender Transition

Each individual patient will desire different outcomes. Not all patients will want hormone therapy, and not everyone will desire surgery. Some transmasculine patients may desire only masculinizing chest surgery, and other patients will desire hysterectomy and phalloplasty in addition to chest surgery. Medication and surgery are not required parts of transition and should not be required for legally changing one's name or gender marker on official documents (eg, birth certificate, passport, driver's license). Legal transition will vary depending on state laws. Some patients may request letters of support for changing their name or sex on legal documents, and these should be provided. It is important to remember that although hormone therapy is a medically necessary treatment for many transgender individuals with gender dysphoria, not all transgender patients experience gender dysphoria and not everyone desires hormone treatment.

Historically, a referral letter from a mental health professional was required before initiating a patient's gender-affirming hormone therapy. However, current consensus is that an informed consent process without a separate letter from a mental health care professional is more than adequate for initiating therapy for those patients who wish to medically transition. The majority of medications used for gender transition are common and can be safely prescribed by a wide variety of health care professionals with appropriate training and education, including, but not limited to, obstetrician–gynecologists, family or internal medicine physicians, endocrinologists, advanced practice clinicians, and psychiatrists. Although being knowledgeable about the medications used for gender transition and potential risks and side effects is important, specific certification for prescribing them is not required and should not be a limiting factor in helping patients access care. *Standards of Care (SOC) for the Health of Transsexual, Transgender, and Gender Nonconforming People*, published by the World Professional Association for Transgender Health, is an important resource for health care professionals working with transgender patients (15).

Fertility, Pregnancy, Contraception, and Abortion

Health care professionals' knowledge and awareness about reproductive options need improvement. Pregnancies are possible after transitioning, and perhaps, most important, contraceptive counseling is crucial to prevent undesired pregnancies. Fertility and parenting desires should be discussed early in the process of transition, before the initiation of hormone therapy or gender affirmation surgery. Fertility preservation options for transgender individuals are the same as for those *cisgender* individuals who desire preservation before gonadotoxic cancer therapy or for elective preservation. These options include sperm banking, oocyte preservation, embryo preservation, and in some cases, ovarian or testicular tissue cryopreservation. In addition to the expected pregnancy outcomes with these procedures, patients should be informed of the potential for out-of-pocket costs, which vary by state and insurance coverage.

Transmasculine Individuals

Transmasculine individuals taking testosterone who desire biologically related children may safely achieve pregnancy after the cessation of testosterone. Whether they choose insemination from partner or donor sperm and carry a pregnancy themselves or in vitro fertilization with embryo transfer to a partner or surrogate, transgender masculine individuals have many options for facilitating pregnancy. A 2013 survey of 41 transgender men who experienced pregnancy after transitioning found that two-thirds had used testosterone before pregnancy, with 81% using their own oocytes. Many of the respondents became pregnant within 4 months of stopping testosterone therapy and 32% of these pregnancies were unintended (16). As with cisgender patients, obstetrician–gynecologists should discuss pregnancy intention and prepregnancy health, if appropriate, with transgender patients. The Society of Family Planning provides guidance on contraceptive counseling for transgender and gender diverse people who were assigned female sex at birth (17). Given that contraception can be underutilized in this population because of concerns about adverse effects or access to care, undesired pregnancy is a substantial concern. Abortion access is a critical component to comprehensive reproductive health care for transgender individuals. The 2013 survey also demonstrated that patients experienced low levels of health care professional awareness and knowledge of the needs of transgender individuals (16).

Obstetrician–gynecologists and other health care professionals who care for transmasculine individuals during pregnancy should keep in mind that pregnancy is a gendered experience and pregnancy may trigger feelings of dysphoria or isolation for some patients (18). In addition, some postpartum transgender individuals may not identify as "mothers;" thus, obstetrician–gynecologists and other health care professionals

should be mindful of the language they use. It may be appropriate to use a more neutral term, such as "parent." Some patients may benefit from referral to mental health care professionals with experience in this area. A recent study of patients' experiences recommends providing affirming and inclusive care from prepregnancy through the postpartum period (18). During the postpartum period, patients will need to decide when to restart testosterone. For those making the decision to *chestfeed*, there is little evidence that testosterone passes into breast milk; however, because testosterone may suppress milk production, its use is not recommended until after chestfeeding is complete. Individuals who have had top surgery may still be able to lactate and chestfeed with the help of a support device. Some individuals may have worsening symptoms of dysphoria with lactation, and management of lactation suppression with cabergoline can be discussed with those individuals (19).

Transfeminine Individuals

For those transfeminine individuals preferring to retain their gonads, some may need to use assisted reproductive technologies to achieve pregnancy and others may have return of fertility within months of ceasing hormone therapy. For transfeminine individuals wishing to use their sperm for a pregnancy in a partner or surrogate, some data indicate that long-term estrogen exposure may be associated with testicular damage (20); however, discontinuing hormones for a few months may lead to the return of normal sperm counts. It is best practice to encourage sperm banking before initiation of hormones. Transfeminine individuals who wish to breastfeed may have success with induction of lactation using modifications to the Newman-Goldfarb method (21). A 2018 case report described a transgender woman successfully inducing lactation and continuing breastfeeding at 6 months follow-up (22).

Contraception

Gender-affirming hormone therapy is not effective contraception. Sexually active individuals with retained gonads who do not wish to become pregnant or cause pregnancy in others should be counseled about the possibility of pregnancy if they are having sexual activity that involves sperm and oocytes. Transmasculine individuals should be counseled that lack of menses does not mean they are unable to conceive. All patients should be counseled on barrier use for prevention of sexually transmitted infections. For transmasculine individuals interested in hormonal contraception, testosterone is not a specific contraindication to using any form of contraception. Many transmasculine patients prefer to avoid estrogen-containing methods because they do not want to add estrogen to their system; however, little change is seen in masculinization when these methods are used. Many patients will choose hormonal intrauterine device, contraceptive implant or, depot medroxyprogesterone acetate injection.

Medical Transition

Identifying the patient's goals before initiating masculinizing or feminizing hormone therapy is important. Hormone therapy can be provided in the office, and obstetrician–gynecologists can broaden their skill sets by educating themselves on the provision of transition care. For more details on the provision of hormone therapy for these populations, obstetrician–gynecologists should see resources from the World Professional Association for Transgender Health (8) and the Endocrine Society (20).

Masculinizing Therapy

For many patients, goals of masculinization therapy will include the development of facial hair, deepening of the voice, and increasing body hair and muscle mass. Other effects of masculinizing hormone therapy include the redistribution of subcutaneous fat, change in sweat and odor patterns, and hairline recession, including possible male pattern baldness. Patients also may experience increased libido, cessation of menses, vaginal atrophy, and increased clitoral size. Although testosterone generally causes temporary, and possibly permanent, decreased fertility, discussion about the possibility of continued ovulation is important for those patients with sexual practices that leave them with the potential for pregnancy. Patients should be counseled on current contraception options and their future reproductive life plan. The only absolute contraindications to masculinizing hormone therapy are current pregnancy, unstable coronary artery disease, and polycythemia (hematocrit greater than 55%) (15). Lipid profiles should be monitored in transmasculine patients receiving testosterone therapy (23). High-density lipoprotein levels decrease and triglycerides increase in transmasculine individuals receiving testosterone therapy. Studies have not shown an increased risk of cardiovascular events despite these adverse changes in the lipid profile.

There are many testosterone preparations available in the United States, including injectables, gels, creams, patches, and implantable pellets. Injectable testosterone cypionate is most commonly used subcutaneously, which allows for use of a smaller, less painful needle, but other formulations may be used based on patient preferences or adverse effects. Target ranges for testosterone levels are in the normal physiologic male range (typically 320–1,000 ng/dL) (20). See Table 1 for details on formulations and dosing. In addition to standard health care screening, it is recommended that testosterone levels and hematocrit be monitored every 3 months for the first year and then once or twice a year thereafter.

Patients should be counseled that menses likely will cease within a few months after initiating hormone therapy. If bleeding continues, the obstetrician–gynecologist may consider adding progesterone therapy to facilitate

Table 1. Hormone Preparations and Dosage: Masculinizing Hormone Therapy*

Route	Formulation	Dosage
Oral†	Testosterone undecanoate	160–240 mg/day
Parental (subcutaneous, intramuscular)	Testosterone enanthate, cypionate	50–200 mg/week 100–200 mg/10–14 days
Implant (subcutaneous)	Testosterone pellets, 75 mg	75 mg/pellet
Transdermal	Testosterone gel (1%) Testosterone patch	2.5–10 g/day 2.5–7.5 mg/day

*Dosages should be individualized according to the needs, preferences, and potential contraindications for each patient. Health care professionals also should have knowledge about generics and what medications will be covered by different payers.

†Requires participation in manufacturer monitored program.

Modified with permission of Nancy International Ltd Subsidiary AME Publishing Company from Unger C. Hormone therapy for transgender patients. Transl Androl Urol. 2016;5(6):877–884. doi: https://tau.amegroups.com/article/view/11807/13169.

amenorrhea for patients who wish to avoid hysterectomy or endometrial ablation. Testosterone commonly will cause vaginal tissues to atrophy, similar to what is experienced by postmenopausal cisgender women. These tissues may be more susceptible to small amounts of tearing and changes in microbial environment, resulting in increased risk of bacterial vaginosis, cystitis, cervicitis, or dyspareunia (4). In these situations, obstetrician–gynecologists should consider topical treatments such as lubricants, vaginal moisturizers, and topical estrogen. Patients can be counseled that topical estrogen will have minimal systemic absorption and will not interfere with testosterone therapy.

Feminizing Therapy

Feminizing effects of hormone therapy include decreased erectile function, decreased testicular size, breast growth, and increased body fat percentage. Although there are no absolute contraindications to feminizing therapy, risks include venous thromboembolic embolism (VTE), hypertriglyceridemia, development of gallstones, and elevated liver enzymes. Patients on feminizing hormone therapy should be counseled to decrease risk factors for cardiovascular disease, such as smoking. Ethinyl estradiol, which provides better cycle control, may increase the risk of VTE; therefore, because cycle control is unnecessary for transgender women, its use is not indicated. Transdermal preparations of estradiol typically used for hormone replacement therapy are recommended for those with risk factors. If using oral estrogens, 17-β estradiol preparations are preferred (23). In general, prescribing the smallest dose possible to achieve desired effects is recommended. See Table 2 for preparation and dosing suggestions.

Antiandrogens, such as spironolactone, cyproterone acetate, gonadotropin-releasing hormone agonists, and 5-α reductase inhibitors, are used to reduce endogenous testosterone levels, which will decrease masculine characteristics and the amount of estrogen needed (15). Cyproterone is not available in the United States because of concern for hepatotoxicity. Gonadotropin-releasing hormone agonists are often expensive, so are not widely used. Spironolactone, which directly inhibits secretion of testosterone and androgen receptor binding, is the most commonly used antiandrogen in the United States. Because of the risk of hyperkalemia with these medications, it is important to monitor patients' blood pressure and potassium levels (23).

Although currently available data do not provide clear guidance on titration of dosing, it generally should be based on patient goals. Doses should be titrated to physiologic effects, while adjusting estrogen and antiandrogen dosing until in female physiologic range; then, dosing can be modified to focus on further increasing androgen blocking. The goals are to maintain estradiol levels at the mean daily levels for premenopausal women (less than 200 ng/ml) and testosterone in female range (less than 55 ng/dl) (20). Progestins may increase breast development as well as improve libido and mood in some patients. Recommended laboratory surveillance includes estradiol and total testosterone levels, sex hormone binding globulin, and albumin levels every 3 months in the first year to titrate estrogen dosing. After the first year, laboratory tests are necessary only if there are patient or health care professional concerns about adverse effects or after a change in dosage. Patients taking spironolactone also should be tested for potassium and creatinine levels every 3 months for first year and then yearly.

Notably, feminizing hormones do not result in substantial changes to voice. Vocal pitch is secondary to the size and mass of folds of the vocal cords, which are not reversed by the addition of estrogen. Patients with concerns that their voice is incongruent with their gender can be referred to a speech language pathologist who has specific training in this area. If speech therapy does not adequately help, surgical procedures can be considered.

Table 2. Hormone Preparations and Dosage: Feminizing Hormone Therapy*

Route	Formulation	Dosage
Oral	Estradiol	2–4 mg daily
Parental (subcutaneous, intramuscular)	Estradiol valerate	5–30 mg every 2 weeks
Transdermal	Estradiol	0.1–0.4 mg twice weekly
Antiandrogens	Progesterone	20–60 mg by mouth daily
	Medroxyprogesterone acetate	150 mg intramuscularly every 3 months
	GnRH agonist (leuprolide)	3.75–7.5 mg intramuscularly monthly
	Histrelin implant	50 mg implanted every 12 months
	Spironolactone	100–200 mg by mouth daily
	Finasteride	1 mg by mouth daily

*Dosages should be individualized according to the needs, preferences, and potential contraindications for each patient. Health care professionals also should have knowledge about generics and what medications will be covered by different payers.

Abbreviation: GnRH, gonadotropin-releasing hormone.

Surgical Transition

Some of the surgical procedures described here may not be considered within the scope of practice for an obstetrician–gynecologist, but this section may provide education for clinicians who care for transgender patients before and after surgery. As with any surgical procedure, the quality of care provided before, during, and after surgery greatly affects patient outcomes. Many insurance companies that cover gender affirmation procedures will require a mental health assessment letter before authorization for surgery. Box 4 provides an overview of surgical procedures. For additional information on postoperative care for patients who have had gender-affirming surgery, obstetrician–gynecologists can see resources from the University of San Francisco's Center of Excellence for Transgender Health (4).

Masculinizing Surgery

Transmasculine individuals may choose chest reconstruction, hysterectomy with or without salpingo-oophorectomy, or metoidioplasty, phalloplasty, or both. The U.S. Transgender Survey reported that the majority (97%) of patients had or wanted masculinizing chest surgery; similarly, a majority (79%) of patients had undergone or wanted a hysterectomy. When asked about genital surgeries, only 4% had had metoidioplasty and 53% wanted the procedure in the future; for phalloplasty, 2% had had the procedure and 27% desired it in the future (10). The lower percentage of patients wanting these surgeries is likely multifactorial; limited insurance coverage is one issue. Masculinizing chest surgery, sometimes referred to as "top surgery," generally includes a subcutaneous mastectomy and recontouring to develop a masculine-appearing chest. Factors such as surgeon

Box 4. Surgical Procedures for Transgender Individuals

Masculinizing Surgical Procedures May Include the Following:

- Breast or chest surgery: subcutaneous mastectomy, creation of a male chest
- Genital surgery: hysterectomy with or without salpingo-oophorectomy, reconstruction of the fixed part of the urethra, which can be combined with a metoidioplasty or with a phalloplasty (employing a pedicled or free vascularized flap), vaginectomy, scrotoplasty, and implantation of erection or testicular prostheses
- Nongenital, nonbreast surgical interventions: voice surgery (rare), liposuction, lipofilling, pectoral implants, and various aesthetic procedures

Feminizing Surgical Procedures May Include the Following:

- Breast or chest surgery: augmentation mammoplasty (implants/lipofilling)
- Genital surgery: penectomy, orchiectomy, vaginoplasty, clitoroplasty, vulvoplasty
- Nongenital, nonbreast surgical interventions: facial feminization surgery, liposuction, lipofilling, voice surgery, thyroid cartilage reduction, gluteal augmentation (implants/lipofilling), hair reconstruction, and various aesthetic procedures

Reprinted from World Professional Association for Transgender Health. Standards of care for the health of transsexual, transgender, and gender nonconforming people. 7th version. Minneapolis (MN): WPATH; 2012.

expertise, body habitus, skin quality, and breast shape and size will influence the surgical approach.

Metoidioplasty to create a neophallus is generally chosen by patients who want genital surgery but are not interested in phalloplasty. Metoidioplasty involves releasing the clitoris, lengthening the urethra to the tip of the phallus, and covering the phallus with neighboring skin. It is possible to have concurrent vaginectomy and scrotoplasty. Patients who choose urethral lengthening will be able to void when standing if they are close to ideal body weight. If a patient desires scrotoplasty, rotational flaps of the labia majora are used to place the scrotum in an anatomic male position. Implants can be placed approximately 6 months later. Phalloplasty generally takes tissue from a donor site, which is shaped into a phallus, allowing for later penile implant to facilitate penetrative intercourse. Most commonly, tissue is taken from the radial forearm, latissimus dorsi, or anterolateral thigh. The decision on the location of the tissue donor site is based on surgeon technique and desired patient outcomes.

Hysterectomy with or without bilateral salpingo-oophorectomy is medically necessary for patients with gender dysphoria who desire this procedure. The route of hysterectomy should be based on clinical findings as well as surgeon and patient preference. Although vaginal hysterectomy will allow for recovery without abdominal scarring, some surgeons may find it to be technically difficult given likely lack of uterine descent and severe vaginal atrophy with a narrow introitus; however, it can be accomplished if desired (24). A genital examination may be challenging and worsen dysphoria for some patients. In these cases, it may be appropriate to conduct the examination under anesthesia before initiating the surgical procedure. Whether the ovaries are removed at the time of hysterectomy will be informed by the patient's fertility desires, long-term plans for hormonal use, and personal preferences and should be considered within a shared decision-making model. Patients should be offered consultation with a fertility specialist before surgical removal of ovaries. Counseling about bone health and cardiovascular protection is challenging because of limited data. Testosterone may have an anabolic effect on cortical bone, and if provided in adequate doses will prevent bone demineralization. No studies have found an increase in the occurrence of cardiovascular events in transmasculine individuals (23), so unless the patient is planning to stop taking testosterone in the future, it is unlikely that the ovaries are necessary to maintain bone or cardiovascular health. More research is needed in this area. Notably while some patients may not plan to stop testosterone, they may do so because of issues such as lack of access. Engaging in shared decision making and counseling regarding the risks and benefits of ovarian preservation before hysterectomy is important.

Feminizing Surgery

Although desire for surgical transition varies depending on the individual, the U.S. Transgender Survey reported that 74% of respondents had either undergone breast augmentation or wanted it in the future. One quarter had undergone orchiectomy and 61% desired it in the future; 87% had undergone vaginoplasty or wanted to do so in the future (10). Potential procedures for transfeminine individuals include breast augmentation, orchiectomy, vaginoplasty, and facial feminization surgeries. It generally is recommended that patients wait at least 6 months after initiating feminizing hormone therapy before undergoing breast augmentation; other experts suggest waiting 2–3 years to maximize hormonal effects (4). Breast augmentation typically is performed with implants, either subglandular or subpectoral depending on a patient's body habitus and desire.

Vaginoplasty involves penile inversion and the creation of a vaginal vault between the rectum and urethra. The vagina is lined with penile skin and labia are created using scrotal skin after orchiectomy is completed. The glans penis is used to create the clitoris. If there is not enough skin available to provide adequate depth, a skin graft is performed. Preoperative electrolysis of the scrotum is recommended to prevent hair from growing in the neovagina.

Successful recovery from this procedure requires patient commitment to a dilation regimen (up to three times per day) to maintain depth and width of the neovagina. Given the limited number of centers providing these procedures, it is not uncommon for a patient to present to their local obstetrician–gynecologist for ongoing postoperative care. The vagina is lined by skin, not mucosa; therefore, it will not lubricate naturally. For patients who are struggling with dilation, they should be counseled to increase the amount of lubricant used and to consider using a smaller-sized dilator to allow for more frequent and deeper dilation; patients can then gradually increase the size of the dilator. Individuals with persistent pain or discomfort with dilation may benefit from a referral to a pelvic floor physical therapist. For individuals presenting with vaginal discharge and odor, sources are most likely sebum, dead skin, or retained semen or lubricant. Those patients should be counseled to clean or douche with soap and water; the addition of vinegar may be considered if strong odor is noted. Patients may present with bleeding or discharge consistent with granulation tissue; this often can be easily treated with silver nitrate.

Cancer Screening

There are insufficient data to determine whether transgender individuals are at increased risk of malignancy compared with the general population. To guide preventive medical care, any anatomical structure present that warrants screening should be screened regardless of gender identity. It may be useful to comprehensively

label laboratory specimens (eg, "male with cervix") to ensure they are appropriately processed.

Transmasculine Individuals

For transmasculine individuals, screening includes breast cancer screening for patients who have breast tissue and cervical cancer screening for those who have a cervix. Before ceasing breast cancer screening, it is important to review operative reports to ensure that mastectomy was performed and not just breast reduction. For those individuals who have undergone mastectomy and reconstruction, there are limited data to support clinical chest examinations in the absence of patient concern (4). The American College of Obstetricians and Gynecologists recommends genetic counseling before surgery for those with a personal or family history of breast cancer or ovarian cancer (25).

Cervical cancer screening should be performed according to age-related guidelines (26–28). Self-collected human papillomavirus (HPV) specimens may be appropriate for those patients who otherwise may not access screening or for whom speculum insertion may be physically difficult or emotionally traumatic; though, to date, there is no patient-collected HPV test approved by the U.S. Food and Drug Administration. Atrophy secondary to testosterone may make cervical cancer screening more challenging. Transmasculine individuals have a 10-fold higher rate of unsatisfactory Pap tests (samples that cannot be evaluated by the laboratory due to a lack of sufficient cells or obscuring factors such as blood) compared with cisgender individuals (29). A 2018 study of transmasculine patients aged 21–64 years reported a high patient preference for self-collected vaginal HPV swabs (greater than 90% preference over swabs collected by health care professionals) and accurate self-collected results consistent with previous studies in cisgender female patients. There was a 71.4% concordance of self-collected samples compared with samples collected by health care professionals (15 of 21 cases detected) (30).

Similar to cisgender women, routine screening for endometrial cancer is not recommended for transmasculine individuals who still have a uterus. Although for transmasculine individuals there is a theoretical concern for increased risk of hyperplasia or malignancy because of the aromatization of exogenous testosterone to estrogen with anovulation leading to unopposed estrogen, there are no data to support this. In fact, most studies demonstrate that the endometrium is atrophic secondary to testosterone use. Therefore, on the basis of limited data, recommendations for screening for endometrial cancer for transmasculine individuals are no different than for cisgender women. Additionally, evaluation of transmasculine individuals with abnormal uterine bleeding are the same as those for cisgender women (31).

Transfeminine Individuals

A neovagina does not require routine cytologic screening. Prostate cancer screening for transfeminine individuals should follow the recommendations for cisgender men (32). Although there are some case reports of prostate cancer in transfeminine individuals, most of these were in individuals who started hormone therapy after 50 years of age; these individuals likely had preexisting lesions before initiating hormone therapy (33). It is likely that transfeminine individuals have a lower risk of breast cancer than cisgender women. A retrospective study of Dutch transfeminine individuals found an estimated breast cancer incidence of 4.1 in 100,000 person-years in comparison with 155 in 100,000 person-years in the cisgender female population (34). This decreased risk is likely because of a substantially decreased length of lifetime exposure to estrogen. However, it is notable that a study of 50 transfeminine individuals found 60% had dense or very dense breasts on mammography, leading to increased rates of false-negative mammogram results (35). General consensus is that screening should begin after 50 years of age and a minimum of 5 years of feminizing hormone use, with a health care professional-patient discussion about the potential harms of over screening (4).

Additional Considerations for Preventive Care

As for all patients, transgender individuals should be counseled about the importance of routine preventive health care. All individuals should be routinely screened for intimate partner violence, depression, substance use, cancer, and other health care needs and should be screened for sexually transmitted infections and counseled about appropriate immunizations based on age and risk factors, including HPV vaccination. As with the general population, screening for intimate partner violence in transgender patients is important and should be performed. A 2017 study found a higher report rate of intimate partner violence in transfeminine individuals (12.1%) when compared with cisgender women (2.7%), transmasculine individuals (6.6%), nonbinary individuals (8.2%), and transgender or gender diverse individuals who did not report a gender identity (9.1%) (36). Screening for mental health issues should be part of standard practice. Forty percent of transgender individuals have attempted suicide at some point during their lifetime (10).

Obstetrician–gynecologists should take a careful and thoughtful medical, family, and surgical history for all patients. Risk assessment for sexually transmitted infections should be based on a patient's behaviors and present anatomy. When performing the physical examination, it is important to remember that patients may have had traumatic examinations in the past. Self-collected vaginal and rectal swabs as well as the option for urine specimens may be appropriate alternatives to physical examination. Obstetrician–gynecologists should follow guidance for transgender individuals in the Centers for Disease Control and Prevention's 2015 STD Treatment Guidelines,

endorsed by the American College of Obstetricians and Gynecologists (37). Screening for human immunodeficiency virus (HIV) in at-risk individuals is of high importance. Among those respondents to the Transgender Discrimination Survey, 1.4% were living with HIV; this is five times higher than the rate of the general U.S. population. The rate in transfeminine individuals was 3.4%, and 19% of Black transfeminine individuals reported living with HIV (10). Obstetrician–gynecologists should counsel patients at high risk of HIV infection on safer sex practices and other prevention methods, as well as the option of preexposure prophylaxis (38).

Conclusion

Accessing health care as a transgender individual often is challenging. Obstetrician–gynecologists may provide comprehensive care for transgender patients at various times in their lives. Obstetrician–gynecologists should make their offices inclusive and inviting to all individuals who need obstetric or gynecologic health care. They should take steps to educate themselves and their medical teams about appropriate language and the health care needs of transgender patients. Putting the patient in the role of educator of the health care professional diminishes the patient-physician relationship. In order to provide the best care for patients, it is useful to know which health care professionals to include in a referral network for primary care and to have many clinician and surgeon options given the many different therapies available and the different sites at which these therapies are offered. Connecting with trans-friendly colleagues is a way to expand access to care for the transgender individuals in the community.

Attacks on Gender-Affirming and Transgender Health Care

Published: May 3, 2022

In 2021, Arkansas became the first state in the country to ban gender-affirming health care for transgender minors. Since then, Tennessee, Arizona, and Alabama have also enacted laws restricting access to gender-affirming care, and 11 other states are considering such bans as of March 2022. Alabama's ban included the harshest penalties of any legislation passed thus far, making the provision of gender-affirming care a felony punishable by up to 10 years in prison. Though legal challenges have so far kept these laws on hold, these health care bans are part of an increasing trend of anti-LGBTQ+ legislation proliferating at the state level, with a record of nearly 240 anti-LGBTQ+ bills already introduced this year.

The Office of Population Affairs at the U.S. Department of Health and Human Services (HHS) defines gender affirming care as "an array of services that may include medical, surgical, mental health, and non-medical services for transgender and nonbinary people. For transgender and nonbinary children and adolescents, early gender-affirming care is crucial to overall health and well-being as it allows the child or adolescent to focus on social transitions and can increase their confidence while navigating the healthcare system." Gender-affirming care is evidence-based medicine supported by many prestigious medical organizations, and study after study shows that gender-affirming care reduces depression and suicide among transgender youth. ACP and other leading medical organizations have condemned efforts to criminalize gender-affirming care and any care that interferes with the physician-patient relationship.

While restrictions have primarily focused on preventing minors from accessing gender-affirming care, some have also targeted transgender health care for older individuals. In four states, these laws extend bans to adults – applying to those under the age of 19 in Alabama, those under the age of 21 in North Carolina and Oklahoma, and those under 25 in Missouri. Additionally, Arkansas' law has banned insurance coverage of gender-affirming care overall for both public and private insurance plans, as would about half the bills being considered by other states.

The Williams Institute at the UCLA School of Law found that over 58,000 transgender youth and young adults are at risk of losing access to care in states that have restricted access to gender-affirming care or are considering doing so. Beyond immediate impacts, these laws drive stigma and endanger the wellbeing

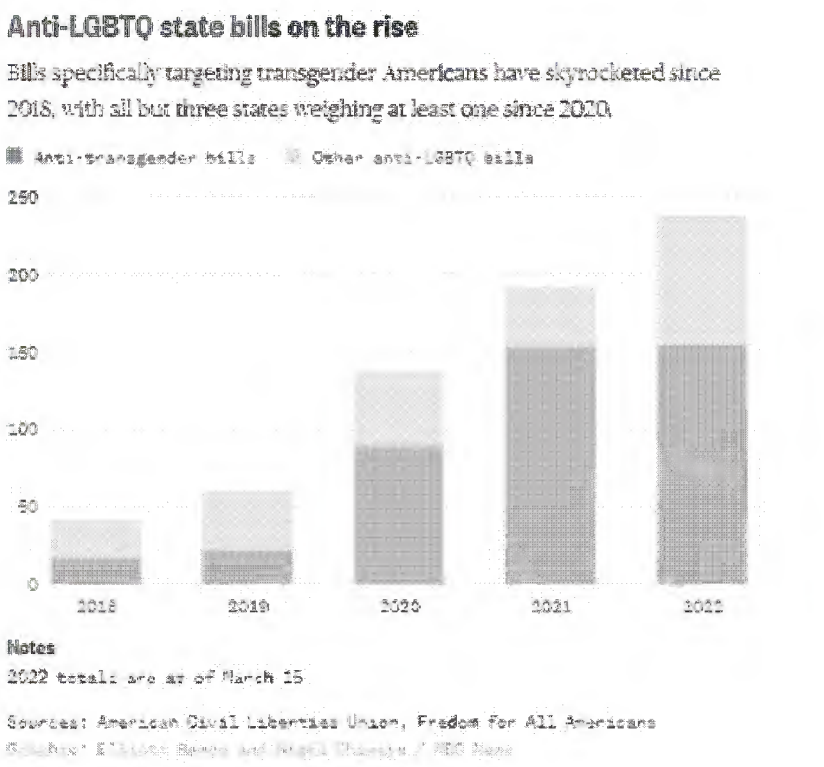
of LGBTQ+ youth. According to the Trevor Project's 2021 National Survey on LGBTQ Youth Mental Health, 94 percent of LGBTQ+ youth reported that recent politics have negatively impacted their mental health.

Most gender-affirming care restrictions either criminalize physicians – sometimes with extreme penalties, such as the bill passed by Idaho's House of Representatives carrying up to a life sentence for those who provide a minor with gender-affirming care – or make them subject to civil penalties or professional discipline through state licensing boards. Bills in multiple states (Alabama, Idaho, Kansas, North Carolina, Oklahoma, South Carolina, and Tennessee) would also establish penalties for parents who facilitate their children's access to gender-affirming care, including by designating this health care as abuse.

While Texas bills to ban gender-affirming care for transgender minors have not passed, the state has used administrative means to restrict access. After Texas Attorney General Ken Paxton issued an opinion describing gender-affirming care as child abuse, Governor Greg Abbott instructed the Texas Department of Family and Protective Services to investigate families with transgender children. This directive, which is currently blocked by a Texas appeals court, would have also imposed criminal penalties on physicians and other licensed professionals who did not report families who provide gender-affirming care to their children.

Florida has also moved to restrict gender-affirming care administratively. The state's Surgeon General released a memo contradicting HHS guidance on gender-affirming care for minors and setting "guidelines" prohibiting gender-affirming care, going as far to say that even social gender transition – such as a change in haircut or name – "should not be a treatment option."

While most of the nearly 240 anti-LGBTQ+ bills introduced so far this year propose restrictions on the lives of transgender children in medical and educational settings, they are part of a growing wave of anti-LGBTQ+ legislation overall. Notable in this trend have been efforts to limit school employees from discussing gender identity, sexual orientation, and race – such as Florida's recently passed "Don't Say Gay" law – and to ban libraries from carrying books related to those topics.



As a result of these initiatives that challenge or deny access to critical health care, criminalize parents, and threaten the removal of children from their homes, some families with the means to do so have fled their states for other jurisdictions. Removing a child from loving parents solely for providing evidence-based and oftentimes life-affirming care is wrong. Alarmingly, these laws have also fueled misinformation that has led to increasing harassment and violence against physicians and other health care workers who provide gender-affirming health care services.

ACP has decried these discriminatory policies against LGBTQ+ people and objected in particular to the interference with the physician-patient relationship and penalization of evidence-based care. ACP believes that physicians and other health care professionals should not fear criminal punishment for providing the medical standard of care, nor should the government attempt to force disclosure of patient information related to gender-affirming care. ACP policy also calls for coverage of comprehensive transgender health care in private and public insurance plans, which about half of these bills would ban. In addition to speaking out against these harmful laws, ACP has joined amicus briefs in legal challenges to the Texas directive and other policies discriminating against transgender people and will continue to support legal and legislative efforts protecting against these medically unsound and dangerous restrictions.

Federal Actions to Address Discrimination against Transgender People

The Biden Administration has taken multiple actions to address this legislative trend. On March 2, 2022, HHS clarified that physicians and other health care personnel are not required to disclose patient information regarding gender-affirming care and that denials of care based on gender identity are illegal.

On March 31, the U.S. Department of Justice wrote to state attorneys general warning that bans on gender-affirming care are unconstitutional and violate multiple federal laws. HHS has also called for physicians and patients who believe they have been discriminated against on the basis of gender identity or disability in seeking to access gender-affirming care to file a complaint with the department's Office of Civil Rights.

HHS also proposed a new rule in December 2021 banning health coverage-related discrimination based on gender identity or sexual orientation. While the new rule has not been finalized, ACP has expressed support.

State Actions to Support Gender-Affirming Care

In response to these bans, at least eight states have introduced legislation this year to prevent discrimination against transgender people in health care or otherwise protect access to gender- affirming care.

- The Hawaii's legislature passed a bill requiring insurers to cover gender-affirming care services if they also cover those treatments for purposes other than gender transition and to provide clear information about coverage of gender-affirming care.
- A Georgia bill would prohibit public insurance plans from discriminating on the basis of gender identity, including through denial of gender-affirming hormone therapy, and would repeal conflicting laws.
- A bill in Vermont would allow minors to consent to non-surgical gender-affirming care.
- A Maryland bill would ensure Medicaid coverage of comprehensive transgender health care.
- Washington state proposed legislation addressing the need to ensure access to gender- affirming care and other forms of health care in mergers, acquisitions, and contracting affiliations.
- California, Minnesota, and New York have responded to efforts in Texas and other states that designate gender-affirming care as abuse by introducing legislation that would block officials in their states from complying with out-of-state laws or judgments penalizing parents for providing gender-affirming care.

Abstract

In this position paper, the American College of Physicians examines the health disparities experienced by the lesbian, gay, bisexual, and transgender (LGBT) community and makes a series of recommendations to achieve equity for LGBT individuals in the health care system. These recommendations include enhancing physician understanding of how to provide culturally and clinically competent care for LGBT individuals, addressing environmental and social factors that can affect their mental and physical well-being, and supporting further research into understanding their unique health needs.

The lesbian, gay, bisexual, and transgender (LGBT) community is diverse, comprising persons from various races, ethnicities, and socioeconomic

backgrounds; however, LGBT persons face a common set of challenges within the health care system. These challenges range from access to health care coverage and culturally competent care to state and federal policies that reinforce social stigma, marginalization, or discrimination. Recent years have brought about reliable data collection, research, and a greater understanding of the health care needs of the LGBT community and the challenges they face in accessing care. Although great strides have been taken in reducing health disparities in the LGBT community, much more needs to be done to achieve equity for LGBT persons in the health care system.

Although members of the LGBT community face similar health concerns as the general population, certain disparities are reported at a higher rate among LGBT persons than the heterosexual population (1). These disparities experienced by LGBT persons may be compounded if they are also part of a racial or ethnic minority (1). Of note, LGBT persons are more likely to identify themselves as being in poor health than heterosexual individuals, and different segments of the LGBT population have individual health risks and needs. For example, gay and bisexual men are at increased risk fo certain sexually transmitted infections and account for more than half of all persons living with HIV or AIDS in the United States (1); lesbian women are less likely to have mammography or Papanicolaou test screening for cancer (2); lesbian and bisexual women are more likely to be overweight or obese (3); and lesbian, gay, and bisexual persons are more likely to become disabled at a younger age than heterosexual individuals (4).

Various state or federal laws may affect the quality of life of LGBT persons and can affect their physical and mental health. Same-sex marriage bans may cause psychological distress (5), prohibitive hospital visitation policies may prevent a same-sex parent from seeing a minor while the child is ill or participating in medical decision making for the child, and exclusions on transgender health care in private and public health plans may cause a transgender patient to seek treatment options through illegal channels (6). These laws and policies, along with others that reinforce marginalization, discrimination, social stigma, or rejection of LGBT persons by their families or communities or that simply keep LGBT persons from accessing health care, have been associated with increased rates of anxiety, suicide, and substance or alcohol abuse (7).

Addressing these disparities will require changes in the way LGBT persons and their families are regarded in society and by the health care system. Policies that are discriminatory toward the LGBT community, or are no longer supported by empirical research, continue to reinforce the environmental and social factors that can affect the mental and physical well-being of LGBT persons. The American College of Physicians (ACP) has a long-standing commitment to improving the health of all Americans and opposes any form of discrimination in the delivery of health care services. ACP is dedicated to eliminating disparities in the quality of or access to health care and is committed to working toward fully understanding the unique needs of the LGBT community and eliminating health disparities for LGBT persons.

This Executive Summary provides a synopsis of the full position paper, which is available in Appendix.

Methods

The ACP Health and Public Policy Committee, which is charged with addressing issues affecting the health care of the U.S. public and the practice of internal medicine and its subspecialties, developed these recommendations. The committee reviewed numerous studies, reports, and surveys on LGBT health care and related health policy. The committee also reviewed information on how state and federal policies may affect the physical and mental health of the LGBT population. Draft recommendations were reviewed by the ACP Board of Regents, Board of Governors, Council of Early Career Physicians, Council of Resident/Fellow Members, Council of Student Members, and Council of Subspecialty Societies. The position paper and recommendations were reviewed by the ACP Board of Regents and approved on 27 April 2015.

ACP Position Statements and Recommendations

The following statements represent the official policy positions and recommendations of the ACP. The rationale for each is provided in the full position paper (Appendix).

A glossary of LGBT terminology used throughout this paper can be found at https://lgbt.ucsf.edu/glossary-terms.

1. The American College of Physicians recommends that gender identity, independent and fundamentally different from sexual orientation, be included as part of nondiscrimination and antiharassment policies. The College encourages medical schools, hospitals, physicians' offices, and other medical facilities to adopt gender identity as part of their nondiscrimination and antiharassment policies.

2. The American College of Physicians recommends that public and private health benefit plans include comprehensive transgender health care services and provide all covered services to transgender persons as they would all other beneficiaries.

3. The definition of "family" should be inclusive of those who maintain an ongoing emotional relationship with a person, regardless of their legal or biological relationship.

4. The American College of Physicians encourages all hospitals and medical facilities to allow all patients to determine who may visit and who may act on their behalf during their stay, regardless of their sexual orientation, gender identity, or marital status, and ensure visitation policies are consisten

the Centers for Medicare & Medicaid Services Conditions of Participation and The Joint Commission standards for Medicare-funded hospitals and critical-access hospitals.

5. The American College of Physicians supports civil marriage rights for same-sex couples. The denial of such rights can have a negative impact on

the physical and mental health of these persons and contribute to ongoing stigma and discrimination for LGBT persons and their families.

6. The American College of Physicians supports data collection and research into understanding the demographics of the LGBT population, potential causes of LGBT health disparities, and best practices in reducing these disparities.

7. Medical schools, residency programs, and continuing medical education programs should incorporate LGBT health issues into their curricula. The College supports programs that would help recruit LGBT persons into the practice of medicine and programs that offer support to LGBT medical students, residents, and practicing physicians.

8. The College opposes the use of "conversion," "reorientation," or "reparative' therapy for the treatment of LGBT persons.

9. The American College of Physicians supports continued reviews of blood donation deferral policies for men who have sex with men. The College supports evidence-based deferral policies that take into account a comprehensive assessment of the risk level of all individuals seeking to donate, which may result in varying deferral periods or a lengthened or permanent deferral on blood donation.

Conclusion

The ACP recognizes that reducing health disparities in the LGBT population will take concerted efforts not only by those in the medical community but

also from society as a whole. Training future physicians to be culturally and clinically competent in LGBT health care, working with practicing physicians to increase their understanding of the LGBT population and their health needs, advocating for practical health policies supported by empirical research, and working to eliminate laws that discriminate against the LGBT community and their families are all important steps to reducing and ultimately eliminating the health disparities experienced by the LGBT community.

Appendix: Lesbian, Gay, Bisexual, and Transgender Health Disparities: A Policy Position Paper From The American College of Physicians

Understanding the LGBT Community

The LGBT community is a highly diverse and multifaceted group of persons encompassing all cultures, ethnicities, and walks of life. Under the LGBT umbrella, each individual group faces unique cultural and health-related needs but shares common challenges, such as social stigma, discrimi and disparities in health care, that unite them.

Research into LGBT health has been expanding as the community has become more visible and outspoken about engaging the health care system in developing a knowledge base on the distinctive challenges and health disparities they face. However, gaps in the medical community's understanding of the overall makeup of the LGBT community and the environmental and social factors that may influence the needs of those

persons present an obstacle to addressing challenges in a meaningful way. In 2011, the Institute of Medicine issued a report outlining a research agenda targeting several areas that could affect how the health care system approaches LGBT health, including demographics, social influences, disparities and inequalities, intervention that includes increasing access to care and addressing physical or mental conditions, and transgender-specific needs. The report also recommended the inclusion of the LGBT community in national health surveys and emphasized a need for scientific rigor and a respectful environment when gathering data (8).

One important obstacle to identifying health issues within the LGBT population is a lack of reliable data and the exclusion of sexual and gender minorities' identification on federal health surveys. Recent efforts have been made to gather population data on persons who identify as lesbian, gay, bisexual, or transgender and those who identify as being in a same-sex marriage or partnership. For the first time in 2010, the U.S. Census Bureau did not change the data reporting the number of same-sex couples that identified as being married. Before that, the 2000 U.S. Census changed the relationship status of same-sex partners identifying as being the spou
the head of household to an "unmarried partner" because there were no states in which same-sex marriage was legal. In the 1990 U.S. Census, if a same-sex couple identified themselves as married, the sex of 1 of the respondents was automatically changed to the opposite sex and the couple was enumerated as an opposite-sex married couple (9). The Patient Protection and Affordable Care Act allows the Department of Health and Human Services (HHS) to collect "additional demographic data to further

improve our understanding of health disparities," and in 2013, the National Health Interview Survey—an annual study of health care access, use, and behaviors—included sexual orientation as part of its data collection system (10). Recent estimates put the number of persons who identify as lesbian, gay, bisexual, or transgender at more than 9 million or approximately 3.4% of the U.S. population, which some analysts believe may be an underestimate (1). Individuals who may have same-sex attractions or experiences but do not self-identify as LGBT may still fall into the category of sexual minorities and face health disparities associated with LGBT persons.

Access to Care in the LGBT Population

The LGBT community has often been overlooked when discussing health care disparities and continues to face barriers to equitable care. Barriers to care are multidimensional and include stigma and discrimination, poverty, lack of education, racial or ethnic minority status, and other psychological health determinants (11). Studies show that persons who identify as LGBT have greater economic disadvantages and are more vulnerable to poverty than those who do not. Using available information from national sur the Williams Institute reports higher overall poverty rates for persons identifying under the LGBT umbrella than heterosexual persons and higher rates of poverty in same-sex couples than heterosexual couples (7.6% vs. 5.7%) (12).

Research shows that LGBT adults and their children are more likely to be uninsured by public or private insurance and that they and their family

members continue to face difficulties in gaining access to care and face a higher risk for health disparities than the general population (2). Most Americans gain health insurance coverage through their employer; data are limited but suggest LGBT persons face higher unemployment rates than non-LGBT persons. A 2009 survey in California found a 14% unemployment rate among LGBT adult workers compared with 10% among non-LGBT adults (13).

The Affordable Care Act sought to increase access to care for low-income Americans by expanding Medicaid programs to all persons at or below 133% of the federal poverty level, providing financial subsidies to help those making between 100% and 400% of the federal poverty level purchase insurance on the federal and state marketplace exchanges, and including nondiscrimination protections in health plans sold on the exchanges. Although estimates suggested that the number of uninsured LGBT persons would be reduced as a result of Medicaid expansion, only about half of states have chosen to expand their Medicaid programs, which greatly diminishes its effect. This increases the number of LGBT persons who may fall into what has been dubbed the "coverage gap," in which persons may earn too m qualify for their state's Medicaid program but too little to qualify for subsidies (14).

Transgender individuals face additional challenges in gaining access to care. Not only are they more likely to be uninsured than the general population, they are more likely to be uninsured than lesbian, gay, or bisexual persons (1). They also face high out-of-pocket costs for transgender-specific medical

care if they lack insurance or their insurance coverage does not cover transgender health care. According to the American Congress of Obstetricians and Gynecologists, transgender youth who receive inadequate treatment are at an increased risk for engaging in self-mutilation or using illicit venues to obtain certain treatments; research shows more than 50% of persons who identify as transgender have obtained injected hormones through illegal means or outside of the traditional medical setting (6).

Mental and Physical Health Disparities

Existing research into the health of the LGBT population has found some health disparities that disproportionately affect the LGBT population. In 2000, the first federally funded research study on the health of LGBT persons assessed 5 major areas of concern for lesbian, gay, and bisexual persons (the report noted that transgender health concerns warranted an independent evaluation): cancer, family planning, HIV and AIDS, immunization and infectious diseases, and mental health (15). Research has shown that lesbian women are less likely to get preventive cancer screenings; lesbian and bisexual women are more likely to be overweight or obese (16); gay m
at higher risk for HIV and other sexually transmitted infections; and LGBT populations have the highest rates of tobacco, alcohol, and other drug use (17). Lesbian, gay, and bisexual persons are approximately 2.5 times more likely to have a mental health disorder than heterosexual men and women (18).

Transgender persons are also at a higher lifetime risk for suicide attempt and show higher incidence of social stressors, such as violence, discrimination, or childhood abuse, than nontransgender persons (19). A 2011 survey of transgender or gender-nonconforming persons found that 41% reported having attempted suicide, with the highest rates among those who faced job loss, harassment, poverty, and physical or sexual assault (20).

Positions

1. The American College of Physicians recommends that gender identity, independent and fundamentally different from sexual orientation, be included as part of nondiscrimination and antiharassment policies. The College encourages medical schools, hospitals, physicians' offices, and other medical facilities to adopt gender identity as part of their nondiscrimination and antiharassment policies.

Nondiscrimination policies are in place to prevent employment discrimination or harassment based on race, color, national or ethnic origin, age, religion, sex, disability, genetics, or other characteristics protecte under federal, state, or local law (21). However, state law varies consic on the inclusion of sexual orientation and gender identity in nondiscrimination policies and some policies based on sexual orientation alone may not include gender identity. Eighteen states have employment nondiscrimination or equal employment opportunity statutes that cover both gender identity and sexual orientation, and an additional 3 states have nondiscrimination statutes that cover sexual orientation only (22). The

Human Rights Campaign, an LGBT rights organization, estimated that as a result of these assorted laws, 3 of 5 U.S. citizens live in an area that does not provide protection for gender identity or sexual orientation (23).

Sexual orientation and gender identity are inherently different and should be considered as such when assessing whether nondiscrimination or harassment policies provide protection to all members of the LGBT community. According to the Institute of Medicine, "sexual orientation" refers to a person's enduring pattern of or disposition to have sexual or romantic desires for, and relationships with, persons of the same sex or both sexes (8). "Gender identity" refers to a person's basic sense of being a man or boy, a woman or girl, or another gender. Gender identity may or may not correspond to a person's anatomical sex assigned at birth. The term "transgender" is now widely used to refer to a diverse group of persons who depart significantly from traditional gender norms (24). Persons who have a "marked difference" between their anatomical sex at birth and their expressed or experienced gender may be diagnosed with gender dysphoria, which is a diagnosis under the American Psychiatric Association *Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition* (25).

Evidence shows that individuals with gender identity variants face increased discrimination, threats of violence, and stigma. The National Gay and Lesbian Task Force and the National Center for Transgender Equality conducted a national survey of transgender and gender-nonidentifying persons and found high rates of harassment (78%), physical assault (35%), and sexual violence (12%) (20). More than 90% of survey participants

reported harassment or discrimination in the workplace, and they experience double the rate of unemployment than the general population (20). Therefore, LGBT persons are more likely to lose their job or not be hired (26).

Employers have the option to include gender identity as part of their company's nondiscrimination or antiharassment policies even if their state does not, and many companies have chosen to include comprehensive protections policies. To reduce the potential for discrimination, harassment, and physical and emotional harm toward persons who are not covered by current protections, the medical community should include both sexual orientation and gender identity as part of any comprehensive nondiscrimination or antiharassment policy.

2. The American College of Physicians recommends that public and private health benefit plans include comprehensive transgender health care services and provide all covered services to transgender persons as they would all other beneficiaries.

The LGBT community is at increased risk for physical and emotional l

resulting from discrimination or harassment, and transgender persons may face greater inequalities in the health care system than the general population. Of note, 19% of transgender persons lack any type of health insurance (20). A handful of states have laws about insurance coverage for transgender health care, such as hormone replacement therapy or sexual reassignment surgery, which may be considered medically necessary as part of the patient's care. Eight states and the District of Columbia have

prohibitions on insurance exclusion of treatments for sex reassignment surgery (27).

The World Professional Association for Transgender Health has developed health care standards for transgender persons who have been diagnosed with gender dysphoria. The standards emphasize treatments that will achieve "lasting personal comfort with their gendered selves, in order to maximize their overall health, psychological well-being, and self-fulfillment" and may or may not include modification to a person's gender expression or how this individual appears or presents physically to others (28). Research shows that when transgender persons receive individual, medically appropriate care, they have improved mental health, reduction in suicide rates, and lower health care costs overall because of fewer mental health–related and substance abuse–related costs (29). However, not all health plans cover all services associated with transgender health or consider such services medically necessary; some plans may issue blanket exclusions on transgender health care, not cover certain services for a transgender person as they would for nontransgender persons, or only cover the cost of gender reassignment surgery if certain conditions are met. For example, an insurance company may cover posthysterectomy estrogenic hormone replacement therapy for biological women but will not cover a similar type of hormone therapy for a postoperative male-to-female transgender patient. Many professional medical organizations, including the American Medical Association, American Psychological Association, American Psychiatric Association, American Congress of Obstetricians and Gynecologists, and

American Academy of Family Physicians, consider gender transition–related medical services medically necessary (30).

The decision to institute a hormone therapy regimen or pursue sexual reassignment surgery for transgender individuals is not taken lightly. Transgender patients and their health care team, which may include primary care physicians, endocrinologists, mental health professionals, and others, are in the best position to determine the most appropriate care plan unique to the patient's needs. Throughout the course of treatment, patients and their physicians or health care team should discuss available options and the evidence base for those treatments in which such evidence exists. It is especially important that transgender patients whose health care team has determined that treatment should include cross-sex hormone therapy or sexual reassignment surgery and postoperative hormone therapy be well-informed about the potential health risks associated with the long-term use of some hormonal replacement therapies before treatment.

Without insurance coverage, the cost of treatment for persons with gender dysphoria may be prohibitively expensive. The most extensive and exp sexual reassignment surgeries may cost tens of thousands of dollars; t does not include associated costs, such as counseling, hormone replacement therapy, copays, or aftercare. The high costs of treatment can result in persons who cannot access the type of care they need, which can increase their levels of stress and discomfort and lead to more serious health conditions. In 2014, the HHS lifted the blanket ban on Medicare coverage for gender reassignment surgery (31) and the federal government announced it

would no longer prohibit health plans offered on the Federal Employees Health Benefits Program from offering gender reassignment as part of the plan (27). Transgender health advocates are hopeful this will result in wider coverage for transgender care in private health plans.

The cost of including transgender health care in employee health benefits plans is minimal and is unlikely to raise costs significantly, if at all. A survey of employers offering transition-related health care in their health benefit plans found that two thirds of employers that provided information on actual costs of employee utilization of transition-related coverage reported 0 costs (32). This is the result of a very small portion of the population identifying as transgender and a smaller portion of that group having the most expensive type of gender reassignment surgery as part of their treatment. An analysis of the utilization of transgender health services over 6 years after transgender discrimination was prohibited in one California health plan found a utilization rate of 0.062 per 1000 covered persons (33). The inclusion of transgender-related health care services within a health plan may also result in an overall reduction of health care costs over time because patients are less likely to engage in self-destructive behaviors, such alcohol or substance abuse.

3. The definition of "family" should be inclusive of those who maintain an ongoing emotional relationship with a person, regardless of their legal or biological relationship.

The term "family" as it is seen in society is changing and no longer means married heterosexual parents with children. An analysis shows only 22% of

families fall into this category (34). Stepparents, single parents, grandparents, same-sex couples, or foster or adoptive parents all make up the changing face of U.S. families. Across the country, LGBT persons are raising children, and demographic data shows that 110 000 same-sex couples are raising as many as 170 000 biological, adopted, or foster children and 37% of LGBT adults have had a child (35). This modern concept of family is no longer dependent on parental status and does not only include adult heads of household with minor children. Same-sex couples and different-sex couples who do not have children may nevertheless have persons in their lives that they consider family.

Despite research that shows a growing trend toward acceptance of LGBT individuals and families (36), there is no widely used standard definition of family inclusive of the diverse nature of the family structure and definitions vary widely: They can differ from state to state, within the Internal Revenue Service for tax purposes, by employers to determine eligibility for health plans, and by hospitals for the purposes of visitation or medical decision making. If LGBT spouses or partners are not legally considered a family member, they are at risk for reduced access to health care and restrict on caregiving and decision making; further, they are at increased risk for health disparities, and their children may not be eligible for health coverage (34). Therefore, LGBT persons and families may already be at a financial disadvantage, with single LGBT parents 3 times more likely to live near the poverty line than their non-LGBT counterparts and LGBT families twice as likely to live near the poverty threshold (35). These financial disadvantages can translate into lack of access to medical care and poorer health outcomes

similar to those experienced by non-LGBT persons and their families who are uninsured or underinsured, in addition to the health disparities that are already reported among the LGBT community.

The Human Rights Campaign's definition of family for health care organizations, developed with multistakeholder input, is inclusive of same- and different-sex married couples and families and is an example of a broad, comprehensive definition of family that includes a person's biological, legal, and chosen family:

> Family means any person(s) who plays a significant role in an individual's life. This may include a person(s) not legally related to the individual. Members of "family" include spouses, domestic partners, and both different-sex and same-sex significant others. "Family" includes a minor patient's parents, regardless of the gender of either parent. (37)

A definition of family inclusive of all types of families, including the LGBT population, is not only fundamental to reducing the disparities and inequalities that exist within the health care system, but also important for the equal treatment of LGBT patients and their visitors in the hospital setting. Countless accounts show loved ones being denied the right to visit; assist in the medical decision-making process for their partner, minor, or child; or be updated on the condition of a patient because hospital visitation policy broadly prohibits those who are not recognized family members from access to the patient. These policies are discriminatory against LGBT patients, their visitors, and the millions of others who are considered family,

such as friends, neighbors, or nonrelative caregivers who can offer support to the patient.

4. The American College of Physicians encourages all hospitals and medical facilities to allow all patients to determine who may visit and who may to act on their behalf during their stay, regardless of their sexual orientation, gender identity, or marital status, and ensure visitation policies are consistent with the Centers for Medicare & Medicaid Services Conditions of Participation and The Joint Commission standards for Medicare-funded hospitals and critical-access hospitals.

When persons or their loved ones need emergency care or extended inpatient stays in the hospital, they do not often immediately think about access to visitors or hospital visitation policies, the ability to assist in medical decision making, or their legal rights as patients or visitors. Hospital visitation policies are not always clear or consistent about who can visit or make medical decisions for a patient if they become incapacitated or cannot do so themselves. The absence or limited access of loved ones can cause uncertainty and anxiety for the patient. In contrast, the involvement c family and outside support systems can improve health outcomes, suc management of chronic illness and continuity of care (38).

A highly publicized incident of LGBT families facing discrimination and being denied hospital visitation occurred in Florida in 2007. A woman on vacation with her family had an aneurysm and was taken to the hospital. Her same-sex partner and their children were denied the right to see her or receive updates on her condition, and she eventually slipped into a coma

and died (39). In response to this incident, President Obama issued a presidential memorandum recommending that the HHS review and update hospital visitation policies for hospitals participating in Medicare or Medicaid and critical-access hospitals to prohibit discrimination based on such factors as sexual orientation or gender identity (40).

Throughout the rulemaking process, the HHS revised the Medicare Conditions of Participation to require that all hospitals explain to all patients their right to choose who may visit during an inpatient stay, including same-sex spouses, domestic partners, and other visitors, and the patients' right to choose a person to act on their behalf. The Joint Commission, the nation's largest organization for hospital accreditation, also updated its standards to include equal visitation for LGBT patients and visitors (41). As a result of these updated policies, most hospitals and long-term care facilities are required to allow equal visitation for LGBT persons and their families.

The presidential memorandum also recommended that the HHS instruct hospitals to disclose to their patients that patients have a right to designate a representative to make medical decisions on their behalf if they cann make those decisions themselves. The revised Conditions of Participa emphasized that hospitals "should give deference to patients' wishes about their representatives, whether expressed in writing, orally, or through other evidence, unless prohibited by state law" (42). With piecemeal regulations and policies governing the legal rights of LGBT persons and their families, some same-sex spouses or domestic partners choose to prepare advance directives, such as durable powers of attorney and health care proxies, in an

effort to ensure their access to family members and their ability to exert their right to medical decision making if necessary.

5. The American College of Physicians supports civil marriage rights for same-sex couples. The denial of such rights can have a negative impact on the physical and mental health of these persons and contribute to ongoing stigma and discrimination for LGBT persons and their families.

The health and financial benefits of marriage for different-sex couples are widely reported, and contemporary research supports similar benefits in same-sex marriage. On the other hand, denial of marriage rights for LGBT persons may lead to mental and physical health problems. Health benefits associated with same-sex marriage result from improved psychological health and a reinforced social environment with community support (43). Research suggests that being in a legally recognized same-sex marriage diminishes mental health differentials between LGBT and heterosexual persons (5). A comparison study on the utilization of public health services by gay and bisexual men before and after Massachusetts legalized same-sex marriage found a reduction in the number of visits for health problen mental health services. The study noted a 13% reduction in visits over after the legalization of same-sex marriage (44).

In contrast, denial of such rights can result in ongoing physical and psychological health issues. Thus, LGBT persons encountering negative societal attitudes and discrimination often internalize stressors and have poor health unseen to those around them; further, these stressors can lead to self-destructive behaviors (43). A study of LGBT individuals living in states

with a same-sex marriage ban found increases in general anxiety, mood disorders, and alcohol abuse (45). The denial of marriage rights to LGBT persons has also been found to reinforce stigmas of the LGBT population that may undermine health and social factors, which can affect young adults (46). The American Medical Association's broad policy supporting civil rights for LGBT persons acknowledges that denial of civil marriage rights can be harmful to LGBT persons and their families and contribute to ongoing health disparities (47).

Since 2003, the overall support for marriage equality has increased. The shift in attitudes toward acceptance of same-sex marriage has broad positive implications for the future of U.S. civil marriage rights. A 2013 survey by the Pew Research Center revealed that nearly half of U.S. adults expressed support for same-sex marriage. Of note, millennials (those born after 1980) showed the highest rate of support for same-sex marriage rights at 70%. Not only has overall opinion changed, but individually, 1 in 7 respondents reported they had changed their minds from opposing to supporting same-sex marriage. The Pew survey found that 32% of respondents changed their mind because they knew someone who identified as lesbian or gay (36

The legal landscape is also shifting in favor of inclusive civil marriage rights for same-sex couples. The American Bar Association has adopted a resolution recognizing "that lesbian, gay, bisexual and transgender (LGBT) persons have a human right to be free from discrimination, threats and violence based on their LGBT status and condemns all laws, regulations and rules or practices that discriminate on the basis that an individual is [an]

LGBT person" (48). In June 2013, the U.S. Supreme Court struck down a provision of the Defense of Marriage Act that defined marriage as a "union between a man and a woman." The decision allowed legally married same-sex couples to have the same federal benefits offered to heterosexual couples (49). Currently more than half of the states and the District of Columbia allow same-sex marriage, and several states have rulings in favor of same-sex marriage that are stayed pending legal appeals (50). In April 2015, the Supreme Court heard oral arguments in a case involving same-sex marriage bans in Michigan, Ohio, Kentucky, and Tennessee; this will ultimately determine the constitutionality of same-sex marriage bans, including whether states would be required to recognize same-sex marriages performed legally out of state (51).

6. The American College of Physicians supports data collection and research into understanding the demographics of the LGBT population, potential causes of LGBT health disparities, and best practices in reducing these disparities.

Previous efforts to understand the LGBT population by including sexu orientation or gender identity in health surveys and data collection ar good first step, but there is a long way to go to understand the unique health needs of all members of the LGBT community. Understanding the demographics of the persons who make up this community is a key first step to understanding how environmental and social determinants may contribute to the health disparities they face. Overwhelming evidence shows that racial and ethnic minorities experience greater health disparities than

the general population. In 2010, ACP published an updated position paper on racial and ethnic disparities in health care, which identified various statistics on health disparities in racial and ethnic minority groups, such as higher levels of uninsured Hispanics than white persons (34% vs. 13%) and lower rates of medication adherence in minority Medicare beneficiaries diagnosed with dementia (52). Persons who are part of both the LGBT community and a racial or ethnic minority group may face the highest levels of disparities. For example, data show that 30% of African American adults who identify as lesbian, gay, or bisexual are likely to delay getting a prescription compared with 19% of African American heterosexual adults (26).

Transgender persons may also face certain increased risk factors that can affect their health that are not included when discussing the LGBT population as a whole, which creates research gaps with the LGBT community. A survey study of transgender persons shows elevated reports of harassment, physical assault, and sexual violence (20). In addition, transgender persons are more likely to face discrimination in education, employment, housing, and public accommodations than other sexual, racial, or ethnic minority groups. The lack of and unfamiliarity with research focused on the physical health issues of transgender persons, such as hormone replacement therapy and cancer risk, limit the understanding or development of best practices that could reduce the disparities felt by this population. The dearth of such research is detrimental to physicians' understanding of issues unique to transgender patients and reduces their ability to care for these patients.

Data that have been gathered in the relatively short time since the inclusion of sexual orientation, gender identity, and same-sex marital status have revealed information that can be used to create tailored plans to decrease health disparities in in the LGBT community. For example, in 2009 the California Health Interview Survey collected information on certain health indicators and included sexual orientation along with racial and minority status. The survey found a higher rate of uninsured lesbian, gay, or bisexual Latino adults in the state than their African American counterparts (36% vs. 14%) (20).

In addition to obtaining information from population surveys, including gender identity and sexual orientation as a component of a patient's medical record (paper or electronic) may help a physician to better understand an LGBT patient's needs and provide more comprehensive care. This can be particularly useful in the care of transgender persons, whose gender identity and gender expression may differ from their sex assigned at birth and are not in line with the standard sex template on many forms. Including this information—especially in electronic health records that can standardize information, such as anatomy present and the preferred name/pronou can create a more comfortable experience for the patient and keep the physician up to date on the patient's transition history, if applicable (53). If a physician uses paper medical records, the patient's chart should be flagged using an indicator, such as a sticker, to alert staff to use the preferred name and pronoun of the patient (54).

7. Medical schools, residency programs, and continuing medical education programs should incorporate LGBT health issues into their curricula. The College supports programs that would help recruit LGBT persons into the practice of medicine and programs that offer support to LGBT medical students, residents, and practicing physicians.

Establishing understanding, trust, and communication between a physician and a patient is key to an ongoing and beneficial physician–patient relationship. However, reported instances of physician bias or denial of care to LGBT patients may influence patients to withhold information on their sexual orientation, gender identity, or medical conditions that could help the physician have a better understanding of the potential health needs of their patients. Physicians can play an integral role in helping an LGBT patient navigate through the medical system by providing respectful, culturally, and clinically competent care that underscores the overall health of the patient. In an article published in *The New England Journal of Medicine,* Makadon noted how physicians can create a welcoming and inclusive environment to LGBT patients:

> [G]uidelines for clinical practice can be very simple: ask the appropri[illegible] questions and be open and nonjudgmental about the answers. Few patients expect their providers to be experts on all aspects of gay and lesbian life. But it is important that providers inquire about life situations, be concerned about family and other important relationships, understand support systems, and make appropriate referrals for counseling and support when necessary. (55)

Providing clinically and culturally competent care for transgender persons in the primary care setting may present a challenge to physicians who are not knowledgeable about transgender health. Transgender persons have reported encounters with physicians who are unaware of how to approach treatment of a transgender person, and half of transgender patients reported having to "teach" their physician about transgender health (20). The National Transgender Survey found that 19% of participants had been denied medical care because of their transgender status (20). Resources for physicians on how to approach the treatment of transgender patients should emphasize respecting the patient's gender identity while providing prevention, treatment, and screening to the anatomy that is present (56).

To better understand the unique health needs of the LGBT community, physicians and medical professionals must develop a knowledge base in cultural and clinical competency and understand the factors that affect LGBT health; this should begin in the medical school setting and continue during practice. Assessment of LGBT-related content at medical schools found a median of 5 hours spent on LGBT-related issues over the course of the curriculum (57). Exposure to members of the LGBT population in medical school has been shown to increase the likelihood that a physician will take a more comprehensive patient history, have a better understanding of LGBT health issues, and have a more positive attitude toward LGBT patients (58). Studies show that undergraduate students pursuing a career in medicine are receptive to incorporating LGBT-related issues into their education and agree that it applies to their future work (59). The College recognizes the importance of incorporating LGBT health into the medical

school curriculum and publishes a comprehensive medical textbook on LGBT health, *The Fenway Guide to Lesbian, Gay, Bisexual, and Transgender Health, 2nd Edition* (60).

In November 2014, the Association of American Medical Colleges Advisory Committee on Sexual Orientation, Gender Identity, and Sex Development released a comprehensive report recommending strategies on how to implement changes in academic medical institutions to better address the needs of LGBT patients; further, the committee identified challenges and barriers to carrying out these changes. The report recognizes 3 methods of integrating LGBT health into the medical school curricula: full curriculum revision, the addition of a required class, or LGBT health study as a part of elective materials. The report also identifies barriers to curricular changes, including but not limited to a lack of material that has been shown to be effective, reluctance of faculty and staff to teach the new material, and a shortage of institutional time that would permit teachers to participate in continuing education on the topic (61).

For some LGBT persons interested in pursuing careers in medicine, th continues to be an underlying concern that their sexual orientation or gender identity may affect their selection into a medical school or residency program and acceptance by their peers. In 2012, Dr. Mark Schuster published his personal story about being gay in medicine starting in the 1980s when he entered medical school, through residency, and into practice. In his article, he spoke of a former attending physician he worked under who acted as an advisor and had indicated he would offer him a

recommendation for residency, only to find this physician later renege on that offer after Dr. Schuster shared that he was gay (62). Little research has been done on the recruitment of LGBT physicians into the practice of medicine or how disclosing sexual orientation may affect training. One survey measuring the perceptions and attitudes toward sexual orientation during training found that 30% of respondents did not reveal their sexual orientation when applying for residency positions for fear of rejection (63).

Academic medical institutions can make efforts to create a welcoming and inclusive environment for students and faculty. The University of California, San Francisco, LGBT Resource Center developed a checklist for medical schools to assess LGBT curriculum, admissions, and the working environment within their institution. The checklist includes inclusive application procedures, measurement of retention of LGBT students, and efforts and resources dedicated to student well-being (64). In a 2013 white paper, the Gay and Lesbian Medical Association made several recommendations to support an LGBT-inclusive climate at health professional schools in such areas as institutional equality, transgender services and support, diversity initiatives, admissions, staff and facult recruitment and retention, staff and faculty training, and other areas that underscore simple yet thoughtful ways to create an accepting environment for LGBT students, faculty, and employees (65). Tools such as these can assist in recruiting and retaining LGBT physicians.

8. The College opposes the use of "conversion," "reorientation," or "reparative' therapy for the treatment of LGBT persons.

Since 1973, the American Psychiatric Association's *Diagnostic and Statistical Manual of Mental Disorders* has not considered homosexuality an illness (66). All major medical and mental health organizations do not consider homosexuality as an illness but as a variation of human sexuality, and they denounce the practice of reparative therapy for treatment of LGBT persons (67). The core basis for "conversion," "reorientation," or "reparative" therapy, which is generally defined as therapy aiming at changing the sexual orientation of lesbian women and gay men, is mostly based on religious or moral objections to homosexuality or the belief that a homosexual person can be "cured" of their presumed illness.

In 2007, the American Psychological Association conducted a literature review of 83 studies on the efficacy of efforts to change sexual orientation. It found serious flaws in the research methods of most of the studies and identified only 1 study that met research standards for establishing safety or efficacy of conversion therapy and also compared persons who received a treatment with those who did not. In that study, intervention had no effect on the rates of same-sex behavior, so it is widely believed that there is no scientific evidence to support the use of reparative therapy (68). The I PDF Help American Health Organization, the regional office for the Americas of the larger World Health Organization, also supports the position that there is no medical basis for reparative therapy and that the practice may pose a threat to the overall health and well-being of an individual (69). Dr. Robert Spitzer, the author of a 2003 research study often cited by supporters of the reparative therapy movement to purport that persons may choose to change their sexual orientation, has denounced the research as flawed and

apologized to the LGBT community in a letter for misinterpretations or misrepresentations that arose from the study (70).

Available research does not support the use of reparative therapy as an effective method in the treatment of LGBT persons. Evidence shows that the practice may actually cause emotional or physical harm to LGBT individuals, particularly adolescents or young persons. Research done at San Francisco State University on the effect of familial attitudes and acceptance found that LGBT youth who were rejected by their families because of their identity were more likely than their LGBT peers who were not rejected or only mildly rejected by their families to attempt suicide, report high levels of depression, use illegal drugs, or be at risk for HIV and sexually transmitted illnesses (71). The American Psychological Association literature review found that reparative therapy is associated with the loss of sexual feeling, depression, anxiety, and suicidality (68).

States have delved into the debate over the use of reparative therapy for minor children given the potential for harm. California; New Jersey; and Washington, DC, have enacted laws banning the practice. Several othe legislatures, such as those in Washington state, Massachusetts, New Y and Oregon, have introduced or passed legislation through one chamber but failed to pass the bill into law (72). The New Jersey law was challenged on the grounds that the ban limited the free speech of mental health professionals, but the law was upheld by the Third U.S. Circuit Court of Appeals (73). In May 2015, the U.S. Supreme Court declined to hear a challenge to the law (74).

9. The American College of Physicians supports continued reviews of blood donation deferral policies for men who have sex with men. The College supports evidence-based deferral policies that take into account a comprehensive assessment of the risk level of all individuals seeking to donate, which may result in varying deferral periods or a lengthened or permanent deferral on blood donation.

Persons who are considered at increased or possible risk for certain infectious diseases, such as intravenous drug users, recipients of animal organs or tissues, and those who have traveled or lived abroad in certain countries, are prohibited by the U.S Food and Drug Administration from donating blood (75). Since the early 1980s, the policy has also included men who have sex with men (MSM) since 1977. This lifetime deferral of blood donation for MSM was instituted during a time when the incidence of HIV and AIDS increased to epidemic levels in the United States, and the disease and how it was transmitted were largely misunderstood by the scientific community. In the following years, concerted efforts by the medical community, patient advocates, and government officials and agencies resulted in advancements in blood screening technology and treatmei the virus. However, during that time of uncertainty, policies were implemented to balance the risk for contaminating the blood supply with what was known about the transmissibility of the disease.

Several medical organizations support deferral policy reform based on available scientific evidence and testing capabilities. The American Medical Association policy on blood donor criteria supports, "the use of rational,

scientifically based blood and tissue donation deferral periods that are fairly and consistently applied to donors according to their level of risk" (76). The American Association of Blood Banks, America's Blood Centers, and the American Red Cross have long advocated for a modification to deferral criteria to be "made comparable with criteria for other groups at increased risk for sexual transmission of transfusion-transmitted infections" and recommend a 12-month deferral for men who have had sex with another man since 1977, which is in line with deferral criteria for others who have exhibited high-risk behavior (77). The eligibility standards and policies on the donation of tissues or tissue products (5-year deferral since last sexual contact) (78) and vascular organs (risk assessed individually, disclosed to transplant team, and consent required) (79) by MSM also reflect a measured assessment of disease transmission risk to donor recipients.

Many countries, including the United Kingdom, Canada, Finland, Australia, and New Zealand, have successfully instituted deferral periods ranging from 12 months to 5 years in lieu of a lifetime ban on blood donation by MSM without measurable increased risk to the blood supply. A study of the risk of blood donations from MSM after the implementation of shorter defer periods in England and Wales 12 months after their last sexual encounter found only a marginal increase in the risk for transfusion-transmitted HIV (80). Australia changed the deferral policy for MSM from 5 years to 12 months over 1996 to 2000. A study that compared the prevalence of HIV among blood donors from the 5-year deferral period compared with the 12-month deferral period found no evidence that the 12-month period increased risk for HIV in recipients (81).

In late 2014, the HHS Advisory Committee on Blood and Tissue Safety and Availability voted in favor of recommending a 1-year deferral policy for MSM and increased surveillance of the blood supply. The U.S Food and Drug Administration announced it would be updating its policy on blood donation from MSM after considering recommendations made by the HHS, reviews of available scientific evidence, and recommendations from its own Blood Products Advisory Committee. The policy about indefinite deferral on blood donation from MSM is being updated to a 1-year deferral period from the last sexual contact, and the U.S. Food and Drug Administration will issue draft guidance on the policy change in 2015. In addition, the agency announced it has already taken steps to implement a national blood surveillance system to monitor what, if any, effects the new policy has on the nation's blood supply (82). Lifting the lifetime ban on blood donation by MSM is an important first step toward creating equity among those wishing to donate blood. The U.S Food and Drug Administration should continue to monitor the effects of a 1-year deferral and update its policy as information and data are gathered through surveillance to make further strides toward policies that assess donor eligibility on the basis of scientific data and individual risk fact such as the length of time since a high-risk behavior has occurred, typ sex that occurred, number of partners during a period of time, or a combination of factors (83).

Comment

To the Editor: "ACP Takes a Stand against Health Disparities Affecting LGBT Individuals New policy paper aims to ensure high-quality health care for all" This is very disappointing. I love the Annals and very much enjoyed and learned a great deal at several ACP conferences. But I left the AMA as it stood up for abortion rights and I resign from ACP, now as you stand up for a number of foolish policies, more oriented to political ideology than medical care or logic. Your new policy states: For instance, health data related to marital status show a benefit for married heterosexual couples, but the committee found that the fact that LGBT partners and families live without the same protections and recognition appears to increase their risk for depression and other poor health outcomes. Does it really follow that societys protections and encouragement of heterosexual marriage has the power to prevent depression and poor health outcomes? Is it possible that heterosexual marriage is our natural state and that our minds and bodies work best when used in the appropriate way? ACP's Health and Public Policy Committee recommends: Including comprehensive transgender heath care services in public and private health benefit plans. You recommend public and private insurance pay for sexual reassignment surgery. Is there data of benefit? Perhaps a reduction in mortality, disability or morbidity? Do those who have sexual reassignment surgery live longer or commit suicide less often? Why should anyone outside the person determined to change their body pay for it? Expanding the definition of "family" to include all who maintain an emotional connection to the patient, regardless of legal or biological relationship. Do you have data that children raised in families other than with their biological parents do better or as well? In absence of data, would it not be logical to encourage keeping biological parents together or at least permit states to make the judgment for themselves how to regulate/ encourage marriage? (as opposed to having courts take over as the "determiners of all things not established by study or fact") Opposing the use of "conversion," "reorientation" or "reparative" therapies in the treatment of LGBT individuals. Do you have data that such therapies are harmful? If a deeply disturbed person is confused about his/ her sexual identity and wants to focus attention on the opposite sex and seeks counseling to do so, is that wrong or harmful? LGBT individuals have a high incidence of depression and suicide. Do you wish to oppose possible the may help if you have no alternative therapy that will help? Political trends come and go. Slavery, racial marriage, cocaine, smoking, breast self-exam, and epinephrine have been normal, encouraged, discouraged and tossed away. Allowing a popular political idea to lead to policy changes not supported by data, that costs a great deal of money and is very disruptive to a current healthy institution: heterosexual marriage is a poor plan. ACP think before you act. When you act wrongly think again and change. Good-bye, Rex Moss MD

Response to Comments Made by Drs. Lacy and Ng

The two comments submitted by Drs. Lacy and Ng speak to the diversity of ACP's 143,000 internal medicine physicians and student members. ACP advocates on a wide variety of topics and the College

recognizes that not all ACP members will agree with our positions. The need to address the unique needs of the LGBT persons and their families is a based on ACP's long standing commitment to advocate for those being negatively affected by health care disparities. Ignoring or glossing over some topics that affect health because they are controversial would be inconsistent with ACP's mission "To enhance the quality and effectiveness of health care by fostering excellence and professionalism in the practice of medicine" including "to advocate responsible positions on individual health and on public policy relating to health care for the benefit of the public, our patients, the medical profession, and our members."

We appreciate Dr. Ng's support for our paper. As the paper was being developed, policies concerning same sex marriage, blood donation by men who have sex with men, and coverage for transgender health care services were undergoing change. The College recognizes the need for continued review of issues relating to LGBT health.

Dr. Lacy takes issue with our call for a more inclusive definition of family. As our paper points out, it's estimated that only 22% of U.S. families consist of married heterosexual parents with their own biological children. A modern definition of family that is inclusive of all types of families, including the LGBT population, is fundamental to reducing the disparities and inequalities that exist within the health care system and to equal treatment of LGBT patients and their visitors in the hospital setting. Our opposition to "therapy" to change the sexual orientation of an individual is based on the science that shows that sexual and gender orientation are not disability or disorder in need of treatment or cure, and that such "therapies" may be harmful to patients receiving them.

The policy on LGBT reaches beyond evidence

Dear friends at ACP,

I too am disappointed at the lack of evidence for this very broad set of policy changes, which not only goes beyond the evidence but becomes an agent for changing institutions that have stood the test of millenia. For example, defining a family as something other than biological is a step in the wrong direction. The evidence shows that children need a father and they need a mother; this has something to do with biology, and cannot be socially constructed.

Please reconsider your over-reach and return to medical evidence.

Thank you,

Paul Hudson, MD, FACP, MPH

Access for All but losing our way in the Process

To advocate for the elimination of health care disparities among Lesbian, Gay, Bisexual, and Transgender (LGBT) persons is a worthy objective not just for these populations but all patients facing obstacles to quality care. Sadly, the American College of Physicians Position Paper published May 12, 2015 addressing LGBT Health Disparities goes beyond advocating health care access by promoting a damaging sociopolitical ideology. The Paper re-defines the meaning of family, marriage, and calls for denying LGBT persons choices in behavioral health services.

While alleging the Position Paper was the product following review of "numerous studies, reports, and surveys on LGBT health care and related health policy" many cited references are based on research neither well executed nor widely corroborated. Further, it appears the reviewers fail to account for sound, copious evidence contradicting the cited sources.

To redefine family as "those who maintain an ongoing emotional relationship with a person, regardless of their legal or biological relationship" is to deny the reality of paternity and maternity, both integr most wholesome child-rearing environments. Dads contribute to the growth and development children much differently than moms do. Asserting family as whatever one wants it to be is to succumb to the solipsistic notion that the self is the final arbiter of reality, to substitute the real and immutable childhood need for mothers and fathers with the sexual-romantic mutable desires of adults. Will the next Position Paper call for endorsing the aims of the North American Man Boy Love Association or Peter Singer's call for granting civil rights to primates? Marriage is, and for millennia has been, rooted in the male-female complementarity that makes sexual reproduction possible and child-rearing wholistic. What is at play in this Statement are very imprudent mental maneuvres, "The moment you step into the world of facts, you step into a world of limits. You can free things from alien or accidental laws, but not from the laws of their own nature. You may, if you like, free a tiger from his bars, but not free him from his stripes. Do not free a camel from his hump; you may be freeing him from being a camel". In "re-inventing" family and the meaning of marriage is to engage in the same sort of casuistry.

With regard to the American Psychological Association (APA) being invoked as the authority to repudiate psychotherapy for unwanted sexual behaviours recall the APA Task Force unequivocally posits "Same-sex sexual attractions, behavior, and orientations per se are normal and positive variants of human sexuality." If that is the a priori assertion, can objective assessment of "sexual orientation change efforts" (SOCE) be realistically expected? Probably not. To satisfactorily debunk SOCE entails more than citing the APA. In the meantime, persons who opt for SOCE should be given the prerogative in the same way, for example, the transgender person is offered high- dose estrogens in spite of the increased risk of thrombosis.

The LGBT Position Papers unfortunately makes the Annals a mouthpiece for the post-modern notion that we can write our own narrative and call it true, regardless of the facts. Once the Annals becomes a purveyor of ideology and asserts a world view which doesn't comport with facts, it is no longer a reliable source of guidance for physicians.

In support of the American College of Physician's Policy Position Paper on Lesbian, Gay, Bisexual and Transgender Health Disparities

As an internist-pediatrician who has worked in LGBT health care for the last decade, I am invigorated that the American College of Physicians (ACP), one of my professional homes, has developed a set of LGBT health focused policy statements. From my perspective as an LGBT health advocate and clinical director of a hospital-based LGBT health service line, these policy statements were sorely needed to assist internists around the US and internationally to improve the health experiences and outcomes, and ultimately eliminate health disparities of LGBT patients. I am proud to see the American College of Physicians join a growing group of professional organizations with LGBT-inclusive policies or mi: statements including the American Academy of Family Physicians, the American Medical Assoc American Academy of Pediatrics, the American Academy of Physician Assistants, the American Academy of Nursing , the American College of Obstetrics and Gynecology, the American Psychological Association, the American Psychiatric Association, GLMA: Health Professionals Advancing LGBT Equality and others.

The nine policy statements developed by Daniel et al which compose the ACP's policy position paper are both bold and broad in their recommendations. Many of the recommendations are timely and remind internists to keep in-step with guidelines set forth by accrediting bodies such as the Joint Commission and the Centers for Medicare & Medicaid Services. This is especially important as more and more LGBT Americans enroll in health insurance through the Affordable Care Act and begin to routinely access the US health care system. However, the ACP's policy statements will only be as useful as they are complete and current and must be considered a living document with the capacity to grow and change based on

the best available data and knowledge regarding LGBT health. I encourage the members of the ACP Health and Public Policy Committee to revisit the policy statement on regular intervals for updates to fill the many gaps in our knowledge about LGBT health.

Future revisions of the policy statement should pay careful attention to details not necessarily called out in the current policy's executive summary. For example, policy statement 2 calls for the ACP to "recommend that all public and private health benefit plans include comprehensive transgender care services and provide all covered services to transgender persons as they would all other beneficiaries."1 The authors continue to describe the impact of arbitrary or blanket exclusions for transgender health services in their example of hysterectomy coverage for a cisgender patient, but exclusion for a transgender patient. Yet in the policy statement, the ACP falls short of stating that such hormonal and/or surgical care is medically necessary. Moreover, the term "comprehensive" is an unclear term in this context. For optimal health outcomes, comprehensive care would need to be inclusive of all medically necessary care including primary care, mental health care, transgender hormonal care, transgender-related and non-transgender-related surgical care, and HIV care.

The policy authors write in policy statement 6 that the ACP supports data collection and research into the understanding the demographics of the LGBT population, potential causes of LGBT health disparities, and best practices in reducing these disparities. This statement particularly important as there exist few nationally representative datasets describing LGBT population health. In fact, Healthy People 2020 still prioritizes collecting data on LGB and Transgender populations in their four objectives.2 To date, only the 2013 National Health Interview Survey has collected nationally representative data on lesbian, gay and bisexual people.3 Federal nationally representative surveys continue to exclude transgender respondents by not collecting gender identity/expression as part of the respondents' demographic variables. Unfortunately, the majority of electronic health records also fail to provide fields for collection of sexual orientation and gender identity (SOGI) data. Cahill et al found that integrating SOGI data collection into the meaningful use requirements was both acceptable to diverse samples of patients, including heterosexuals, and feasible.4 The ACP should consider supporting inclusion of SOGI data collection in Meaningful Use as another strategy to improve LGBT health data collection.

Daniel et al write in position statement 7 that "Medical Schools, residency programs, and continue medical education programs should incorporate LGBT health issues into their curriculum. The College supports programs that would help recruit LGBT persons into the practice of medicine and programs that offer support to other LGBT medical students, residents, and practicing physicians."1 Creating the next generation of culturally and clinically competent health professionals and internists is central to improving LGBT health. Nationally, few health organizations and hospitals have actively implemented comprehensive programs to create LGBT affirming environments, educate health professionals and staff on LGBT health, or create sustainable supportive infrastructure. There continues to be a great need for LGBT safe space programs, LGBT 101 cultural competency education, and inclusion of LGBT topics in academic discourse and mentorship. Homophobia, transphobia, few visible LGBT health professional

mentors and lack of institutional support for LGBT health scholarship serve as barriers to growing a cadre of academic internists adequately prepared to care for LGBT populations.5 The College can continue to champion LGBT health by supporting inclusion of LGBT health content in internal medicine certification examination questions, internal medicine in-training examination questions and promotion of additional LGBT health education resources like Fenway Guide to Lesbian, Gay, Bisexual, and Transgender Health.6

Finally, the ACP should consider adding an additional statement which addresses and acknowledges the intersectionality of our patients' identities as noted by IOM report.7 Sexual orientation and gender identity/expression do not exist within a vacuum and are part of the multidimensionality of our identities as people.

FDA Releases Draft Guidance on Blood Donation by MSM

On Tuesday May 12, 2015 the Food and Drug Administration released the document "Revised Recommendations for Reducing the Risk of Human Immunodeficiency Virus Transmission by Blood and Blood Products: Draft Guidance for Industry." The proposed recommendations would replace the lifetime deferral period on blood donation by men who have sex with men (MSM) with a 12-month deferral period from most recent sexual contact. The FDA is accepting public comment on the guidance for 60 days.

James L. Madara, MD
CEO, EXECUTIVE VICE PRESIDENT
jamo.madara@ama-assn.org

Pl. Trial Ex. 042

April 26, 2021

Mr. Bill McBride
Executive Director
National Governors Association
Hall of States
444 North Capitol Street NW, Suite 267
Washington, DC 20001

Dear Mr. McBride:

On behalf of the American Medical Association (AMA) and our physician and medical student members, I write to urge the National Governors Association (NGA) and its member governors to oppose state legislation that would prohibit the provision of medically necessary gender transition-related care to minor patients. We believe this legislation represents a dangerous governmental intrusion into the practice of medicine and will be detrimental to the health of transgender children across the country.

Empirical evidence has demonstrated that trans and non-binary gender identities are normal variations of human identity and expression. For gender diverse individuals, standards of care and accepted medically necessary services that affirm gender or treat gender dysphoria may include mental health counseling, non-medical social transition, gender-affirming hormone therapy, and/or gender-affirming surgeries. Clinical guidelines established by professional medical organizations for the care of minors promote these supportive interventions based on the current evidence and that enable young people to explore and live the gender that they choose. Every major medical association in the United States recognizes the medical necessity of transition-related care for improving the physical and mental health of transgender people.

Arkansas' recently enacted SAFE Act and similar bills pending in several other states would insert the government into clinical decision-making and force physicians to disregard clinical guidelines. Decisions about medical care belong within the sanctity of the patient-physician relationship. As with all medical interventions, physicians are guided by their ethical duty to act in the best interest of their patients and must tailor recommendations about specific interventions and the timing of those interventions to each patient's unique circumstances. Such decisions must be sensitive to the child's clinical situation, nurture the child's short and long-term development, and balance the need to preserve the child's opportunity to make important life choices autonomously in the future. We believe it is inappropriate and harmful for any state to legislatively dictate that certain transition-related services are never appropriate and limit the range of options physicians and families may consider when making decisions for pediatric patients.

In addition, evidence has demonstrated that forgoing gender-affirming care can have tragic consequences. Transgender individuals are up to three times more likely than the general population to report or be diagnosed with mental health disorders, with as many as 41.5 percent reporting at least one diagnosis of a mental health or substance use disorder.[1] The increased prevalence of these mental health conditions is widely thought to be a consequence of minority stress, the chronic stress from coping with societal

[1] Sari Reisner, et al., *Psychiatric Diagnoses and Comorbidities in a Diverse, Multicity Cohort of Young Transgender Women: Baseline Findings from Project LifeSkills*, 170 J. Am. Med. Ass'n Pediatrics 5, 481–86 (May 2016).

stigma, and discrimination because of one's gender identity and expression. Because of this stress, transgender minors also face a significantly heightened risk of suicide.

Transgender children, like all children, have the best chance to thrive when they are supported and can obtain the health care they need. Studies suggest that improved body satisfaction and self-esteem following the receipt of gender-affirming care is protective against poorer mental health and supports healthy relationships with parents and peers.[2] Studies also demonstrate dramatic reductions in suicide attempts, as well as decreased rates of depression and anxiety.[3] Other studies show that a majority of patients report improved mental health and function after receipt of gender-affirming care. Medically supervised care can also reduce rates of harmful self-prescribed hormones, use of construction-grade silicone injections, and other interventions that have potential to cause adverse events.[4]

It is imperative that transgender minors be given the opportunity to explore their gender identity under the safe and supportive care of a physician. Arkansas's law and others like it would forestall that opportunity. This is a dangerous intrusion into the practice of medicine and we strongly urge the NGA and its member governors to oppose these troubling bills.

We thank you for the opportunity to express our views on this important issue. Please contact Annalia Michelman, JD, Senior Legislative Attorney, AMA Advocacy Resource Center at annalia.michelman@ama-assn.org to discuss this issue further and how our two organizations can work together.

Sincerely,

James L. Madara, MD

TAB 176-3

ISSUE BRIEF

Health insurance coverage for gender-affirming care of transgender patients

Background

Gender identity refers to an individual's concept of self as male, female, a blend of both or neither. Approximately 1.4 million adults and 150,000 youth ages 13 to 17 in the United States identify as transgender, meaning those individuals' gender identity and/or expression is different from cultural expectations based on the sex they were assigned at birth.[1] Individuals may also identify as gender expansive, meaning they identify with neither traditional binary gender role nor a single gender narrative or experience.[2] In this document, the term transgender is used inclusive of patients with transgender or gender expansive identities.

Many but not all transgender people experience gender dysphoria, a medical condition defined by the American Psychiatric Association as a "conflict between a person's physical or assigned gender and the gender with which he/she/they identify."[3] Standards of care and accepted medically necessary services that affirm gender or treat gender dysphoria may include but are not limited to mental health counseling, non-medical social transition, gender-affirming hormone therapy, and/or gender-affirming surgeries.[4] Every major medical association in the United States recognizes the medical necessity of transition-related care for improving the physical and mental health of transgender people and has called for health insurance coverage for treatment of gender dysphoria.[5]

Barriers to care

As a population, transgender individuals are frequently subject to bias and discrimination in many aspects of their lives, including the provision of health care. The transgender population is less likely to be insured than both the lesbian, gay and bisexual (LGB) and general populations and often faces challenges in accessing needed healthcare services.[6] A national survey of transgender individuals found:

- 25 percent of respondents experienced a problem with their insurance in the past year related to being transgender, such as being denied coverage for care related to gender transition;
- 25 percent of those who sought coverage for hormones in the past year were denied;
- 55 percent of those who sought coverage for transition-related surgery in the past year were denied;

Pl. Trial Ex. 043

- 78 percent of respondents wanted hormone therapy related to gender transition, but only 49 percent had ever received it;
- 42 percent reported that insurance covered only some of the surgical care needed for transition; and
- 21 percent reported that insurance covered transition-related surgery, but had no in-network providers.[7]

Federal and state policies

Section 1557 of the Affordable Care Act (ACA) created specific protections barring insurance discrimination based on sexual orientation and gender identity.[8] Prior to enactment, medically necessary gender-affirming hormones and surgeries were often excluded from insurance coverage. Addressing this disparity, the US Department of Health and Human Services (HHS) promulgated final regulations in 2016 implementing section 1557 of the ACA to extend protections against sex discrimination to health coverage and care for the first time and including gender identity discrimination within the definition of sex discrimination.[9] However, a federal court stayed a legal challenge to the rule after the current Administration announced it would reconsider the rule's prohibition on discrimination based on gender identity. The timeline for HHS reconsideration is unknown and the current Administration has, to date, declined to defend the regulation.[10] Rulings by the Equal Employment Opportunity Commission remain intact, however, which found that employer-sponsored plans that exclude gender-affirming care violate Title VII.[11] Title VII of the Civil Rights Act prohibits employment discrimination based on race, color, religion, sex and national origin.

In addition to the ACA, the federal government has taken steps to bar discrimination against transgender individuals in federal health programs. In 2014, HHS invalidated a prior prohibition on Medicare coverage of gender-affirming surgery, citing evidence supporting its effectiveness in treating gender dysphoria and potential for improved health outcomes.[12] In 2016, the federal Office of Personnel Management barred exclusions for gender transition services from the Federal Employees Health Benefits Program. In 2018, the US Department of Veterans Affairs (VA) proposed to amend its medical regulations by removing a provision that excludes "gender alterations" from its medical benefits package, which would effectively authorize transition-related surgery as part of VA care when medically necessary. Final regulations, however, have not yet been issued by the VA.

State-wise, twenty states (CA, CT, CO, DE, HI, IL, MA, MD, MI, MN, NJ, NM, NV, NY, OR, PA, RI, VT and WA) and District of Columbia prohibit health insurers from excluding coverage for transgender health services.[13] California, for example, prohibits health plans from denying coverage or limiting coverage on the basis of sex, which is defined to include gender, gender identity and gender expression. In regulation, California specifies four prohibited practices:

- Denying or cancelling an insurance policy on the basis of gender identity;
- Using gender identity as a basis for determining premium;
- Considering gender identity as a pre-existing condition; and
- Denying coverage or claims for health care services to transgender people when coverage is provided to non-transgender people for the same services.[14]

Cost savings

In promulgating the regulations, the California Department of Insurance issued an Economic Impact Assessment that determined that aggregate costs of the antidiscrimination rules would be "insignificant and immaterial" while yielding significant benefits to transgender individuals including suicide reduction, improvements in mental health, reduction in substance use rates, higher rates of adherence to HIV care and reduction in self-medication.[15] The Economic Impact Assessment also identified potential cost savings in the medium to long term due to lower costs associated with suicide, attempts at suicide, overall improvements in mental health and lower rates of substance abuse.[16] The assessment noted that the Centers for Disease Control and Prevention estimate the average acute medical costs of a single suicide completion or attempt in the United States is $2,596 and $7,234 respectively.[17]

Other studies have similarly demonstrated that transgender inclusive health coverage is cost-effective compared to the costs associated with untreated gender dysphoria.[18] A cost analysis of the City and County of San Francisco's coverage of transition-related surgeries found that costs in the first five years to both insurers and employers were low, averaging between $0.77 and $0.96 per year per enrollee, and resulted in no surcharge or premium increases.[19] The analysis also found no evidence of a "magnet effect" wherein transgender individuals would have deliberately sought employment in order to access services.

Health implications for transgender individuals

Transgender individuals in the US are up to three times more likely than the general population to report or be diagnosed with mental health disorders, with as many as 41.5 percent reporting at least one diagnosis of a mental health or substance use disorder:

- Over a third of transgender individuals suffer a major depressive episode in their lifetimes;
- 20.2 percent have been diagnosed with suicidality in the past 30 days;
- 7.9 percent have been diagnosed with an anxiety disorder in the past six months;
- 9.8 percent have been diagnosed with post-traumatic stress disorder in the past six months; and
- 15.2 percent have been diagnosed with a substance use disorder in the past year.[20]

The increased prevalence of these mental health conditions is widely thought to be a consequence of minority stress, the chronic stress from coping with societal stigma and discrimination because of one's gender identity and expression.[21] Indeed, gender based discrimination affecting access to services is a strong predictor of suicide risk among transgender persons.[22] Lack of access to gender-affirming care may directly contribute to poor mental

health: individuals with gender dysphoria who have undergone no gender confirmation treatment are twice as likely to experience moderate to severe depression and four times more likely to experience anxiety than their surgically-affirmed peers.[23]

Improving access to gender-affirming care is an important means of improving health outcomes for the transgender population. Studies demonstrate dramatic reductions in rate of suicide attempts, with one meta-analysis finding that suicidality rates dropped from 30 percent pre-treatment to 8 percent post-treatment.[24] Studies have also demonstrated a decrease in depression and anxiety and that a majority of patients report improved mental health and function after receipt of gender-affirming care.[25] In addition, receipt of appropriate care is associated with decreased substance use and improved HIV medication adherence among the transgender population, reducing long term negative health outcomes and potential transmission rates. [26] Medically supervised care can also reduce rates of harmful self-prescribed hormones, use of construction grade silicone injections and other interventions that have potential to cause adverse events.[27]

Patients who receive gender-affirming care, including surgical care, feel more congruent in their bodies and report improved mental health. Specifically, one study found that facial feminization surgery improved mental health-related quality of life scores among transgender women to levels seen in the general female population.[28] Studies suggest that improved body satisfaction and self-esteem following medical and surgical therapies is protective against poorer mental health and also supports healthy relationships with parents and peers.[29]

Positive health effects from gender-affirming care extend to children and adolescents as well.[30] Recent research demonstrates that integrated affirmative models of care for youths, which include access to medications and surgeries, result in fewer mental health concerns than has been historically seen among transgender populations.[31] Importantly, rates of self-reported feelings of regret among adolescents following receipt of gender-affirming care are extremely low.[32]

Medical society opinions

The AMA opposes any discrimination based on an individual's sex, sexual orientation or gender identity, opposes the denial of health insurance on the basis of sexual orientation or gender identity, and supports public and private health insurance coverage for treatment of gender dysphoria as recommended by the patient's physician. GLMA: Health Professionals Advancing LGBTQ Equality recognizes that mental healthcare, hormone replacement therapy, and/or gender-affirming surgery are medically necessary for the treatment of transgender people who meet the criteria for gender dysphoria and advocates that these services not be excluded from any public or private insurance programs. In addition, other medical associations, including the American Academy of Family Physicians, American College of Obstetricians and Gynecologists and American Psychiatric Association have stated that medically necessary transition-related care should be covered by insurance.[33]

AMA policy

Removing Financial Barriers to Care for Transgender Patients H-185.950
Our AMA supports public and private health insurance coverage for treatment of gender dysphoria as recommended by the patient's physician. (Res. 122 A-08; Modified: Res. 05, A-16)

Sexual Orientation and/or Gender Identity as Health Insurance Criteria H-180.980
The AMA opposes the denial of health insurance on the basis of sexual orientation or gender identity. (Res. 178, A-88; Reaffirmed: Sub. Res. 101, I-97; Reaffirmed: CMS Rep. 9, A-07; Modified: BOT Rep. 11, A-07; Reaffirmed: CMS Rep. 01, A-17)

Military Medical Policies Affecting Transgender Individuals H-40.966
Our American Medical Association affirms that there is no medically valid reason to exclude transgender individuals from service in the US military and affirms transgender service members be provided care as determined by patient and physician according to the same medical standards that apply to non-transgender personnel. (Res. 11, A-15)

Reducing Suicide Risk Among Lesbian, Gay, Bisexual, Transgender, and Questioning Youth Through Collaboration with Allied Organizations H-60.927
Our AMA will partner with public and private organizations dedicated to public health and public policy to reduce lesbian, gay, bisexual, transgender, and questioning (LGBTQ) youth suicide and improve health among LGBTQ youth. (Res. 402, A-12)

GLMA policy

GLMA 127-18-101: Transgender Healthcare
Therapeutic treatment, including hormone therapy, mental health therapy and gender affirming surgeries, are medically necessary for the treatment of gender dysphoria. These gender-affirming medical and surgical treatments should be covered by all public and private insurance plans. (Approved 2018)

For additional information or assistance with advocacy to protect transgender individuals' access to medically necessary services, please visit the www.ama-assn.org/go/arc or contact Annalia Michelman, JD, Senior Legislative Attorney, AMA Advocacy Resource Center at annalia.michelman@ama-assn.org or (312) 464-4788.

TAB 176-5

Guidelines for Psychological Practice With Transgender and Gender Nonconforming People

American Psychological Association

Transgender and gender nonconforming[1] (TGNC) people are those who have a gender identity that is not fully aligned with their sex assigned at birth. The existence of TGNC people has been documented in a range of historical cultures (Coleman, Colgan, & Gooren, 1992; Feinberg, 1996; Miller & Nichols, 2012; Schmidt, 2003). Current population estimates of TGNC people have ranged from 0.17 to 1,333 per 100,000 (Meier & Labuski, 2013). The Massachusetts Behavioral Risk Factor Surveillance Survey found 0.5% of the adult population aged 18 to 64 years identified as TGNC between 2009 and 2011 (Conron, Scott, Stowell, & Landers, 2012). However, population estimates likely underreport the true number of TGNC people, given difficulties in collecting comprehensive demographic information about this group (Meier & Labuski, 2013). Within the last two decades, there has been a significant increase in research about TGNC people. This increase in knowledge, informed by the TGNC community, has resulted in the development of progressively more trans-affirmative practice across the multiple health disciplines involved in the care of TGNC people (Bockting, Knudson, & Goldberg, 2006; Coleman et al., 2012). Research has documented the extensive experiences of stigma and discrimination reported by TGNC people (Grant et al., 2011) and the mental health consequences of these experiences across the life span (Bockting, Miner, Swinburne Romine, Hamilton, & Coleman, 2013), including increased rates of depression (Fredriksen-Goldsen et al., 2014) and suicidality (Clements-Nolle, Marx, & Katz, 2006). TGNC people's lack of access to trans-affirmative mental and physical health care is a common barrier (Fredriksen-Goldsen et al., 2014; Garofalo, Deleon, Osmer, Doll, & Harper, 2006; Grossman & D'Augelli, 2006), with TGNC people sometimes being denied care because of their gender identity (Xavier et al., 2012).

In 2009, the American Psychological Association (APA) Task Force on Gender Identity and Gender Variance (TFGIGV) survey found that less than 30% of psychologist and graduate student participants reported familiarity with issues that TGNC people experience (APA TFGIGV, 2009). Psychologists and other mental health professionals who have limited training and experience in TGNC-affirmative care may cause harm to TGNC people (Mikalson, Pardo, & Green, 2012; Xavier et al., 2012). The significant level of societal stigma and discrimination that TGNC people face, the associated mental health consequences, and psychologists' lack of familiarity with trans-affirmative care led the APA Task Force to recommend that psychological practice guidelines be developed to help psychologists maximize the effectiveness of services offered and avoid harm when working with TGNC people and their families.

Purpose

The purpose of the *Guidelines for Psychological Practice with Transgender and Gender Nonconforming People* (hereafter *Guidelines*) is to assist psychologists in the provision of culturally competent, developmentally appropriate, and trans-affirmative psychological practice with TGNC people. Trans-affirmative practice is the provision

The American Psychological Association's (APA's) Task Force on Guidelines for Psychological Practice with Transgender and Gender Nonconforming People developed these guidelines. lore m. dickey, Louisiana Tech University, and Anneliese A. Singh, The University of Georgia, served as chairs of the Task Force. The members of the Task Force included Walter O. Bockting, Columbia University; Sand Chang, Independent Practice; Kelly Ducheny, Howard Brown Health Center; Laura Edwards-Leeper, Pacific University; Randall D. Ehrbar, Whitman Walker Health Center; Max Fuentes Fuhrmann, Independent Practice; Michael L. Hendricks, Washington Psychological Center, P.C.; and Ellen Magalhaes, Center for Psychological Studies at Nova Southeastern University and California School of Professional Psychology at Alliant International University.

The Task Force is grateful to BT, Robin Buhrke, Jenn Burleton, Theo Burnes, Loree Cook-Daniels, Ed Delgado-Romero, Maddie Deutsch, Michelle Emerick, Terry S. Gock, Kristin Hancock, Razia Kosi, Kimberly Lux, Shawn MacDonald, Pat Magee, Tracee McDaniel, Edgardo Menvielle, Parrish Paul, Jamie Roberts, Louise Silverstein, Mary Alice Silverman, Holiday Simmons, Michael C. Smith, Cullen Sprague, David Whitcomb, and Milo Wilson for their assistance in providing important input and feedback on drafts of the guidelines. The Task Force is especially grateful to Clinton Anderson, Director, and Ron Schlittler, Program Coordinator, of APA's Office on LGBT Concerns, who adeptly assisted and provided counsel to the Task Force throughout this project. The Task Force would also like to thank liaisons from the APA Committee on Professional Practice and Standards (COPPS), April Harris-Britt and Scott Hunter, and their staff support, Mary Hardiman. Additionally, members of the Task Force would like to thank the staff at the Phillip Rush Center and Agnes Scott College Counseling Center in Atlanta, Georgia, who served as hosts for face-to-face meetings.

This document will expire as APA policy in 2022. After this date, users should contact the APA Public Interest Directorate to determine whether the guidelines in this document remain in effect as APA policy.

Correspondence concerning this article should be addressed to the Public Interest Directorate, American Psychological Association, 750 First Street, NE, Washington, DC 20002.

[1] For the purposes of these guidelines, we use the term *transgender and gender nonconforming* (TGNC). We intend for the term to be as broadly inclusive as possible, and recognize that some TGNC people do not ascribe to these terms. Readers are referred to Appendix A for a listing of terms that include various TGNC identity labels.

December 2015 • American Psychologist
© 2015 American Psychological Association 0003-066X/15/$12.00
Vol. 70, No. 9, 832–864 http://dx.doi.org/10.1037/a0039906

of care that is respectful, aware, and supportive of the identities and life experiences of TGNC people (Korell & Lorah, 2007). The *Guidelines* are an introductory resource for psychologists who will encounter TGNC people in their practice, but can also be useful for psychologists with expertise in this area of practice to improve the care already offered to TGNC people. The *Guidelines* include a set of definitions for readers who may be less familiar with language used when discussing gender identity and TGNC populations (see Appendix A). Distinct from TGNC, the term "cisgender" is used to refer to people whose sex assigned at birth is aligned with their gender identity (E. R. Green, 2006; Serano, 2006).

Given the added complexity of working with TGNC and gender-questioning youth[2] and the limitations of the available research, the *Guidelines* focus primarily, though not exclusively, on TGNC adults. Future revisions of the *Guidelines* will deepen a focus on TGNC and gender-questioning children and adolescents. The *Guidelines* address the strengths of TGNC people, the challenges they face, ethical and legal issues, life span considerations, research, education, training, and health care. Because issues of gender identity are often conflated with issues of gender expression or sexual orientation, psychological practice with the TGNC population warrants the acquisition of specific knowledge about concerns unique to TGNC people that are not addressed by other practice guidelines (APA, 2012). It is important to note that these *Guidelines* are not intended to address some of the conflicts that cisgender people may experience due to societal expectations regarding gender roles (Butler, 1990), nor are they intended to address intersex people (Dreger, 1999; Preves, 2003).

Documentation of Need

In 2005, the APA Council of Representatives authorized the creation of the Task Force on Gender Identity and Gender Variance (TFGIGV), charging the Task Force to review APA policies related to TGNC people and to offer recommendations for APA to best meet the needs of TGNC people (APA TFGIGV, 2009). In 2009, the APA Council of Representatives adopted the Resolution on Transgender, Gender Identity, & Gender Expression Non-Discrimination, which calls upon psychologists in their professional roles to provide appropriate, nondiscriminatory treatment; encourages psychologists to take a leadership role in working against discrimination; supports the provision of adequate and necessary mental and medical health care; recognizes the efficacy, benefit, and medical necessity of gender transition; supports access to appropriate treatment in institutional settings; and supports the creation of educational resources for all psychologists (Anton, 2009). In 2009, in an extensive report on the current state of psychological practice with TGNC people, the TFGIGV determined that there was sufficient knowledge and expertise in the field to warrant the development of practice guidelines for TGNC populations (APA TFGIGV, 2009). The report identified that TGNC people constituted a population with unique needs and that the creation of practice guidelines would be a valuable resource for the field (APA TFGIGV, 2009). Psychologists' relative lack of knowledge about TGNC people and trans-affirmative care, the level of societal stigma and discrimination that TGNC people face, and the significant mental health consequences that TGNC people experience as a result offer a compelling need for psychological practice guidelines for this population.

Users

The intended audience for these *Guidelines* includes psychologists who provide clinical care, conduct research, or provide education or training. Given that gender identity issues can arise at any stage in a TGNC person's life (Lev, 2004), clinicians can encounter a TGNC person in practice or have a client's presenting problem evolve into an issue related to gender identity and gender expression. Researchers, educators, and trainers will benefit from use of these *Guidelines* to inform their work, even when not specifically focused on TGNC populations. Psychologists who focus on TGNC populations in their clinical practice, research, or educational and training activities will also benefit from the use of these *Guidelines*.

Distinction Between Standards and Guidelines

When using these *Guidelines*, psychologists should be aware that APA has made an important distinction between *standards* and *guidelines* (Reed, McLaughlin, & Newman, 2002). Standards are mandates to which all psychologists must adhere (e.g., the *Ethical Principles of Psychologists and Code of Conduct*; APA, 2010), whereas guidelines are aspirational. Psychologists are encouraged to use these *Guidelines* in tandem with the *Ethical Principles of Psychologists and Code of Conduct*, and should be aware that state and federal laws may override these *Guidelines* (APA, 2010).

In addition, these *Guidelines* refer to psychological practice (e.g., clinical work, consultation, education, research, and training) rather than treatment. Practice guidelines are practitioner-focused and provide guidance for professionals regarding "conduct and the issues to be considered in particular areas of clinical practice" (Reed et al., 2002, p. 1044). Treatment guidelines are client-focused and address intervention-specific recommendations for a clinical population or condition (Reed et al., 2002). The current *Guidelines* are intended to complement treatment guidelines for TGNC people seeking mental health services, such as those set forth by the World Professional Association for Transgender Health Standards of Care (Coleman et al., 2012) and the Endocrine Society (Hembree et al., 2009).

[2] For the purposes of these guidelines, "youth" refers to both children and adolescents under the age of 18.

Compatibility

These *Guidelines* are consistent with the APA *Ethical Principles of Psychologists and Code of Conduct* (APA, 2010), the *Standards of Accreditation for Health Service Psychology* (APA, 2015), the APA TFGIGV (2009) report, and the APA Council of Representatives Resolution on Transgender, Gender Identity, & Gender Expression Non-Discrimination (Anton, 2009).

Practice Guidelines Development Process

To address one of the recommendations of the APA TFGIGV (2009), the APA Committee on Sexual Orientation and Gender Diversity (CSOGD; then the Committee on Lesbian, Gay, Bisexual, and Transgender Concerns) and Division 44 (the Society for the Psychological Study of Lesbian, Gay, Bisexual and Transgender Issues) initiated a joint Task Force on Psychological Practice Guidelines with Transgender and Gender Nonconforming People in 2011. Task Force members were selected through an application and review process conducted by the leadership of CSOGD and Division 44. The Task Force included 10 members who had substantial psychological practice expertise with TGNC people. Of the 10 task force members, five individuals identified as TGNC with a range of gender identities and five identified as cisgender. In terms of race/ethnicity, six of the task force members identified as White and four identified as people of color (one Indian American, one Chinese American, one Latina American, and one mixed race).

The Task Force conducted a comprehensive review of the extant scholarship, identified content most pertinent to the practice of psychology with TGNC people, and evaluated the level of evidence to support guidance within each guideline. To ensure the accuracy and comprehensiveness of these *Guidelines*, Task Force members met with TGNC community members and groups and consulted with subject matter experts within and outside of psychology. When the Task Force discovered a lack of professional consensus, every effort was made to include divergent opinions in the field relevant to that issue. When this occurred, the Task Force described the various approaches documented in the literature. Additionally, these *Guidelines* were informed by comments received at multiple presentations held at professional conferences and comments obtained through two cycles of open public comment on earlier *Guideline* drafts.

This document contains 16 guidelines for TGNC psychological practice. Each guideline includes a Rationale section, which reviews relevant scholarship supporting the need for the guideline, and an Application section, which describes how the particular guideline may be applied in psychological practice. The *Guidelines* are organized into five clusters: (a) foundational knowledge and awareness; (b) stigma, discrimination, and barriers to care; (c) life span development; (d) assessment, therapy, and intervention; and (e) research, education, and training.

Funding for this project was provided by Division 44 (Society for the Psychological Study of LGBT Issues); the APA Office on Lesbian, Gay, Bisexual, and Transgender (LGBT) Concerns; a grant from the Committee on Division/APA Relations (CODAPAR); and donations from Randall Ehrbar and Pamela St. Amand. Some members of the Task Force have received compensation through presentations (e.g., honoraria) or royalties (e.g., book contracts) based in part on information contained in these *Guidelines*.

Selection of Evidence

Although the number of publications on the topic of TGNC-affirmative practice has been increasing, this is still an emerging area of scholarly literature and research. When possible, the Task Force relied on peer-reviewed publications, but books, chapters, and reports that do not typically receive a high level of peer review have also been cited when appropriate. These sources are from a diverse range of fields addressing mental health, including psychology, counseling, social work, and psychiatry. Some studies of TGNC people utilize small sample sizes, which limits the generalizability of results. Few studies of TGNC people utilize probability samples or randomized control groups (e.g., Conron et al., 2012; Dhejne et al., 2011). As a result, the Task Force relied primarily on studies using convenience samples, which limits the generalizability of results to the population as a whole, but can be adequate for describing issues and situations that arise within the population.

Foundational Knowledge and Awareness

Guideline 1. Psychologists understand that gender is a nonbinary construct that allows for a range of gender identities and that a person's gender identity may not align with sex assigned at birth.

Rationale. Gender identity is defined as a person's deeply felt, inherent sense of being a girl, woman, or female; a boy, a man, or male; a blend of male or female; or an alternative gender (Bethea & McCollum, 2013; Institute of Medicine [IOM], 2011). In many cultures and religious traditions, gender has been perceived as a binary construct, with mutually exclusive categories of male or female, boy or girl, man or woman (Benjamin, 1966; Mollenkott, 2001; Tanis, 2003). These mutually exclusive categories include an assumption that gender identity is always in alignment with sex assigned at birth (Bethea & McCollum, 2013). For TGNC people, gender identity differs from sex assigned at birth to varying degrees, and may be experienced and expressed outside of the gender binary (Harrison, Grant, & Herman, 2012; Kuper, Nussbaum, & Mustanski, 2012).

Gender as a nonbinary construct has been described and studied for decades (Benjamin, 1966; Herdt, 1994; Kulick, 1998). There is historical evidence of recognition, societal acceptance, and sometimes reverence of diversity in gender identity and gender expression in several different cultures (Coleman et al., 1992; Feinberg, 1996; Miller

& Nichols, 2012; Schmidt, 2003). Many cultures in which gender nonconforming persons and groups were visible were diminished by westernization, colonialism, and systemic inequity (Nanda, 1999). In the 20th century, TGNC expression became medicalized (Hirschfeld, 1910/1991), and medical interventions to treat discordance between a person's sex assigned at birth, secondary sex characteristics, and gender identity became available (Meyerowitz, 2002).

As early as the 1950s, research found variability in how an individual described their[3] gender, with some participants reporting a gender identity different from the culturally defined, mutually exclusive categories of "man" or "woman" (Benjamin, 1966). In several recent large online studies of the TGNC population in the United States, 30% to 40% of participants identified their gender identity as other than man or woman (Harrison et al., 2012; Kuper et al., 2012). Although some studies have cultivated a broader understanding of gender (Conron, Scout, & Austin, 2008), the majority of research has required a forced choice between man and woman, thus failing to represent or depict those with different gender identities (IOM, 2011). Research over the last two decades has demonstrated the existence of a wide spectrum of gender identity and gender expression (Bockting, 2008; Harrison et al., 2012; Kuper et al., 2012), which includes people who identify as either man or woman, neither man nor woman, a blend of man and woman, or a unique gender identity. A person's identification as TGNC can be healthy and self-affirming, and is not inherently pathological (Coleman et al., 2012). However, people may experience distress associated with discordance between their gender identity and their body or sex assigned at birth, as well as societal stigma and discrimination (Coleman et al., 2012).

Between the late 1960s and the early 1990s, health care to alleviate gender dysphoria largely reinforced a binary conceptualization of gender (APA TFGIGV, 2009; Bolin, 1994; Hastings, 1974). At that time, it was considered an ideal outcome for TGNC people to conform to an identity that aligned with either sex assigned at birth or, if not possible, with the "opposite" sex, with a heavy emphasis on blending into the cisgender population or "passing" (APA TFGIGV, 2009; Bolin, 1994; Hastings, 1974). Variance from these options could raise concern for health care providers about a TGNC person's ability to transition successfully. These concerns could act as a barrier to accessing surgery or hormone therapy because medical and mental health care provider endorsement was required before surgery or hormones could be accessed (Berger et al., 1979). Largely because of self-advocacy of TGNC individuals and communities in the 1990s, combined with advances in research and models of trans-affirmative care, there is greater recognition and acknowledgment of a spectrum of gender diversity and corresponding individualized, TGNC-specific health care (Bockting et al., 2006; Coleman et al., 2012).

Application. A nonbinary understanding of gender is fundamental to the provision of affirmative care for TGNC people. Psychologists are encouraged to adapt or modify their understanding of gender, broadening the range of variation viewed as healthy and normative. By understanding the spectrum of gender identities and gender expressions that exist, and that a person's gender identity may not be in full alignment with sex assigned at birth, psychologists can increase their capacity to assist TGNC people, their families, and their communities (Lev, 2004). Respecting and supporting TGNC people in authentically articulating their gender identity and gender expression, as well as their lived experience, can improve TGNC people's health, well-being, and quality of life (Witten, 2003).

Some TGNC people may have limited access to visible, positive TGNC role models. As a result, many TGNC people are isolated and must cope with the stigma of gender nonconformity without guidance or support, worsening the negative effect of stigma on mental health (Fredriksen-Goldsen et al., 2014; Singh, Hays, & Watson, 2011). Psychologists may assist TGNC people in challenging gender norms and stereotypes, and in exploring their unique gender identity and gender expression. TGNC people, partners, families, friends, and communities can benefit from education about the healthy variation of gender identity and gender expression, and the incorrect assumption that gender identity automatically aligns with sex assigned at birth.

Psychologists may model an acceptance of ambiguity as TGNC people develop and explore aspects of their gender, especially in childhood and adolescence. A nonjudgmental stance toward gender nonconformity can help to counteract the pervasive stigma faced by many TGNC people and provide a safe environment to explore gender identity and make informed decisions about gender expression.

Guideline 2. Psychologists understand that gender identity and sexual orientation are distinct but interrelated constructs.

Rationale. The constructs of gender identity and sexual orientation are theoretically and clinically distinct, even though professionals and nonprofessionals frequently conflate them. Although some research suggests a potential link in the development of gender identity and sexual orientation, the mechanisms of such a relationship are unknown (Adelson & American Academy of Child and Adolescent Psychiatry [AACAP] Committee on Quality Issues [CQI], 2012; APA TFGIGV, 2009; A. H. Devor, 2004; Drescher & Byne, 2013). *Sexual orientation* is defined as a person's sexual and/or emotional attraction to another person (Shively & De Cecco, 1977), compared with *gender identity*, which is defined by a person's felt, inherent sense of gender. For most people, gender identity develops earlier than sexual orientation. Gender identity is often established in young toddlerhood (Adelson & AACAP CQI, 2012; Kohlberg, 1966), compared with aware-

[3] The third person plural pronouns "they," "them," and "their" in some instances function in these guidelines as third-person singular pronouns to model a common technique used to avoid the use of gendered pronouns when speaking to or about TGNC people.

ness of same-sex attraction, which often emerges in early adolescence (Adelson & AACAP CQI, 2012; D'Augelli & Hershberger, 1993; Herdt & Boxer, 1993; Ryan, 2009; Savin-Williams & Diamond, 2000). Although gender identity is usually established in childhood, individuals may become aware that their gender identity is not in full alignment with sex assigned at birth in childhood, adolescence, or adulthood. The developmental pathway of gender identity typically includes a progression through multiple stages of awareness, exploration, expression, and identity integration (Bockting & Coleman, 2007; A. H. Devor, 2004; Vanderburgh, 2007). Similarly, a person's sexual orientation may progress through multiple stages of awareness, exploration, and identity through adolescence and into adulthood (Bilodeau & Renn, 2005). Just as some people experience their sexual orientation as being fluid or variable (L. M. Diamond, 2013), some people also experience their gender identity as fluid (Lev, 2004).

The experience of questioning one's gender can create significant confusion for some TGNC people, especially for those who are unfamiliar with the range of gender identities that exist. To explain any discordance they may experience between their sex assigned at birth, related societal expectations, patterns of sexual and romantic attraction, and/or gender role nonconformity and gender identity, some TGNC people may assume that they must be gay, lesbian, bisexual, or queer (Bockting, Benner, & Coleman, 2009). Focusing solely on sexual orientation as the cause for discordance may obscure awareness of a TGNC identity. It can be very important to include sexual orientation and gender identity in the process of identity exploration as well as in the associated decisions about which options will work best for any particular person. In addition, many TGNC adults have disguised or rejected their experience of gender incongruence in childhood or adolescence to conform to societal expectations and minimize their fear of difference (Bockting & Coleman, 2007; Byne et al., 2012).

Because gender and patterns of attraction are used to identify a person's sexual orientation, the articulation of sexual orientation is made more complex when sex assigned at birth is not aligned with gender identity. A person's sexual orientation identity cannot be determined by simply examining external appearance or behavior, but must incorporate a person's identity and self-identification (Broido, 2000).

Application. Psychologists may assist people in differentiating gender identity and sexual orientation. As clients become aware of previously hidden or constrained aspects of their gender identity or sexuality, psychologists may provide acceptance, support, and understanding without making assumptions or imposing a specific sexual orientation or gender identity outcome (APA TFGIGV, 2009). Because of their roles in assessment, treatment, and prevention, psychologists are in a unique position to help TGNC people better understand and integrate the various aspects of their identities. Psychologists may assist TGNC people by introducing and normalizing differences in gender identity and expression. As a TGNC person finds a comfortable way to actualize and express their gender identity, psychologists may notice that previously incongruent aspects of their sexual orientation may become more salient, better integrated, or increasingly egosyntonic (Bockting et al., 2009; H. Devor, 1993; Schleifer, 2006). This process may allow TGNC people the comfort and opportunity to explore attractions or aspects of their sexual orientation that previously had been repressed, hidden, or in conflict with their identity. TGNC people may experience a renewed exploration of their sexual orientation, a widened spectrum of attraction, or a shift in how they identify their sexual orientation in the context of a developing TGNC identity (Coleman, Bockting, & Gooren, 1993; Meier, Pardo, Labuski, & Babcock, 2013; Samons, 2008).

Psychologists may need to provide TGNC people with information about TGNC identities, offering language to describe the discordance and confusion TGNC people may be experiencing. To facilitate TGNC people's learning, psychologists may introduce some of the narratives written by TGNC people that reflect a range of outcomes and developmental processes in exploring and affirming gender identity (e.g., Bornstein & Bergman, 2010; Boylan, 2013; J. Green, 2004; Krieger, 2011; Lawrence, 2014). These resources may potentially aid TGNC people in distinguishing between issues of sexual orientation and gender identity and in locating themselves on the gender spectrum. Psychologists may also educate families and broader community systems (e.g., schools, medical systems) to better understand how gender identity and sexual orientation are different but related; this may be particularly useful when working with youth (Singh & Burnes, 2009; Whitman, 2013). Because gender identity and sexual orientation are often conflated, even by professionals, psychologists are encouraged to carefully examine resources that claim to provide affirmative services for lesbian, gay, bisexual, transgender, and queer (LGBTQ) people, and to confirm which are knowledgeable about and inclusive of the needs of TGNC people before offering referrals or recommendations to TGNC people and their families.

Guideline 3. Psychologists seek to understand how gender identity intersects with the other cultural identities of TGNC people.

Rationale. Gender identity and gender expression may have profound intersections with other aspects of identity (Collins, 2000; Warner, 2008). These aspects may include, but are not limited to, race/ethnicity, age, education, socioeconomic status, immigration status, occupation, disability status, HIV status, sexual orientation, relational status, and religion and/or spiritual affiliation. Whereas some of these aspects of identity may afford privilege, others may create stigma and hinder empowerment (Burnes & Chen, 2012; K. M. de Vries, 2015). In addition, TGNC people who transition may not be prepared for changes in privilege or societal treatment based on gender identity and gender expression. To illustrate, an African American trans man may gain male privilege, but may face racism and

societal stigma particular to African American men. An Asian American/Pacific Islander trans woman may experience the benefit of being perceived as a cisgender woman, but may also experience sexism, misogyny, and objectification particular to Asian American/Pacific Islander cisgender women.

The intersection of multiple identities within TGNC people's lives is complex and may obstruct or facilitate access to necessary support (A. Daley, Solomon, Newman, & Mishna, 2008). TGNC people with less privilege and/or multiple oppressed identities may experience greater stress and restricted access to resources. They may also develop resilience and strength in coping with disadvantages, or may locate community-based resources available to specific groups (e.g., for people living with HIV; Singh et al., 2011). Gender identity affirmation may conflict with religious beliefs or traditions (Bockting & Cesaretti, 2001). Finding an affirmative expression of their religious and spiritual beliefs and traditions, including positive relationships with religious leaders, can be an important resource for TGNC people (Glaser, 2008; Porter, Ronneberg, & Witten, 2013; Xavier, 2000).

Application. In practice, psychologists strive to recognize the salient multiple and intersecting identities of TGNC people that influence coping, discrimination, and resilience (Burnes & Chen, 2012). Improved rapport and therapeutic alliance are likely to develop when psychologists avoid overemphasizing gender identity and gender expression when not directly relevant to TGNC people's needs and concerns. Even when gender identity is the main focus of care, psychologists are encouraged to understand that a TGNC person's experience of gender may also be shaped by other important aspects of identity (e.g., age, race/ethnicity, sexual orientation), and that the salience of different aspects of identity may evolve as the person continues psychosocial development across the life span, regardless of whether they complete a social or medical transition.

At times, a TGNC person's intersection of identities may result in conflict, such as a person's struggle to integrate gender identity with religious and/or spiritual upbringing and beliefs (Kidd & Witten, 2008; Levy & Lo, 2013; Rodriguez & Follins, 2012). Psychologists may aid TGNC people in understanding and integrating identities that may be differently privileged within systems of power and systemic inequity (Burnes & Chen, 2012). Psychologists may also highlight and strengthen the development of TGNC people's competencies and resilience as they learn to manage the intersection of stigmatized identities (Singh, 2012).

Guideline 4. Psychologists are aware of how their attitudes about and knowledge of gender identity and gender expression may affect the quality of care they provide to TGNC people and their families.

Rationale. Psychologists, like other members of society, come to their personal understanding and acceptance of different aspects of human diversity through a process of socialization. Psychologists' cultural biases, as well as the cultural differences between psychologists and their clients, have a clinical impact (Israel, Gorcheva, Burnes, & Walther, 2008; Vasquez, 2007). The assumptions, biases, and attitudes psychologists hold regarding TGNC people and gender identity and/or gender expression can affect the quality of services psychologists provide and their ability to develop an effective therapeutic alliance (Bess & Stabb, 2009; Rachlin, 2002). In addition, a lack of knowledge or training in providing affirmative care to TGNC people can limit a psychologist's effectiveness and perpetuate barriers to care (Bess & Stabb, 2009; Rachlin, 2002). Psychologists experienced with lesbian, gay, or bisexual (LGB) people may not be familiar with the unique needs of TGNC people (Israel, 2005; Israel et al., 2008). In community surveys, TGNC people have reported that many mental health care providers lack basic knowledge and skills relevant to care of TGNC people (Bradford, Xavier, Hendricks, Rives, & Honnold, 2007; Xavier, Bobbin, Singer, & Budd, 2005) and receive little training to prepare them to work with TGNC people (APA TFGIGV, 2009; Lurie, 2005). The National Transgender Discrimination Survey (Grant et al., 2011) reported that 50% of TGNC respondents shared that they had to educate their health care providers about TGNC care, 28% postponed seeking medical care due to antitrans bias, and 19% were refused care due to discrimination.

The APA ethics code (APA, 2010) specifies that psychologists practice in areas only within the boundaries of their competence (Standard 2.01), participate in proactive and consistent ways to enhance their competence (Standard 2.03), and base their work upon established scientific and professional knowledge (Standard 2.04). Competence in working with TGNC people can be developed through a range of activities, such as education, training, supervised experience, consultation, study, or professional experience.

Application. Psychologists may engage in practice with TGNC people in various ways; therefore, the depth and level of knowledge and competence required by a psychologist depends on the type and complexity of service offered to TGNC people. Services that psychologists provide to TGNC people require a basic understanding of the population and its needs, as well as the ability to respectfully interact in a trans-affirmative manner (L. Carroll, 2010).

APA emphasizes the use of evidence-based practice (APA Presidential Task Force on Evidence-Based Practice, 2006). Given how easily assumptions or stereotypes could influence treatment, evidence-based practice may be especially relevant to psychological practice with TGNC people. Until evidence-based practices are developed specifically for TGNC people, psychologists are encouraged to utilize existing evidence-based practices in the care they provide. APA also promotes collaboration with clients concerning clinical decisions, including issues related to costs, potential benefits, and the existing options and resources related to treatment (APA Presidential Task Force on Evidence-Based Practice, 2006). TGNC people could benefit from such collaboration and active engagement in decision

making, given the historical disenfranchisement and disempowerment of TGNC people in health care.

In an effort to develop competence in working with TGNC people, psychologists are encouraged to examine their personal beliefs regarding gender and sexuality, gender stereotypes, and TGNC identities, in addition to identifying gaps in their own knowledge, understanding, and acceptance (American Counseling Association [ACA], 2010). This examination may include exploring one's own gender identity and gendered experiences related to privilege, power, or marginalization, as well as seeking consultation and training with psychologists who have expertise in working with TGNC people and communities.

Psychologists are further encouraged to develop competence in working with TGNC people and their families by seeking up-to-date basic knowledge and understanding of gender identity and expression, and learning how to interact with TGNC people and their families respectfully and without judgment. Competence in working with TGNC people may be achieved and maintained in formal and informal ways, ranging from exposure in the curriculum of training programs for future psychologists and continuing education at professional conferences, to affirmative involvement as allies in the TGNC community. Beyond acquiring general competence, psychologists who choose to specialize in working with TGNC people presenting with gender-identity-related concerns are strongly encouraged to obtain advanced training, consultation, and professional experience (ACA, 2010; Coleman et al., 2012).

Psychologists may gain knowledge about the TGNC community and become more familiar with the complex social issues that affect the lives of TGNC people through first-hand experiences (e.g., attending community meetings and conferences, reading narratives written by TGNC people). If psychologists have not yet developed competence in working with TGNC people, it is recommended that they refer TGNC people to other psychologists or providers who are knowledgeable and able to provide trans-affirmative care.

Stigma, Discrimination, and Barriers to Care

Guideline 5. Psychologists recognize how stigma, prejudice, discrimination, and violence affect the health and well-being of TGNC people.

Rationale. Many TGNC people experience discrimination, ranging from subtle to severe, when accessing housing, health care, employment, education, public assistance, and other social services (Bazargan & Galvan, 2012; Bradford, Reisner, Honnold, & Xavier, 2013; Dispenza, Watson, Chung, & Brack, 2012; Grant et al., 2011). Discrimination can include assuming a person's assigned sex at birth is fully aligned with that person's gender identity, not using a person's preferred name or pronoun, asking TGNC people inappropriate questions about their bodies, or making the assumption that psychopathology exists given a specific gender identity or gender expression (Nadal, Rivera, & Corpus, 2010; Nadal, Skolnik, & Wong, 2012). Discrimination may also include refusing access to housing or employment or extreme acts of violence (e.g., sexual assault, murder). TGNC people who hold multiple marginalized identities are more vulnerable to discrimination and violence. TGNC women and people of color disproportionately experience severe forms of violence and discrimination, including police violence, and are less likely to receive help from law enforcement (Edelman, 2011; National Coalition of Anti-Violence Programs, 2011; Saffin, 2011).

TGNC people are at risk of experiencing antitrans prejudice and discrimination in educational settings. In a national representative sample of 7,898 LGBT youth in K-12 settings, 55.2% of participants reported verbal harassment, 22.7% reported physical harassment, and 11.4% reported physical assault based on their gender expression (Kosciw, Greytak, Palmer, & Boesen, 2014). In a national community survey of TGNC adults, 15% reported prematurely leaving educational settings ranging from kindergarten through college as a result of harassment (Grant et al., 2011). Many schools do not include gender identity and gender expression in their school nondiscrimination policies; this leaves TGNC youth without needed protections from bullying and aggression in schools (Singh & Jackson, 2012). TGNC youth in rural settings may be even more vulnerable to bullying and hostility in their school environments due to antitrans prejudice (Kosciw et al., 2014).

Inequities in educational settings and other forms of TGNC-related discrimination may contribute to the significant economic disparities TGNC people have reported. Grant and colleagues (2011) found that TGNC people were four times more likely to have a household income of less than $10,000 compared with cisgender people, and almost half of a sample of TGNC older adults reported a household income at or below 200% of poverty (Fredriksen-Goldsen et al., 2014). TGNC people often face workplace discrimination both when seeking and maintaining employment (Brewster, Velez, Mennicke, & Tebbe, 2014; Dispenza et al., 2012; Mizock & Mueser, 2014). In a nonrepresentative national study of TGNC people, 90% reported having "directly experienced harassment or mistreatment at work and felt forced to take protective actions that negatively impacted their careers or their well-being, such as hiding who they were to avoid workplace repercussions" (Grant et al., 2011, p. 56). In addition, 78% of respondents reported experiencing some kind of direct mistreatment or discrimination at work (Grant et al., 2011). Employment discrimination may be related to stigma based on a TGNC person's appearance, discrepancies in identity documentation, or being unable to provide job references linked to that person's pretransition name or gender presentation (Bender-Baird, 2011).

Issues of employment discrimination and workplace harassment are particularly salient for TGNC military personnel and veterans. Currently, TGNC people cannot serve openly in the U.S. military. Military regulations cite "transsexualism" as a medical exclusion from service (Department of Defense, 2011; Elders & Steinman, 2014). When

enlisted, TGNC military personnel are faced with very difficult decisions related to coming out, transition, and seeking appropriate medical and mental health care, which may significantly impact or end their military careers. Not surprisingly, research documents very high rates of suicidal ideation and behavior among TGNC military and veteran populations (Blosnich et al., 2013; Matarazzo et al., 2014). Being open about their TGNC identity with health care providers can carry risk for TGNC military personnel (OutServe-Servicemembers Legal Defense Network, n.d.). Barriers to accessing health care noted by TGNC veterans include viewing the VA health care system as an extension of the military, perceiving the VA as an unwelcoming environment, and fearing providers' negative reactions to their identity (Sherman, Kauth, Shipherd, & Street, 2014; Shipherd, Mizock, Maguen, & Green, 2012). A recent study shows 28% of LGBT veterans perceived their VA as welcoming and one third as unwelcoming (Sherman et al., 2014). Multiple initiatives are underway throughout the VA system to improve the quality and sensitivity of services to LGBT veterans.

Given widespread workplace discrimination and possible dismissal following transition, TGNC people may engage in sex work or survival sex (e.g., trading sex for food), or sell drugs to generate income (Grant et al., 2011; Hwahng & Nuttbrock, 2007; Operario, Soma, & Underhill, 2008; Stanley, 2011). This increases the potential for negative interactions with the legal system, such as harassment by the police, bribery, extortion, and arrest (Edelman, 2011; Testa et al., 2012), as well as increased likelihood of mental health symptoms and greater health risks, such as higher incidence of sexually transmitted infections, including HIV (Nemoto, Operario, Keatley, & Villegas, 2004).

Incarcerated TGNC people report harassment, isolation, forced sex, and physical assault, both by prison personnel and other inmates (American Civil Liberties Union National Prison Project, 2005; Brotheim, 2013; C. Daley, 2005). In sex-segregated facilities, TGNC people may be subjected to involuntary solitary confinement (also called "administrative segregation"), which can lead to severe negative mental and physical health consequences and may block access to services (Gallagher, 2014; National Center for Transgender Equality, 2012). Another area of concern is for TGNC immigrants and refugees. TGNC people in detention centers may not be granted access to necessary care and experience significant rates of assault and violence in these facilities (Gruberg, 2013). TGNC people may seek asylum in the United States to escape danger as a direct result of lack of protections in their country of origin (APA Presidential Task Force on Immigration, 2012; Cerezo, Morales, Quintero, & Rothman, 2014; Morales, 2013).

TGNC people have difficulty accessing necessary health care (Fredriksen-Goldsen et al., 2014; Lambda Legal, 2012) and often feel unsafe sharing their gender identity or their experiences of antitrans prejudice and discrimination due to historical and current discrimination from health care providers (Grant et al., 2011; Lurie, 2005; Singh & McKleroy, 2011). Even when TGNC people have health insurance, plans may explicitly exclude coverage related to gender transition (e.g., hormone therapy, surgery). TGNC people may also have difficulty accessing trans-affirmative primary health care if coverage for procedures is denied based on gender. For example, trans men may be excluded from necessary gynecological care based on the assumption that men do not need these services. These barriers often lead to a lack of preventive health care for TGNC people (Fredriksen-Goldsen et al., 2014; Lambda Legal, 2012). Although the landscape is beginning to change with the recent revision of Medicare policy (National Center for Transgender Equality, 2014) and changes to state laws (Transgender Law Center, n.d.), many TGNC people are still likely to have little to no access to TGNC-related health care as a result of the exclusions in their insurance.

Application. Awareness of and sensitivity to the effects of antitrans prejudice and discrimination can assist psychologists in assessing, treating, and advocating for their TGNC clients. When a TGNC person faces discrimination based on gender identity or gender expression, psychologists may facilitate emotional processing of these experiences and work with the person to identify supportive resources and possible courses of action. Specific needs of TGNC people might vary from developing self-advocacy strategies, to navigating public spaces, to seeking legal recourse for harassment and discrimination in social services and other systems. Additionally, TGNC people who have been traumatized by physical or emotional violence may need therapeutic support.

Psychologists may be able to assist TGNC people in accessing relevant social service systems. For example, psychologists may be able to assist in identifying health care providers and housing resources that are affirming and affordable, or locating affirming religious and spiritual communities (Glaser, 2008; Porter et al., 2013). Psychologists may also assist in furnishing documentation or official correspondence that affirms gender identity for the purpose of accessing appropriate public accommodations, such as bathroom use or housing (Lev, 2009; W. J. Meyer, 2009).

Additionally, psychologists may identify appropriate resources, information, and services to help TGNC people in addressing workplace discrimination, including strategies during a social and/or medical transition for identity disclosure at work. For those who are seeking employment, psychologists may help strategize about how and whether to share information about gender history. Psychologists may also work with employers to develop supportive policies for workplace gender transition or to develop training to help employees adjust to the transition of a coworker.

For TGNC military and veteran populations, psychologists may help to address the emotional impact of navigating TGNC identity development in the military system. Psychologists are encouraged to be aware that issues of confidentiality may be particularly sensitive with active duty or reserve status service members, as the consequences of being identified as TGNC may prevent the client's disclosure of gender identity in treatment.

In educational settings, psychologists may advocate for TGNC youth on a number of levels (APA & National

Association of School Psychologists, 2014; Boulder Valley School District, 2012). Psychologists may consult with administrators, teachers, and school counselors to provide resources and trainings on antitrans prejudice and developing safer school environments for TGNC students (Singh & Burnes, 2009). Peer support from other TGNC people has been shown to buffer the negative effect of stigma on mental health (Bockting et al., 2013). As such, psychologists may consider and develop peer-based interventions to facilitate greater understanding and respectful treatment of TGNC youth by cisgender peers (Case & Meier, 2014). Psychologists may work with TGNC youth and their families to identify relevant resources, such as school policies that protect gender identity and gender expression (APA & National Association of School Psychologists, 2014; Gonzalez & McNulty, 2010), referrals to TGNC-affirmative organizations, and online resources, which may be especially helpful for TGNC youth in rural settings.

Guideline 6. Psychologists strive to recognize the influence of institutional barriers on the lives of TGNC people and to assist in developing TGNC-affirmative environments.

Rationale. Antitrans prejudice and the adherence of mainstream society to the gender binary adversely affect TGNC people within their families, schools, health care, legal systems, workplaces, religious traditions, and communities (American Civil Liberties Union National Prison Project, 2005; Bradford et al., 2013; Brewster et al., 2014; Levy & Lo, 2013; McGuire, Anderson, & Toomey, 2010). TGNC people face challenges accessing gender-inclusive restrooms, which may result in discomfort when being forced to use a men's or women's restroom (Transgender Law Center, 2005). In addition to the emotional distress the forced binary choice that public restrooms may create for some, TGNC people are frequently concerned with others' reactions to their presence in public restrooms, including potential discrimination, harassment, and violence (Herman, 2013).

Many TGNC people may be distrustful of care providers due to previous experiences of being pathologized (Benson, 2013). Experiences of discrimination and prejudice with health care providers may be complicated by power differentials within the therapeutic relationship that may greatly affect or complicate the care that TGNC people experience. TGNC people have routinely been asked to obtain an endorsement letter from a psychologist attesting to the stability of their gender identity as a prerequisite to access an endocrinologist, surgeon, or legal institution (e.g., driver's license bureau; Lev, 2009). The need for such required documentation from a psychologist may influence rapport, resulting in TGNC people fearing prejudicial treatment in which this documentation is withheld or delayed by the treating provider (Bouman et al., 2014). Whether a TGNC person has personally experienced interactions with providers as disempowering or has learned from community members to expect such a dynamic, psychologists are encouraged to be prepared for TGNC people to be very cautious when entering into a therapeutic relationship. When TGNC people feel validated and empowered within the environment in which a psychologist practices, the therapeutic relationship will benefit and the person may be more willing to explore their authentic selves and share uncertainties and ambiguities that are a common part of TGNC identity development.

Application. Because many TGNC people experience antitrans prejudice or discrimination, psychologists are encouraged to ensure that their work settings are welcoming and respectful of TGNC people, and to be mindful of what TGNC people may perceive as unwelcoming. To do so, psychologists may educate themselves about the many ways that cisgender privilege and antitrans prejudice may be expressed. Psychologists may also have specific conversations with TGNC people about their experiences of the mental health system and implement feedback to foster TGNC-affirmative environments. As a result, when TGNC people access various treatment settings and public spaces, they may experience less harm, disempowerment, or pathologization, and thus will be more likely to avail themselves of resources and support.

Psychologists are encouraged to be proactive in considering how overt or subtle cues in their workplaces and other environments may affect the comfort and safety of TGNC people. To increase the comfort of TGNC people, psychologists are encouraged to display TGNC-affirmative resources in waiting areas and to avoid the display of items that reflect antitrans attitudes (Lev, 2009). Psychologists are encouraged to examine how their language (e.g., use of incorrect pronouns and names) may reinforce the gender binary in overt or subtle and unintentional ways (Smith, Shin, & Officer, 2012). It may be helpful for psychologists to provide training for support staff on how to respectfully interact with TGNC people. A psychologist may consider making changes to paperwork, forms, or outreach materials to ensure that these materials are more inclusive of TGNC people (Spade, 2011b). For example, demographic questionnaires can communicate respect through the use of inclusive language and the inclusion of a range of gender identities. In addition, psychologists may also work within their institutions to advocate for restrooms that are inclusive and accessible for people of all gender identities and/or gender expressions.

When working with TGNC people in a variety of care and institutional settings (e.g., inpatient medical and psychiatric hospitals, substance abuse treatment settings, nursing homes, foster care, religious communities, military and VA health care settings, and prisons), psychologists may become liaisons and advocates for TGNC people's mental health needs and for respectful treatment that addresses their gender identity in an affirming manner. In playing this role, psychologists may find guidance and best practices that have been published for particular institutional contexts to be helpful (e.g., Department of Veterans Affairs, Veterans' Health Administration, 2013; Glezer, McNiel, & Binder, 2013; Merksamer, 2011).

Guideline 7: Psychologists understand the need to promote social change that reduces the negative effects of stigma on the health and well-being of TGNC people.

Rationale. The lack of public policy that addresses the needs of TGNC people creates significant hardships for them (Taylor, 2007). Although there have been major advances in legal protections for TGNC people in recent years (Buzuvis, 2013; Harvard Law Review Association, 2013), many TGNC people are still not afforded protections from discrimination on the basis of gender identity or expression (National LGBTQ Task Force, 2013; Taylor, 2007). For instance, in many states, TGNC people do not have employment or housing protections and may be fired or lose their housing based on their gender identity. Many policies that protect the rights of cisgender people, including LGB people, do not protect the rights of TGNC people (Currah, & Minter, 2000; Spade, 2011a).

TGNC people can experience challenges obtaining gender-affirming identity documentation (e.g., birth certificate, passport, social security card, driver's license). For TGNC people experiencing poverty or economic hardship, requirements for obtaining this documentation may be impossible to meet, in part due to the difficulty of securing employment without identity documentation that aligns with their gender identity and gender expression (Sheridan, 2009). Additionally, systemic barriers related to binary gender identification systems prevent some TGNC people from changing their documents, including those who are incarcerated, undocumented immigrants, and people who live in jurisdictions that explicitly forbid such changes (Spade, 2006). Documentation requirements can also assume a universal TGNC experience that marginalizes some TGNC people, especially those who do not undergo a medical transition. This may affect a TGNC person's social and psychological well-being and interfere with accessing employment, education, housing and shelter, health care, public benefits, and basic life management resources (e.g., opening a bank account).

Application. Psychologists are encouraged to inform public policy to reduce negative systemic impact on TGNC people and to promote positive social change. Psychologists are encouraged to identify and improve systems that permit violence; educational, employment, and housing discrimination; lack of access to health care; unequal access to other vital resources; and other instances of systemic inequity that TGNC people experience (ACA, 2010). Many TGNC people experience stressors from constant barriers, inequitable treatment, and forced release of sensitive and private information about their bodies and their lives (Hendricks & Testa, 2012). To obtain proper identity documentation, TGNC people may be required to provide court orders, proof of having had surgery, and documentation of psychotherapy or a psychiatric diagnosis. Psychologists may assist TGNC people by normalizing their reactions of fatigue and traumatization while interacting with legal systems and requirements; TGNC people may also benefit from guidance about alternate avenues of recourse, self-advocacy, or appeal. When TGNC people feel that it is unsafe to advocate for themselves, psychologists may work with their clients to access appropriate resources in the community.

Psychologists are encouraged to be sensitive to the challenges of attaining gender-affirming identity documentation and how the receipt or denial of such documentation may affect social and psychological well-being, the person's ability to obtain education and employment, find safe housing, access public benefits, obtain student loans, and access health insurance. It may be of significant assistance for psychologists to understand and offer information about the process of a legal name change, gender marker change on identification, or the process for accessing other gender-affirming documents. Psychologists may consult the National Center for Transgender Equality, the Sylvia Rivera Law Project, or the Transgender Law Center for additional information on identity documentation for TGNC people.

Psychologists may choose to become involved with an organization that seeks to revise law and public policy to better protect the rights and dignities of TGNC people. Psychologists may participate at the local, state, or national level to support TGNC-affirmative health care accessibility, human rights in sex-segregated facilities, or policy change regarding gender-affirming identity documentation. Psychologists working in institutional settings may also expand their roles to work as collaborative advocates for TGNC people (Gonzalez & McNulty, 2010). Psychologists are encouraged to provide written affirmations supporting TGNC people and their gender identity so that they may access necessary services (e.g., hormone therapy).

Life Span Development

Guideline 8. Psychologists working with gender-questioning [4] and TGNC youth understand the different developmental needs of children and adolescents, and that not all youth will persist in a TGNC identity into adulthood.

Rationale. Many children develop stability (constancy across time) in their gender identity between Ages 3 to 4 (Kohlberg, 1966), although gender consistency (recognition that gender remains the same across situations) often does not occur until Ages 4 to 7 (Siegal & Robinson, 1987). Children who demonstrate gender nonconformity in preschool and early elementary years may not follow this trajectory (Zucker & Bradley, 1995). Existing research suggests that between 12% and 50% of children diagnosed with gender dysphoria may persist in their identification with a gender different than sex assigned at birth into late adolescence and young adulthood (Drummond, Bradley,

[4] Gender-questioning youth are differentiated from TGNC youth in this section of the guidelines. Gender-questioning youth may be questioning or exploring their gender identity but have not yet developed a TGNC identity. As such, they may not be eligible for some services that would be offered to TGNC youth. Gender-questioning youth are included here because gender questioning may lead to a TGNC identity.

Peterson-Badaali, & Zucker, 2008; Steensma, McGuire, Kreukels, Beekman, & Cohen-Kettenis, 2013; Wallien & Cohen-Kettenis, 2008). However, several research studies categorized 30% to 62% of youth who did not return to the clinic for medical intervention after initial assessment, and whose gender identity may be unknown, as "desisters" who no longer identified with a gender different than sex assigned at birth (Steensma et al., 2013; Wallien & Cohen-Kettenis, 2008; Zucker, 2008a). As a result, this research runs a strong risk of inflating estimates of the number of youth who do not persist with a TGNC identity. Research has suggested that children who identify more intensely with a gender different than sex assigned at birth are more likely to persist in this gender identification into adolescence (Steensma et al., 2013), and that when gender dysphoria persists through childhood and intensifies into adolescence, the likelihood of long-term TGNC identification increases (A. L. de Vries, Steensma, Doreleijers, & Cohen-Kettenis, 2011; Steensma et al., 2013; Wallien & Cohen-Kettenis, 2008; Zucker, 2008b). Gender-questioning children who do not persist may be more likely to later identify as gay or lesbian than non-gender-questioning children (Bailey & Zucker, 1995; Drescher, 2014; Wallien & Cohen-Kettenis, 2008).

A clear distinction between care of TGNC and gender-questioning children and adolescents exists in the literature. Due to the evidence that not all children persist in a TGNC identity into adolescence or adulthood, and because no approach to working with TGNC children has been adequately, empirically validated, consensus does not exist regarding best practice with prepubertal children. Lack of consensus about the preferred approach to treatment may be due in part to divergent ideas regarding what constitutes optimal treatment outcomes for TGNC and gender-questioning youth (Hembree et al., 2009). Two distinct approaches exist to address gender identity concerns in children (Hill, Menvielle, Sica, & Johnson, 2010; Wallace & Russell, 2013), with some authors subdividing one of the approaches to suggest three (Byne et al., 2012; Drescher, 2014; Stein, 2012).

One approach encourages an affirmation and acceptance of children's expressed gender identity. This may include assisting children to socially transition and to begin medical transition when their bodies have physically developed, or allowing a child's gender identity to unfold without expectation of a specific outcome (A. L. de Vries & Cohen-Kettenis, 2012; Edwards-Leeper & Spack, 2012; Ehrensaft, 2012; Hidalgo et al., 2013; Tishelman et al., 2015). Clinicians using this approach believe that an open exploration and affirmation will assist children to develop coping strategies and emotional tools to integrate a positive TGNC identity should gender questioning persist (Edwards-Leeper & Spack, 2012).

In the second approach, children are encouraged to embrace their given bodies and to align with their assigned gender roles. This includes endorsing and supporting behaviors and attitudes that align with the child's sex assigned at birth prior to the onset of puberty (Zucker, 2008a; Zucker, Wood, Singh, & Bradley, 2012). Clinicians using this approach believe that undergoing multiple medical interventions and living as a TGNC person in a world that stigmatizes gender nonconformity is a less desirable outcome than one in which children may be assisted to happily align with their sex assigned at birth (Zucker et al., 2012). Consensus does not exist regarding whether this approach may provide benefit (Zucker, 2008a; Zucker et al., 2012) or may cause harm or lead to psychosocial adversities (Hill et al., 2010; Pyne, 2014; Travers et al., 2012; Wallace & Russell, 2013). When addressing psychological interventions for children and adolescents, the World Professional Association for Transgender Health Standards of Care identify interventions "aimed at trying to change gender identity and expression to become more congruent with sex assigned at birth" as unethical (Coleman et al., 2012, p. 175). It is hoped that future research will offer improved guidance in this area of practice (Adelson & AACAP CQI, 2012; Malpas, 2011).

Much greater consensus exists regarding practice with adolescents. Adolescents presenting with gender identity concerns bring their own set of unique challenges. This may include having a late-onset (i.e., postpubertal) presentation of gender nonconforming identification, with no history of gender role nonconformity or gender questioning in childhood (Edwards-Leeper & Spack, 2012). Complicating their clinical presentation, many gender-questioning adolescents also present with co-occurring psychological concerns, such as suicidal ideation, self-injurious behaviors (Liu & Mustanski, 2012; Mustanski, Garofalo, & Emerson, 2010), drug and alcohol use (Garofalo et al., 2006), and autism spectrum disorders (A. L. de Vries, Noens, Cohen-Kettenis, van Berckelaer-Onnes, & Doreleijers, 2010; Jones et al., 2012). Additionally, adolescents can become intensely focused on their immediate desires, resulting in outward displays of frustration and resentment when faced with any delay in receiving the medical treatment from which they feel they would benefit and to which they feel entitled (Angello, 2013; Edwards-Leeper & Spack, 2012). This intense focus on immediate needs may create challenges in assuring that adolescents are cognitively and emotionally able to make life-altering decisions to change their name or gender marker, begin hormone therapy (which may affect fertility), or pursue surgery.

Nonetheless, there is greater consensus that treatment approaches for adolescents affirm an adolescents' gender identity (Coleman et al., 2012). Treatment options for adolescents extend beyond social approaches to include medical approaches. One particular medical intervention involves the use of puberty-suppressing medication or "blockers" (GnRH analogue), which is a reversible medical intervention used to delay puberty for appropriately screened adolescents with gender dysphoria (Coleman et al., 2012; A. L. C. de Vries et al., 2014; Edwards-Leeper, & Spack, 2012). Because of their age, other medical interventions may also become available to adolescents, and psychologists are frequently consulted to provide an assessment of whether such procedures would be advisable (Coleman et al., 2012).

Application. Psychologists working with TGNC and gender-questioning youth are encouraged to regularly review the most current literature in this area, recognizing the limited available research regarding the potential benefits and risks of different treatment approaches for children and for adolescents. Psychologists are encouraged to offer parents and guardians clear information about available treatment approaches, regardless of the specific approach chosen by the psychologist. Psychologists are encouraged to provide psychological service to TGNC and gender-questioning children and adolescents that draws from empirically validated literature when available, recognizing the influence psychologists' values and beliefs may have on the treatment approaches they select (Ehrbar & Gorton, 2010). Psychologists are also encouraged to remain aware that what one youth and/or parent may be seeking in a therapeutic relationship may not coincide with a clinician's approach (Brill & Pepper, 2008). In cases in which a youth and/or parent identify different preferred treatment outcomes than a clinician, it may not be clinically appropriate for the clinician to continue working with the youth and family, and alternative options, including referral, might be considered. Psychologists may also find themselves navigating family systems in which youth and their caregivers are seeking different treatment outcomes (Edwards-Leeper & Spack, 2012). Psychologists are encouraged to carefully reflect on their personal values and beliefs about gender identity development in conjunction with the available research, and to keep the best interest of the child or adolescent at the forefront of their clinical decisions at all times.

Because gender nonconformity may be transient for younger children in particular, the psychologist's role may be to help support children and their families through the process of exploration and self-identification (Ehrensaft, 2012). Additionally, psychologists may provide parents with information about possible long-term trajectories children may take in regard to their gender identity, along with the available medical interventions for adolescents whose TGNC identification persists (Edwards-Leeper & Spack, 2012).

When working with adolescents, psychologists are encouraged to recognize that some TGNC adolescents will not have a strong history of childhood gender role nonconformity or gender dysphoria either by self-report or family observation (Edwards-Leeper & Spack, 2012). Some of these adolescents may have withheld their feelings of gender nonconformity out of a fear of rejection, confusion, conflating gender identity and sexual orientation, or a lack of awareness of the option to identify as TGNC. Parents of these adolescents may need additional assistance in understanding and supporting their youth, given that late-onset gender dysphoria and TGNC identification may come as a significant surprise. Moving more slowly and cautiously in these cases is often advisable (Edwards-Leeper & Spack, 2012). Given the possibility of adolescents' intense focus on immediate desires and strong reactions to perceived delays or barriers, psychologists are encouraged to validate these concerns and the desire to move through the process quickly while also remaining thoughtful and deliberate in treatment. Adolescents and their families may need support in tolerating ambiguity and uncertainty with regard to gender identity and its development (Brill & Pepper, 2008). It is encouraged that care should be taken not to foreclose this process.

For adolescents who exhibit a long history of gender nonconformity, psychologists may inform parents that the adolescent's self-affirmed gender identity is most likely stable (A. L. de Vries et al., 2011). The clinical needs of these adolescents may be different than those who are in the initial phases of exploring or questioning their gender identity. Psychologists are encouraged to complete a comprehensive evaluation and ensure the adolescent's and family's readiness to progress while also avoiding unnecessary delay for those who are ready to move forward.

Psychologists working with TGNC and gender-questioning youth are encouraged to become familiar with medical treatment options for adolescents (e.g., puberty-suppressing medication, hormone therapy) and work collaboratively with medical providers to provide appropriate care to clients. Because the ongoing involvement of a knowledgeable mental health provider is encouraged due to the psychosocial implications, and is often also a required part of the medical treatment regimen that may be offered to TGNC adolescents (Coleman et al., 2012; Hembree et al., 2009), psychologists often play an essential role in assisting in this process.

Psychologists may encourage parents and caregivers to involve youth in developmentally appropriate decision making about their education, health care, and peer networks, as these relate to children's and adolescents' gender identity and gender expression (Ryan, Russell, Huebner, Diaz, & Sanchez, 2010). Psychologists are also encouraged to educate themselves about the advantages and disadvantages of social transition during childhood and adolescence, and to discuss these factors with both their young clients and clients' parents. Emphasizing to parents the importance of allowing their child the freedom to return to a gender identity that aligns with sex assigned at birth or another gender identity at any point cannot be overstated, particularly given the research that suggests that not all young gender nonconforming children will ultimately express a gender identity different from that assigned at birth (Wallien, & Cohen-Kettenis, 2008; Zucker & Bradley, 1995). Psychologists are encouraged to acknowledge and explore the fear and burden of responsibility that parents and caregivers may feel as they make decisions about the health of their child or adolescent (Grossman, D'Augelli, Howell, & Hubbard, 2006). Parents and caregivers may benefit from a supportive environment to discuss feelings of isolation, explore loss and grief they may experience, vent anger and frustration at systems that disrespect or discriminate against them and their youth, and learn how to communicate with others about their child's or adolescent's gender identity or gender expression (Brill & Pepper, 2008).

Guideline 9. Psychologists strive to understand both the particular challenges that TGNC elders experience and the resilience they can develop.

Rationale. Little research has been conducted about TGNC elders, leaving much to be discovered about this life stage for TGNC people (Auldridge, Tamar-Mattis, Kennedy, Ames, & Tobin, 2012). Socialization into gender role behaviors and expectations based on sex assigned at birth, as well as the extent to which TGNC people adhere to these societal standards, is influenced by the chronological age at which a person self-identifies as TGNC, the age at which a person comes out or socially and/or medically transitions (Birren & Schaie, 2006; Bockting & Coleman, 2007; Cavanaugh & Blanchard-Fields, 2010; Nuttbrock et al., 2010; Wahl, Iwarsson, & Oswald, 2012), and a person's generational cohort (e.g., 1950 vs. 2010; Fredriksen-Goldsen et al., 2011).

Even decades after a medical or social transition, TGNC elders may still subscribe to the predominant gender role expectations that existed at the time of their transition (Knochel, Croghan, Moore, & Quam, 2011). Prior to the 1980s, TGNC people who transitioned were strongly encouraged by providers to pass in society as cisgender and heterosexual and to avoid associating with other TGNC people (Benjamin, 1966; R. Green & Money, 1969; Hastings, 1974; Hastings & Markland, 1978). Even TGNC elders who were comfortable telling others about their TGNC identity when they were younger may choose not to reveal their identity at a later stage of life (Ekins & King, 2005; Ippolito & Witten, 2014). Elders' unwillingness to disclose their TGNC identity can result from feelings of physical vulnerability or increased reliance on others who may discriminate against them or treat them poorly as a result of their gender identity (Bockting & Coleman, 2007), especially if the elder resides in an institutionalized setting (i.e., nursing home, assisted living facility) and relies on others for many daily needs (Auldridge et al., 2012). TGNC elders are also at a heightened risk for depression, suicidal ideation, and loneliness compared with LGB elders (Auldridge et al., 2012; Fredriksen-Goldsen et al., 2011).

A Transgender Law Center survey found that TGNC and LGB elders had less financial well-being than their younger cohorts, despite having a higher than average educational level for their age group compared with the general population (Hartzell, Frazer, Wertz, & Davis, 2009). Survey research has also revealed that TGNC elders experience underemployment and gaps in employment, often due to discrimination (Auldridge et al., 2012; Beemyn & Rankin, 2011; Factor & Rothblum, 2007). In the past, some TGNC people with established careers may have been encouraged by service providers to find new careers or jobs to avoid undergoing a gender transition at work or being identified as TGNC, potentially leading to a significant loss of income and occupational identity (Cook-Daniels, 2006). Obstacles to employment can increase economic disparities that result in increased needs for supportive housing and other social services (National Center for Transgender Equality, 2012; Services and Advocacy for GLBT Elders & National Center for Transgender Equality, 2012).

TGNC elders may face obstacles to seeking or accessing resources that support their physical, financial, or emotional well-being. For instance, they may be concerned about applying for social security benefits, fearing that their TGNC identity may become known (Hartzell et al., 2009). A TGNC elder may avoid medical care, increasing the likelihood of later needing a higher level of medical care (e.g., home-based care, assisted living, or nursing home) than their same-age cisgender peers (Hartzell et al., 2009; Ippolito & Witten, 2014; Mikalson et al., 2012). Nursing homes and assisted living facilities are rarely sensitive to the unique medical needs of TGNC elders (National Senior Citizens Law Center, 2011). Some TGNC individuals who enter congregate housing, assisted living, or long-term care settings may feel the need to reverse their transition to align with sex assigned at birth to avoid discrimination and persecution by other residents and staff (Ippolito & Witten, 2014).

Older age may both facilitate and complicate medical treatment related to gender transition. TGNC people who begin hormone therapy later in life may have a smoother transition due to waning hormone levels that are a natural part of aging (Witten & Eyler, 2012). Age may also influence the decisions TGNC elders make regarding sex-affirmation surgeries, especially if physical conditions exist that could significantly increase risks associated with surgery or recovery.

Much has been written about the resilience of elders who have endured trauma (Fuhrmann & Shevlowitz, 2006; Hardy, Concato, & Gill, 2004; Mlinac, Sheeran, Blissmer, Lees, & Martins, 2011; Rodin & Stewart, 2012). Although some TGNC elders have experienced significant psychological trauma related to their gender identity, some also have developed resilience and effective ways of coping with adversity (Fruhauf & Orel, 2015). Despite the limited availability of LGBTQ-affirmative religious organizations in many local communities, TGNC elders make greater use of these resources than their cisgender peers (Porter et al., 2013).

Application. Psychologists are encouraged to seek information about the biopsychosocial needs of TGNC elders to inform case conceptualization and treatment planning to address psychological, social, and medical concerns. Many TGNC elders are socially isolated. Isolation can occur as a result of a loss of social networks through death or through disclosure of a TGNC identity. Psychologists may assist TGNC elders in establishing new social networks that support and value their TGNC identity, while also working to strengthen existing family and friend networks after a TGNC identity has been disclosed. TGNC elders may find special value in relationships with others in their generational cohort or those who may have similar coming-out experiences. Psychologists may encourage TGNC elders to identify ways they can mentor and improve the resilience of younger TGNC generations, creating a sense of generativity (Erikson, 1968) and contribu-

tion while building new supportive relationships. Psychologists working with TGNC elders may help them recognize the sources of their resilience and encourage them to connect with and be active in their communities (Fuhrmann & Craffey, 2014).

For TGNC elders who have chosen not to disclose their gender identity, psychologists may provide support to address shame, guilt, or internalized antitrans prejudice, and validate each person's freedom to choose their pattern of disclosure. Clinicians may also provide validation and empathy when TGNC elders have chosen a model of transition that avoids any disclosure of gender identity and is heavily focused on passing as cisgender.

TGNC elders who choose to undergo a medical or social transition in older adulthood may experience antitrans prejudice from people who question the value of transition at an older age or who believe that these elders are not truly invested in their transition or in a TGNC identity given the length of time they have waited (Auldridge et al., 2012). Some TGNC elders may also grieve lost time and missed opportunities. Psychologists may validate elders' choices to come out, transition, or evolve their gender identity or gender expression at any age, recognizing that such choices may have been much less accessible or viable at earlier stages of TGNC elders' lives.

Psychologists may assist congregate housing, assisted living, or long-term care settings to best meet TGNC elders' needs through respectful communication and affirmation of each person's gender identity and gender expression. Psychologists may work with TGNC people in hospice care systems to develop an end-of-life plan that respects the person's wishes about disclosure of gender identity during and after death.

Assessment, Therapy, and Intervention

Guideline 10. Psychologists strive to understand how mental health concerns may or may not be related to a TGNC person's gender identity and the psychological effects of minority stress.

Rationale. TGNC people may seek assistance from psychologists in addressing gender-related concerns, other mental health issues, or both. Mental health problems experienced by a TGNC person may or may not be related to that person's gender identity and/or may complicate assessment and intervention of gender-related concerns. In some cases, there may not be a relationship between a person's gender identity and a co-occurring condition (e.g., depression, PTSD, substance abuse). In other cases, having a TGNC identity may lead or contribute to a co-occurring mental health condition, either directly by way of gender dysphoria, or indirectly by way of minority stress and oppression (Hendricks & Testa, 2012; I. H. Meyer, 1995, 2003). In extremely rare cases, a co-occurring condition can mimic gender dysphoria (i.e., a psychotic process that distorts the perception of one's gender; Baltieri & De Andrade, 2009; Hepp, Kraemer, Schnyder, Miller, & Delsignore, 2004).

Regardless of the presence or absence of an etiological link, gender identity may affect how a TGNC person experiences a co-occurring mental health condition, and/or a co-occurring mental health condition may complicate the person's gender expression or gender identity. For example, an eating disorder may be influenced by a TGNC person's gender expression (e.g., rigid eating patterns used to manage body shape or menstruation may be related to gender identity or gender dysphoria; Ålgars, Alanko, Santtila, & Sandnabba, 2012; Murray, Boon, & Touyz, 2013). In addition, the presence of autism spectrum disorder may complicate a TGNC person's articulation and exploration of gender identity (Jones et al., 2012). In cases in which gender dysphoria is contributing to other mental health concerns, treatment of gender dysphoria may be helpful in alleviating those concerns as well (Keo-Meier et al., 2015).

A relationship also exists between mental health conditions and the psychological sequelae of minority stress that TGNC people can experience. Given that TGNC people experience physical and sexual violence (Clements-Nolle et al., 2006; Kenagy & Bostwick, 2005; Lombardi, Wilchins, Priesing, & Malouf, 2001; Xavier et al., 2005), general harassment and discrimination (Beemyn & Rankin, 2011; Factor & Rothblum, 2007), and employment and housing discrimination (Bradford et al., 2007), they are likely to experience significant levels of minority stress. Studies have demonstrated the disproportionately high levels of negative psychological sequelae related to minority stress, including suicidal ideation and suicide attempts (Center for Substance Abuse Treatment, 2012; Clements-Nolle et al., 2006; Cochran & Cauce, 2006; Nuttbrock et al., 2010; Xavier et al., 2005) and completed suicides (Dhejne et al., 2011; van Kesteren, Asscheman, Megens, & Gooren, 1997). Recent studies have begun to demonstrate an association between sources of external stress and psychological distress (Bockting et al., 2013; Nuttbrock et al., 2010), including suicidal ideation and attempts and self-injurious behavior (dickey, Reisner, & Juntunen, 2015; Goldblum et al., 2012; Testa et al., 2012).

The minority stress model accounts for both the negative mental health effects of stigma-related stress and the processes by which members of the minority group may develop resilience and resistance to the negative effects of stress (I. H. Meyer, 1995, 2003). Although the minority stress model was developed as a theory of the relationship between sexual orientation and mental disorders, the model has been adapted to TGNC populations (Hendricks & Testa, 2012).

Application. Because of the increased risk of stress-related mental health conditions, psychologists are encouraged to conduct a careful diagnostic assessment, including a differential diagnosis, when working with TGNC people (Coleman et al., 2012). Taking into account the intricate interplay between the effects of mental health symptoms and gender identity and gender expression, psychologists are encouraged to neither ignore mental health problems a TGNC person is experiencing, nor erroneously

assume that those mental health problems are a result of the person's gender identity or gender expression. Psychologists are strongly encouraged to be cautious before determining that gender nonconformity or dysphoria is due to an underlying psychotic process, as this type of causal relationship is rare.

When TGNC people seek to access transition-related health care, a psychosocial assessment is often part of this process (Coleman et al., 2012). A comprehensive and balanced assessment typically includes not only information about a person's past experiences of antitrans prejudice or discrimination, internalized messages related to these experiences, and anticipation of future victimization or rejection (Coolhart, Provancher, Hager, & Wang, 2008), but also coping strategies and sources of resilience (Hendricks & Testa, 2012; Singh et al., 2011). Gathering information about negative life events directly related to a TGNC person's gender identity and gender expression may assist psychologists in understanding the sequelae of stress and discrimination, distinguishing them from concurrent and potentially unrelated mental health problems. Similarly, when a TGNC person has a primary presenting concern that is not gender focused, a comprehensive assessment takes into account that person's experience relative to gender identity and gender expression, including any discrimination, just as it would include assessing other potential trauma history, medical concerns, previous experience with helping professionals, important future goals, and important aspects of identity. Strategies a TGNC person uses to navigate antitrans discrimination could be sources of strength to deal with life challenges or sources of distress that increase challenges and barriers.

Psychologists are encouraged to help TGNC people understand the pervasive influence of minority stress and discrimination that may exist in their lives, potentially including internalized negative attitudes about themselves and their TGNC identity (Hendricks & Testa, 2012). With this support, clients can better understand the origins of their mental health symptoms and normalize their reactions when faced with TGNC-related inequities and discrimination. Minority stress models also identify potentially important sources of resilience. TGNC people can develop resilience when they connect with other TGNC people who provide information on how to navigate antitrans prejudice and increase access to necessary care and resources (Singh et al., 2011). TGNC people may need help developing social support systems to nurture their resilience and bolster their ability to cope with the adverse effects of antitrans prejudice and/or discrimination (Singh & McKleroy, 2011).

Feminizing or masculinizing hormone therapy can positively or negatively affect existing mood disorders (Coleman et al., 2012). Psychologists may also help TGNC people who are in the initial stages of hormone therapy adjust to normal changes in how they experience emotions. For example, trans women who begin estrogens and antiandrogens may experience a broader range of emotions than they are accustomed to, or trans men beginning testosterone might be faced with adjusting to a higher libido and feeling more emotionally reactive in stressful situations. These changes can be normalized as similar to the emotional adjustments that cisgender women and men experience during puberty. Some TGNC people will be able to adapt existing coping strategies, whereas others may need help developing additional skills (e.g., emotional regulation or assertiveness). Readers are encouraged to refer to the World Professional Association for Transgender Health Standards of Care for discussion of the possible effects of hormone therapy on a TGNC person's mood, affect, and behavior (Coleman et al., 2012).

Guideline 11. Psychologists recognize that TGNC people are more likely to experience positive life outcomes when they receive social support or trans-affirmative care.

Rationale. Research has primarily shown positive treatment outcomes when TGNC adults and adolescents receive TGNC-affirmative medical and psychological services (i.e., psychotherapy, hormones, surgery; Byne et al., 2012; R. Carroll, 1999; Cohen-Kettenis, Delemarre-van de Waal, & Gooren, 2008; Davis & Meier, 2014; De Cuypere et al., 2006; Gooren, Giltay, & Bunck, 2008; Kuhn et al., 2009), although sample sizes are frequently small with no population-based studies. In a meta-analysis of the hormone therapy treatment literature with TGNC adults and adolescents, researchers reported that 80% of participants receiving trans-affirmative care experienced an improved quality of life, decreased gender dysphoria, and a reduction in negative psychological symptoms (Murad et al., 2010).

In addition, TGNC people who receive social support about their gender identity and gender expression have improved outcomes and quality of life (Brill & Pepper, 2008; Pinto, Melendez, & Spector, 2008). Several studies indicate that family acceptance of TGNC adolescents and adults is associated with decreased rates of negative outcomes, such as depression, suicide, and HIV risk behaviors and infection (Bockting et al., 2013; Dhejne et al., 2011; Grant et al., 2011; Liu & Mustanski, 2012; Ryan, 2009). Family support is also a strong protective factor for TGNC adults and adolescents (Bockting et al., 2013; Moody & Smith, 2013; Ryan et al., 2010). TGNC people, however, frequently experience blatant or subtle antitrans prejudice, discrimination, and even violence within their families (Bradford et al., 2007). Such family rejection is associated with higher rates of HIV infection, suicide, incarceration, and homelessness for TGNC adults and adolescents (Grant et al., 2011; Liu & Mustanski, 2012). Family rejection and lower levels of social support are significantly correlated with depression (Clements-Nolle et al., 2006; Ryan, 2009). Many TGNC people seek support through peer relationships, chosen families, and communities in which they may be more likely to experience acceptance (Gonzalez & McNulty, 2010; Nuttbrock et al., 2009). Peer support from other TGNC people has been found to be a moderator between antitrans discrimination and mental health, with higher levels of peer support associated with better mental health (Bockting et al., 2013). For some TGNC people, support from religious and spiritual communities provides

an important source of resilience (Glaser, 2008; Kidd & Witten, 2008; Porter et al., 2013).

Application. Given the strong evidence for the positive influence of affirmative care, psychologists are encouraged to facilitate access to and provide trans-affirmative care to TGNC people. Whether through the provision of assessment and psychotherapy, or through assisting clients to access hormone therapy or surgery, psychologists may play a critical role in empowering and validating TGNC adults' and adolescents' experiences and increasing TGNC people's positive life outcomes (Bess & Stabb, 2009; Rachlin, 2002).

Psychologists are also encouraged to be aware of the importance of affirmative social support and assist TGNC adults and adolescents in building social support networks in which their gender identity is accepted and affirmed. Psychologists may assist TGNC people in negotiating family dynamics that may arise in the course of exploring and establishing gender identity. Depending on the context of psychological practice, these issues might be addressed in individual work with TGNC clients, conjoint sessions including members of their support system, family therapy, or group therapy. Psychologists may help TGNC people decide how and when to reveal their gender identity at work or school, in religious communities, and to friends and contacts in other settings. TGNC people who decide not to come out in all aspects of their lives can still benefit from TGNC-affirmative in-person or online peer support groups.

Clients may ask psychologists to assist family members in exploring feelings about their loved one's gender identity and gender expression. Published models of family adjustment (Emerson & Rosenfeld, 1996) may be useful to help normalize family members' reactions upon learning that they have a TGNC family member, and to reduce feelings of isolation. When working with family members or significant others, it may be helpful to normalize feelings of loss or fear of what may happen to current relationships as TGNC people disclose their gender identity and expression to others. Psychologists may help significant others adjust to changing relationships and consider how to talk to extended family, friends, and other community members about TGNC loved ones. Providing significant others with referrals to TGNC-affirmative providers, educational resources, and support groups can have a profound impact on their understanding of gender identity and their communication with TGNC loved ones. Psychologists working with couples and families may also help TGNC people identify ways to include significant others in their social or medical transition.

Psychologists working with TGNC people in rural settings may provide clients with resources to connect with other TGNC people online or provide information about in-person support groups in which they can explore the unique challenges of being TGNC in these geographic areas (Walinsky & Whitcomb, 2010). Psychologists serving TGNC military and veteran populations are encouraged to be sensitive to the barriers these individuals face, especially for people who are on active duty in the U.S. military (OutServe-Servicemembers Legal Defense Network, n.d.). Psychologists may help TGNC military members and veterans establish specific systems of support that create a safe and affirming space to reduce isolation and to create a network of peers with a shared military experience. Psychologists who work with veterans are encouraged to educate themselves on recent changes to VA policy that support equal access to VA medical and mental health services (Department of Veterans Affairs, Veterans' Health Administration, 2013).

Guideline 12. Psychologists strive to understand the effects that changes in gender identity and gender expression have on the romantic and sexual relationships of TGNC people.

Rationale. Relationships involving TGNC people can be healthy and successful (Kins, Hoebeke, Heylens, Rubens, & De Cuyprere, 2008; Meier, Sharp, Michonski, Babcock, & Fitzgerald, 2013) as well as challenging (Brown, 2007; Iantaffi & Bockting, 2011). A study of successful relationships between TGNC men and cisgender women found that these couples attributed the success of their relationship to respect, honesty, trust, love, understanding, and open communication (Kins et al., 2008). Just as relationships between cisgender people can involve abuse, so can relationships between TGNC people and their partners (Brown, 2007), with some violent partners threatening to disclose a TGNC person's identity to exact control in the relationship (FORGE, n.d.).

In the early decades of medical and social transition for TGNC people, only those whose sexual orientations would be heterosexual posttransition (e.g., trans woman with a cisgender man) were deemed eligible for medical and social transition (Meyerowitz, 2002). This restriction prescribed only certain relationship partners (American Psychiatric Association, 1980; Benjamin, 1966; Chivers & Bailey, 2000), denied access to surgery for trans men identifying as gay or bisexual (Coleman & Bockting, 1988), or trans women identifying as lesbian or bisexual, and even required that TGNC people's existing legal marriages be dissolved before they could gain access to transition care (Lev, 2004).

Disclosure of a TGNC identity can have an important impact on the relationship between TGNC people and their partners. Disclosure of TGNC status earlier in the relationship tends to be associated with better relationship outcomes, whereas disclosure of TGNC status many years into an existing relationship may be perceived as a betrayal (Erhardt, 2007). When a TGNC person comes out in the context of an existing relationship, it can also be helpful if both partners are involved in decision making about the use of shared resources (i.e., how to balance the financial costs of transition with other family needs) and how to share this news with shared supports (i.e., friends and family). Sometimes relationship roles are renegotiated in the context of a TGNC person coming out to their partner (Samons, 2008). Assumptions about what it means to be a "husband" or a "wife" can shift if the gender identity of one's spouse shifts

(Erhardt, 2007). Depending on when gender issues are disclosed and how much of a change this creates in the relationship, partners may grieve the loss of aspects of their partner and the way the relationship used to be (Lev, 2004).

Although increasing alignment between gender identity and gender expression, whether it be through dress, behavior, or through medical interventions (i.e., hormones, surgery), does not necessarily affect to whom a TGNC person is attracted (Coleman et al., 1993), TGNC people may become more open to exploring their sexual orientation, may redefine sexual orientation as they move through transition, or both (Daskalos, 1998; H. Devor, 1993; Schleifer, 2006). Through increased comfort with their body and gender identity, TGNC people may explore aspects of their sexual orientation that were previously hidden or that felt discordant with their sex assigned at birth. Following a medical and/or social transition, a TGNC person's sexual orientation may remain constant or shift, either temporarily or permanently (e.g., renewed exploration of sexual orientation in the context of TGNC identity, shift in attraction or choice of sexual partners, widened spectrum of attraction, shift in sexual orientation identity; Meier, Sharp et al., 2013; Samons, 2008). For example, a trans man previously identified as a lesbian may later be attracted to men (Coleman et al., 1993; dickey, Burnes, & Singh, 2012), and a trans woman attracted to women pretransition may remain attracted to women posttransition (Lev, 2004).

Some TGNC people and their partners may fear the loss of mutual sexual attraction and other potential effects of shifting gender identities in the relationship. Lesbian-identified partners of trans men may struggle with the idea that being in a relationship with a man may cause others to perceive them as a heterosexual couple (Califia, 1997). Similarly, women in heterosexual relationships who later learn that their partners are trans women may be unfamiliar with navigating stigma associated with sexual minority status when viewed as a lesbian couple (Erhardt, 2007). Additionally, partners may find they are not attracted to a partner after transition. As an example, a lesbian whose partner transitions to a male identity may find that she is no longer attracted to this person because she is not sexually attracted to men. Partners of TGNC people may also experience grief and loss as their partners engage in social and/or medical transitions.

Application. Psychologists may help foster resilience in relationships by addressing issues specific to partners of TGNC people. Psychologists may provide support to partners of TGNC people who are having difficulty with their partner's evolving gender identity or transition, or are experiencing others having difficulty with the partner's transition. Partner peer support groups may be especially helpful in navigating internalized antitrans prejudice, shame, resentment, and relationship concerns related to a partner's gender transition. Meeting or knowing other TGNC people, other partners of TGNC people, and couples who have successfully navigated transition may also help TGNC people and their partners and serve as a protective factor (Brown, 2007). When TGNC status is disclosed during an existing relationship, psychologists may help couples explore which relationship dynamics they want to preserve and which they might like to change.

In working with psychologists, TGNC people may explore a range of issues in their relationships and sexuality (dickey et al., 2012), including when and how to come out to current or potential romantic and sexual partners, communicating their sexual desires, renegotiating intimacy that may be lost during the TGNC partner's transition, adapting to bodily changes caused by hormone use or surgery, and exploring boundaries regarding touch, affection, and safer sex practices (Iantaffi & Bockting, 2011; Sevelius, 2009). TGNC people may experience increased sexual self-efficacy through transition. Although psychologists may aid partners in understanding a TGNC person's transition decisions, TGNC people may also benefit from help in cultivating awareness of the ways in which these decisions influence the lives of loved ones.

Guideline 13. Psychologists seek to understand how parenting and family formation among TGNC people take a variety of forms.

Rationale. Psychologists work with TGNC people across the life span to address parenting and family issues (Kenagy & Hsieh, 2005). There is evidence that many TGNC people have and want children (Wierckx et al., 2012). Some TGNC people conceive a child through sexual intercourse, whereas others may foster, adopt, pursue surrogacy, or employ assisted reproductive technologies, such as sperm or egg donation, to build or expand a family (De Sutter, Kira, Verschoor, & Hotimsky, 2002). Based on a small body of research to date, there is no indication that children of TGNC parents suffer long-term negative impacts directly related to parental gender change (R. Green, 1978, 1988; White & Ettner, 2004). TGNC people may find it both challenging to find medical providers who are willing to offer them reproductive treatment and to afford the cost (Coleman et al., 2012). Similarly, adoption can be quite costly, and some TGNC people may find it challenging to find foster care or adoption agencies that will work with them in a nondiscriminatory manner. Current or past use of hormone therapy may limit fertility and restrict a TGNC person's reproductive options (Darnery, 2008; Wierckx et al., 2012). Other TGNC people may have children or families before coming out as TGNC or beginning a gender transition.

TGNC people may present with a range of parenting and family-building concerns. Some will seek support to address issues within preexisting family systems, some will explore the creation or expansion of a family, and some will need to make decisions regarding potential fertility issues related to hormone therapy, pubertal suppression, or surgical transition. The medical and/or social transition of a TGNC parent may shift family dynamics, creating challenges and opportunities for partners, children, and other family members. One study of therapists' reflections on their experiences with TGNC clients suggested that family constellation and the parental relationship was more significant for children than the parent's social and/or medical

transition itself (White & Ettner, 2004). Although research has not documented that the transitions of TGNC people have an effect on their parenting abilities, preexisting partnerships or marriages may not survive the disclosure of a TGNC identity or a subsequent transition (dickey et al., 2012). This may result in divorce or separation, which may affect the children in the family. A positive relationship between parents, regardless of marital status, has been suggested to be an important protective factor for children (Amato, 2001; White & Ettner, 2007). This seems to be the case especially when children are reminded of the parent's love and assured of the parent's continued presence in their life (White & Ettner, 2007). Based on a small body of literature available, it is generally the case that younger children are best able to incorporate the transition of a parent, followed by adult children, with adolescents generally having the most difficulty (White & Ettner, 2007). If separated or divorced from their partners or spouses, TGNC parents may be at risk for loss of custody or visitation rights because some courts presume that there is a nexus between their gender identity or gender expression and parental fitness (Flynn, 2006). This type of prejudice is especially common for TGNC people of color (Grant et al., 2011).

Application. Psychologists are encouraged to attend to the parenting and family-building concerns of TGNC people. When working with TGNC people who have previous parenting experience, psychologists may help TGNC people identify how being a parent may influence decisions to come out as TGNC or to begin a transition (Freeman, Tasker, & Di Ceglie, 2002; Grant et al., 2011; Wierckx et al., 2012). Some TGNC people may choose to delay disclosure until their children have grown and left home (Bethea & McCollum, 2013). Clinical guidelines jointly developed by a Vancouver, British Columbia, TGNC community organization and a health care provider organization encourage psychologists and other mental health providers working with TGNC people to plan for disclosure to a partner, previous partner, or children, and to pay particular attention to resources that assist TGNC people to discuss their identity with children of various ages in developmentally appropriate ways (Bockting et al., 2006). Lev (2004) uses a developmental stage framework for the process that family members are likely to go through in coming to terms with a TGNC family member's identity that some psychologists may find helpful. Awareness of peer support networks for spouses and children of TGNC people can also be helpful (e.g., PFLAG, TransYouth Family Allies). Psychologists may provide family counseling to assist a family in managing disclosure, improve family functioning, and maintain family involvement of the TGNC person, as well as aiding the TGNC person in attending to the ways that their transition process has affected their family members (Samons, 2008). Helping parents to continue to work together to focus on the needs of their children and to maintain family bonds is likely to lead to the best results for the children (White & Ettner, 2007).

For TGNC people with existing families, psychologists may support TGNC people in seeking legal counsel regarding parental rights in adoption or custody. Depending on the situation, this may be desirable even if the TGNC parent is biologically related to the child (Minter & Wald, 2012). Although being TGNC is not a legal impediment to adoption in the United States, there is the potential for overt and covert discrimination and barriers, given the widespread prejudice against TGNC people. The question of whether to disclose TGNC status on an adoption application is a personal one, and a prospective TGNC parent would benefit from consulting a lawyer for legal advice, including what the laws in their jurisdiction say about disclosure. Given the extensive background investigation frequently conducted, it may be difficult to avoid disclosure. Many lawyers favor disclosure to avoid any potential legal challenges during the adoption process (Minter & Wald, 2012).

In discussing family-building options with TGNC people, psychologists are encouraged to remain aware that some of these options require medical intervention and are not available everywhere, in addition to being quite costly (Coleman et al., 2012). Psychologists may work with clients to manage feelings of loss, grief, anger, and resentment that may arise if TGNC people are unable to access or afford the services they need for building a family (Bockting et al., 2006; De Sutter et al., 2002).

When TGNC people consider beginning hormone therapy, psychologists may engage them in a conversation about the possibly permanent effects on fertility to better prepare TGNC people to make a fully informed decision. This may be of special importance with TGNC adolescents and young adults who often feel that family planning or loss of fertility is not a significant concern in their current daily lives, and therefore disregard the long-term reproductive implications of hormone therapy or surgery (Coleman et al., 2012). Psychologists are encouraged to discuss contraception and safer sex practices with TGNC people, given that they may still have the ability to conceive even when undergoing hormone therapy (Bockting, Robinson, & Rosser, 1998). Psychologists may play a critical role in educating TGNC adolescents and young adults and their parents about the long-term effects of medical interventions on fertility and assist them in offering informed consent prior to pursuing such interventions. Although hormone therapy may limit fertility (Coleman et al., 2012), psychologists may encourage TGNC people to refrain from relying on hormone therapy as the sole means of birth control, even when a person has amenorrhea (Gorton & Grubb, 2014). Education on safer sex practices may also be important, as some segments of the TGNC community (e.g., trans women and people of color) are especially vulnerable to sexually transmitted infections and have been shown to have high prevalence and incidence rates of HIV infection (Kellogg, Clements-Nolle, Dilley, Katz, & McFarland, 2001; Nemoto, Operario, Keatley, Han, & Soma, 2004).

Depending on the timing and type of options selected, psychologists may explore the physical, social, and emotional implications should TGNC people choose to delay or

stop hormone therapy, undergo fertility treatment, or become pregnant. Psychological effects of stopping hormone therapy may include depression, mood swings, and reactions to the loss of physical masculinization or feminization facilitated by hormone therapy (Coleman et al., 2012). TGNC people who choose to halt hormone therapy during attempts to conceive or during a pregnancy may need additional psychological support. For example, TGNC people and their families may need help in managing the additional antitrans prejudice and scrutiny that may result when a TGNC person with stereotypically masculine features becomes visibly pregnant. Psychologists may also assist TGNC people in addressing their loss when they cannot engage in reproductive activities that are consistent with their gender identity, or when they encounter barriers to conceiving, adopting, or fostering children not typically faced by other people (Vanderburgh, 2007). Psychologists are encouraged to assess the degree to which reproductive health services are TGNC-affirmative prior to referring TGNC people to them. Psychologists are also encouraged to provide TGNC-affirmative information to reproductive health service personnel when there is a lack of trans-affirmative knowledge.

Guideline 14. Psychologists recognize the potential benefits of an interdisciplinary approach when providing care to TGNC people and strive to work collaboratively with other providers.

Rationale. Collaboration across disciplines can be crucial when working with TGNC people because of the potential interplay of biological, psychological, and social factors in diagnosis and treatment (Hendricks & Testa, 2012). The challenges of living with a stigmatized identity and the need of many TGNC people to transition, socially and/or medically, may call for the involvement of health professionals from various disciplines, including psychologists, psychiatrists, social workers, primary health care providers, endocrinologists, nurses, pharmacists, surgeons, gynecologists, urologists, electrologists, speech therapists, physical therapists, pastoral counselors and chaplains, and career or educational counselors. Communication, cooperation, and collaboration will ensure optimal coordination and quality of care. Just as psychologists often refer TGNC people to medical providers for assessment and treatment of medical issues, medical providers may rely on psychologists to assess readiness and assist TGNC clients to prepare for the psychological and social aspects of transition before, during, and after medical interventions (Coleman et al., 2012; Hembree et al., 2009; Lev, 2009). Outcome research to date supports the value and effectiveness of an interdisciplinary, collaborative approach to TGNC-specific care (see Coleman et al., 2012 for a review).

Application. Psychologists' collaboration with colleagues in medical and associated health disciplines involved in TGNC clients' care (e.g., hormonal and surgical treatment, primary health care; Coleman et al., 2012; Lev, 2009) may take many forms and should occur in a timely manner that does not complicate access to needed services (e.g., considerations of wait time). For example, a psychologist working with a trans man who has a diagnosis of bipolar disorder may need to coordinate with his primary care provider and psychiatrist to adjust his hormone levels and psychiatric medications, given that testosterone can have an activating effect, in addition to treating gender dysphoria. At a basic level, collaboration may entail the creation of required documentation that TGNC people present to surgeons or medical providers to access gender-affirming medical interventions (e.g., surgery, hormone therapy; Coleman et al., 2012). Psychologists may offer support, information, and education to interdisciplinary colleagues who are unfamiliar with issues of gender identity and gender expression to assist TGNC people in obtaining TGNC-affirmative care (Holman & Goldberg, 2006; Lev, 2009). For example, a psychologist who is assisting a trans woman with obtaining gender-affirming surgery may, with her consent, contact her new gynecologist in preparation for her first medical visit. This contact could include sharing general information about her gender history and discussing how both providers could most affirmatively support appropriate health checks to ensure her best physical health (Holman & Goldberg, 2006).

Psychologists in interdisciplinary settings could also collaborate with medical professionals prescribing hormone therapy by educating TGNC people and ensuring TGNC people are able to make fully informed decisions prior to starting hormone treatment (Coleman et al., 2012; Deutsch, 2012; Lev, 2009). Psychologists working with children and adolescents play a particularly important role on the interdisciplinary team due to considerations of cognitive and social development, family dynamics, and degree of parental support. This role is especially crucial when providing psychological evaluation to determine the appropriateness and timeliness of a medical intervention. When psychologists are not part of an interdisciplinary setting, especially in isolated or rural communities, they can identify interdisciplinary colleagues with whom they may collaborate and/or refer (Walinsky & Whitcomb, 2010). For example, a rural psychologist could identify a trans-affirmative pediatrician in a surrounding area and collaborate with the pediatrician to work with parents raising concerns about their TGNC and questioning children and adolescents.

In addition to working collaboratively with other providers, psychologists who obtain additional training to specialize in work with TGNC people may also serve as consultants in the field (e.g., providing additional support to providers working with TGNC people or assisting school and workplaces with diversity training). Psychologists who have expertise in working with TGNC people may play a consultative role with providers in inpatient settings seeking to provide affirmative care to TGNC clients. Psychologists may also collaborate with social service colleagues to provide TGNC people with affirmative referrals related to housing, financial support, vocational/educational counseling and training, TGNC-affirming religious or spiritual communities, peer support, and other community resources (Gehi & Arkles, 2007). This collaboration might also in-

clude assuring that TGNC people who are minors in the care of the state have access to culturally appropriate care.

Research, Education, and Training

Guideline 15. Psychologists respect the welfare and rights of TGNC participants in research and strive to represent results accurately and avoid misuse or misrepresentation of findings.

Rationale. Historically, in a set of demographic questions, psychological research has included one item on either sex or gender, with two response options—male and female. This approach wastes an opportunity to increase knowledge about TGNC people for whom neither option may fit their identity, and runs the risk of alienating TGNC research participants (IOM, 2011). For example, there is little knowledge about HIV prevalence, risks, and prevention needs of TGNC people because most of the research on HIV has not included demographic questions to identify TGNC participants within their samples. Instead, TGNC people have been historically subsumed within larger demographic categories (e.g., men who have sex with men, women of color), rendering the impact of the HIV epidemic on the TGNC population invisible (Herbst et al., 2008). Scholars have noted that this invisibility fails to draw attention to the needs of TGNC populations that experience the greatest health disparities, including TGNC people who are of color, immigrants, low income, homeless, veterans, incarcerated, live in rural areas, or have disabilities (Bauer et al., 2009; Hanssmann, Morrison, Russian, Shiu-Thornton, & Bowen, 2010; Shipherd et al., 2012; Walinsky & Whitcomb, 2010).

There is a great need for more research to inform practice, including affirmative treatment approaches with TGNC people. Although sufficient evidence exists to support current standards of care (Byne et al., 2012; Coleman et al., 2012), much is yet to be learned to optimize quality of care and outcome for TGNC clients, especially as it relates to the treatment of children (IOM, 2011; Mikalson et al., 2012). In addition, some research with TGNC populations has been misused and misinterpreted, negatively affecting TGNC people's access to health services to address issues of gender identity and gender expression (Namaste, 2000). This has resulted in justifiable skepticism and suspicion in the TGNC community when invited to participate in research initiatives. In accordance with the APA ethics code (APA, 2010), psychologists conduct research and distribute research findings with integrity and respect for their research participants. As TGNC research increases, some TGNC communities may experience being oversampled in particular geographic areas and/or TGNC people of color may not be well-represented in TGNC studies (Hwahng & Lin, 2009; Namaste, 2000).

Application. All psychologists conducting research, even when not specific to TGNC populations, are encouraged to provide a range of options for capturing demographic information about TGNC people so that TGNC people may be included and accurately represented (Conron et al., 2008; Deutsch et al., 2013). One group of experts has recommended that population research, and especially government-sponsored surveillance research, use a two-step method, first asking for sex assigned at birth, and then following with a question about gender identity (GenIUSS, 2013). For research focused on TGNC people, including questions that assess both sex assigned at birth and current gender identity allows the disaggregation of subgroups within the TGNC population and has the potential to increase knowledge of differences within the population. In addition, findings about one subgroup of TGNC people may not apply to other subgroups. For example, results from a study of trans women of color with a history of sex work who live in urban areas (Nemoto, Operario, Keatley, & Villegas, 2004) may not generalize to all TGNC women of color or to the larger TGNC population (Bauer, Travers, Scanlon, & Coleman, 2012; Operario et al., 2008).

In conducting research with TGNC people, psychologists will confront the challenges associated with studying a relatively small, geographically dispersed, diverse, stigmatized, hidden, and hard-to-reach population (IOM, 2011). Because TGNC individuals are often hard to reach (IOM, 2011) and TGNC research is rapidly evolving, it is important to consider the strengths and limitations of the methods that have been or may be used to study the TGNC population, and to interpret and represent findings accordingly. Some researchers have strongly recommended collaborative research models (e.g., participatory action research) in which TGNC community members are integrally involved in these research activities (Clements-Nolle & Bachrach, 2003; Singh, Richmond, & Burnes, 2013). Psychologists who seek to educate the public by communicating research findings in the popular media will also confront challenges, because most journalists have limited knowledge about the scientific method and there is potential for the media to misinterpret, exploit, or sensationalize findings (Garber, 1992; Namaste, 2000).

Guideline 16. Psychologists Seek to Prepare Trainees in Psychology to Work Competently With TGNC People.

Rationale. The *Ethical Principles of Psychologists and Code of Conduct* (APA, 2010) include gender identity as one factor for which psychologists may need to obtain training, experience, consultation, or supervision in order to ensure their competence (APA, 2010). In addition, when APA-accredited programs are required to demonstrate a commitment to cultural and individual diversity, gender identity is specifically included (APA, 2015). Yet surveys of TGNC people suggest that many mental health care providers lack even basic knowledge and skills required to offer trans-affirmative care (Bradford et al., 2007; O'Hara, Dispenza, Brack, & Blood, 2013; Xavier et al., 2005). The APA Task Force on Gender Identity and Gender Variance (2009) projected that many, if not most, psychologists and graduate psychology students will at some point encounter TGNC people among their clients, colleagues, and trainees. Yet professional education and training in psychology includes little or no preparation for

working with TGNC people (Anton, 2009; APA TFGIGV, 2009), and continuing professional education available to practicing mental health clinicians is also scant (Lurie, 2005). Only 52% percent of psychologists and graduate students who responded to a survey conducted by an APA Task Force reported having had the opportunity to learn about TGNC issues in school; of those respondents, only 27% reported feeling adequately familiar with gender concerns (n = 294; APA TFGIGV, 2009).

Training on gender identity in professional psychology has frequently been subsumed under discussions of sexual orientation or in classes on human sexuality. Some scholars have suggested that psychologists and students may mistakenly believe that they have obtained adequate knowledge and awareness about TGNC people through training focused on LGB populations (Harper & Schneider, 2003). However, Israel and colleagues have found important differences between the therapeutic needs of TGNC people and those of LGB people in the perceptions of both clients and providers (Israel et al., 2008; Israel, Walther, Gorcheva, & Perry, 2011). Nadal and colleagues have suggested that the absence of distinct, accurate information about TGNC populations in psychology training not only perpetuates misunderstanding and marginalization of TGNC people by psychologists but also contributes to continued marginalization of TGNC people in society as a whole (Nadal et al., 2010, 2012).

Application. Psychologists strive to continue their education on issues of gender identity and gender expression with TGNC people as a foundational component of affirmative psychological practice. In addition to these guidelines, which educators may use as a resource in developing curricula and training experiences, ACA (2010) has also adopted a set of competencies that may be a helpful resource for educators. In addition to including TGNC people and their issues in foundational education in health service psychology (e.g., personality development, multiculturalism, research methods), some psychology programs may also provide coursework and training for students interested in developing more advanced expertise on issues of gender identity and gender expression.

Because of the high level of societal ignorance and stigma associated with TGNC people, ensuring that psychological education, training, and supervision is affirmative, and does not sensationalize (Namaste, 2000), exploit, or pathologize TGNC people (Lev, 2004), will require care on the part of educators. Students will benefit from support from their educators in developing a professional, nonjudgmental attitude toward people who may have a different experience of gender identity and gender expression from their own. A number of training resources have been published that may be helpful to psychologists in integrating information about TGNC people into the training they offer (e.g., Catalano, McCarthy, & Shlasko, 2007; Stryker, 2008; Wentling, Schilt, Windsor, & Lucal, 2008). Because most psychologists have had little or no training on TGNC populations and do not perceive themselves as having sufficient understanding of issues related to gender identity and gender expression (APA TFGIGV, 2009), psychologists with relevant expertise are encouraged to develop and distribute continuing education and training to help to address these gaps. Psychologists providing education can incorporate activities that increase awareness of cisgender privilege, antitrans prejudice and discrimination, host a panel of TGNC people to offer personal perspectives, or include narratives of TGNC people in course readings (ACA, 2010). When engaging these approaches, it is important to include a wide variety of TGNC experiences to reflect the inherent diversity within the TGNC community.

Appendix A
Definitions

Terminology within the health care field and transgender and gender nonconforming (TGNC) communities is constantly evolving (Coleman et al., 2012). The evolution of terminology has been especially rapid in the last decade, as the profession's awareness of gender diversity has increased, as more literature and research in this area has been published, and as voices of the TGNC community have strengthened. Some terms or definitions are not universally accepted, and there is some disagreement among professionals and communities as to the "correct" words or definitions, depending on theoretical orientation, geographic region, generation, or culture, with some terms seen as affirming and others as outdated or demeaning. American Psychological Association (APA) Task Force for *Guidelines for Psychological Practice with Transgender and Gender Nonconforming People* developed the definitions below by reviewing existing definitions put forward by professional organizations (e.g., APA Task Force on Gender Identity and Gender Variance, 2009; the Institute of Medicine, 2011; and the World Professional Association for Transgender Health [Coleman et al., 2012]), health care agencies serving TGNC clients (e.g., Fenway Health Center), TGNC community resources (Gender Equity Resource Center, National Center for Transgender Equality), and professional literature. Psychologists are encouraged to refresh their knowledge and familiarity with evolving terminology on a regular basis as changes emerge in the community and/or the professional literature. The definitions below include terms frequently used within the *Guidelines*, by the TGNC community, and within professional literature.

Ally: a cisgender person who supports and advocates for TGNC people and/or communities.

(*Appendices continue*)

Antitrans prejudice (transprejudice, transnegativity, transphobia): prejudicial attitudes that may result in the devaluing, dislike, and hatred of people whose gender identity and/or gender expression do not conform to their sex assigned at birth. Antitrans prejudice may lead to discriminatory behaviors in such areas as employment and public accommodations, and may lead to harassment and violence. When TGNC people hold these negative attitudes about themselves and their gender identity, it is called *internalized transphobia* (a construct analogous to internalized homophobia). Transmisogyny describes a simultaneous experience of sexism and antitrans prejudice with particularly adverse effects on trans women.

Cisgender: an adjective used to describe a person whose gender identity and gender expression align with sex assigned at birth; a person who is not TGNC.

Cisgenderism: a systemic bias based on the ideology that gender expression and gender identities are determined by sex assigned at birth rather than self-identified gender identity. Cisgenderism may lead to prejudicial attitudes and discriminatory behaviors toward TGNC people or to forms of behavior or gender expression that lie outside of the traditional gender binary.

Coming out: a process by which individuals affirm and actualize a stigmatized identity. Coming out as TGNC can include disclosing a gender identity or gender history that does not align with sex assigned at birth or current gender expression. Coming out is an individual process and is partially influenced by one's age and other generational influences.

Cross dressing: wearing clothing, accessories, and/or make-up, and/or adopting a gender expression not associated with a person's assigned sex at birth according to cultural and environmental standards (Bullough & Bullough, 1993). Cross-dressing is not always reflective of gender identity or sexual orientation. People who cross-dress may or may not identify with the larger TGNC community.

Disorders of sex development (DSD, Intersex): term used to describe a variety of medical conditions associated with atypical development of an individual's physical sex characteristics (Hughes, Houk, Ahmed, & Lee, 2006). These conditions may involve differences of a person's internal and/or external reproductive organs, sex chromosomes, and/or sex-related hormones that may complicate sex assignment at birth. DSD conditions may be considered variations in biological diversity rather than disorders (M. Diamond, 2009); therefore some prefer the terms *intersex*, *intersexuality*, or *differences in sex development* rather than "disorders of sex development" (Coleman et al., 2012).

Drag: the act of adopting a gender expression, often as part of a performance. Drag may be enacted as a political comment on gender, as parody, or as entertainment, and is not necessarily reflective of gender identity.

Female-to-male (FTM): individuals assigned a female sex at birth who have changed, are changing, or wish to change their body and/or gender identity to a more masculine body or gender identity. FTM persons are also often referred to as *transgender men*, *transmen*, or *trans men*.

Gatekeeping: the role of psychologists and other mental health professionals of evaluating a TGNC person's eligibility and readiness for hormone therapy or surgery according to the Standards of Care set forth by the World Professional Association for Transgender Health (Coleman et al., 2012). In the past, this role has been perceived as limiting a TGNC adult's autonomy and contributing to mistrust between psychologists and TGNC clients. Current approaches are sensitive to this history and are more affirming of a TGNC adult's autonomy in making decisions with regard to medical transition (American Counseling Association, 2010; Coleman et al., 2012; Singh & Burnes, 2010).

Gender-affirming surgery (sex reassignment surgery or gender reassignment surgery): surgery to change primary and/or secondary sex characteristics to better align a person's physical appearance with their gender identity. Gender-affirming surgery can be an important part of medically necessary treatment to alleviate gender dysphoria and may include mastectomy, hysterectomy, metoidioplasty, phalloplasty, breast augmentation, orchiectomy, vaginoplasty, facial feminization surgery, and/or other surgical procedures.

Gender binary: the classification of gender into two discrete categories of boy/man and girl/woman.

Gender dysphoria: discomfort or distress related to incongruence between a person's gender identity, sex assigned at birth, gender identity, and/or primary and secondary sex characteristics (Knudson, De Cuypere, & Bockting, 2010). In 2013, the fifth edition of the *Diagnostic and Statistical Manual of Mental Disorders* (*DSM–5*; American Psychiatric Association, 2013) adopted the term *gender dysphoria* as a diagnosis characterized by "a marked incongruence between" a person's gender assigned at birth and gender identity (American Psychiatric Association, 2013, p. 453). Gender dysphoria replaced the diagnosis of gender identity disorder (GID) in the previous version of the *DSM* (American Psychiatric Association, 2000).

Gender expression: the presentation of an individual, including physical appearance, clothing choice and accessories, and behaviors that express aspects of gender identity or role. Gender expression may or may not conform to a person's gender identity.

(*Appendices continue*)

Gender identity: a person's deeply felt, inherent sense of being a boy, a man, or male; a girl, a woman, or female; or an alternative gender (e.g., genderqueer, gender nonconforming, gender neutral) that may or may not correspond to a person's sex assigned at birth or to a person's primary or secondary sex characteristics. Because gender identity is internal, a person's gender identity is not necessarily visible to others. "Affirmed gender identity" refers to a person's gender identity after coming out as TGNC or undergoing a social and/or medical transition process.

Gender marker: an indicator (M, F) of a person's sex or gender found on identification (e.g., driver's license, passport) and other legal documents (e.g., birth certificate, academic transcripts).

Gender nonconforming (GNC): an adjective used as an umbrella term to describe people whose gender expression or gender identity differs from gender norms associated with their assigned birth sex. Subpopulations of the TGNC community can develop specialized language to represent their experience and culture, such as the term "masculine of center" (MOC; Cole & Han, 2011) that is used in communities of color to describe one's GNC identity.

Gender questioning: an adjective to describe people who may be questioning or exploring their gender identity and whose gender identity may not align with their sex assigned at birth.

Genderqueer: a term to describe a person whose gender identity does not align with a binary understanding of gender (i.e., a person who does not identify fully as either a man or a woman). People who identify as genderqueer may redefine gender or decline to define themselves as gendered altogether. For example, people who identify as genderqueer may think of themselves as both man and woman (bigender, pangender, androgyne); neither man nor woman (genderless, gender neutral, neutrois, agender); moving between genders (genderfluid); or embodying a third gender.

Gender role: refers to a pattern of appearance, personality, and behavior that, in a given culture, is associated with being a boy/man/male or being a girl/woman/female. The appearance, personality, and behavior characteristics may or may not conform to what is expected based on a person's sex assigned at birth according to cultural and environmental standards. Gender role may also refer to the *social* role in which one is living (e.g., as a woman, a man, or another gender), with some role characteristics conforming and others not conforming to what is associated with girls/women or boys/men in a given culture and time.

Hormone therapy (gender-affirming hormone therapy, hormone replacement therapy): the use of hormones to masculinize or feminize a person's body to better align that person's physical characteristics with their gender identity. People wishing to feminize their body receive antiandrogens and/or estrogens; people wishing to masculinize their body receive testosterone. Hormone therapy may be an important part of medically necessary treatment to alleviate gender dysphoria.

Male-to-female (MTF): individuals whose assigned sex at birth was male and who have changed, are changing, or wish to change their body and/or gender role to a more feminized body or gender role. MTF persons are also often referred to as *transgender women*, *transwomen*, or *trans women*.

Passing: the ability to blend in with cisgender people without being recognized as transgender based on appearance or gender role and expression; being perceived as cisgender. Passing may or may not be a goal for all TGNC people.

Puberty suppression (puberty blocking, puberty delaying therapy): a treatment that can be used to temporarily suppress the development of secondary sex characteristics that occur during puberty in youth, typically using gonadotropin-releasing hormone (GnRH) analogues. Puberty suppression may be an important part of medically necessary treatment to alleviate gender dysphoria. Puberty suppression can provide adolescents time to determine whether they desire less reversible medical intervention and can serve as a diagnostic tool to determine if further medical intervention is warranted.

Sex (sex assigned at birth): sex is typically assigned at birth (or before during ultrasound) based on the appearance of external genitalia. When the external genitalia are ambiguous, other indicators (e.g., internal genitalia, chromosomal and hormonal sex) are considered to assign a sex, with the aim of assigning a sex that is most likely to be congruent with the child's gender identity (MacLaughlin & Donahoe, 2004). For most people, gender identity is congruent with sex assigned at birth (see *cisgender*); for TGNC individuals, gender identity differs in varying degrees from sex assigned at birth.

Sexual orientation: a component of identity that includes a person's sexual and emotional attraction to another person and the behavior and/or social affiliation that may result from this attraction. A person may be attracted to men, women, both, neither, or to people who are genderqueer, androgynous, or have other gender identities. Individuals may identify as lesbian, gay, heterosexual, bisexual, queer, pansexual, or asexual, among others.

Stealth (going stealth): a phrase used by some TGNC people across the life span (e.g., children, adolescents) who choose to make a transition in a new environment (e.g., school) in their affirmed gender without openly sharing their identity as a TGNC person.

(*Appendices continue*)

TGNC: an abbreviation used to refer to people who are transgender or gender nonconforming.

Trans: common short-hand for the terms transgender, transsexual, and/or gender nonconforming. Although the term "trans" is commonly accepted, not all transsexual or gender nonconforming people identify as trans.

Trans-affirmative: being respectful, aware and supportive of the needs of TGNC people.

Transgender: an adjective that is an umbrella term used to describe the full range of people whose gender identity and/or gender role do not conform to what is typically associated with their sex assigned at birth. Although the term "transgender" is commonly accepted, not all TGNC people self-identify as transgender.

Transgender man, trans man, or transman: a person whose sex assigned at birth was female, but who identifies as a man (see FTM).

Transgender woman, trans woman, or transwoman: a person whose sex assigned at birth was male, but who identifies as a woman (see MTF).

Transition: a process some TGNC people progress through when they shift toward a gender role that differs from the one associated with their sex assigned at birth. The length, scope, and process of transition are unique to each person's life situation. For many people, this involves developing a gender role and expression that is more aligned with their gender identity. A transition typically occurs over a period of time; TGNC people may proceed through a social transition (e.g., changes in gender expression, gender role, name, pronoun, and gender marker) and/or a medical transition (e.g., hormone therapy, surgery, and/or other interventions).

Transsexual: term to describe TGNC people who have changed or are changing their bodies through medical interventions (e.g., hormones, surgery) to better align their bodies with a gender identity that is different than their sex assigned at birth. Not all people who identify as transsexual consider themselves to be TGNC. For example, some transsexual individuals identify as female or male, without identifying as TGNC. Transsexualism is used as a medical diagnosis in the World Health Organization's (2015) International Classification of Diseases version 10.

Two-spirit: term used by some Native American cultures to describe people who identify with both male and female gender roles; this can include both gender identity and sexual orientation. Two-spirit people are often respected and carry unique spiritual roles for their community.

Appendix B
Guidelines for Psychological Practice With Transgender and Gender Nonconforming People

Foundational Knowledge and Awareness

Guideline 1. Psychologists understand that gender is a nonbinary construct that allows for a range of gender identities and that a person's gender identity may not align with sex assigned at birth.

Guideline 2. Psychologists understand that gender identity and sexual orientation are distinct but interrelated constructs.

Guideline 3. Psychologists seek to understand how gender identity intersects with the other cultural identities of TGNC people.

Guideline 4. Psychologists are aware of how their attitudes about and knowledge of gender identity and gender expression may affect the quality of care they provide to TGNC people and their families.

Stigma, Discrimination, and Barriers to Care

Guideline 5. Psychologists recognize how stigma, prejudice, discrimination, and violence affect the health and well-being of TGNC people.

Guideline 6. Psychologists strive to recognize the influence of institutional barriers on the lives of TGNC people and to assist in developing TGNC-affirmative environments.

Guideline 7. Psychologists understand the need to promote social change that reduces the negative effects of stigma on the health and well-being of TGNC people.

(*Appendices continue*)

Life Span Development

Guideline 8. Psychologists working with gender-questioning and TGNC youth understand the different developmental needs of children and adolescents and that not all youth will persist in a TGNC identity into adulthood.

Guideline 9. Psychologists strive to understand both the particular challenges that TGNC elders experience and the resilience they can develop.

Assessment, Therapy, and Intervention

Guideline 10. Psychologists strive to understand how mental health concerns may or may not be related to a TGNC person's gender identity and the psychological effects of minority stress.

Guideline 11. Psychologists recognize that TGNC people are more likely to experience positive life outcomes when they receive social support or trans-affirmative care.

Guideline 12. Psychologists strive to understand the effects that changes in gender identity and gender expression have on the romantic and sexual relationships of TGNC people.

Guideline 13. Psychologists seek to understand how parenting and family formation among TGNC people take a variety of forms.

Guideline 14. Psychologists recognize the potential benefits of an interdisciplinary approach when providing care to TGNC people and strive to work collaboratively with other providers.

Research, Education, and Training

Guideline 15. Psychologists respect the welfare and rights of TGNC participants in research and strive to represent results accurately and avoid misuse or misrepresentation of findings.

Guideline 16. Psychologists Seek to Prepare Trainees in Psychology to Work Competently With TGNC People.

AMERICAN PSYCHOLOGICAL ASSOCIATION

APA RESOLUTION on Gender Identity Change Efforts

FEBRUARY 2021

The foundational professional guideline for working with gender diverse persons acknowledges that, "Psychologists understand that gender is a nonbinary construct that allows for a range of gender identities and that a person's gender identity may not align with sex assigned at birth." (APA, 2015, p. 834). Gender identity refers to "a person's deep felt, inherent sense of being a girl, woman, or female; a boy, a man, or male; a blend of male or female; [or another] gender" (APA, 2015, p. 862). While gender refers to the trait characteristics and behaviors culturally associated with one's sex assigned at birth, in some cases, gender may be distinct from the physical markers of biological sex (e.g., genitals, chromosomes). Gender identity is also distinct from gender expression, which refers to "the presentation of an individual including physical appearance, clothing choice and accessories, and behaviors that express aspects of gender identity" (APA, 2015, p. 861). Cisgender refers to "a person whose gender identity aligns with sex assigned at birth" (e.g., an individual assigned female at birth who identifies as a woman/girl; APA, 2015, p. 861). Transgender is "an umbrella term used to describe the full range of people whose gender identity and/or gender role do not conform to what is typically associated with their sex assigned at birth" (APA, 2015, p. 863). For the purpose of this resolution, we are using a broad definition of transgender to include transgender women/girls, transgender men/boys, nonbinary individuals (i.e., people who may identify as a gender other than a woman/girl or a man/boy), and any individual who articulates a gender identity different from societal expectations based on their sex assigned at birth.

Some transgender and gender nonbinary individuals seek gender-affirming medical care (e.g., hormone therapy, surgery) while others do not. Similarly, some transgender and gender nonbinary individuals seek to change their gender marker and/or their name on legal documents, while others do not. In this resolution, we strive to be inclusive of all gender diversity regardless of a person's pursuance of social, medical, or legal transition.

The fields of psychiatry and psychology have a long history of pathologizing individuals and those who question their gender identity (Barkai, 2017; Benson, 2013; Bouman et al, 2014; Burke, 2011; Drescher, 2010; Nadal et al., 2010; Riggs et al. 2019). This history is informed by, and parallels, the larger Western and United States-based, medical-model, narratives that 1) define gender as binary and conflate it with physical markers, 2) define masculinity, and characteristics historically attributed to men/boys, as superior to femininity and characteristics historically attributed to women/girls, 3) create systems that confer privilege to cisgender people and label cisgender identities and expressions as normative, 4) discriminate against transgender and gender nonbinary individuals (Stryker, 2017).

Gender identity change efforts (GICE) refer to a range of techniques used by mental health professionals and non-professionals with the goal of changing gender identity, gender expression, or associated components of these to be in alignment with gender role behaviors that are stereotypically associated with sex assigned at birth, (Hill et al., 2010; SAMHSA, 2015). In addition to explicit attempts to change individuals' gender according to cisnormative pressures, GICE has also been a component of sexual orientation change efforts (SOCE). As intense focus on cisnormative conformity is a frequent characteristic of SOCE it is possible that authors in the literature describing sexual orientation change efforts misgendered their participants (Hipp et al., 2019). Moreover, "ex-gay" literature and discourse conceptualize gender diversity as a sin, a mental illness, and harmful, perpetuating cisgenderism and transmisogyny (Robinson & Spivey, 2019). Finally, Hipp et al. (2019) identified forms of GICE that are often not discussed in the psychological literature but that appear to disproportionately affect Black transgender and gender nonbinary individuals including violence, "church hurt" (i.e., religious or faith-based trauma), and gatekeeping from gender affirming care. These efforts may be referred to as "conversion therapies", "corrective" treatments, or "normalizing" therapies (Hill et al., 2010). However, to consider these techniques as therapies or treatments is inaccurate and inappropriate because, the incongruence between sex and gender in and of itself is not a mental disorder (World Health Organization, n.d.) so, any behavioral health or GICE technique or treatment that seeks to change an individual's gender identity or expression is not indicated; thus, any behavioral health or GICE effort that attempt to change an individual's gender identity or expression is inappropriate (Hill et al. 2010; SAMHSA, 2015).

With roots in this history, GICE are founded on the notion that any gender identity that is not concordant with sex assigned at birth is disordered, and that a cisgender identity is healthier, preferable, and superior to a transgender or gender nonbinary identity (Ansara & Hegarty, 2011; Hill et al., 2010; Robinson & Spivey, 2019).

GICE cause harm by reinforcing anti-transgender and anti-gender nonbinary stigma and discrimination (Turban et al., 2020); and by creating social pressure on an individual to conform to an

identity and/or presentation that may not be consistent with their sense of self (e.g., Bockting et al., 2013; Egan & Perry, 2001; Meyer, 2003; Nadal et al., 2012; Russell et al., 2012; Toomey et al., 2010; Sandfort et al., 2007). Furthermore, GICE are not supported by empirical evidence as effective practices for changing gender identity and are associated with psychological and social harm (Brinkman et al., 2014; Carr, 1998; Gagné & Tewksbury, 1998; Horn, 2007; Price et al., 2019; Smith & Leaper, 2006). The American Psychological Association (APA), as well as other healthcare organizations, (e.g., American Counseling Association, World Professional Association for Transgender Health) have established empirically-supported practice guidelines that encourage clinicians to use gender-affirming practices when addressing gender identity issues (ACA, 2010; APA, 2015; Coleman et al., 2012). Additionally, a number of national and international professional healthcare organizations have publicly warned against the harmful effects of GICE and SOCE (Sexual Orientation Change Efforts) by endorsing the United States Joint Statement Against Conversion Efforts (USJS, n.d.), including the American Academy of Family Physicians, American Academy of Nursing, American Association of Sexual Educators, Counselors and Therapists, American Counseling Association, American Medical Association, American Medical Student Association, American Psychoanalytic Association, The Association of LGBTQ Psychiatrists, Society for Affectional, Intersex, and Gender Expansive Identities, Clinical Social Work Association, GLMA: Health Professionals Advancing LGBTQ Equality, The Association of Lesbian, Gay, Bisexual, Transgender Addiction Professionals and their Allies, and the World Professional Association for Transgender Health. A growing number of states and municipalities have enacted laws that prohibit licensed mental health professionals from engaging in sexual orientation and gender identity change efforts with minors (Movement Advancement Project, n.d.)

GENDER DIVERSITY, STIGMA, AND DISCRIMINATION

WHEREAS diversity in gender identity and expression is part of the human experience and transgender and gender nonbinary identities and expressions are healthy, incongruence between one's sex and gender is neither pathological nor a mental health disorder (APA, 2009, 2015; SAMHSA, 2015);

WHEREAS gender diverse individuals experience cissexist discrimination and prejudice throughout the lifespan and life domains (APA, 2009) including significant discrimination in healthcare settings (Burnes et al., 2016; Fredriksen-Goldsen et al., 2014; Grant et al., 2011; James et al., 2016; Johns et al, 2019; Lambda Legal, 2010; Macapagal et al., 2016; Reisner et al., 2015; White Hughto et al., 2015);

WHEREAS the practice of GICE reinforces stigma and discrimination against transgender and gender diverse people (Turban et al., 2020);

WHEREAS gender-related bias, victimization, discrimination, criminalization, and forced-gender conformity experienced by transgender and gender nonbinary people are associated with poor psychosocial outcomes, such as heightened psychological distress, compromised overall wellbeing, and disparities across various contexts (e.g., healthcare, schools/education, workplace, law) (Bockting et al., 2013; dickey et al., 2016; Egan & Perry, 2001; Meyer, 2003; Nadal et al., 2012; Russell et al., 2012; Hendricks & Testa, 2012; Toomey et al., 2010; Sandfort et al., 2007);

WHEREAS invalidation and rejection of transgender and gender nonbinary identities and diverse gender expressions by others (e.g., families, therapists, school personnel) are forms of discrimination, stigma, and victimization, which result in psychological distress (Bockting et al., 2013; D'Augelli et al., 2006; Egan & Perry, 2001; Hendricks & Testa, 2012; Hidalgo et al., 2015; Landolt et al., 2004; Meyer, 2003; Nadal et al., 2012; Price, et al., 2019; Roberts et al., 2012; Sandfort et al., 2007; Stotzer, 2012; Russell et al., 2012; Toomey et al., 2010; Truong et al., 2020a, 2020b; Zongrone et al., 2020);

GICE AND RISKS OF HARM

WHEREAS individuals who have experienced pressure or coercion to conform to their sex assigned at birth or therapy that was biased toward conformity to one's assigned sex at birth have reported harm resulting from these experience such as emotional distress, loss of relationships, and low self-worth (Brinkman et al., 2014; Carr, 1998; Gagné & Tewksbury, 1998; Horn, 2007; Price et al., 2019; Smith & Leaper, 2006);

WHEREAS in one study of a large online sample of LGBTQ young people, those who reported experiencing change efforts were more than twice as likely to report having attempted suicide and having multiple suicide attempts as those who did not experience change efforts, (Green et al., 2020);

WHEREAS GICE have not been shown to alleviate or resolve gender dysphoria (Bradley & Zucker, 1997; Cohen-Kettenis & Kuiper, 1984; Gelder & Marks, 1969; Greenson, 1964; Pauly, 1965, SAMHSA, 2015);

WHEREAS GICE can cause undue stress and suffering and interfere with healthy sexual and gender identity development (Hiestand & Levitt, 2005; SAMHSA, 2015);

WHEREAS GICE can reduce one's willingness to pursue future mental health treatment (Craig et al., 2017);

WHEREAS GICE often involves the promotion of stereotyped gender behaviors consistent with cultural expectations (Coleman et al., 2012; Hill et al., 2010);

WHEREAS GICE are associated with harmful social and emotional effects for many individuals, including but not limited to, the onset or increase of depression, anxiety, suicidality, loss of sexual feeling, impotence, deteriorated family relationships, a range of post-traumatic responses, and substance abuse (c.f. Burnes et al., 2016; Green et al., 2020; SAMHSA 2015 for a review; Turban et al., 2019);

WHEREAS diverse gender expressions and transgender and gender nonbinary identities are not mental disorders (American Psychiatric Association, 2013) and many transgender and gender nonbinary individuals lead satisfying lives and have healthy relationships (APA, 2015; SAMHSA, 2015);

GENDER AFFIRMING PRACTICES

WHEREAS transgender and gender nonbinary people whose gender has been affirmed report increased quality of life (Ainsworth & Spiegel, 2010; APA, 2015; Gerhardstein & Anderson, 2010; Kraemer et al., 2008; Newfield et al., 2006);

WHEREAS self-determination in defining one's gender identity is a source of resilience for transgender and gender nonbinary people and associated with improvements in wellbeing and reductions in psychological distress (Menvielle & Tuerk, 2002; Pickstone-Taylor, 2003; Rosenburg, 2002; Singh et al., 2011; Singh et al., 2014);

WHEREAS individuals who have experienced gender-affirming psychological and medical practices report improved psychological functioning, quality of life, treatment retention and engagement, and reductions in psychological distress, gender dysphoria, and maladaptive coping mechanisms (Austin & Craig, 2015; de Vries et al., 2014; Haas et al., 2011; Sevelius, 2013; White Hughto & Reisner, 2016);

WHEREAS professional consensus recommends affirming therapeutic interventions for transgender and gender nonbinary adults who request that a therapist engage in GICE, and for trans youth whose parents/guardians or other custodians (e.g., state, foster care) request that a therapist engage in GICE (American Counseling Association, 2009; APA, 2012; 2015; American Psychiatric Association, 2018; Byne et al., 2012; Edwards-Leeper et al., 2016);

WHEREAS affirming therapeutic practices and guidelines recommend that the therapist should remain objective and nonjudgmental to the outcome, focusing on empowering the client to be active in exploring, discovering, and understanding their own identity (American Counseling Association, 2009; APA, 2012; 2015; American Psychiatric Association, 2018; Byne et al., 2012; Edwards-Leeper et al., 2016);

APA POLICY

WHEREAS APA opposes discrimination on the basis of gender identity, gender expression, and transgender and gender nonbinary identities, and actively opposes the adoption of discriminatory legislation (APA, 2008);

WHEREAS APA supports the passage of laws and policies protecting the legal rights and freedoms of transgender and gender nonbinary people, regardless of gender identity or expression (APA, 2008);

WHEREAS Psychologists' work is based upon established scientific and professional knowledge of the discipline. (APA, 2017b, p. 5);

WHEREAS APA recognizes that psychologists work is based upon Respect for People's Rights and Dignity (Principle E), Avoiding Harm (3.04), and Unfair Discrimination (3.01; APA, 2017b);

WHEREAS gender affirming psychotherapy is founded in clinical practice guidelines, and harm has not been identified for any of these gender-affirming treatment practices (APA, 2015, 2017b; Byne et al., 2012);

WHEREAS the APA policy and practice guidelines (e.g., Multicultural Guidelines: An Ecological Approach to Context, Identity, and Intersectionality; Guidelines for Psychological Practice with Transgender and Gender Nonconforming People) affirm that psychologists do not engage in discriminatory or biased practices and urge psychologists to take a leadership role in preventing discrimination towards transgender and gender diverse people (APA, 2009, 2015, 2017a);

WHEREAS APA's 2005 Policy Statement on Evidence-Based Practice in Psychology defines evidence-based practice as the integration of the best available research with clinical expertise in the context of patient characteristics, culture, and preferences (APA, 2005);

BE IT THEREFORE RESOLVED that consistent with the APA definition of evidence-based practice (APA, 2005), the APA affirms that scientific evidence and clinical experience indicate that GICE put individuals at significant risk of harm;

BE IT FURTHER RESOLVED that the APA opposes GICE because such efforts put individuals at significant risk of harm and encourages individuals, families, health professionals, and organizations to avoid GICE;

BE IT FURTHER RESOLVED that APA opposes the idea that incongruence between sex and gender is a mental disorder (Hill et al., 2010; SAMHSA, 2015; WHO).

BE IT FURTHER RESOLVED that after reviewing scientific evidence on GICE harm, affirmative treatments, and professional practice guidelines, the APA affirms GICE are associated with reported harm.

BE IT FURTHER RESOLVED that the APA opposes GICE because of their association with harm.

BE IT FURTHER RESOLVED that Transgender and gender nonbinary identities, as well as other gender identities that transcend culturally prescriptive binary notions of gender, represent normal variations in human expression of gender.

BE IT FURTHER RESOLVEDthat neither transgender or gender nonbinary identities nor the pursuit of gender-affirming medical care constitutes evidence of a mental disorder.

BE IT FURTHER RESOLVED that APA opposes portrayals of transgender and gender nonbinary people as mentally ill because of their gender identities and expressions.

BE IT FURTHER RESOLVED that evidence supports psychologists in their professional roles to use affirming and culturally relevant approaches with individuals of diverse gender expressions and identities.

BE IT FURTHER RESOLVED that APA is committed to promoting accurate scientific data regarding gender identity and expression in its own policy, public advocacy, judicial proceedings, media, and public opinion;

BE IT FURTHER RESOLVED that APA encourages collaboration between and among individuals and organizations to promote the wellbeing of transgender and gender nonbinary people;

BE IT FURTHER RESOLVED that the APA encourages psychologists to be aware of multiple and intersecting factors in identity, such as sex assigned at birth, gender expression, gender identity, age, race, ethnicity, religion, spirituality, socioeconomic status, disability, national origin, and sexual orientation in conceptualization, treatment, research, and teaching about transgender and gender nonbinary people;

BE IT FURTHER RESOLVED that the APA opposes the dissemination of inaccurate information about gender identity, gender expression, and the efficacy of GICE, including the claim that gender identity can be changed through treatment, the characterization of transgender or gender nonbinary identity as a mental disorder and the promotion of treatments that prescribe gender identity or expression consistent with one's birth-assigned sex as effective for clients with gender dysphoria;

BE IT FURTHER RESOLVED that APA encourages the development and dissemination of evidence-based, multiculturally-informed, and gender affirmative educational resources that inform psychologists, the community and education and mental health institutions about the harms of GICE;

BE IT FURTHER RESOLVED that APA re-affirms that APA (2015) encourages psychologists to:

- Acknowledge the diversity and complexity of identities and experiences and recognize transgender and gender nonbinary identities as healthy expressions of gender
- Recognize that descriptions of any gender identity or expression as unnatural, abhorrent, or unhealthy perpetuate stigma for sexual and gender minorities, and have negative mental health and social consequences
- Assist clients in a developmentally appropriate manner to explore and understand the cultural and familial influence on gender roles and expression. Psychologists are urged to help clients in a developmentally appropriate manner understand the societal contexts of sexism, heterosexism, transphobia, racism and other forms of social oppression, and to use a developmental multicultural- and gender-affirmative framework in research, teaching, training, and supervision;

BE IT FURTHER RESOLVED that the American Psychological Association opposes GICE because there is evidence of former participants reporting harm resulting from their experiences of GICE and the contribution that such efforts make to social stigma, injustice, and prejudice directed at gender diverse individuals, consistent with other major professional mental health associations, including the American Psychiatric Association (2018); American Counseling Association (2017), SAMHSA (2015), American Academy of Child & Adolescent Psychiatry (2018), World Health Organization (n.d.) and World Psychiatric Association (2016);

BE IT FURTHER RESOLVED that the APA, because of evidence of harm and lack of evidence of efficacy, supports public policies and legislation that prohibit, or aim to reduce GICE, cissexism, and anti-transgender and anti-gender nonbinary bias and that increase support for gender diversity;

BE IT FURTHER RESOLVED that the APA supports collaboration and partnerships with global, national and state and local partners to achieve the aims of this resolution;

BE IT FURTHER RESOLVED that the APA promotes professional training in gender-affirming practices and opposes professional training in GICE in any stage of the education of psychologists, including graduate training, continuing education, and professional development.

APA Official Actions

Position Statement on Treatment of Transgender (Trans) and Gender Diverse Youth

Approved by the Board of Trustees, July 2020
Approved by the Assembly, April 2020

"Policy documents are approved by the APA Assembly and Board of Trustees. . . These are . . . position statements that define APA official policy on specific subjects. . ." – *APA Operations Manual*

Issue:

Transgender and gender non-conforming youth often experience an intensification of emotional distress when the physical changes of puberty occur in opposition to the adolescent's gender identity and sense of self. The onset of menses, for example, is unwanted and psychologically devastating for an adolescent transman (assigned female at birth). Worsening dysphoria may manifest as depression, anxiety, poor relationships with family and peers, self-harm and suicide. Racism, misogyny, economic disadvantage and neurodiversity can compound the risk of negative outcomes. Due to the dynamic nature of puberty development, lack of gender-affirming interventions (i.e. social, psychological, and medical) is not a neutral decision; youth often experience worsening dysphoria and negative impact on mental health as the incongruent and unwanted puberty progresses. Trans-affirming treatment, such as the use of puberty suppression, is associated with the relief of emotional distress, and notable gains in psychosocial and emotional development, in trans and gender diverse youth.

Gender-affirming treatment of trans and gender diverse youth who experience gender dysphoria due to the physical changes of puberty, may include suppression of puberty development with GnRH (gonadotropin releasing hormone) agonists, commonly referred to as "puberty blockers." Use of GnRH agonists, despite potential side effects (e.g., hot flashes, depression) can allow the adolescent a period of time, often several years, in which to further explore their gender identity and benefit from additional cognitive and emotional development. During this time, the youth and family can receive mental health and social support services, if needed, to navigate the gender affirmation process including the consideration of whether gender affirming hormone therapy is an appropriate next step. If during this discernment period further adolescent development leads to increased comfort with the birth-assigned gender, the GnRH agonist can be discontinued, and puberty allowed to resume. If the developmental trajectory affirms the trans identity, treatment with estrogen or testosterone can be instituted to facilitate development of affirmed secondary sex characteristics, if desired. Gender-affirming surgeries may follow in later adolescence or young adulthood. However, affirmation of gender identity is a highly individualized process. For gender diverse youth and their families, decisions to which gender-affirming medical, surgical, social, and/or legal procedures to pursue are best managed via an informed consent approach.

APA Position:

The American Psychiatric Association:

Pl. Trial Ex. 047

1. **Supports access to affirming and supportive treatment for trans and gender diverse youth and their families, including appropriate mental health services, and when indicated puberty suppression and medical transition support.**
2. **Opposes all legislative and other governmental attempts to limit access to these services for trans and gender diverse youth, or to sanction or criminalize the actions of physicians and other clinicians who provide them.**

TAB 176-8

APA Official Actions

Position Statement on Access to Care for Transgender and Gender Diverse Individuals

Approved by the Board of Trustees, July 2018
Approved by the Assembly, May 2018

"Policy documents are approved by the APA Assembly and Board of Trustees. . . . These are . . . position statements that define APA official policy on specific subjects. . ." – *APA Operations Manual*

Issue:
Significant and long-standing medical and psychiatric literature exists that demonstrates clear benefits of medical and surgical interventions to assist gender diverse individuals seeking transition. However, private and public insurers often do not offer, or may specifically exclude, coverage for medically necessary treatments for gender transition. Access to medical care (both medical and surgical) positively impacts the mental health of transgender and gender diverse individuals.

The APA's vision statement includes the phrase: "Its vision is a society that has available, accessible, quality psychiatric diagnosis and treatment," yet currently, transgender and gender diverse individuals frequently lack available and accessible gender-affirming treatment. In addition, APA's values include the following points:

- best standards of clinical practice
- patient-focused treatment decisions
- scientifically-established principles of treatment
- advocacy for patients

Transgender and gender diverse individuals currently lack access to the best standards of clinical practice, do not have the opportunity to pursue patient-focused gender-affirming treatment decisions, and do not receive scientifically-established treatment. They could benefit significantly from APA's advocacy.

Position:

Therefore, the American Psychiatric Association:

1. **Recognizes that appropriately evaluated transgender and gender diverse individuals can benefit greatly from medical and surgical gender-affirming treatments.**
2. **Advocates for removal of barriers to care and supports both public and private health insurance coverage for gender transition treatment.**
3. **Opposes categorical exclusions of coverage for such medically necessary treatment when prescribed by a physician.**
4. **Supports evidence-based coverage of all gender-affirming procedures which would help the**

TRANSGENDER HEALTH POSITION STATEMENT

INTRODUCTION

Over the last few decades, there has been a rapid expansion in the understanding of gender identity along with the implications for the care of transgender and gender diverse individuals. In parallel with the greater societal awareness of transgender individuals, evidence-based practices in caring for pediatric and adult transgender patients have been developed in response to scientific research. While there continue to be gaps in knowledge about the optimal care for transgender individuals, the framework for providing care is increasingly well-established as is the recognition of needed policy changes.

BACKGROUND

The medical consensus in the late 20th century was that transgender and gender incongruent individuals suffered a mental health disorder termed "gender identity disorder." Gender identity was considered malleable and subject to external influences. Today, however, this attitude is no longer considered valid. Considerable scientific evidence has emerged demonstrating a durable biological element underlying gender identity.[1,2] Individuals may make choices due to other factors in their lives, but there do not seem to be external forces that genuinely cause individuals to change gender identity.

Although the specific mechanisms guiding the biological underpinnings of gender identity are not entirely understood, there is evolving consensus that being transgender is not a mental health disorder. Such evidence stems from scientific studies suggesting that: 1) attempts to change gender identity in intersex patients to match external genitalia or chromosomes are typically unsuccessful[1,2]; 2) identical twins (who share the exact same genetic background) are more likely to both experience transgender identity as compared to fraternal (non-identical) twins[3]; 3) among individuals with female chromosomes (XX), rates of male gender identity are higher for those exposed to higher levels of androgens *in utero* relative to those without such exposure, and male (XY)-chromosome individuals with complete androgen insensitivity syndrome typically have female gender identity[4]; and 4) there are associations of certain brain scan or staining patterns with gender identity rather than external genitalia or chromosomes.[1,2]

CONSIDERATIONS

Transgender individuals are often denied insurance coverage for appropriate medical and psychological treatment. Those gender diverse youth who have barriers to accessing adequate healthcare have poorer overall physical and mental health compared to their cisgender peers.[5] Over the last decade, there has been considerable research on and development of evidence-based standards of care that have proven to be both safe and efficacious for the treatment of gender dysphoria/gender incongruence in youth and adults. There is also a growing understanding of the positive impact that increased access to such treatments can have on the mental health of these individuals.

The Endocrine Society's Clinical Practice Guideline on gender dysphoria/gender incongruence[6] provides the standard of care for supporting transgender individuals. The guideline establishes a methodical, conservative framework for gender-affirming care, including pubertal suppression, hormones and surgery and standardizes terminology to be used by healthcare professionals. These recommendations include evidence that treatment of gender dysphoria/incongruence is medically necessary and should be covered by insurance.

Despite increased awareness, many barriers to improving the health and well-being of transgender youth and adults remain. Oftentimes, medical treatment for gender dysphoria/gender incongruence is considered elective by insurance companies, which fail to provide coverage for physician-prescribed treatment. Access to appropriately trained healthcare professionals can also be challenging as there

is a lack of formal education on gender dysphoria/gender incongruence among clinicians trained in the United States. A 2016 survey of endocrinologists, the physicians most likely to care for these patients, found that over 80% have never received training on care of transgender patients.[7]

This can have an adverse impact on patient outcomes, particularly in rural and underserved areas. In fact, studies have indicated that 70% of transgender individuals have experienced maltreatment by medical providers, including harassment and violence.[7] Many transgender individuals have been subjected to conversion therapy, or efforts to change a transgender person's gender identity using psychological interventions; this is known to be associated with adverse mental health outcomes, including suicidality, and is banned in 20 states and the District of Columbia.[8]

Transgender individuals who have been denied care show an increased likelihood of dying by suicide and engaging in self-harm.[7] Transgender/gender incongruent youth who had access to pubertal suppression, a treatment which is fully reversible and prevents development of secondary sex characteristics not in alignment with their gender identity, have lower lifetime odds of suicidal ideation compared to those youth who desired pubertal suppression but did not have access to such treatment.[9] Youth who are able to access gender-affirming care, including pubertal suppression, hormones and surgery based on conservative medical guidelines and consultation from medical and mental health experts, experience significantly improved mental health outcomes over time, similar to their cis-gender peers.[10-12] Pre-pubertal youth who are supported and affirmed in their social transitions long before medical interventions are indicated, experience no elevation in depression compared to their cis-gender peers.[12] It is critical that transgender individuals have access to the appropriate treatment and care to ensure their health and well-being.

FUTURE CONSIDERATIONS

While the data are strong for both a biological underpinning to gender identity and the relative safety of hormone treatment (when appropriately monitored medically), there are gaps in knowledge that are necessary to address in order to optimize care. Comparative effectiveness research in hormone regimens is needed to determine: the best endocrine and surgical protocols[13], as it is not yet known if certain regimens are safer or more effective than others; the degree of improvement as a result of the intervention (e.g. decrease in mental health diagnoses); the need for training of health care providers and the most effective training methods; and to build the body of evidence pertaining to cardiovascular, malignancy, or other long-term risks from hormone interventions, particularly as the transgender individual ages. Additional studies are needed to elucidate the biological processes underlying gender identity; such studies may lead to destigmatization and may also decrease health disparities for gender minorities. In addition, further studies are needed to determine strategies for fertility preservation and to investigate long-term outcomes of early medical intervention, including pubertal suppression, gender-affirming hormones and gender-affirming surgeries for transgender/gender incongruent youth. To successfully establish and enact these protocols requires long-term, large-scale studies across countries that employ similar care protocols.

POSITIONS

- There is a durable biological underpinning to gender identity that should be considered in policy determinations.
- Medical intervention for transgender youth and adults (including puberty suppression, hormone therapy and medically indicated surgery) is effective, relatively safe (when appropriately monitored), and has been established as the standard of care.[6] Federal and private insurers should cover such interventions as prescribed by a physician as well as the appropriate medical screenings that are recommended for all body tissues that a person may have.
- Increased funding for national pediatric and adult transgender health research programs is needed to close the gaps in knowledge regarding transgender medical care and should be made a priority.

I. INTRODUCTION

The Medicaid program's benefit for children and adolescents is known as Early and Periodic Screening, Diagnostic and Treatment services, or EPSDT. EPSDT provides a comprehensive array of prevention, diagnostic, and treatment services for low-income infants, children and adolescents under age 21, as specified in Section 1905(r) of the Social Security Act (the Act). The EPSDT benefit is more robust than the Medicaid benefit for adults and is designed to assure that children receive early detection and care, so that health problems are averted or diagnosed and treated as early as possible. The goal of EPSDT is to assure that individual children get the health care they need when they need it – the right care to the right child at the right time in the right setting.

EPSDT's goal is to assure that individual children get the health care they need when they need it – the right care to the right child at the right time in the right setting.

States share responsibility for implementing the benefit, along with the Centers for Medicare & Medicaid Services (CMS). States have an affirmative obligation to make sure that Medicaid-eligible children and their families are aware of EPSDT and have access to required screenings and necessary treatment services.[1] States also have broad flexibility to determine how to best ensure such services are provided. In general, they either administer the benefit outright (through fee for service arrangements) or provide oversight to private entities with whom they have contracted to administer the benefit (e.g., managed care entities). States must arrange (directly or through delegations or contracts) for children to receive the physical, mental, vision, hearing, and dental services they need to treat health problems and conditions. Through the EPSDT benefit, children's health problems should be addressed before they become advanced and treatment is more difficult and costly.

[1] CMS, State Medicaid Manual §§ 5010, 5121, 5310 (requiring states to "[a]ssure that health problems found are diagnosed and treated early, before they become more complex and their treatment more costly,. . . that informing methods are effective, . . . [and] that services covered under Medicaid are available.")

EPSDT entitles enrolled infants, children and adolescents to any treatment or procedure that fits within any of the categories of Medicaid-covered services listed in Section 1905(a) of the Act if that treatment or service is necessary to "correct or ameliorate" defects and physical and mental illnesses or conditions.[2] This includes physician, nurse practitioner and hospital services; physical, speech/language, and occupational therapies; home health services, including medical equipment, supplies, and appliances; treatment for mental health and substance use disorders; treatment for vision, hearing and dental diseases and disorders, and much more. This broad coverage requirement results in a comprehensive, high-quality health benefit for children under age 21 enrolled in Medicaid.

Children's health problems should be addressed before they become advanced and treatment is more difficult and costly.

States report annually to CMS certain data about their delivery of services under the EPSDT benefit.[3] The reporting is made on the CMS Form 416. CMS and states use this data to monitor EPSDT performance.

This guide is intended to help states, health care providers and others to understand the scope of services that are covered under EPSDT so that they may realize EPSDT's goals and provide the best possible child and adolescent health benefit through their Medicaid programs. While it does not establish new EPSDT policy, this guide serves the important purpose of compiling into a single document various EPSDT policy guidances that CMS has issued over the years.

This guide outlines:

- ✓ EPSDT's screening requirements, including when interperiodic screening should be provided;
- ✓ Scope of services covered under EPSDT;
- ✓ EPSDT's requirements governing dental, vision, and hearing services;
- ✓ Permissible limitations on service coverage under EPSDT;

[2] Section 1905(r)(5) of the Social Security Act.
[3] Sections 1902(a)(43)(D) and 2108(e) of the Social Security Act; CMS, State Medicaid Manual § 2700.4.

- ✓ States' responsibilities to assure access to EPSDT services and providers;
- ✓ Assistance to states as they work with managed care plans to provide the best child health benefit possible; and
- ✓ Notice and appeal procedures required when services are denied, reduced or terminated.

II. PERIODIC AND INTERPERIODIC SCREENINGS

EPSDT covers regular screening services (check-ups) for infants, children and adolescents. These screenings are designed to identify health and developmental issues as early as possible. States have the responsibility to ensure that all eligible children (and their families) are informed of both the availability of screening services, and that a formal request for an EPSDT screening service is not required. States must provide or arrange for screening services both at established times and on an as-needed basis. Covered screening services are medical, mental health, vision, hearing and dental. Medical screenings has five components:

- ✓ Comprehensive health and developmental history that assesses for both physical and mental health, as well as for substance use disorders;4
- ✓ Comprehensive, unclothed physical examination;
- ✓ Appropriate immunizations, in accordance with the schedule for pediatric vaccines established by the Advisory Committee on Immunization Practices;
- ✓ Laboratory testing (including blood lead screening appropriate for age and risk factors);5 and
- ✓ Health education and anticipatory guidance for both the child and caregiver.6

Under the Act, states must establish a periodicity schedule for each type of screening service: medical, vision, hearing, and dental. The periodicity schedules set the frequency by which certain services should be provided and will be covered.[7] The schedules are not prescribed by federal law, but should be based on current standards of pediatric medical and dental practice, and states are required to consult with recognized medical and dental organizations involved in child health care to assist in developing their periodicity schedules. One commonly used source is Bright Futures (developed by the American Academy of Pediatrics), which, for example, suggests that developmental screenings be conducted when children are ages 9 months, 18 months, and 30 months. The American Academy of Pediatric Dentistry (AAPD) has published a recommended periodicity schedule for dental services for children and adolescents. States should review their EPSDT periodicity schedules regularly to keep them up to date.

---

[4] CMS issued an Informational Bulletin on March 27, 2013, discussing Prevention and Early Identification of Mental Health and Substance Use Conditions in Children and informing states about resources available to help them meet the needs of children under EPSDT.
[5] CMS issued guidance on June 22, 2012 to align blood lead screening for Medicaid children with recommendations of the Centers for Disease Control and Prevention (CDC). After providing data that demonstrates that universal screening is not the most effective approach to identifying childhood exposure to lead, a state may request to implement a targeted lead screening plan rather than continue universal screening of all Medicaid-eligible children ages 1 and 2.
[6] Section 1905(r)(1)(B) of the Social Security Act.
[7] 42 C.F.R. § 441.58; CMS, State Medicaid Manual §§ 5110, 5140.

States should review their EPSDT periodicity schedules regularly to keep them up to date.

EPSDT also requires coverage of medically necessary "interperiodic" screening outside of the state's periodicity schedule. Coverage for such screenings is required based on an indication of a medical need to diagnose an illness or condition that was not present at the regularly scheduled screening or to determine if there has been a change in a previously diagnosed illness or condition that requires additional services. The determination of whether a screening service outside of the periodicity schedule is necessary may be made by the child's physician or dentist, or by a health, developmental, or educational professional who comes into contact with a child outside of the formal health care system. This includes, for example, personnel working for state early intervention or special education programs, Head Start, and the Special Supplemental Nutrition Program for Women, Infants, and Children. A state may not limit the number of medically necessary screenings a child receives and may not require prior authorization for either periodic or "interperiodic" screenings.

Example of Screenings Beyond Those Required by the Periodicity Schedule
A child receives a regularly scheduled periodic vision screening at age 5 at which no problem is detected. According to the state's periodicity schedule, his next vision screening is due at age 7. At age 6, the school nurse recommends to the child's parent that the child see an optometrist because a teacher suspects a vision problem. Even though the next scheduled vision screening is not due until the age of 7, the child would be entitled to receive a timely "interperiodic" screening to determine if there is a vision problem for which treatment is needed. The screening should not be delayed if there is a concern the child may have a vision problem. Source: NPRM, 58 Fed. Reg. 51288, 51290, 51291 (Oct. 1, 1993)

Screening services provide the crucial link to necessary covered treatment, as EPSDT requires states to "arrang[e] for . . . corrective treatment," either directly or through referral to appropriate providers or licensed practitioners, for any illness or condition detected by a screening.[8] The affirmative obligation to connect children with necessary treatment makes EPSDT different from Medicaid for adults.[9] It is a crucial component of a quality child health benefit.

[8] Section 1902(a)(43)(C) of the Social Security Act.
[9] CMS, State Medicaid Manual § 5124.B.

The affirmative obligation to connect children with necessary treatment makes EPSDT different from Medicaid for adults.

Any qualified provider operating within the scope of his or her practice, as defined by state law, can provide a screening service. The screening *need not be* conducted by a Medicaid provider in order to trigger EPSDT coverage for follow up diagnostic services and medically necessary treatment by a qualified Medicaid provider. A screening service provided before a child enrolls in Medicaid is sufficient to trigger EPSDT coverage, after enrollment, for follow-up diagnostic services and necessary treatment. The family or beneficiary need not formally request an EPSDT screening in order to receive the benefits of EPSDT. Rather, any visit or contact with a qualified medical professional is sufficient to satisfy EPSDT's screening requirement, and states should consider a beneficiary who is receiving services to be participating in EPSDT, whether the beneficiary requested screening services directly from the state or the health care provider.[10]

Any qualified provider operating within the scope of his or her practice, as defined by state law, can provide a screening service.

States establish their own fee schedules for screening services and should be using Health Insurance Portability and Accountability Act (HIPAA) compliant billing codes. States may develop a bundled payment rate to pay for the physical health screening components under one billing code. States may also recognize each component of the EPSDT screening separately. For example, one state pays for the visit itself with one code and pays separately for each individual screening service delivered during the visit. This payment methodology not only encourages providers to perform every component of an EPSDT well-child visit, it also provides the state, through claims, information as to whether the physician actually met the elements of the EPSDT guidelines set out in the periodicity

[10] CMS, State Medicaid Manual § 5310; HCFA, Title XIX State Agency Letter No. 91-33 (April 3, 1991).

schedules. States may encourage providers to perform all five components of the EPSDT screening but may not exclude providers who perform only partial screenings from being reimbursed for the parts they do provide.

Professional guidelines (e.g., Bright Futures) recommend that physicians include an oral health screening as part of the well-child visit at specified ages. In addition, states are permitted to include dental or oral health screening as a separately covered EPSDT service. These screening services, which may be performed by dental professionals or by medical professionals according to state scope of practice rules, can take place in community or group settings as well as in clinics or medical and dental offices. Such screenings can be helpful in identifying children with unmet dental care needs so they can be referred to a dental professional for treatment. Two new procedure codes were added to the Code on Dental Procedures and Nomenclature (CDT) in 2012 to facilitate payment for oral health screenings and assessments: CDT 0190 and CDT 0191.

In 2012, two new procedure codes were added to facilitate payment for oral health screenings and assessments: CDT 0190 and 0191.

Vision and hearing screening services must also be provided. States should consult with ophthalmologists and optometrists to determine what procedures should be used during a vision screening and to establish the criteria for referral for a diagnostic examination. For hearing screenings, appropriate procedures for screening and methods of administering them can be obtained from audiologists or from state health or education departments.[11]

[11] CMS, State Medicaid Manual § 5123.2.F.

III. DIAGNOSTIC SERVICES

EPSDT covers medically necessary diagnostic services. When a screening examination indicates the need for further evaluation of a child's health, the child should be appropriately referred for diagnosis without delay.

A child's diagnosis may be performed by a physician, dentist or other practitioner qualified to evaluate and diagnose health problems at locations, including practitioners' offices, maternal and child health (MCH) facilities, community health centers, rehabilitation centers, and hospital outpatient departments. Diagnosis can generally be made on an outpatient basis. However, inpatient services are covered when necessary to complete a diagnosis.

When a screening examination indicates the need for further evaluation of a child's health, the child should be referred for diagnosis without delay.

IV. THE SCOPE OF EPSDT TREATMENT SERVICES

A. Scope of Services

The Act provides for coverage of all medically necessary services that are included within the categories of mandatory and optional services listed in section 1905(a), regardless of whether such services are covered under the State Plan. These include physician and hospital services, private duty nursing, personal care services, home health and medical equipment and supplies, rehabilitative services, and vision, hearing, and dental services. Covered EPSDT services also include "any other medical care, and any other type of remedial care recognized under State law, specified by the Secretary."[12] The role of states is to make sure the full range of EPSDT services is available as well as to assure that families of enrolled children are aware of and have access to those services so as to meet the individual child's needs. The broad scope of services enables states to design a child health benefit to meet the individual needs of the children served by its Medicaid program—a benefit design that has the potential to result in better care and healthier children at a lower overall cost. As discussed in the next section: while children enrolled in Medicaid are entitled to a broad scope of treatment services, no such service is covered under Medicaid unless medically necessary for that particular child.

The Act provides for coverage of all medically necessary services that are included within the categories of mandatory and optional services listed in section 1905(a), regardless of whether such services are covered under the State Plan.

[12] Section 1905(a)(29) of the Social Security Act.

If a service, supply or equipment that has been determined to be medically necessary for a child is not listed as covered (for adults) in a State Medicaid Plan, the state will nonetheless need to provide it to the child as long as the service or supply could be covered under the State Plan, that is, as long as it is included within the categories of mandatory and optional services listed in section 1905(a). In such circumstances, the state would need to develop a payment methodology for the service, supply or equipment, including the possibility that payment may need to be made using a single-service agreement with an in-state provider or an out-of-state provider who will accept Medicaid payment.

A service need not cure a condition in order to be covered under EPSDT. Services that maintain or improve the child's current health condition are also covered in EPSDT because they "ameliorate" a condition. Maintenance services are defined as services that sustain or support rather than those that cure or improve health problems. Services are covered when they prevent a condition from worsening or prevent development of additional health problems. The common definition of "ameliorate" is to "make more tolerable." Thus, services such as physical and occupational therapy are covered when they have an ameliorative, maintenance purpose. This is particularly important for children with disabilities, because such services can prevent conditions from worsening, reduce pain, and avert the development of more costly illnesses and conditions. Other, less common examples include items of durable medical equipment, such as decubitus cushions, bed rails and augmentative communication devices. Such services are a crucial component of a good, comprehensive child-focused health benefit.

B. Covering a Range of Treatment Services to Meet a Child's Needs

As noted above, EPSDT covers physical and mental health and substance use disorder services, regardless of whether these services are provided under the State Plan and regardless of any restrictions that states may impose on coverage for adult services, as long as those services *could* be covered under the State Plan. This section provides some examples of EPSDT's broad scope of services, focusing on mental health and substance use services, personal care services, oral health and dental services, and vision and hearing services.

a. Mental Health and Substance Use Services

Treatment for mental health and substance use issues and conditions is available under a number of Medicaid service categories, including hospital and clinic services, physician services, and services provided by a licensed professional such as a psychologist. States should also make use of rehabilitative services. While rehabilitative services can meet a range of children's treatment needs, they

can be particularly critical for children with mental health and substance use issues. Rehabilitative services are defined to include:

> *any medical or remedial services (provided in a facility, a home, or other setting) recommended by a physician or other licensed practitioner of the healing arts within the scope of their practice under State law, for the maximum reduction of physical or mental disability and restoration of an individual to the best possible functional level.*[13]

Like other services covered under EPSDT, rehabilitative services need not actually cure a disability or completely restore an individual to a previous functional level. Rather, such services are covered when they ameliorate a physical or mental disability, as discussed above. Moreover, determinations of whether a service is rehabilitative must take into consideration that a child may not have attained the ability to perform certain functions. That is, a child's rehabilitative services plan of care should reflect goals appropriate for the child's developmental stage.

Rehabilitative services are particularly critical for children with mental health and substance use issues.

Depending on the interventions that the individual child needs, services that can be covered as rehabilitative services include:

- ✓ Community-based crisis services, such as mobile crisis teams, and intensive outpatient services;
- ✓ Individualized mental health and substance use treatment services, including in non-traditional settings such as a school, a workplace or at home;
- ✓ Medication management;
- ✓ Counseling and therapy, including to eliminate psychological barriers that would impede development of community living skills; and
- ✓ Rehabilitative equipment, for instance daily living aids.

With respect to the provision of rehabilitative services, including those noted above, CMS requires more specificity of providers and services due to the wide spectrum of rehabilitative services coverable under the broad definition. CMS

[13] Section 1905(a)(13) of the Social Security Act; 42 C.F.R. § 440.130(d).

would expect a state to include in their State Plan the services, and providers with their qualifications, as well as a reimbursement methodology for each service it provides. CMS is available to provide technical assistance to states that are covering a service for children that has not otherwise been identified in their State Plan.

A number of home and community-based services, including those that can be provided through EPSDT, have proven to significantly enhance positive outcomes for children and youth. These include intensive care coordination ("wraparound"), intensive in-home services, and mobile crisis response and stabilization.

CMS has issued detailed guidance encouraging states to include screening, assessments, and treatments focusing on children who have been victims of complex trauma. EPSDT can be a crucial tool in addressing the profound needs of this population, including children who are involved in the child welfare system.

b. Personal Care Services

EPSDT requires coverage of medically necessary personal care services, which:

> *are furnished to an individual who is not an inpatient or resident of a hospital, nursing facility, intermediate care facility . . . or institution for mental disease, that are (A) authorized for the individual by a physician in accordance with a plan of treatment or (at the option of the State), otherwise authorized for the individual in accordance with a service plan approved by the State; (B) provided by an individual who is qualified to provide such services and is not a member of the individual's family; and (C) furnished in a home or . . . in other location.*[14]

Personal care services provide a range of assistance with performing activities of daily living, such as dressing, eating, bathing, transferring, and toileting; and instrumental activities of daily living, such as preparing meals and managing medications.[15] While it is optional for states to provide personal care services for adults in locations other than the home, this is not the case for a child. Under EPSDT, personal care services are to be provided, for example, in a school or group home if necessary to "correct or ameliorate" a condition.

The determination of whether a child needs personal care services must be based upon the child's individual needs and provided in accordance with a plan of treatment or service plan. Under regular State Plan Medicaid, no Medicaid payments are available for personal care services provided by the child's legally

[14] Section 1905(a)(24) of the Social Security Act; 42 C.F.R. § 440.167.
[15] CMS, State Medicaid Manual § 4480.

responsible relatives.[16] In addition, the determination of whether a child needs personal care services must be based upon the child's individual needs and a consideration of family resources that are actually—not hypothetically—available.

c. Oral Health and Dental Services

Dental services required in the EPSDT benefit include:[17]

- ✓ Dental care needed for relief of pain, infection, restoration of teeth, and maintenance of dental health (provided at as early an age as necessary); and
- ✓ Emergency, preventive, and therapeutic services for dental disease that, if left untreated, may become acute dental problems or cause irreversible damage to the teeth or supporting structures.18

In addition, medically necessary oral health and dental services,[19] including those identified during an oral screening or a dental exam, are covered for children. States must provide orthodontic services to EPSDT-eligible children to the extent necessary to prevent disease and promote oral health, and restore oral structures to health and function.[20] Orthodontic services for cosmetic purposes are not covered.

Once a child reaches the age specified by the state in its pediatric dental periodicity schedule, typically age one, a direct dental referral is required.[21] The referral must be for an encounter with a dentist or with another dental professional, such as a dental hygienist, working under the supervision of a dentist.[22] Dental supervision includes the entire range, for example, direct, indirect, general, public health and collaborative practice arrangements.

---

[16] 42 C.F.R. § 440.167.

[17] Information on CMS efforts working with states to improve access to oral health services for children enrolled in Medicaid and CHIP can be found in CMS, *Improving Access to and Utilization of Oral Health Services for Children in Medicaid and CHIP Programs: CMS Oral Health Strategy* (April 11, 2011). Approaches states can use to improve the delivery of dental and oral health services to children in Medicaid and CHIP can be found in *Keep Kids Smiling: Promoting Oral Health Through the Medicaid Benefit for Children and Adolescents* and in *Improving Oral Health Care Delivery in Medicaid and CHIP: A Toolkit for States*. All of these documents are available at http://www.medicaid.gov/Medicaid-CHIP-Program-Information/By-Topics/Benefits/Dental-Care.html.

[18] CMS, State Medicaid Manual § 5124.B.2.b.

[19] CMS, State Medicaid Manual § 2700.4 (Form 416 Instructions, Note for Line 12 Data). Dental services are those performed by or under the supervision of a dentist. Oral health services are those performed by other licensed providers not working under the supervision of a dentist, for example, a physician or nurse, or by a dental professional operating without a supervisory relationship to a dentist (e.g., an independent practice dental hygienist).

[20] CMS, State Medicaid Manual § 5124.B.2.b

[21] 42 C.F.R. § 441.56(b)(vi).

[22] CMS, State Medicaid Manual § 5123.2.G.

Current clinical guidelines recommend that a child have a first dental visit when the first tooth erupts or by age one.

Dental care must be provided at intervals indicated in the pediatric dental periodicity schedule adopted by the state after consultation with a recognized dental organization involved in child health care.[23] Current clinical guidelines recommend that a child have a first dental visit when the first tooth erupts or by age one, whichever occurs first. Dental care that is deemed medically necessary for an individual child is covered even when the frequency is greater than specified in the periodicity schedule.[24] For example, a child determined by a qualified provider to be at moderate or high risk for developing early childhood caries could be covered to receive dental exams and preventive treatments more frequently than the twice-yearly periodicity schedule recommended by the AAPD.

As determined by dental practice acts in individual states, there is a wide range of dental professionals who can work under the supervision of a dentist, for example, dental hygienists, dental therapists, dental health aide therapists, dental hygienists in advanced practice, advanced practice dental therapists, dental assistants, and community dental health coordinators. Some state practice acts permit specified dental professionals to work without dentist supervision in certain circumstances. Such provisions can help ensure access to dental care as well as promote an integrated health care delivery system. As with medical care, any qualified provider operating within the scope of his or her practice, as defined by state law, can provide a dental or oral health service to a Medicaid enrollee. To qualify for federal matching funds, State Plans must list all provider types that will be permitted to bill for dental or oral health services. However, rendering providers (providers who actually serve the patient) need not be separately enumerated in the State Plan.

Better integration of primary medical care with dental care can help identify children at risk for tooth decay at the youngest age possible, offer evidence-based preventive care, such as fluoride varnish and oral health education, and refer children to a dental professional for a complete check-up and any needed treatment. Three oral health risk assessment CDT billing codes can support this

[23] Section 1905(r)(3) of the Social Security Act; CMS, State Medicaid Manual § 5110.
[24] CMS, State Medicaid Manual § 5110.

approach, potentially preventing the need for costly treatment, such as that provided in an operating room.

State Medicaid and CHIP programs can use risk assessment codes to help children access services based on their individual levels of risk, instead of assuming that all children need the same level of intervention. AAPD guidelines encourage providers to customize care plans based on an assessment of each child's individual risk for developing dental disease. Risk assessment resources are available for providers, including an assessment tool from AAPD that includes a caries-risk assessment form, clinical guidelines and treatment protocols.

In addition to dental providers, states may reimburse primary care medical providers for conducting oral health risk assessments, providing oral health education to parents and children, applying preventive measures such as fluoride varnish, and making referrals to dental professionals. The CMCS oral health strategy guide, *Keep Kids Smiling: Promoting Oral Health Through the Medicaid Benefit for Children & Adolescents*, provides additional information on oral health and EPSDT.

d. Vision and Hearing Services

Vision and hearing services are an essential component of the EPSDT benefit. Hearing impairments can lead to other problems, including interference with normal language development in young children. They can also delay a child's social, emotional, and academic development. Vision problems can be evidence of serious, degenerative conditions, and can also lead to delays in learning and social development.

EPSDT requires that vision and hearing services be provided at intervals that meet reasonable standards as determined in consultation with medical experts, and at other intervals, as medically necessary, to determine the existence of a suspected illness or condition. At a minimum, vision services must include diagnosis and treatment for defects in vision, including eyeglasses. Glasses to replace those that are lost, broken, or stolen also must be covered. Hearing services must include, at a minimum, diagnosis and treatment for defects in hearing, including hearing aids.[25]

In addition, if hearing and vision problems are detected through screening, medically necessary services that are coverable under section 1905(a) must be covered. This includes not only physician and clinic services, but services from licensed professionals such as ophthalmologists, and equipment such as augmentative communication devices and cochlear implants.

[25] Sections 1905(r)(2) and (4) of the Social Security Act.

e. *Other Services*

Examples of other services covered for children under Medicaid when medically necessary (and for which a federal match is available) include, but are not limited to, case management services (including targeted case management);[26] incontinence supplies; organ transplants and any related services; a specially adapted car seat that is needed by a child because of a medical problem or condition; and nutritional supplements.

Physicians and other providers use medical terminology, not Medicaid terms or legal terms, when recommending or prescribing medical services and treatments. If a requested service or treatment is not listed by name in Medicaid's list of services, it should nonetheless be provided if the service or item is determined to be medically necessary and coverable under the list of services at section 1905(a). In general, states are encouraged to include in their State Plans a range of provider types and settings likely to be sufficient to meet the needs of enrollees. Nonetheless, there may be cases in which the type of provider that is needed is not already participating in Medicaid. In such an instance, the state could meet the EPSDT requirement by, for example, entering into a single-service agreement with the needed provider.

When providers use medical terminology instead of Medicaid or legal terms to recommend medically necessary services, the recommended services should be covered if coverable under section 1905(a).

C. Enabling Services

a. *Transportation Services*

In order to promote access to needed preventive, diagnostic and treatment services, states must offer appointment scheduling assistance and are required to assure necessary transportation, to and from medical appointments, for children

[26] Section 1905(a)(19) of the Social Security Act; 42 C.F.R. §§ 440.169, 441.18.

enrolled in Medicaid.[27] This includes covering the costs of an ambulance, taxi, bus, or other carrier. It can also include reimbursing for mileage. As with other services covered through EPSDT, states may cover the least expensive means of transportation if it is actually available, accessible, and appropriate. For example, public transportation can be covered instead of a taxi if the public transportation is physically accessible for a particular beneficiary and takes a reasonable amount of time. In addition, "related travel expenses" are covered if medically necessary, including meals and lodging for a child and necessary attendant.[28]

Some states have addressed the transportation requirement by offering non-emergency transportation through brokers who coordinate transportation services, or through administrative managers who act as gatekeepers for transportation services. Transportation may also be included in managed care contracts. If a state chooses not to include transportation services in their managed care contracts, or otherwise to contract out administration of the service, the state must administer the service itself. No matter the type of arrangement, it is important to remember that the state has ultimate responsibility for ensuring the provision of transportation services.

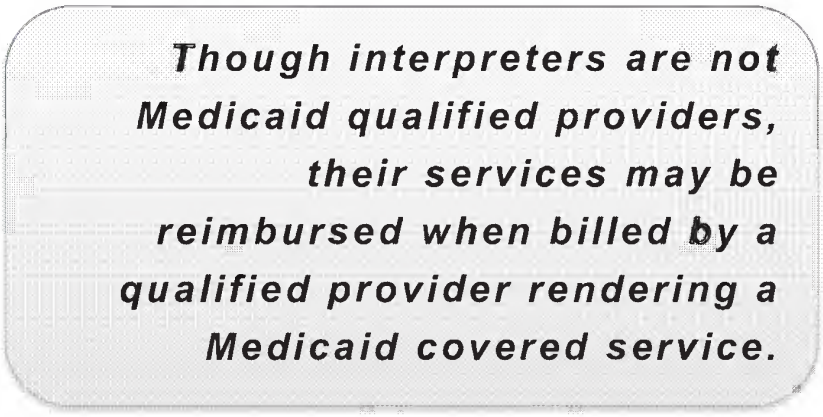
b. Language Access and Culturally Appropriate Services

Many Medicaid-enrolled children live in families where English is not spoken at home. State Medicaid agencies and their contractors should inform eligible individuals about the EPSDT benefit with a combination of written and oral methods "using clear and nontechnical language" and "effectively informing those individuals who . . . cannot read or understand the English language."[29] State Medicaid agencies and Medicaid managed care plans, as recipients of federal funds, also have responsibilities to assure that covered services are delivered to children without a language barrier. They are required take "reasonable steps" to assure that individuals who are limited English proficient have meaningful access to Medicaid services.[30] This may include providing interpreter services, including at medical appointments, depending on factors such as the number of limited English proficient individuals served by the program.[31]

---

[27] Section 1905(a)(29) of the Social Security Act; 42 C.F.R. §§ 440.170, 441.62.
[28] 42 C.F.R. § 440.170(a).
[29] 42 C.F.R. § 441.56(a); CMS, State Medicaid Manual §§ 5121.A, 5121.C.
[30] 42 U.S.C. § 2000d (Title VI of the Civil Rights Act); Affordable Care Act § 1557; CMS Dear State Medicaid Director (Aug. 31, 2000).
[31] Department of Health & Human Services, Guidance to Federal Financial Assistance Recipients Regarding Title VI Prohibition Against National Origin Discrimination Affecting Limited English Proficient Persons, 68 Fed. Reg. 47311 (August 8, 2003).

Though interpreter services are not classified as mandatory 1905(a) services, all providers who receive federal funds from HHS for the provision of Medicaid services are obligated, under Title VI of the Civil Rights Act, to make language services available to those with limited English proficiency.



States are not required to (but may) reimburse providers for the cost of language services. States may consider the cost of language services to be included in the regular rate of reimbursement for the underlying direct service. In those cases, Medicaid providers are obligated to provide language services to those with limited English proficiency and to bear the costs for doing so. Alternatively, states may allow providers to bill specifically for interpreter services. States have the option to claim for the cost of interpretation services, either as medical-assistance related expenditures or as administration.[32]

Claiming Federal Matching Funds for Interpreter Services. Interpreters are not Medicaid qualified providers. However, their services may be reimbursed when billed by a qualified provider rendering a Medicaid covered service. Interpreters may not be paid separately. As of February 2009, oral interpreter services can be claimed using billing code T-1013 along with the CPT code used for the medical encounter. States can also raise reimbursement rates to recognize additional service costs, including interpreter costs, but must do so for services rendered by all providers in the class. With the enactment of the Children's Health Insurance Program Reauthorization Act in 2009, states were given the option to claim a higher federal matching rate (75% under Medicaid) for translation and interpretation services that are claimed as administration and are related to the enrollment, retention and use of services under Medicaid and CHIP by children of families for whom English is not their primary language.[33] Otherwise, longstanding CMS policy permits reimbursement at the standard 50% federal

[32] CMS, Dear State Medicaid Director (July 1, 2010); CMS, CMCS Informational Bulletin: *Recent Developments in Medicaid* (April 26, 2011).
[33] Section 1903(a)(2)(E) of the Social Security Act.

matching rate for translation and interpretation activities that are claimed as an administrative expense, so long as they are not included and paid for as part of the reimbursement rate for direct services.[34]

The HHS Office for Civil Rights and the Department of Justice have provided guidance for recipients of federal funds on expectations of how to provide language services.[35]

State Medicaid programs, managed care entities, and Medicaid-participating health care providers should all be culturally competent. This means they need to recognize and understand the cultural beliefs and health practices of the families and children they serve, and use that knowledge to implement policies and inform practices that support quality interventions and good health outcomes for children. Given changing demographics, this process is ongoing. The DHHS Office of Minority Health offers numerous resources, including:

- ✓ Center for Linguistic and Cultural Competence in Health Care;
- ✓ Think Cultural Health;
- ✓ A Physician's Practical Guide to Culturally Competent Care;
- ✓ The National Standards for Culturally and Linguistically Appropriate Services in Health and Health Care (the National CLAS Standards); and
- ✓ The National CLAS Standards' implementation guide, A Blueprint for Advancing and Sustaining CLAS Policy and Practice.

D. Settings and Locations for Services

a. Services Provided Out of State

States may need to rely upon out-of-state services if necessary covered services are not available locally, or if a Medicaid beneficiary is out of state at the time a need for medical services arises. States are required to pay for services provided

[34] CMS, Dear State Medicaid Director (August 31, 2000).
[35] *Id*; U.S. Department of Justice, Executive Order 13166.

in another state to the same extent services furnished in-state would be paid for if:

- ✓ The out-of-state services are required because of an emergency;
- ✓ The child's health would be endangered if she or he were required to travel to their home state;
- ✓ The state determines that the needed services are more readily available in the other state; or
- ✓ It is a general practice of the locality to use the services of an out-of-state provider, for example, in areas that border another state.[36]

Including out-of-state providers gives states the opportunity to expand the range and accessibility of Medicaid services that are available to their enrollees.[37]

b. Services Provided in Schools

Services provided in schools can play an important role in the health care of adolescents and children. Whether implemented for children with special needs under the Individuals with Disabilities Education Act (IDEA) or through school-based or linked health clinics, school-centered programs may be able to provide medical and dental care efficiently and effectively while avoiding extended absences from school.

In order for Medicaid to reimburse for health services provided in the schools, the services must be included among those listed in section 1905(a) of the Act and included in the State Plan, or be available under the EPSDT benefit. There is no benefit category in the Medicaid statute titled "school health services" or "early intervention services." Therefore a state must describe its school health services in terms of the specific section 1905(a) services which will be provided. In addition, there must be a provider agreement in place between the state Medicaid agency and the provider billing for the service; and the school must agree to comply with Medicaid-specific requirements regarding service documentation and claims submission.[38] States are encouraged to promote relationships between school-based providers and managed care plans.

Services provided in schools can play an important role in the health care of adolescents and children.

[36] Section 1902(a)(16) of the Social Security Act; 42 C.F.R. § 431.52.
[37] HCFA, Dear State Medicaid Director (July 25, 2000).
[38] 42 C.F.R. § 431.107.

Schools are particularly appropriate places to provide medical, vision, and hearing screenings; vaccinations; some dental care; and behavioral health services. The Individuals with Disabilities Education Act (IDEA) requires that every child with a disability have available a free appropriate public education that includes special education and related services. Part B of IDEA requires the development and implementation of an individualized education program (IEP) that addresses the unique needs of each child with a disability ages 3 through 21.[39] A child's IEP identifies the special education and related services needed by that child. Medicaid covered services included in the IEP may be provided in, and reimbursed to, schools. Part C of IDEA covers early intervention services, which are developmental services designed to meet a child's developmental needs in physical, cognitive, communication, adaptive, and social and emotional development, for children from birth to age 3. These services are provided pursuant to an Individualized Family Service Plan (IFSP).

Examples of IDEA services that can be covered by Medicaid for a Medicaid eligible child include physical therapy, occupational therapy, personal care, and services for children with speech, hearing and language disorders.[40]

c. Most Integrated Setting Appropriate

Title II of the Americans with Disabilities Act (ADA) prohibits discrimination on the basis of disability in public programs, including Medicaid. In *Olmstead v. L.C.,* the Supreme Court held that unjustified institutionalization of Medicaid beneficiaries violates the ADA. Accordingly, states must cover services in the community, rather than in an institution, when the need for community services can be reasonably accommodated and providing services in the community will not fundamentally alter the state's Medicaid program.

Community-based care is a best practice for supporting children with disabilities and chronic conditions.

CMS has long encouraged states to provide services in home and community settings, particularly for children, not only because of *Olmstead,* but because community-based care is considered a best practice for supporting children with

[39] While EPSDT covers children only through age 20 (up to the 21st birthday), the IDEA covers children through age 21 (up to the 22nd birthday).
[40] Additional information about Medicaid-covered services provided in schools can be found in the CMS, *Medicaid School Based Administrative Claiming Guide* (2003).

disabilities and chronic conditions. In addition, it is generally more cost-effective.[41]

EPSDT provides states with many options for covering physical and mental health services in the community. The EPSDT benefit requires coverage of medically necessary personal care, private duty nursing, physical, occupational and speech-language therapy. And, as discussed below, optional services provided through home and community based services waivers can further advance the state's efforts to provide services in the community.

[41] HCFA, Dear State Medicaid Director, Olmstead Update Nos. 2 and 3 (July 25, 2000), No. 5 (January 10, 2001); CMS, Dear State Medicaid Director (May 20, 2010); CMS, Joint CMCS and SAMHSA Informational Bulletin: *Coverage of Behavioral Health Services for Children, Youth, and Young Adults with Significant Mental Health Conditions* (May 7, 2013).

V. PERMISSIBLE LIMITATIONS ON COVERAGE OF EPSDT SERVICES

A. Individual Medical Necessity

Services that fit within the scope of coverage under EPSDT must be provided to a child only if necessary to correct or ameliorate the individual child's physical or mental condition, i.e., only if "medically necessary." The determination of whether a service is medically necessary for an individual child must be made on a case-by-case basis, taking into account the particular needs of the child. The state (or the managed care entity as delegated by the state) should consider the child's long-term needs, not just what is required to address the immediate situation. The state should also consider all aspects of a child's needs, including nutritional, social development, and mental health and substance use disorders. States are permitted (but not required) to set parameters that apply to the determination of medical necessity in individual cases, but those parameters may not contradict or be more restrictive than the federal statutory requirement. As discussed above, services such as physical and occupational therapy are covered when they have an ameliorative, maintenance purpose.

Determination of whether a service is medically necessary must be made on a case-by-case basis, taking into account a particular child's needs.

Because medical necessity decisions are individualized, flat limits or hard limits based on a monetary cap or budgetary constraints are not consistent with EPSDT requirements.[42] States may adopt a definition of medical necessity that places tentative limits on services pending an individualized determination by the state, or that limits a treating provider's discretion, as a utilization control, but additional services must be provided if determined to be medically necessary for

[42] HCFA, *Regional Transmittal Notice* (Region IV) (Sept. 18, 1990); Memorandum from Rozann Abato, Acting Director, HCFA, to Associate Regional Administrator, Atlanta (Sept. 5, 1990); Memorandum from Christine Nye, HCFA Medicaid Director, to Regional Administrator Region VIII (FME-42) (1991).

an individual child.[43] For example, while a state may place in its State Plan a limit of a certain number of physical therapy visits per year for individuals age 21 and older, such a "hard" limit could not be applied to children. A state could impose a "soft" limit of a certain number of physical therapy visits annually for children, but if it were to be determined in an individual child's case, upon review, that additional physical therapy services were medically necessary to correct or ameliorate a diagnosed condition, those services would have to be covered.

While the treating health care provider has a responsibility for determining or recommending that a particular covered service is needed to correct or ameliorate the child's condition,[44] both the state and a child's treating provider play a role in determining whether a service is medically necessary. If there is a disagreement between the treating provider and the state's expert as to whether a service is medically necessary for a particular child, the state is responsible for making a decision, for the individual child, based on the evidence. That decision may be appealed by the child (or the child's family) under the state's Medicaid fair hearing procedures, as described in Section VIII below.

B. Prior Authorization

States may impose utilization controls to safeguard against unnecessary use of care and services. For example, a state may establish tentative limits on the amount of a treatment service a child can receive and require prior authorization for coverage of medically necessary services above those limits.[45] Prior authorization must be conducted on a case-by-case basis, evaluating each child's needs individually. Importantly, prior authorization procedures may not delay delivery of needed treatment services and must be consistent with the "preventive thrust" of EPSDT.[46] As such, prior authorization may not be required for any EPSDT screening services. In addition, medical management techniques used for mental health and substance use disorders should comply with the Mental Health Parity and Addiction Equity Act.

C. Experimental Treatments

EPSDT does not require coverage of treatments, services, or items that are experimental or investigational. Such services and items may, however, be covered at the state's discretion if it is determined that the treatment or item would be effective to address the child's condition.[47] Neither the Federal Medicaid statute nor the regulations define what constitutes an experimental

[47] CMS, State Medicaid Manual §§ 4385.C.1, 5122.F.

treatment. The state's determination of whether a service is experimental must be reasonable and should be based on the latest scientific information available.[48]

Medicare guidance on whether a service is experimental or investigational is not determinative of the issue and may not be relevant to the pediatric population.[49]

D. Cost-Effective Alternatives

A state may not deny medically necessary treatment to a child based on cost alone, but may consider the relative cost effectiveness of alternatives as part of the prior authorization process. Also, a state need not make services available in every possible setting as long as the services are reasonably available through the settings where the service is actually offered. States may cover services in the most cost effective mode as long as the less expensive service is equally effective and actually available.[50] The child's quality of life must also be considered.[51] In addition, the ADA and the *Olmstead* decision require states to provide services in the most integrated setting appropriate to a child's needs, as long as doing so does not fundamentally alter the state's program. See above, Section IV.D. Thus, if an institutional setting is less costly than providing services in a home or community, the ADA's integration mandate may nevertheless require that the services be provided in the community.[52]

A state may not deny medically necessary treatment based on cost alone, but may consider the relative cost effectiveness of alternatives as part of the prior authorization process.

VI. SERVICES AVAILABLE UNDER OTHER FEDERAL AUTHORITIES

A. Home and Community Based Services Waivers

A state Medicaid program may offer services through home and community based services (HCBS) waiver programs. Such programs allow states to provide HCBS to individuals who would otherwise need long-term care in a nursing facility, intermediate care facility, or hospital. Waiver programs provide for coverage of services that are not otherwise available through the Medicaid program (including EPSDT) because they do not fit into one of the categories listed in section 1905(a). This includes habilitative services, respite services, or other services approved by CMS that can help prevent institutionalization. These programs are sometimes called 1915(c) waivers after the section of the Social Security Act that authorizes them.[53]

Children under age 21 who are enrolled in an HCBS waiver program are also entitled to all EPSDT screening, diagnostic, and treatment services. Because HCBS waivers can provide services not otherwise covered under Medicaid, waivers and EPSDT can be used together to provide a comprehensive benefit for children with disabilities who would otherwise need the level of care provided in an institutional setting. This enables those children to remain in their homes and communities while receiving medically necessary services and supports. The HCBS waiver services essentially "wrap-around" the EPSDT benefit. If a child enrolled in Medicaid is on a waiting list for HCBS waiver services, EPSDT requirements apply and necessary services that fit into the categories listed in 1905(a) must be covered.[54]

Children who are enrolled in an HCBS waiver program are also entitled to all EPSDT services.

States may also choose to offer services to children under section 1915(j) (self-directed personal assistance services), section 1915(k) (home and community-based attendant services and support) and section 1945 (coordinated care in

[53] Section 1915(c) of the Social Security Act.
[54] CMS, Dear State Medicaid Director, Olmstead Update No. 4, Att. 4-B (Jan. 10, 2001).

health homes for individuals with chronic conditions). Like services provided pursuant to a 1915(c) waiver, these services are not subject to EPSDT coverage provisions, but are instead available to supplement EPSDT services.

B. Alternative Benefit Plans

States must assure access to services available under the EPSDT benefit for all EPSDT-eligible children under age 21 enrolled in Alternative Benefit Plans (formerly known as benchmark plans and benchmark-equivalent plans).[55]

C. Role of Maternal and Child Health Services

Federal rules require state Medicaid agencies and Title V Maternal and Child Health (MCH) agencies and grantees to collaborate to assure better access to and receipt of the full range of screening, diagnostic, and treatment services covered under EPSDT.[56] Title V is administered by the Health Resources and Services Administration. Many state Medicaid agencies have entered into written agreements with their sister MCH programs and collaborate on improving access to EPSDT services in order to improve child health status. Among other things, cooperating MCH agencies can provide outreach, screening, diagnostic or treatment services, health education and counseling, case management and other assistance in achieving a comprehensive and effective child health benefit. MCH programs can also help Medicaid programs to enlist providers who can help deliver a broad array of services. In addition, they can inform potential and actual Medicaid recipients about EPSDT and refer them to necessary services.[57] CMS encourages such collaborations as MCH programs are crucial partners in the creation and delivery of a high quality, well-integrated child health benefit.

Many state Medicaid agencies have written agreements with their states' MCH programs and collaborate to improve access to EPSDT services.

[56] 42 U.S.C. §§ 705(a)(5)(F), 709(a)(2); 42 C.F.R. § 441.61(c).
[57] CMS, State Medicaid Manual § 5230.

VII. ACCESS TO SERVICES

A. Access to Providers

Access to covered services is of course a critical component of delivering an appropriate health benefit to children. Accordingly, a number of Medicaid and EPSDT provisions are intended to assure that children have access to an adequate number and range of pediatric providers. For example, states are required to "make available a variety of individual and group providers qualified and willing to provide" services to children.[58] States must also "take advantage of all resources available" to provide a "broad base" of providers who treat children."[59] Some states may find it necessary to recruit new providers to meet children's needs.[60] In the event a child needs a treatment that is not coverable under the categories listed in section 1905(a), states are to provide referral assistance that includes giving the family or beneficiary the names, addresses, and telephone numbers of providers who have expressed a willingness to furnish uncovered services at little or no expense to the family.[61]

States are required to make available a variety of providers who are qualified and willing to treat EPSDT children.

A child is entitled to receive Medicaid services from any provider qualified to provide the service and willing to furnish it, unless CMS has decided that this "freedom of choice" requirement will not apply.[62] Most states have received permission from CMS to provide some services to some children through managed care arrangements that restrict the free choice of provider.

An appropriate level of reimbursement can be critical to ensuring adequate access to providers.[63] While the statute provides states with broad authority to set provider payment rates, it requires that payments to providers must be consistent with efficiency, economy, and quality care and be sufficient to enlist enough

[58] 42 C.F.R. § 441.61.
[59] CMS, State Medicaid Manual § 5220.
[60] *Id.*
[61] 42 C.F.R. § 441.61(a).
[62] Sections 1902(a)(23) and 1932(a) of the Social Security Act; 42 C.F.R. § 431.51(b).
[63] HCFA, Dear State Medicaid Director (Jan 18, 2001).

providers that care and services are available to Medicaid beneficiaries at least to the extent that they are available to the general population in the geographic area.[64]

Federal regulations provide that a Medicaid provider must agree to accept, as payment in full, the Medicaid payment for a covered service or item.[65] This means that a provider *may not* bill a Medicaid beneficiary for the difference between the provider's charge and the Medicaid payment (called "balance billing"). The payment in full requirement also prohibits Medicaid providers from billing beneficiaries for missed appointments. States may need to monitor compliance with this requirement.

Section 1905(a) lists coverable Medicaid services and some provider types. There are at least two means by which a state may cover a service by a provider type that is not specified in section 1905(a). Section 1905(a)(6) permits states to cover "medical care, or any other type of remedial care recognized under State law, furnished by licensed practitioners within the scope of their practice as defined by State law." Thus, a state may cover services performed by a class of providers (such as licensed dieticians) when the service they provide is not specified in section 1905(a) as long as the service is determined medically necessary for a child. Alternatively, a provider's services can be covered as a component of a section 1905(a) service. For example, in the case of a licensed social worker, the services could be provided through a federally qualified health center or a clinic, both of which are recognized providers under section 1905(a). The process for covering a provider for a service not specified in section 1905(a) varies depending on how the state intends to provide the service.

B. Managed Care

EPSDT benefits must be available to all children covered by Medicaid. As such, children enrolled in managed care plans, prepaid inpatient health plans, prepaid ambulatory health plans, primary care case management systems (collectively referred to as managed care entities) are entitled to the same EPSDT benefits they would have in a fee for service Medicaid delivery system. Properly implemented, managed care can enhance and promote EPSDT's goals of ensuring that care is provided in a coordinated way and with an emphasis on prevention.

States are responsible for assuring that the full EPSDT benefit is available to all Medicaid children in the state, even if the state contracts with a managed care entity to deliver some or all of the services available under EPSDT. The state's

[64] Section 1902(a)(30)(A) of the Social Security Act; Medicaid Program: Methods for Assuring Access to Covered Medicaid Services, 76 Fed. Reg. 26,342 (May 11, 2011) (proposed regulations).
[65] 42 C.F.R. § 447.15.

contracts with managed care entities should be drafted with sufficient precision so that the entity's responsibilities with respect to children are clearly delineated. A contract can provide that the managed care entities will be responsible for providing services under the EPSDT benefit to the same degree that the services are covered by the state. Or, if certain responsibilities are carved out of the managed care contract, those carve-outs must be explicit, and the state will retain the responsibility for ensuring that those carved-out services are provided to enrolled children. For example, the state may 'carve out' dental services from the managed care contract; nonetheless, the state must assure that children receive those services (through either fee for service or a specialized dental plan).

Managed care entities may not use a definition of medical necessity for children that is more restrictive than the state's definition.

Managed care entities may not use a definition of medical necessity for children that is more restrictive than the state's definition. One way to ensure this is for the state to include its definition of medical necessity in the entity's contract. States should review managed care entities' medical necessity definitions and criteria to ascertain whether they meet this requirement. As a further step to provide for consistency across the delivery system and proper implementation of the children's benefit package, it is the state's responsibility to educate its contracted managed care entities about EPSDT requirements, as well as to verify that managed care providers are informed about EPSDT requirements through trainings and provider manuals. Further, states are responsible for ensuring that managed care entities fulfill their contractual responsibilities to inform all families of the services available under EPSDT and how to access them.[66] Information made available to enrollees, usually included in a member handbook, should clearly explain which EPSDT services the managed care entity will provide and how any EPSDT services not within the scope of the contract can be accessed by enrollees. Managed care entities must make available to all enrolled children the entire scope of services included in the EPSDT benefit that is within their contract with the state.[67]

[66] Sections 1902(a)(5) and (a)(43) of the Social Security Act.
[67] 42 C.F.R. § 438.210(a)(4).

Managed care entities must demonstrate to the state that they have adequate provider capacity in the plan to serve enrolled children, including an appropriate range of pediatric and specialty services; access to primary and preventive care; and a sufficient number, mix and geographic distribution of providers.[68]

Monitoring managed care entities' compliance with EPSDT requirements is essential; a strong oversight framework ensures that states are meeting their responsibilities to children as well as Federal monitoring requirements.[69] There are several methods of exercising effective oversight in managed care systems.

First, states contracting with managed care organizations (MCOs) or prepaid inpatient health plans (PIHPs) are statutorily required to draft, implement, and maintain a managed care quality strategy.[70] The quality strategy is intended to provide a blueprint for states in assessing and improving the quality of care provided to managed care enrollees.[71] By means of this strategy, states can monitor and evaluate managed care entities' compliance with quality initiatives, track their performance on specified performance measures, and require them to design, implement and report the results of performance improvement projects.

Second, states are also required to ensure that external quality review of MCOs and PHIPs are performed by unbiased, external entities.[72] In this way, states can determine whether managed care entities are reporting accurate performance outcomes data and whether they are in compliance with state contract provisions.

Third, states can engage in an ongoing review of grievances and appeals related to children's services, as well as monitoring complaints filed with the state's enrollee and provider hotlines (if the state operates such hotlines). States could also require reports and perform data analysis of managed care entities' encounter data to detect underutilization of services by children.

In addition, all states are required to complete and file the Form 416 each year.[73] This reports the number of children receiving health screening services, dental and oral health services, and referrals for corrective treatment, as well as the state's rates of meeting EPSDT participation goals.

[68] 42 C.F.R. § 438.206.
[69] 42 C.F.R. § 438.240.
[70] Section 1932(c)(1) of the Social Security Act; 42 C.F.R. §§ 438.202, 438.204.
[71] 42 C.F.R. § 438.202.
[72] Section 1932(c)(2) of the Social Security Act; 42 C.F.R. § 438.350.
[73] Section 1902(a)(43)(D) of the Social Security Act.

C. Timeliness

Services under the EPSDT benefit, like all Medicaid services, must be provided with "reasonable promptness."[74] The state must set standards to ensure that EPSDT services are provided consistent with reasonable standards of medical and dental practice. The state must also ensure that services are initiated within a reasonable period of time. What is reasonable depends on the nature of the service and the needs of the individual child. Because states have the obligation to "arrang[e] for . . . corrective treatment" either directly or through referral to appropriate providers, a lack of providers does not automatically relieve a state of its obligation to ensure that services are provided in a timely manner. For example, as noted above, it may be necessary to cover services provided out of state.

Services under the EPSDT benefit, like all Medicaid services, must be provided with reasonable promptness.

[74] Section 1902(a)(8) of the Social Security Act.

VIII. NOTICE AND HEARING REQUIREMENTS

Children under age 21, like all other people enrolled in Medicaid, have the right to notice and an opportunity for a hearing. If a state or managed care entity takes an "action" – to deny, terminate, suspend, or reduce a requested treatment or service, it must give the beneficiary written notice of the action and of their right to a hearing (a pre-termination hearing, in instances where services are reduced or terminated), including instructions on how to request a hearing.[75] When services are being terminated or reduced, the notice must be sent at least ten days before the effective date of the action.[76] Under exceptional circumstances, the notice must be mailed no later than the day of the action, such as when the beneficiary's physician prescribes a change in treatment or the beneficiary has been admitted to an institution and is no longer eligible.[77] The notice must contain a statement of the intended action, the specific reasons and legal support for the action, and an explanation of the individual's hearing rights, rights to representation and to continued benefits.[78]

If a state or managed care entity takes an action to deny, terminate, suspend, or reduce a requested treatment or service, it must give the beneficiary written notice of the action and of their right to a hearing.

The beneficiary is entitled to a hearing before the state Medicaid agency, or, if a state's hearing process provides for it, an evidentiary hearing at the local level (for example at a county department of social services) with a right of appeal to the state agency.[79] The hearing must be conducted at a reasonable time, date, and place by an impartial hearing official. A beneficiary must be allowed to present his or her case to an impartial decision maker and present evidence and

[75] Section 1902(a)(3) of the Social Security Act; *Goldberg v. Kelly*, 397 U.S. 254 (1970).
[76] 42 C.F.R. § 431.211.
[77] 42 C.F.R. § 431.213.

[79] 42 C.F.R. § 431.205(b).

witnesses.[80] The beneficiary is also entitled to have representation, including legal counsel, a relative, or a friend.[81] Before the hearing, beneficiaries must have the right to examine the case file and all documents that will be used at the hearing.[82]

When a service is terminated or reduced, if the beneficiary requests a hearing within ten days of receiving notice of the termination or reduction, the beneficiary has the right to continued coverage of services pending a hearing decision.[83] This is sometimes called "aid paid pending." Once the agency issues a final decision, the beneficiary generally has the right to appeal that decision to state court.

Managed care enrollees must have access to in-plan grievance and appeal processes, in addition to the state fair hearing system.[84] Managed care plans must provide enrollees written notices that explain the action, the reason for the action, and the procedures for using the in-plan grievance and state fair hearing processes, including rights to continued benefits. Managed care plans must resolve complaints in a timely manner, including within three working days when the enrollee or provider indicates that delay could seriously jeopardize the enrollee's life, health or ability to attain, maintain, or retain maximum function.[85] The state can require enrollees to exhaust the plan's internal grievance process before obtaining a state fair hearing.

The state agency must issue and publicize its hearing decisions.[86] In addition, the public must have access to all fair hearing decisions, subject to regulatory requirements providing for safeguarding of confidential personal and health information.[87]

[87] 42 C.F.R. § 431.244(g).

IX. CONCLUSION

The goal of EPSDT is to assure that all Medicaid-enrolled children under age 21 receive the health care they need. EPSDT covers not only medically necessary treatment to correct or ameliorate identified conditions, but also preventive, and maintenance services. In addition, EPSDT covers age-appropriate medical, dental, vision and hearing screening services at specified times, and when health problems arise or are suspected.

The broad scope of EPSDT provides states with the tools necessary to offer a comprehensive, high-quality health benefit. To fully realize EPSDT's potential, however, attention is needed on issues affecting access to services, including supply of providers, the presence of managed care, linguistic and disability access, and transportation. CMS is available to help states address these issues to ensure that EPSDT coverage meets the needs of children under age 21 who depend on Medicaid for their health care.

X. WHAT YOU NEED TO KNOW ABOUT EPSDT

EARLY: Assessing and identifying problems early

Children covered by Medicaid are more likely to be born with low birth weights, have poor health, have developmental delays or learning disorders, or have medical conditions (e.g., asthma) requiring ongoing use of prescription drugs. Medicaid helps these children and adolescents receive quality health care.

EPSDT is a key part of Medicaid for children and adolescents. EPSDT emphasizes preventive and comprehensive care. Prevention can help ensure the early identification, diagnosis, and treatment of conditions before they become more complex and costly to treat. It is important that children and adolescents enrolled in Medicaid receive all recommended preventive services and any medical treatment needed to promote healthy growth and development.

PERIODIC: Checking children's health at age-appropriate intervals

As they grow, infants, children and adolescents should see their health care providers regularly. Each state develops its own "periodicity schedule" showing the check-ups recommended at each age. These are often based on the American Academy of Pediatrics' Bright Futures guidelines: Recommendations for Preventive Pediatric Health Care. Bright Futures helps doctors and families understand the types of care that infants, children and adolescents should get and when they should get it. The goal of Bright Futures is to help health care providers offer prevention-based, family-focused, and developmentally-oriented care for all children and adolescents. Children and adolescents are also entitled to receive additional check-ups when a condition or problem is suspected.

SCREENING: Providing physical, mental, developmental, dental, hearing, vision and other screening tests to detect potential problems

All infants, children and adolescents should receive regular well-child check-ups of their physical and mental health, growth, development, and nutritional status. A well-child check-up includes:

- A comprehensive health and developmental history, including both physical and mental health development assessments;
- Physical exam;
- Age-appropriate immunizations;
- Vision and hearing tests;
- Dental exam;
- Laboratory tests, including blood lead level assessments at certain ages; and
- Health education, including anticipatory guidance.

DIAGNOSTIC: Performing diagnostic tests to follow up when a health risk is identified

When a well-child check-up or other visit to a health care professional shows that a child or adolescent might have a health problem, follow up diagnostic testing and evaluations must be provided under EPSDT. Diagnosis of mental health, substance use, vision, hearing and dental problems is included. Also included are any necessary referrals so that the child or adolescent receives all needed treatment.

TREATMENT: Correct, reduce or control health problems found

EPSDT covers health care, treatment and other measures necessary to correct or ameliorate the child or adolescent's physical or mental conditions found by a screening or a diagnostic procedure. In general, States must ensure the provision of, and pay for, any treatment that is considered "medically necessary" for the child or adolescent. This includes treatment for any vision and hearing problems, including eyeglasses and hearing aids. For children's oral health, coverage includes regular preventive dental care and treatment to relieve pain and infections, restore teeth, and maintain dental health. Some orthodontia is also covered.

CMCS Informational Bulletin

DATE: July 21, 2022

FROM: Daniel Tsai, Deputy Administrator and Director
Center for Medicaid and CHIP Services

SUBJECT: Beneficiary Protections and Medicaid Drug Coverage - Under Value Based Purchasing (VBP) and Other Innovative Payment Arrangements

The purpose of this Center for Medicaid and CHIP Services (CMCS) Informational Bulletin (CIB) is to remind states and stakeholders of existing federal beneficiary protections that help ensure appropriate beneficiary access to prescription medications, especially as state programs and stakeholders continue to negotiate novel payment arrangements with drug manufacturers.

The Centers for Medicare & Medicaid Services (CMS) understand the challenges that states face managing pharmacy costs, especially as new, innovative gene and cell therapies are brought to market. We are taking several steps to help states meet these challenges. We have approved 13 state plan amendments (SPAs) that authorize states to negotiate with manufacturers for value-based supplemental rebates for a drug, and several more states' SPAs are under review. Moreover, we are issuing this CIB to coincide with the start of the new flexibilities that allow manufacturers to report to the agency multiple best prices for a drug that are connected to a VBP arrangement (as defined at 42 CFR 447.502) and made available to all states. These VBP arrangements will hold manufacturers more accountable for the clinical outcomes of their drugs, while giving more states the opportunity to earn additional rebates depending on how a drug works for patients. In addition, we look forward to working with states through a learning collaborative that will be launched in the fall of 2022 to help states better manage their pharmacy costs, especially for these high cost drugs. We hope this work will lead to productive negotiations between states and manufacturers regarding the cost of these drugs for Medicaid beneficiaries.

Introduction

Alternative VBP arrangements for drugs, such as outcomes-based models and supplemental rebate agreements, have become more commonplace. These arrangements allow state Medicaid agencies to receive additional discounts or rebates from manufacturers on a drug when a drug does not meet certain observed or expected therapeutic or clinical values in a select population, based on applicable evidence-based or outcomes-based measures. As a result of these new payment arrangements, we believe it is important that beneficiaries, states, and manufacturers understand the beneficiary protections currently in

place to ensure access to medications under both traditional pharmacy programs and alternative payment arrangements.

In the December 31, 2020 issue of the *Federal Register*, the CMS published the final rule entitled: *Medicaid Program; Establishing Minimum Standards in Medicaid State Drug Utilization Review (DUR) and Supporting Value-Based Purchasing (VBP) for Drugs Covered in Medicaid, Revising Medicaid Drug Rebate and Third Party Liability (TPL) Requirements* (hereinafter referred to as the December 2020 final rule) (85 Fed. Reg. 87000; CMS 2482-F2). This new regulation permits manufacturers to report multiple best prices for a covered outpatient drug in certain cases. More specifically, it provides that if a manufacturer offers a VBP arrangement to all states, the lowest price available from a manufacturer may include varying best price points for a single dosage form and strength as a result of that VBP arrangement. These arrangements offered by manufacturers to states must meet the definition of a VBP arrangement as specified in 42 CFR § 447.502 and allow the state to collect additional rebates based on a patient's outcomes beyond those that the state will already receive under the Medicaid Drug Rebate Program (MDRP).

We note that states are not required to participate in these VBP arrangements in order for manufacturers to report multiple best prices. In addition to the states' voluntary participation in commercially-available VBP arrangements, states have also been actively negotiating other types of payment arrangements with manufacturers, such as through CMS-authorized supplemental rebate agreements, pay-over-time models, and "subscription" model arrangements under which the manufacturer charges a payer a fixed amount for an unlimited supply of a drug (resulting in a lower per unit price as utilization of the drug increases). Regardless of the type of arrangement, CMS is providing this guidance to ensure that stakeholders are aware of laws and regulations regarding beneficiaries' access to medically necessary medications.

Medicaid Requirements that Protect Beneficiary Access to Drugs

CMS believes it is important to reiterate to states and manufacturers the current federal protections that are in place under the Medicaid program to help ensure appropriate beneficiary access to drugs. States must generally apply these existing broad statutory requirements to Medicaid coverage of prescription drugs, regardless of any type of payment arrangement the state may have with manufacturers, unless an exception applies, such as a waiver.

1. States must cover all covered outpatient drugs subject to a rebate agreement with the Secretary: States must cover all covered outpatient drugs of a manufacturer that has entered into and has in effect a Medicaid drug rebate agreement, and may only restrict or exclude coverage of drugs as expressly described in section 1927(d) of the Social Security Act (the Act). Subject to these permissible restrictions, covered outpatient drugs that are prescribed for a medically accepted indication must be covered. States are permitted to subject any drug to prior authorization as long as it meets the requirements of section 1927(d)(5).

   Section 1927(d)(1)(B) of the Act permits states to restrict or exclude coverage of a covered outpatient drug only if the prescribed use is not for a medically accepted indication, the drug is included in the list of drugs or drug classes (or their medical uses) that may be excluded or otherwise restricted by the state (e.g., agents when used for cosmetic purposes or to promote fertility), the drug is subject to restrictions

pursuant to an authorized agreement between the manufacturer and state under a permissible prior authorization program or formulary, or pursuant to a state established formulary that is consistent with federal law.

Section 1927(d)(6) permits states to impose limitations with respect to all such drugs in a therapeutic class, on minimum or maximum quantities per prescription or on the number of refills, if such limitations discourage waste, and may address instances of fraud and abuse. The statute also further provides an enumerated list of non-excludable drugs, classes of drug, or their medical uses at section 1927(d)(7), which a state may not exclude from coverage. In summary, a state must ensure the covered outpatient drugs of a manufacturer with an effective Medicaid drug rebate agreement are covered and available when the covered outpatient drug is prescribed for a medically accepted indication, unless certain exclusions or restrictions apply.

2. State Alternative Benefit Plans (ABP) must follow Essential Health Benefit (EHB) standards when providing prescription drug coverage: When providing coverage under alternative benefit plans to a Medicaid population, states are required to provide prescription drug coverage that meets certain specific drug formulary standards, and to have a process in place such that the Medicaid beneficiary can access clinically appropriate drugs not covered on the state's drug formulary. Specifically, under 42 CFR § 440.347(a)(6), states must provide prescription drug coverage that meets the Essential Health Benefits (EHB) standards described in 45 CFR § 156.122, including a formulary that meets the standards at 45 CFR § 156.122(a), and that includes a process in place that allows the Medicaid beneficiary (or their designee) to request and gain access to clinically appropriate drugs not otherwise covered by the formulary consistent with the EHB standard at 45 CFR § 156.122(c). As specified at 42 CFR § 440.347(e), EHBs cannot be based on a benefit design or implementation of a benefit design that discriminates based on an individual's age, expected length of life, present or predicted disability, degree of medical dependency, quality of life or other health conditions.

3. States generally cannot limit beneficiary access to certain providers because of a specific payment arrangement: In general, section 1902(a)(23)(A) of the Act and 42 CFR § 431.51(b) require that any Medicaid beneficiary may obtain Medicaid services (including covered outpatient drugs) from any institution, agency, pharmacy, person, or organization that is qualified to furnish the service or services, and willing to furnish them to that particular beneficiary. CMS can waive this requirement under section 1915(b) or section 1115 of the Act, and this requirement also would not generally apply under state plan Medicaid managed care programs. Therefore, unless this requirement has been waived, is not applicable, or an exception applies, a state may not limit coverage of drugs to those obtained from a limited list of Medicaid providers or pharmacies. Additionally, under certain circumstances specified in 42 CFR § 431.52, states are required to cover Medicaid services provided out of state to their residents who are Medicaid beneficiaries and who are absent from the state.

4. States generally must comply with the Medicaid comparability requirement: Unless an exception applies or this requirement is waived under section 1115 of the Act, section 1902(a)(10)(B) of the Act and 42 CFR § 440.240 require states to ensure that the services available to any categorically needy beneficiary under the Medicaid state plan are not less in amount, duration, and scope than those services available to a medically needy beneficiary. Also, unless an exception applies or the requirement is waived, these provisions require states to ensure that the services available to any

individual in the following groups are equal in amount, duration, and scope for all beneficiaries within the group: (1) the categorically needy; and (2) a covered medically needy group. Therefore, any payment arrangement a state enters into must result in compliance with these comparability requirements, unless an exception applies or the requirements have been waived.

5. States must adhere to Early and Periodic Screening, Diagnostic and Treatment (EPSDT) requirements: Under section 1905(a)(4)(B) and (r) of the Act, states are required to cover all medically necessary services described in section 1905(a) of the Act for children under the age of 21 who are eligible for EPSDT, including prescribed drugs, regardless of any payment arrangement. What this means is that any prescribed drug covered under Medicaid EPSDT requirements is eligible for federal financial participation (FFP), regardless of the applicability of section 1927. In other words, even if the drug is not a covered outpatient drug in accordance with section 1927(k)(2) of the Act or the drug is a covered outpatient drug and a manufacturer does not have in effect a drug rebate agreement, the drug is covered under Medicaid and is eligible for FFP if prescribed under EPSDT requirements.

6. States must continue to have Drug Utilization Review (DUR) Programs in place: As required under section 1927(g) of the Act, a state must continue to have a DUR program targeted, in part, at reducing abuse and misuse of outpatient prescription drugs covered under the state's Medicaid program. The DUR program operates to help ensure that prescriptions are appropriate, medically necessary, and are not likely to result in adverse medical results for Medicaid beneficiaries. Each state DUR program must consist of prospective drug use review, retrospective drug use review, data assessment of drug use against predetermined standards, and ongoing educational outreach activities. States must continue to apply DUR requirements to covered outpatient drugs regardless of how the state pays for the drug.

Other Federal Laws and Regulations Protecting Medicaid Beneficiaries

There are other federal laws and regulations that states and manufacturers must review and follow in addition to the specific Medicaid statutory and regulatory requirements discussed above. Below, we identify some federal laws that provide additional protection to beneficiaries that states and manufacturers should remain mindful of as they pursue any payment arrangement, however, this does not constitute an exhaustive list of all applicable federal laws and regulations.

1. All parties must comply with the federal fraud and abuse laws: For example, federal anti-kickback provisions at section 1128B(b) of the Act makes it a criminal offense to knowingly and willfully offer, pay, solicit, or receive any remuneration to induce, or in return for, the referral of an individual to a person for the furnishing of, or arranging for the furnishing of, any item or service reimbursable under a federal health care program. The statute's prohibition also extends to remuneration to induce, or in return for, the purchasing, leasing, or ordering of, or arranging for or recommending the purchasing, leasing, or ordering of, any good, facility, service, or item reimbursable by a federal health care program. For purposes of the federal anti-kickback statute, "remuneration" includes the transfer of anything of value, directly or indirectly, overtly or covertly, in cash or in kind. The federal anti-kickback statute has been interpreted to cover any arrangement where one purpose of the remuneration is to induce referrals for items or services reimbursable by a federal health care program. The Office of Inspector General (OIG), Department of Health and Human Services (HHS) has promulgated certain

safe harbors potentially applicable to certain value based arrangements, *see, e.g., Medicare and State Health Care Programs: Fraud and Abuse; Revisions to Safe Harbors Under the Anti-Kickback Statute, and Civil Monetary Penalty Rules Regarding Beneficiary Inducements* (https://www.govinfo.gov/content/pkg/FR-2020-12-02/pdf/2020-26072.pdf). In addition, parties may request an advisory opinion[1] from HHS-OIG regarding the application of HHS-OIG's fraud and abuse authorities, including those related to the federal anti-kickback statute, to the party's existing or proposed arrangement.

2. States must comply with federal civil rights laws: Civil rights laws that prohibit discrimination on the basis of race, color, national origin, sex (including pregnancy, sexual orientation and gender identity), age, and disability continue to apply when states participate in any payment arrangement. These laws include Section 1557 of the Affordable Care Act, 42 U.S.C. § 18116 (race, color, national origin, sex (including pregnancy, sexual orientation and gender identity), age, and disability in health programs and activities), Title VI of the Civil Rights Act of 1964, 42 U.S.C. §§ 2000d *et seq*. (race, color, national origin), Title IX of the Education Amendments of 1972, 20 U.S.C. §§ 1681 *et seq*. (sex (including pregnancy, sexual orientation, and gender identity) in education programs and activities), the Age Discrimination Act of 1975, 42 U.S.C. §§ 6101 *et seq*. (age), Section 504 of the Rehabilitation Act of 1973, 29 U.S.C. § 794 (disability), and the Americans with Disabilities Act, 42 U.S.C. §§ 12101 *et seq*. (disability). In accordance with these legal obligations, we noted in the December 2020 rule (85 FR 87014) that manufacturers and payers, including state Medicaid agencies, may not make use of measures that would unlawfully discriminate on the basis of disability or age, among other bases, when designing or participating in VBP arrangements. We further noted at 85 FR 87016, that VBP measures should not endanger certain patients, providers, or impede access to other available medications and treatments, or interfere with the practice of medicine generally.

3. States must comply with applicable privacy and security laws: Privacy and security laws and regulations, such as those under the Health Insurance Portability and Accountability Act of 1996 (HIPAA; P.L. 104-191), must be considered when states participate in arrangements that require reporting and recording of patient-specific outcomes data for evaluation to determine payment when payment is tied to outcomes. This is especially important with respect to lower-utilized drugs when disclosure of individually identifiable health information may lead to privacy concerns. Such information should only be used or disclosed in accordance with applicable privacy and security laws, which may limit use or disclosure to the minimum necessary data.

Available Enforcement Mechanisms for CMS

If CMS becomes aware of potential state compliance concerns related to the specific Medicaid requirements discussed above, CMS will first work with the state to help its Medicaid program come into compliance with the applicable laws and regulations. As a next step, when necessary, CMS may review state and local administration of Medicaid programs through an analysis of the state's policies and procedures, on-site review of selected aspects of agency operations, and examination of samples of

[1] Advisory Opinion Process | Office of Inspector General | Government Oversight | U.S. Department of Health and Human Services (hhs.gov)

individual case records, in accordance with 42 CFR § 430.32. If these reviews reveal serious problems with respect to state compliance with any federal requirement, or with the state's approved state plan, CMS will request the state to correct its practice. After CMS provides a *notice of non-compliance,* with a request to the state to develop a corrective action plan, if the state fails to comply after being notified and given an opportunity for a hearing, CMS may withhold FFP for non-compliance. The withholding may continue until CMS is satisfied that the state's practices are in compliance with federal requirements (see 42 CFR § 430.35).

CMS does not enforce the non-Medicaid related federal requirements summarized above and will work with the HHS-OIG or the HHS Office for Civil Rights if we believe there are potential compliance issues. CMS may also refer any findings specific to manufacturer drug pricing and drug product related reporting activity to the HHS-OIG.

Conclusion

CMS' policy goal with respect to the MDRP, and state adoption of manufacturers' VBP arrangements, as well as participation in other novel payment arrangements, is to further increase access to high cost therapies for underserved populations, and reduce health disparities. This bulletin reminds states that choose to enter into these arrangements of the range of federally-based protections available to Medicaid beneficiaries. CMS will continue to monitor state Medicaid drug coverage under such arrangements to ensure it remains consistent with the Medicaid statutory and regulatory requirements and that Medicaid beneficiaries can access all medically necessary prescription medications.

For further information regarding this CIB, you may contact John M. Coster, Director of the Division of Pharmacy, at John.Coster@cms.hhs.gov.

The U.S. Commission on Civil Rights Statement Condemning Recent State Laws and Pending Proposals Targeting the Lesbian, Gay, Bisexual, and Transgender Community

The United States Commission on Civil Rights, by a majority vote, strongly condemns recent state laws passed, and proposals being considered, under the guise of so-called "religious liberty" which target members of the lesbian, gay, bisexual, and transgender ("LGBT") community for discrimination.

North Carolina Governor Pat McCrory recently signed into law H.B. 2, legislation blocking local governments from passing anti-discrimination rules that grant protections to gay and transgender persons. The law also repeals existing municipal anti-discrimination laws which protected LGBT people from bias in housing and employment. Critically, the new legislation also forces transgender people to utilize public bathrooms and changing facilities based on the sex issued on their birth certificates, and not according to their gender identities. This jeopardizes not only the dignity, but also the actual physical safety, of transgender people whose appearances may not match societal expectations of the sex specified on their identification documents.

In Mississippi, Governor Phil Bryant recently signed HB 1523 into law. The new statute is far- reaching and allows people with "religious objections" to deny wedding services to same-sex couples. It also clears the way for employers to cite religion in determining workplace policies on dress code, grooming and bathroom access. The physical safety concerns for transgender people are the same as in North Carolina.

The laws enacted in North Carolina and Mississippi are not isolated, but are part of a larger, alarming trend to limit the civil rights of a class of people using religious beliefs as the excuse. Similar laws were passed by the legislatures in Georgia and Virginia, but those were vetoed

after significant public pressure. The Tennessee legislature just passed a bill which, if signed by Governor Bill Haslam, will permit mental health professionals to deny counseling services to LGBT people based upon "sincerely held religious beliefs." Kansas is considering a non-legislative, administrative policy change which would make it more difficult for transgender people to change the sex listed on their birth certificates. These laws and policies can be found to violate the Equal Protection and Due Process clauses of the Fourteenth Amendment. These laws can also be found to violate Title IX of the Education Amendments of 1972, which forbids discrimination against transgender students in any school that receives federal funding.

The Commission recently approved a report, which will be released shortly, on the issue of religious liberty. In our findings and recommendations the Commission makes clear:

- Civil rights protections ensuring nondiscrimination, as embodied in the Constitution, laws, and policies, are of preeminent importance in American jurisprudence.
- Religious exemptions to the protections of civil rights based upon classifications such as race, color, national origin, sex, disability status, sexual orientation, and gender identity, when they are permissible, significantly infringe upon these civil rights.
- Overly broad religious exemptions unduly burden nondiscrimination laws and policies. Federal and state courts, lawmakers, and policy-makers at every level must tailor religious exceptions to civil liberties and civil rights protections as narrowly as applicable law requires.

Commission Chairman Martin R. Castro stated on behalf of the Commission, "Religious freedom is an important foundation of our nation. However, in the past, 'religious liberty' has been used to block racial integration and anti-discrimination laws. Those past efforts failed and this new attempt to revive an old evasive tactic should be rejected as well. The North Carolina and Mississippi laws, and similar legislation proposed in other states, perverts the meaning of religious liberty and perpetuates homophobia, transphobia, marginalizes the transgender and gay community and has no place in our society.

#####

The U.S. Commission on Civil Rights is an independent, bipartisan agency charged with advising the President and Congress on civil rights matters and issuing a federal civil rights enforcement report. For information about Commission's reports and meetings, visit http://www.usccr.gov.

Department of Health and Human Services
DEPARTMENTAL APPEALS BOARD
Appellate Division

NCD 140.3, Transsexual Surgery
Docket No. A-13-87
Decision No. 2576
May 30, 2014

DECISION

The Board has determined that the National Coverage Determination (NCD) denying Medicare coverage of all transsexual surgery as a treatment for transsexualism is not valid under the "reasonableness standard" the Board applies. The NCD was based on information compiled in 1981. The record developed before the Board in response to a complaint filed by the aggrieved party (AP), a Medicare beneficiary denied coverage, shows that even assuming the NCD's exclusion of coverage at the time the NCD was adopted was reasonable, that coverage exclusion is no longer reasonable. This record includes expert medical testimony and studies published in the years after publication of the NCD. The Centers for Medicare & Medicaid Services (CMS), which is responsible for issuing and revising NCDs, did not defend the NCD or the NCD record in this proceeding and did not challenge any of the new evidence submitted to the Board.

Effect of this decision

Since the NCD is no longer valid, its provisions are no longer a valid basis for denying claims for Medicare coverage of transsexual surgery, and local coverage determinations (LCDs) used to adjudicate such claims may not rely on the provisions of the NCD. The decision does not bar CMS or its contractors from denying individual claims for payment for transsexual surgery for other reasons permitted by law. Nor does the decision address treatments for transsexualism other than transsexual surgery. The decision does not require CMS to revise the NCD or issue a new NCD, although CMS, of course, may choose to do so. CMS may not reinstate the invalidated NCD unless it has a different basis than that evaluated by the Board. 42 C.F.R. § 426.563.

CMS must implement this Board decision within 30 days and apply any resulting policy changes to claims or service requests made by Medicare beneficiaries other than the AP for any dates of service after that implementation. With respect to the AP's claim in

particular, CMS and its contractors must "adjudicate the claim without using the provision(s) of the NCD that the Board found invalid." 42 C.F.R. § 426.560(b)(1).[1]

Legal background

With exceptions not relevant here, section 1862(a)(l)(A) of the Social Security Act (Act) (42 U.S.C. § 1395y(a)(l)(A)) bars Medicare payment for items or services "not reasonable and necessary for the diagnosis or treatment of illness or injury[.]"[2] CMS refers to this requirement as the "medical necessity provision." 67 Fed. Reg. 54,534, 54,536 (Aug. 22, 2002). An NCD is "a determination by the Secretary [of Health and Human Services] with respect to whether or not a particular item or service is covered nationally under [title XVIII (Medicare)]." Act §§ 1862(l)(6)(A),1869(f)(1)(B); *see also* 42 C.F.R. § 400.202 (NCD "means a decision that CMS makes regarding whether to cover a particular service nationally under title XVIII of the Act."). NCDs "describe the clinical circumstances and settings under which particular [Medicare items and] services are reasonable and necessary (or are not reasonable and necessary)." 67 Fed. Reg. at 54,535. When CMS issues NCDs, they apply nationally and are binding at all levels of administrative review of Medicare claims. 42 C.F.R. § 405.1060. CMS and its contractors use applicable NCDs in determining whether a beneficiary may receive Medicare reimbursement for a particular item or service. 42 C.F.R. §§ 405.920, 405.921.

A Medicare beneficiary "in need of coverage for a service that is denied based on … an NCD" is an "aggrieved party" who may challenge the NCD by filing a "complaint" with the Board.[3] Act § 1869(f)(1); 42 C.F.R. §§ 426.110, 426.320. The complaint must comply with the requirements for a valid complaint in 42 C.F.R. § 426.500 in order to be accepted by the Board. 42 C.F.R. §§ 426.510(b)(2), 426.505(c)(2). After the Board notifies CMS of the receipt of a complaint that is acceptable under the regulations, CMS produces the "NCD record," which "consists of any document or material that CMS

---

[1] *See generally* 42 C.F.R. § 426.560(b) (setting out the effects of a Board NCD decision); 42 C.F.R. § 426.555 (specifying what the Board's decision "may not do"). This decision has no effects beyond those set out in 42 C.F.R.§ 426.560(b) and does not impose on CMS or its contractors any orders or requirements prohibited by 42 C.F.R. § 426.555.

[2] The table of contents to the current version of the Social Security Act, with references to the corresponding United States Code chapter and sections, can be found at http://www.socialsecurity.gov/OP_Home/ssact/ssact-toc.htm.

[3] The regulations also provide that a person other than the aggrieved party with an interest in the issues may petition to participate in the review process as an amicus curiae. 42 C.F.R. §§ 426.510(f), 426.513. The Board posts on its website notice of the NCD complaint specifying a time period for requests to participate in the review. 42 C.F.R. § 426.510(f).

considered during the development of the NCD" including "medical evidence considered on or before the date the NCD was issued . . . ." 42 C.F.R. §§ 426.510(d)(3), 426.515, 426.518(a). The aggrieved party submits a statement "explaining why the NCD record is not complete, or not adequate to support the validity of the NCD under the reasonableness standard," and CMS may submit a response "in order to defend the NCD." 42 C.F.R. § 426.525(a), (b). If the Board determines that the NCD record "is complete and adequate to support the validity of the NCD," the review process ends with the Board's "[i]ssuance of a decision finding the record complete and adequate to support the validity of the NCD . . . ." 42 C.F.R. § 426.525(c)(1), (2). If the Board determines that the record is *not* complete and adequate to support the validity of the NCD, the Board "permits discovery and the taking of evidence . . . and evaluates the NCD" in accordance with the requirements of Part 426, including conducting a hearing, unless the matter can be decided on the written record. 42 C.F.R. §§ 426.525(c)(3), 426.531(a)(2).

Prior to issuing a decision, the Board must review any "new evidence" admitted to the record before the Board and determine whether it "has the potential to significantly affect" the Board's evaluation. 42 C.F .R. §§ 426.340(a), (b), 426.505(d)(3). "New evidence" is defined as "clinical or scientific evidence that was not previously considered by … CMS before the … NCD was issued." 42 C.F.R. § 426.110. If the Board so concludes, the Board stays proceedings for CMS "to examine the new evidence, and to decide whether [to] initiate[] … a reconsideration" of the NCD. 42 C.F.R. § 426.340(d). If CMS does not reconsider the NCD, or reconsiders it but does not change the challenged provision, the Board lifts the stay and the NCD challenge process continues. 42 C.F.R. § 426.340(f). At the end of that process, the Board closes the record and issues a decision that the challenged "provision of the NCD is valid" or "is not valid under the reasonableness standard."[4] 42 C.F.R. § 426.550. The Board's decision "constitutes a final agency action and is subject to judicial review" on appeal by an aggrieved party. 42 C.F.R. § 426.566.

[4] Section 426.547(b) states that the Board must make the decision available at the HHS Medicare Internet site and that "the posted decision does not include any information that identifies any individual, provider of service, or supplier." CMS has indicated in the preamble to the Part 426 regulations that this provision was meant to protect the privacy of Medicare beneficiaries such as the AP. *See, e.g.*, 68 Fed. Reg. 63,692, 63,708 (Nov. 7, 2003) ("Board decisions regarding NCDs will be made available on the Medicare Internet site, without beneficiary identifying information").

Case background

The NCD and the NCD record

The challenged NCD, titled "140.3, Transsexual Surgery," states:[5]

> **Item/Service Description**
>
> Transsexual surgery, also known as sex reassignment surgery or intersex surgery, is the culmination of a series of procedures designed to change the anatomy of transsexuals to conform to their gender identity. Transsexuals are persons with an overwhelming desire to change anatomic sex because of their fixed conviction that they are members of the opposite sex. For the male-to-female, transsexual surgery entails castration, penectomy and vulva-vaginal construction. Surgery for the female-to-male transsexual consists of bilateral mammectomy, hysterectomy and salpingo-oophorectomy, which may be followed by phalloplasty and the insertion of testicular prostheses.
>
> **Indications and Limitations of Coverage**
>
> Transsexual surgery for sex reassignment of transsexuals is controversial. Because of the lack of well controlled, long-term studies of the safety and effectiveness of the surgical procedures and attendant therapies for transsexualism, the treatment is considered experimental. Moreover, there is a high rate of serious complications for these surgical procedures. For these reasons, transsexual surgery is not covered.

NCD Record at 93. CMS's predecessor, the Health Care Financing Administration (HCFA), published the NCD in the Federal Register on August 21, 1989.[6] 54 Fed. Reg. 34,555, 34,572 (Aug. 21, 1989); NCD Record at 76, 78, 93, 128. The NCD quotes or paraphrases portions of an 11-page report that the former National Center for Health Care Technology (NCHCT) of the HHS Public Health Service (PHS) issued in 1981, titled

[5] NCDs are available at http://www.cms.gov/medicare-coverage-database/overview-and-quick-search.aspx?list_type=ncd.

[6] The Federal Register notice stated, "This notice lists those current Medicare national coverage decisions which have been issued in the Medicare Coverage Issues Manual (HCFA Pub. 6)." 54 Fed. Reg. at 34,555.

"Evaluation of Transsexual Surgery" (1981 report).[7] NCD Record at 13-23. The NCHCT forwarded the 1981 report to HCFA with a May 6, 1981 memorandum stating that the 1981 report "concludes that transsexual surgery should be considered experimental because of the lack of proven safety and efficacy of the procedures for the treatment of transsexualism" and recommending "that transsexual surgery not be covered by Medicare at this time." *Id.* at 12.

The NCD record includes three April 1982 letters from the American Civil Liberties Union (ACLU) of Southern California disagreeing with HCFA's noncoverage determination. *Id.* at 24-25, 26, 41-42. The ACLU submitted letters and affidavits from physicians and therapists supporting the medical necessity of transsexual surgery and taking issue with the non-coverage determination. *Id.* at 27-75. On May 11, 1982, the HCFA physicians panel, by a vote of five to two, recommended against referring the ACLU's submissions to PHS, "on the basis that it does not contain information about new clinical studies or other medical and scientific evidence sufficiently substantive to justify reopening the previous PHS assessment." *Id.* at 7, 9. Thus, although the NCD was issued in 1989, it was based on the analysis of medical and scientific publications in the 1981 report.

The NCD complaint

The AP in this case, a Medicare beneficiary whose insurer denied a physician's order for sex reassignment surgery (transsexual surgery), filed an acceptable NCD complaint and supporting materials. CMS submitted the NCD record on May 15, 2013, and the AP submitted a statement of why the NCD record is not complete or adequate to support the validity of the NCD under the reasonableness standard (AP Statement) on June 14, 2013. The Board granted unopposed requests by six advocacy organizations to participate as amici curiae in the NCD review by filing written briefs arguing that the NCD was invalid. (Four of the amici submitted a joint brief.)[8]

---

[7] The concluding summary of the 1981 NCHTC report stated in relevant part:

> Transsexual surgery for sex reassignment of transsexuals is controversial. There is a lack of well controlled, long-term studies of the safety and effectiveness of the surgical procedures and attendant therapies for transsexualism. There is evidence of a high rate of serious complications of these surgical procedures. The safety and effectiveness of transsexual surgery as a treatment of transsexualism is not proven and is questioned. Therefore, transsexual surgery must be considered still experimental.

NCD Record at 19.

[8] The six amici are the Human Rights Campaign (HRC) and the World Professional Association for Transgender Health (WPATH), which each submitted briefs, and the FORGE Transgender Aging Network, the National Center for Transgender Equality, the Sylvia Rivera Law Project, and the Transgender Law Center, which submitted a joint brief.

On June 26, 2013, CMS notified the Board that it "declines to submit a response" to the AP's statement. On December 2, 2013, the Board ruled that the NCD record "is not complete and adequate to support the validity of the NCD[.]" *NCD 140.3, Transsexual Surgery*, NCD Ruling No. 2 (Dec. 2, 2013) (NCD Ruling).[9] The parties then jointly reported that they did not intend to submit additional evidence (except for curricula vitae (CVs) of the AP's witnesses) or cross-examine any witness and asked the Board to close the NCD review record to the taking of evidence and decide the case based on the written record.

The Board determined that the new evidence in the record had the potential to significantly affect its review of the NCD and, as required, stayed proceedings for 10 days for CMS to examine the new evidence and decide whether to reconsider the NCD.[10] *Order Closing Record & Staying Proceedings for CMS to Determine Whether to Reconsider NCD* (Feb. 25, 2014) (Order); 42 C.F.R. §§ 426.340(d), 426.505(d)(3). Two days later, CMS informed the Board by email that it "does not wish to reconsider the NCD." On February 28, 2014, the Board lifted the stay and informed the parties that it would proceed to decision.

The record developed before the Board

The record before the Board consists of the NCD record, the briefs submitted by the AP and the amici and evidence submitted by the AP and one of the amici, the Human Rights Campaign. Since neither party submitted argument or evidence (except for the CVs) after the Board's Ruling, the Board treats the AP statement as the AP's brief in this appeal.[11] The AP submitted written declarations made under penalty of perjury from a clinical psychologist and a physician, and two notarized physician letters submitted to an Administrative Law Judge in the Department of Health and Human Services Office of Medicare Hearings and Appeals in another matter. The AP described the witnesses, who are active in the field of treating transgender persons, as experts and submitted their resumes or CVs. AP Statement at 9; AP complaint; AP/CMS e-mail (Jan. 7, 2014).

---

[9] The NCD Ruling is at http://www.hhs.gov/dab/decisions/dabdecisions/ncd1403.pdf.

[10] The Board also published on its website notice providing an additional time period for interested parties to submit participation requests; none were received.

[11] Most of the AP's evidence other than witness statements is an appendix of sources the clinical psychologist cited in her declaration. We refer to these materials as the AP's exhibits (AP Exs.) and cite to the page numbers used in the publications in which they appeared. In addition, the physician's declaration includes an appendix of 20 unnumbered pages of insurance regulations from four states and the District of Columbia barring exclusion of sex reassignment surgery as medically necessary treatment for severe gender dysphoria. One of the amici, the Human Rights Campaign, submitted 62 exhibits with its brief ("HRC Exs.").

CMS did not challenge the witnesses' qualifications as experts or seek to cross-examine them. We summarize their qualifications when we address their testimony below. In this decision we use the term "new evidence" to refer to the evidence submitted to us by the AP and amici to distinguish it from the evidence used to support the NCD which, as noted, consists principally of the 1981 report. Under the regulatory definition in 42 C.F.R. § 426.110, "new evidence" would also include any evidence submitted by CMS in response to an NCD complaint that was not considered by CMS before the NCD was issued. In this case, however, as we discuss below, CMS submitted no "new evidence."

Standard of review

The Board "evaluate[s] the reasonableness" of an NCD by determining whether it "is valid [or] is not valid under the reasonableness standard," which requires us to uphold the NCD "if the findings of fact, interpretations of law, and applications of fact to law by … CMS are reasonable" based on the NCD record and the relevant record developed before us. Act § 1869(f)(1)(A)(iii); 42 C.F.R. §§ 426.110, 426.531(a), 426.550(a). The Board "defer[s] only to the reasonable findings of fact, reasonable interpretations of law, and reasonable applications of fact to law by the Secretary." Act § 1869(f)(1)(A)(iii); 42 C.F.R. § 426.505(b).

During the review, the aggrieved party bears the burden of proof and the burden of persuasion for the issues raised in an NCD complaint; the burden of persuasion is judged by a preponderance of the evidence. 42 C.F.R. § 426.330. CMS has explained that "[s]o long as the outcome [in the NCD] is one that could be reached by a rational person, based on the evidence in the record as a whole (including logical inferences drawn from that evidence), the determination must be upheld," and that if CMS "has a logical reason as to why some evidence is given more weight than other evidence," the Board "may not overturn the determination simply because they would have accorded more weight to the evidence in support of coverage." 68 Fed. Reg. at 63,703.

Analysis

The NCD is invalid because a preponderance of the evidence in the record as a whole supports a conclusion that the NCD's stated bases for its blanket denial of coverage for transsexual surgery are not reasonable.

As previously stated, the NCD was based principally on the 1981 report findings that the safety and effectiveness of transsexual surgery had not been proven. The AP argues that these findings are not "supportable by the current state of medical science" and "not reasonable in light of the current state of scientific and clinical evidence and current medical standards of care" and are contradicted by studies conducted in the 32 years since the 1981 report. AP Statement at 6-7, 14. The amici made similar arguments. *See, e.g.*, WPATH Br. at 13 ("since [the NCD] was issued, it has been repeatedly

demonstrated that SRS [sex reassignment surgery] is safe, effective, and indisputably necessary treatment for certain individuals with severe GID [gender identity disorder]"). As we discuss below, the new evidence, which is unchallenged, indicates that the bases stated in the NCD and the NCD record for denying coverage, even assuming they were reasonable when the NCD was issued, are no longer reasonable.

A. The fact that the new evidence is unchallenged and the NCD record undefended is significant.

As we stated earlier, the AP has the burden of proof by a preponderance of the evidence that an NCD is invalid under a reasonableness standard. In deciding whether the AP has met this burden, we must weigh the evidence in the record before us. Thus, we consider it important to note at the outset that the only evidence before us, other than the record for the NCD, which consists principally of the 1981 report, is the new evidence submitted by the AP and the amicus HRC. CMS submitted the NCD record, as it was required to do, but has not argued that that record or any other evidence supports the NCD. CMS also did not elect to cross-examine the AP's witnesses, has not challenged their testimony or professional qualifications and joined the AP in asking the Board to decide the appeal based on the written record. *See* AP/CMS e-mail (Jan. 7, 2014). The preamble to the regulations that implement the NCD statute states that the "reasonableness standard . . . recognizes the expertise of … CMS in the Medicare program—specifically, in the area of coverage requiring the exercise of clinical or scientific judgment." 68 Fed. Reg. at 63,703 (emphasis added). Accordingly, in determining whether the NCD is valid under the reasonableness standard, we must accord some deference to CMS's position, and its decision not to defend the NCD or challenge the new evidence in this case has some significance for our decision-making.

Apart from the absence of any challenge to the new evidence or defense of the NCD record, we find the new evidence credible and persuasive on its face.[12] We have no difficulty concluding that the new evidence, which includes medical studies published in the more than 32 years since issuance of the 1981 report underlying the NCD, outweighs the NCD record and demonstrates that transsexual surgery is safe and effective and not experimental. Thus, as we discuss below, the grounds for the NCD's exclusion of coverage are not reasonable, and the NCD is invalid.

[12] For this reason, we found it unnecessary to exercise our independent authority to "consult with appropriate scientific or clinical experts concerning clinical and scientific evidence." *See* 42 C.F.R. § 426.531(b).

B. The new evidence indicates acceptance of criteria for diagnosing transsexualism.

Transsexual surgery is a treatment option for the medical condition of transsexualism. The NCD recognized that transsexualism is a diagnosed medical condition. The 1981 report stated that transsexualism "is defined as an overwhelming desire to change anatomic sex stemming from the fixed conviction that one is a member of the opposite sex." NCD Record at 13, citing Dorland's Illustrated Medical Dictionary, 25th ed. The 1981 report recognized that the American Psychiatric Association's Diagnostic and Statistical Manual of Mental Disorders issued in 1980 (DSM III) had "included for the first time the diagnostic category of 'Transsexualism.'" NCD Record at 13. Nonetheless, the 1981 report expressed concern that diagnosing transsexualism was "problematic" because, the report contended, the criteria for establishing the diagnosis "vary from center to center and have changed over time." NCD Record at 14.

One of the AP's expert witnesses, Randi Ettner, Ph.D., a clinical psychologist, testified that the expressed basis for this concern is "completely untrue now." Ettner Supp. Decl. at ¶ 5. Dr. Ettner stated that "Gender Identity Disorder is a serious medical condition codified in the International Classification of Diseases (10th revision; World Health Organization) and the [DSM]."[13] Ettner Decl. at ¶ 10; *see also* Ettner Supp. Decl. at ¶ 6 (similar testimony). She described the condition as follows:

> The disorder is characterized by intense and persistent discomfort with one's primary and secondary sex characteristics—one's birth sex. The suffering that arises is often described as "being trapped in the wrong body." The psychiatric term for this severe and unremitting emotional pain is "gender dysphoria."

Ettner Decl. at ¶ 10. Dr. Ettner's declaration and CV state that she has a doctorate in psychology, has evaluated or treated between 2,500 and 3,000 individuals with GID and mental health issues related to gender variance, has published three books, including *Principles of Transgender Medicine and Surgery*, has authored articles in peer-reviewed journals, and is a member of the board of directors of the World Professional Association for Transgender Health (WPATH) and an author of the WPATH Standards of Care for

[13] The record indicates that the term "transsexualism" that was used in the NCD and the DSM-III was succeeded in the DSM-IV and DSM-V by the terms "Gender Identity Disorder" (GID) and "gender dysphoria." AP Statement at 1 n.1; Ettner Supp. Decl. at ¶ 6; Hsiao Decl. at ¶ 11; AP Ex. 7, at 208; WPATH Br. at 2 n.3. In this decision, we use the term "transsexualism" because it is used in the NCD, but our decision should be read as encompassing the successor terminology as well.

the Health of Transsexual, Transgender, and Gender-Nonconforming People. *Id.* at ¶¶ 3-6; *see also Sundstrom v. Frank*, 630 F. Supp. 2d 974, 986-87 (E.D.Wis. 2007) ("Dr. Ettner's experience speaks for itself … the doctor has conducted research and has been an instructor specializing in the etiology, diagnosis and treatment of GID [and] is the editor of a medical textbook in which she wrote the chapter of that book on the etiology of GID. The court finds that Dr. Ettner is sufficiently qualified to provide expert testimony.").

We find nothing in the new evidence that would undercut Dr. Ettner's statement. The DSM-IV-TR (text revision), published in 2000, continues to recognize "transsexualism" as a diagnosed medical condition, although it refers to the same disorder as GID and identifies criteria for diagnosing GID in adolescents and adults that are consistent with Dr. Ettner's description, albeit more detailed. The criteria include "strong and persistent cross-gender identification (not merely a desire for any perceived cultural advantages of being the other sex)" that is "manifested by symptoms such as a stated desire to be the other sex, frequent passing as the other sex, desire to live or be treated as the other sex, or the conviction that he or she has the typical feelings and reactions of the other sex;" "[p]ersistent discomfort with his or her sex or sense of inappropriateness in the gender role of that sex" that is "manifested by symptoms such as preoccupation with getting rid of primary and secondary sex characteristics (e.g., request for hormones, surgery, or other procedures to physically alter sexual characteristics to simulate the other sex) or belief that he or she was born the wrong sex;" and "[t]he disturbance is not concurrent with a physical intersex condition." AP Ex. 4, at 581. The DSM-IV-TR states that if GID is present in adults, "[t]he disturbance can be so pervasive that the mental lives of some individuals revolve only around those activities that lessen gender distress." *Id.* at 576, 78. The WPATH brief indicates that transsexualism or GID remains a diagnostic category in the fifth edition of the DSM issued in 2013 (DSM-V), which uses the term "Gender Dysphoria." WPATH Br. at 2, n.3.

The DSM has been recognized as a primary diagnostic tool of American psychiatry. *See O'Donnabhain v. Comm'r of Internal Revenue*, 134 T.C. 34, at 60 (2010) (stating "all three experts agree [that the DSM-IV-TR] is the primary diagnostic tool of American psychiatry"); *see also* AP Ex. 3, at 1[14] (resolution of American Medical Association House of Delegates noting the DSM description of GID as "a persistent discomfort with one's assigned sex and with one's primary and secondary sex characteristics, which causes intense emotional pain and suffering" that "if left untreated, can result in clinically significant psychological distress, dysfunction, debilitating depression and, for some people without access to appropriate medical care and treatment, suicidality and death").

[14] American Medical Association House of Delegates, *Resolution 122 (A-08)*, *Removing Financial Barriers to Care for Transgender Patients* (2008).

We conclude that to the extent the NCD was based on concerns expressed in the NCD record about problems diagnosing transsexualism, that concern is unreasonable based on the new evidence.

C. The new evidence indicates that transsexual surgery is safe.[15]

The 1981 report stated that transsexual surgery "cannot be considered safe because of the high complication rates." NCD Record at 18. The 1981 report identified surgical complications including "rectovaginal fistulas, perineal abscesses, introital and deep vaginal stenosis, and vaginal shortening" in male-to-female (MF) patients, and "rejection of the testicular implants, scrotal fusion, and phalloplasty infections" in female-to-male (FM) patients, and states that "[m]ultiple complications for individual patients and secondary surgeries to correct complications or to improve on undesirable results are not uncommon." *Id.* at 15 (citations omitted). The AP argues that "advancements in surgical techniques have dramatically reduced the risk of complications from sex reassignment surgery and the rates of serious complications from such surgeries are low" and that the studies cited in the 1981 report "evaluated outdated surgical techniques that have been replaced with improved, safer procedures." AP Statement at 7, 10. The new evidence supports the AP.

Expert witness Katherine Hsiao, M.D., testified that hysterectomies and mastectomies are common procedures used to treat gender GID in transgender men (FM) and "are routinely performed in other contexts, such as in cases of breast cancer, ovarian cancer, uterine cancer and/or cervical cancer . . . ." Hsiao Decl. at ¶ 11. These procedures, she stated, "have low rates of complications" and are "generally identical whether performed on transgender men to treat gender dysphoria or to treat women for these other conditions."[16] *Id.* Dr. Hsiao also stated that "insurance companies routinely cover the costs associated" with hysterectomies. *Id.* Dr. Hsiao testified that based on her own practice of providing surgery to transgender men, "gender affirming surgeries for transgender men are extremely safe and have very low rates of serious complications,"

---

[15] We are unable to discuss in the space of this decision all of the new evidence and see no need to do so since it is all unchallenged. However, we find nothing in the new evidence not discussed that would alter our conclusion that the NCD is invalid, at least absent argument or counter-evidence from CMS. We have attached to this decision an Overview of the Scientific Literature in the New Evidence.

[16] Dr. Hsiao testified without contradiction that a "serious complication" of surgery–

> is generally understood among surgeons to include death, conditions requiring an unplanned admission to the Intensive Care Unit or unplanned readmission to the hospital within 30 days, severe hemorrhage requiring transfusion of several units of blood product, permanent disability, an intraoperative injury requiring an unplanned intervention during the surgical procedure, permanent brain damage, or cardiac arrest.

Hsiao Decl. at ¶ 9.

that she has performed hysterectomies for transgender men for the past ten years and that those procedures "are generally identical to the ones I perform on women to treat early cancer or other conditions." *Id.* at ¶ 20. Dr. Hsiao reports having "typically performed multiple obstetrical, gynecologic, or other pelvic surgeries every week, including but not limited to hysterectomies and other advanced pelvic surgeries targeting the reproductive system and adjacent organs . . . ." *Id.* at ¶ 6. Dr. Hsiao's declaration and CV indicate that she is certified by the American Board of Obstetrics and Gynecology, is the chief of the division of gynecology and the director of Ob/Gyn resident education at a California medical center and an assistant clinical professor in the department of obstetrics, gynecology and reproductive medicine at the University of California at San Francisco. *Id.* at ¶¶ 3-6; CV.

Dr. Hsiao further stated, regarding MF transsexual surgery, that she has been part of a surgical team that performed surgery to create a neovagina in women born with a congenital "complete or partial absence of a vagina, cervix, and uterus," a condition called Mayer-Rokitansky-Kuster-Hauser syndrome, or MRKH. Hsiao Decl. at ¶ 12. She stated that this procedure has "a low rate of complications," and that the associated surgical costs are, in her experience, "routinely cover[ed]" by insurance companies for women born with MRKH. She stated that while women with MRKH "can never have biological children … the role of surgery is essential to affirm their gender identity and to align their anatomy with that identity." *Id.*

Dr. Ettner stated that "[t]here is no scientific or medical basis" for the NCD's statement that sex reassignment surgery has not been proven safe and has a high rate of serious complications; that the "[r]ates of complications during and after sex reassignment surgery are relatively low, and most complications are minor;" and that the risk of complications "has, moreover, been dramatically reduced since 1985." Ettner Decl. at ¶¶ 32, 34. Dr. Ettner testified that during eight years at the Chicago Gender Clinic she "regularly consulted with our surgeon" and is "aware of only two major surgical complications, both of which were immediately repaired." *Id.* at ¶ 36. She stated that the clinic "as a whole has a 12 percent complication rate for genital surgery" and that "the vast majority of those complications [were] minor, all were easily corrected, and none involved surgical site infection or readmission." *Id.* Dr. Ettner stated the 1981 report's discussion of surgical complication rates was "outdated and irrelevant based on current medical practices and procedures." Ettner Supp. Decl. at ¶ 9. In particular, she stated that one of the studies cited in the 1981 report's discussion of complications (Laub & Fisk 1974) reflected the use of a MF surgical technique that "led to unacceptably high rates of fistulae and other complications" and was later abandoned by the study's authors. *Id.* at ¶ 10.

Another of the AP's expert witnesses, Marci L. Bowers, M.D., stated in her notarized letter that in her experience of performing gender-related surgeries, transsexual surgery "does not have a higher rate of complication than any other surgery, and in fact has very

few complications, which are mainly minor in nature." Bowers Letter at 1 (Mar. 5, 2013), Att. to AP Statement. Dr. Bowers stated that she performs approximately 220 gender-related surgeries annually and has performed over 1000 "Male to Female Gender Corrective Surgeries." *Id.* Her CV indicates that she has served as the Chair of the Department of Obstetrics and Gynecology at the Swedish (Providence) Medical Center in Seattle.

The fourth expert witness, Sherman N. Leis, M.D., stated that he personally "perform[s] several gender reassignment procedures each week" and has "seen only relatively minor complications which are easily treated" and has "thus far seen no life threatening complications from any of the transgender surgeries" he has performed. Leis Letter at 2 (Feb. 28, 2013), Att. to AP Statement. Dr. Leis's letter and CV indicate that he is Board-certified in plastic and reconstructive surgery and in general surgery. *Id.* at 1.

The testimony of Drs. Ettner and Hsiao is based on studies as well as personal experience. Dr. Hsiao testified that she reviewed five studies in the AP exhibits "that include complication rate data and information for gender affirming surgeries performed in recent years" and that "[n]one of these five studies reported high rates of serious complications." Hsiao Decl. at ¶¶ 13-14, citing studies at AP Exs. 2, 9, 14, 21, 28. She stated that "almost all of the complications listed in these studies, such as urinary incontinence or retention, stenosis or stricture, bleeding, recto-vaginal fistula, and partial necrosis, are not specific to sex reassignment surgeries, but rather are known potential side effects of any type of urogenital surgery which are covered by Medicare." *Id.* at ¶ 15. She further testified that "every complication tracked in [Jarolim, et al. (2009)] for instance, falls into this category and none of them are serious;" that "[t]he Spehr (2007) study includes similar types of complications at very low rates;" and that "none of the complications listed in Lawrence (2006) are serious and many of them are consistent with what would be potential, expected outcomes for any urogenital surgery." *Id.* at 15-17, citing studies at AP Exs. 14,[17] 21,[18] 28.[19] She also stated that of the four "potentially serious" complications noted in the Amend (2013) study of 24 MF patients, none "were serious as that term is generally understood." *Id.* at ¶ 14, citing study at AP Ex. 2.[20]

---

[17] Ladislav Jarolim, et al., *Gender Reassignment Surgery in Male-to-Female Transsexualism: A Retrospective 3-Month Follow-up Study with Anatomical Remarks*, 6 J. Sex. Med. 1635-44 (2009).

[18] Anne A. Lawrence, *Patient-Reported Complications and Functional Outcomes of Male-to-Female Sex Reassignment Surgery*, 35 Arch. Sex. Behav. 717-27 (2006).

[19] Christiane Spehr, *Male-to-Female Sex Reassignment Surgery in Transsexuals*, 10 Int'l J. Transgenderism 25-37 (2007).

[20] Bastian Amend, et al., *Surgical Reconstruction for Male-to-Female Sex Reassignment*, 64 Eur. Urol. 1-9 (2013).

Dr. Hsiao further stated that Eldh et al. (1997) compared complication rates for surgeries performed before and after 1986 and showed that "[n]early all of the surgical complication rates decreased significantly over time." Hsiao Decl. at ¶ 18, citing study at AP Ex. 9.[21] Dr. Hsiao stated that "fistulas, in particular, which are a risk of many urogenital surgeries, decreased from 18 percent in surgeries before 1986 to only 1 percent between 1986 and 1995," and that "the only fistula that occurred after 1985 'closed spontaneously,' meaning without the need for any medical intervention." *Id.* Eldh, Dr. Hsiao stated, showed that "[t]here is not a high rate of serious complications in any of the surgeries performed after 1986" and she noted that "there have been nearly 20 years of additional surgical progress since the last surgery tracked." *Id.*

Dr. Ettner cited the same five studies as showing that surgical outcomes were "far superior" after 1985 due to "improvements in technique, shortened hospital stays and improvements in postoperative care;" that significant surgical complications were uncommon; that only a low percentage of patients experienced complications, which were successfully resolved; and that "the complication rate is low and most complications can be overcome by adequate correctional interventions." Ettner Decl. at ¶¶ 34-35.

We find no reason to discount the opinions of these experts or their representations regarding the findings in the studies they cite. We have conducted our own review of the studies cited by Dr. Hsiao and Dr. Ettner and find them consistent with these opinions and representations. We note, for example, that Eldh, which divided the study group into those operated on before 1986 and those operated on from 1986–1995, made findings tending to support these expert opinions. The Eldh study states:

> After 1985 the outcome of surgery became much better not only because of changes in management but also because of improvements in surgical technique, preoperative planning, and postoperative treatment. Total time spent in hospital decreased dramatically after 1985 because the number of procedures was less and the rate of early and late postoperative complications dropped. Haemorrhage and haematoma were common in both groups, predominantly originating from the spongious tissue of the urethra. Infections occurred less often in the late group perhaps as a result of peroperative antibiotic prophylaxis. Serious complications like fistula formation and partial flap necrosis were rare after 1985, though they were common before then. The reason for the lower fistula rate in the later group may be ascribed to better anatomical knowledge of this region and a more precise surgical technique. There was only one rectovaginal fistula after 1985 and this fistula closed spontaneously.

[21] Jan Eldh, *et al.*, *Long-Term Follow Up After Sex Reassignment Surgery*, 31 Scand. J. Plast. Reconstr. Surg. Hand Surg. 39-45 (1997).

AP Ex. 9, at 44. Dr. Hsiao stated that those findings are "consistent with what I would expect to find when comparing surgeries, and surgical techniques, over a long period of time." Hsiao Decl. at ¶ 18; *see also* WPATH Br. at 9-10 (citing Eldh and stating that "while early sex reassignment surgeries were sometimes accompanied by serious complications like fistulas or necrotic tissue, the rate of such complications has dropped dramatically with the advent of more sophisticated surgical techniques, among other reasons").

We conclude that the AP has shown that the NCD's statement that transsexual surgery is unsafe and has a high rate of complications is not reasonable in light of the evolution of surgical techniques and the studies of outcomes discussed in the unchallenged new evidence presented here.

D. The new evidence indicates that transsexual surgery is an effective treatment option in appropriate cases.[22]

1. The expert testimony and studies on which the experts rely support the surgery's effectiveness.

The AP argues that studies conducted after the 1981 report was issued confirm that transsexual surgery is an effective treatment for persons with severe gender dysphoria, and the expert testimony and studies support that argument. AP Statement at 7-8.

Dr. Ettner testified that "[b]ased on decades of extensive scientific and clinical research, the medical community has reached the consensus that altering a transsexual individual's primary and secondary sex characteristics is a safe and effective treatment for persons with severe Gender Identity Disorder." Ettner Decl. at ¶ 13.[23] With regard to effectiveness in particular, Dr. Ettner testified that "more than three decades of research confirms that sex reassignment surgery is therapeutic and therefore an effective treatment for Gender Identity Disorder" and that "for many patients with severe Gender Identity

---

[22] We use the term "appropriate cases" because we do not read the new evidence as necessarily stating that transsexual surgery is appropriate in all cases of transsexualism, and our conclusion that the NCD's blanket preclusion of Medicare coverage for transsexual surgery is invalid does not require a finding to that effect. However, it is worth noting that WPATH has developed, in its standards of care, criteria for the use of different transsexual surgical procedures. *See, e.g.*, WPATH "[c]riteria for hysterectomy and salpingooophorectomy in [FM] patients and for orchiectomy in [MF] patients." AP Ex. 7, at 202 (E. Coleman, et al., *Standards of Care for the Health of Transsexual, Transgender, and Gender-Nonconforming People*, Version 7, 13 Int'l J. Transgenderism 165–232 (2011)).

[23] Dr. Ettner in her declaration focuses on genital surgery for the male-to-female (MF) transsexual. *See* Ettner Decl. at ¶ 8. Dr. Hsiao's testimony addressed procedures performed on FM patients. Hsiao Decl. at ¶¶ 7, 11, 20-21.

Disorder, sex reassignment surgery is the only effective treatment." *Id.* at ¶ 19. She concluded that "[t]he NCD's determination regarding efficacy is not reasonably supported by scientific or clinical evidence, or standards of professional practice, and fails to take into account the robust body of research establishing that surgery relieves, and very often completely eliminates, gender dysphoria." *Id.* at ¶ 31.

Dr. Bowers stated that "[m]any patients report a dramatic improvement in mental health following surgery, and patients have been able to become productive members of society, no longer disabled with severe depression and gender dysphoria." Bowers Letter at 1. She concluded that "Gender Corrective Surgery has been shown to be a life-saving procedure, and is unequivocally medically necessary." *Id.* Dr. Leis stated that "[m]edical literature reports a dramatic drop in the incidence of depression and suicide attempt[s] by individuals who have undergone gender reassignment, indicating that many lives have been saved because of this surgery," that "there is a very low incidence of 'regret'" of "only about 1% of patients who have had gender reassignment surgery" and that "I personally have never had a single patient who has regretted having this surgery." Leis Letter at 2.

Dr. Ettner cited 20 studies published between 1987 and 2010 as showing the effectiveness of transsexual surgery. Ettner Decl. at ¶¶ 20-26, 28-30. She emphasized three studies, two of which were published in 1998 and 2007 and analyze other studies of the treatment of transsexuals published during the years 1961 to 1991 and 1990 to 2007, respectively. *Id.* at ¶¶ 20-22, citing studies at AP Exs. 10, 25, 27; *see also* WPATH Br. at 7-8 (discussing the same three studies). The 1998 study (Pfafflin & Junge) reviewed "30 years of international follow-up studies of approximately two thousand persons who had undergone sex reassignment surgery" including more than 70 individual studies and eight published reviews from four continents. AP Ex. 25 at unnumbered page 1.[24] As "general results," the researchers in the 1998 study stated that the studies they reviewed concluded "that gender reassigning treatments are effective," that positive, desired results outweigh the negative or non-desired effects, and that "[p]robably the most important change that is found in most research is the increase of subjective satisfaction [which] contrasts markedly to the subjectively unsatisfactory start position of the patients." *Id.* at 45, 49. The study's summary, which it qualified as a "simplification," stated that the studies reviewed show that "[i]n over 80 qualitatively different case studies and reviews from 12 countries, it has been demonstrated during the last 30 years that the treatment that includes the whole process of gender reassignment is effective." *Id.* at 66. The summary stated that all "follow-up studies mostly found the desired effects" the most important of

[24] Friedemann Pfafflin & Astrid Junge, *Sex Reassignment: Thirty Years of International Follow-Up Studies After Sex Reassignment Surgery: A Comprehensive Review 1961-1991* (Roberta B. Jacobson & Alf B. Meier trans., 1998) (1992) (http://web.archive.org/web/20061218132346/http://www.symposion.com/ijt/pfaefflin/1000.htm, accessed May 29, 2014).

which the patients felt were "the lessening of suffering" and "desired changes in the areas of partnership and sexual experience, mental stability and socio-economic functioning level." *Id.* at 66-67.

The 2007 study, Gijs & Brewaeys, which examined the results of 18 studies published between 1990 and 2006, states that sex reassignment "is the most appropriate treatment to alleviate the suffering of extremely gender dysphoric individuals" and that "96% of the persons who underwent [surgery] were satisfied and regret was rare." AP Ex. 10, at 215, cited in Ettner Decl. at ¶ 22, WPATH Br. at 7.[25] Two of the reviewed studies showed that "[s]uicidality was significantly reduced postoperatively" and that in MF patients there were no suicide attempts after surgery as opposed to three attempts before surgery. AP Ex. 10, at 188, 192.

Dr. Ettner and WPATH also cited what Dr. Ettner described as "a large-scale prospective study" finding "that after surgery there was 'a virtual absence of gender dysphoria' in the cohort and that the 'results substantiate previous conclusions that sex reassignment is effective.'" Ettner Decl. at ¶ 21, citing Smith et al. (2005), AP Ex. 27;[26] WPATH Br. at 8. Dr. Ettner concluded that Smith et al. and other studies have, variously, "shown that by alleviating the suffering and dysfunction caused by severe gender dysphoria, sex reassignment surgery improves virtually every facet of a patient's life," including "satisfaction with interpersonal relationships and improved social functioning," "improvement in self-image and satisfaction with body and physical appearance," and "greater acceptance and integration into the family[.]" Ettner Decl. at ¶ 24, citing studies at AP Exs. 1, 12, 15, 19, 22, 26, 27, 30. She also cited nine studies as having "shown that surgery improves patients' abilities to initiate and maintain intimate relationships." *Id.* at ¶ 25, citing studies at AP Exs. 8, 13, 14, 16, 20-22, 26, 27.

Based on our own review of the cited studies, we find no reason to question the expert testimony about them. In general, the studies included interviewing post-operative patients with a variety of surveys or questionnaires to assess changes in different aspects of their lives and psychological symptoms following surgery. The studies also generally used statistical techniques to assess the results. The studies were conducted in countries including the United States, Canada, Sweden, the Czech Republic, Israel, Brazil, The Netherlands, and Belgium.

[26] Yolanda L.S. Smith et al., *Sex Reassignment: Outcomes and Predictors of Treatment for Adolescent and Adult Transsexuals,* 35 Psychol. Med. 89-99 (2005).

We note that these studies are scientific writings and do not make sweeping pronouncements or claim discoveries beyond possible doubt. Indeed, the authors sometimes qualify the results and caution against drawing overly broad and simplistic conclusions. *See, e.g.*, AP Ex. 25, at 66 (Pfafflin & Junge, qualifying the study's summary of its conclusion as a simplification). This, in our view, enhances their facial credibility. Nonetheless, even keeping in mind the possible limitations of these studies, they support the AP's position that transsexual surgery has gained broad acceptance in the medical community.

2. *The 1981 report's expressed concern about an alleged lack of controlled, long-term studies is not reasonable in light of the new evidence.*

The 1981 report summarized the findings of nine studies on "[t]he result or outcome of" transsexual surgery. NCD record at 15-18. With respect to those studies, the report stated that "surgical complications are frequent, and a very small number of post-surgical suicides and psychotic breakdowns are reported." *Id.* at 17-18. However, the report also acknowledged that eight of those nine studies "report that most transsexuals show improved adjustment on a variety of criteria after sex reassignment surgery, and that "[i]n all of these studies the large majority of those who received surgery report that they are personally satisfied with the change[.]" NCD Record at 17. Notwithstanding its discussion of these studies, the 1981 report (and the NCD) cited an alleged "lack of well controlled, long term studies of the safety and effectiveness of the surgical procedures and attendant therapies for transsexualism" as a ground for finding the procedures "experimental." *Id.* at 19. The 1981 report did not define "long term" for the purpose of assigning weight to study results and the NCD record provided no clarification of that phrase. The 1981 report noted "post-operative followup" and "followup" times for eight of the nine studies on the outcomes of surgery, with "average," "mean" or "median" periods ranging from 25 months to over eight years, and individual periods from three months to 13 years. NCD Record at 15-17. If these studies do not qualify as acceptable long-term studies, the basis for such a conclusion is not adequately explained in the NCD record.

Even assuming the studies cited in the 1981 report could be viewed as not sufficiently "long-term," Dr. Ettner stated that "there are numerous long-term follow-up studies on surgical treatment demonstrating that surgeries are effective and have low complication rates" and, as discussed above, her testimony cited some of those studies. Ettner Decl. at ¶ 26. CMS does not challenge this statement, and we find no reason to question it. We note that the participants in one study Dr. Ettner cited had a mean interval since

vaginoplasty of 75.46 months. AP Ex. 30, at 754.[27] We also note that the 18 studies published between 1990 and 2006 and encompassing 807 MF and FM patients analyzed in Gijs & Brewaeys (2007) had mean follow-up durations ranging from six months to as long as (in one study) 168 months. AP Ex. 10, at 186-87.[28] Additionally, two studies Dr. Ettner cited appear to be long term in that they studied patients who had undergone surgery during periods of 14 and 20 years, respectively. AP Exs. 13,[29] 29.[30] Those studies reported favorable overall results.

Dr. Ettner also testified that two studies from 1987 and 1990 used control groups and found improved psychosocial outcomes in surgery patients. Ettner Decl. at ¶¶ 28-30. In the 1990 study, she stated, MF patients were "matched for family and psychiatric histories and severity of the [GID] diagnosis" and "randomly assigned either to immediately undergo surgery, or be placed on a waiting list for two years." *Id.* at ¶ 29, citing study at AP Ex. 23.[31] The study found that patients who underwent surgery "demonstrated dramatically improved psychosocial outcomes, compared to the still-waiting controls" and "were more active socially and had significantly fewer psychiatric symptoms." *Id.*; *see also* WPATH Br. at 8 (study found "comparative improvements in neurotic symptoms and social activity for the group receiving surgery"). Dr. Ettner described the 1990 study as the "best example of a well-controlled investigation." Ettner Decl. at ¶ 29. Dr. Ettner also described a 1987 study comparing transsexuals who had undergone surgery with "those who had not, but were otherwise matched (control group)" as finding that "the patients who underwent surgery were better adjusted psychosocially, had improved financial circumstances, and reported increased satisfaction with sexual experiences, as compared to the unoperated group." *Id.* at ¶ 30, citing study at AP Ex. 17.[32]

Nothing in the record puts into question the authoritativeness of the studies cited in the new evidence based on methodology (or any other ground). Even if questions about methodology had been raised, we would be hard pressed to find that this alone would justify our not crediting the new evidence that transsexual surgery is effective and safe. This is particularly true since the 1981 report itself suggested it might be impossible to find the kind of adequate control groups needed to assuage this criticism. *See* NCD Record at 18 (stating the need for adequate control groups and stating "perhaps this is impossible."). We note that in the local coverage determination (LCD) context, CMS guidance for contractors states that the determinations "shall be based on the strongest evidence available." CMS Medicare Program Integrity Manual (MPIM), CMS Pub. 100-08, Ch. 13, § 13.7.1.[33] While the guidance states a "preference" for "[p]ublished authoritative evidence derived from definitive randomized clinical trials or other definitive studies . . .," it also includes as evidence meeting that standard, "[g]eneral acceptance by the medical community (standard of practice), as supported by sound medical evidence . . . ."[34] *Id.* In *LCD Complaint: Homeopathic Med. & Transfer Factor*, DAB No. 2315 (2010), the Board relied on that guidance when rejecting the argument that a certain type of controlled study was the sole basis on which a determination of medical necessity could be supported. The Board stated, "[a]s the [CMS guidance] explains, general acceptance in the medical community may be sufficient if it has scientific support." DAB No. 2315, at 34. While the guidance applies to contractors, who develop LCDs but not NCDs, it is instructive here as representing CMS's determination of the type of evidence that may support Medicare coverage. Regardless of whether the new evidence here meets the first option for meeting the evidentiary standard set forth in the guidance (and CMS does not assert that it does not), it clearly meets the second option because it indicates a consensus among researchers and mainstream medical organizations that transsexual surgery is an effective, safe and medically necessary treatment for transsexualism.

Based on the record as a whole, including the new evidence discussed above, we conclude that the AP has shown that transsexual surgery is an effective treatment option for transsexualism in appropriate cases.

---

[33] CMS Manuals are available at http://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Internet-Only-Manuals-IOMs.html, accessed May 14, 2014.

[34] The guidance further provides that the "sound medical evidence" supporting this "general acceptance" should be based on "[s]cientific data or research studies published in peer-reviewed medical journals; … [c]onsensus of expert medical opinion (i.e., recognized authorities in the field); or … [m]edical opinion derived from consultations with medical associations or other health care experts." MPIM § 13.7.1.

E. The new evidence indicates that the NCD's rationale for considering the surgery experimental is not valid.

The NCD asserted that transsexual surgery was considered experimental because it had not been shown to be safe and effective.[35] The 1981 report stated that transsexual surgery "must be considered still experimental" because "[t]he safety and effectiveness of transsexual surgery as a treatment of transsexualism is not proven and is questioned." NCD Record at 19. As discussed above, the unchallenged new evidence indicates that transsexual surgery is a safe and effective treatment option for transsexualism in appropriate cases. Accordingly, the NCD's reasons for asserting that transsexual surgery was experimental are no longer valid.

In addition, the new evidence independently indicates that transsexual surgery is not considered experimental in a broader sense relating to its acceptance as a treatment for transsexualism. Dr. Bowers stated that "[m]any thousands of gender corrective surgeries have been performed worldwide for decades, and this treatment is in no way experimental." Bowers Letter at 1. Dr. Hsiao testified that there is "no scientific or medical basis for [the NCD's] description of gender affirming surgeries as 'experimental.'" Hsiao Decl. at ¶ 22. Dr. Hsiao, as noted, stated that some of the procedures involved in transsexual surgery are routinely performed in other contexts, and that surgery to create a neovagina is performed on women born MRKH. Hsiao Decl. at ¶¶ 11, 12; *see* Ettner Supp. Decl. at ¶ 15 ("mastectomies, hysterectomies and salpingo-oophorectomies, which are … excluded from coverage under [the NCD] are performed frequently… when indicated for medical conditions other than gender dysphoria").

Dr. Hsiao cited the "increasing coverage of sex affirming surgeries by private and public medical plans" and the inclusion of those surgeries "in prominent surgical text books" as showing that "gender affirming surgeries … are the standard of care and are not experimental." *Id.* at ¶¶ 23, 24. Dr. Hsiao cited California managed care guidance "clarifying that any attempt 'to exclude insurance coverage of [] transsexual surgery'" would violate California law, and she stated that Vermont, Colorado, Oregon, and Washington, D.C. "have issued similar insurance directives prohibiting discrimination based on gender identity with respect to healthcare policies." *Id.* at ¶ 25, citing Letter No. 12-K: Gender Nondiscrimination Requirements, Calif. Dep't of Managed Health Care

[35] "Because of the lack of well controlled, long-term studies of the safety and effectiveness of the surgical procedures and attendant therapies for transsexualism, the treatment is considered experimental." NCD Record at 93.

(Apr. 9, 2013), Ex. A to Hsiao Decl.[36] "These events in the private and public sector," Dr. Hsiao stated, "solidify what the medical community has known for years—that gender affirming surgeries to treat gender dysphoria are evidence-based, medically necessary, and the standard of care for these patients." *Id.* at ¶ 26.

Dr. Leis stated that gender reassignment surgery "is not experimental and has been performed thousands of times with surgeons around the world and has been proven to be a medically necessary and successful treatment, saving many lives and significantly improving the lives of those who undergo this surgery." Leis Letter at 2. Dr. Leis also stated that "[m]edical and mental health professionals who are knowledgeable and experienced in this field recognize that counseling or psychotherapy, hormone therapy and genital reassignment surgery are medically necessary treatment modalities for many individuals with [GID]" and that those therapies "are widely accepted treatments for individuals with significant [GID] in the United States and in many other countries." *Id.* at 1. Dr. Leis also pointed to the acceptance of transsexual surgery procedures "as standard therapy by leading medical and mental health organizations" including the American Medical Association, the National Association of Social Workers, the American Psychological Association, the American Psychiatric Association, "and experts in the field belonging to" WPATH. *Id.* at 2.

HRC stated that its "Corporate Equality Index" annually surveys the "LGBT [lesbian, gay, bisexual and transgender] workplace policies" of "the Fortune 1000 list of the largest publicly traded companies along with American Lawyer Magazine's top 200 revenue-grossing law firms" and considers "whether these organizations afford transgender-inclusive health care options through at least one firm-wide plan that covers surgical procedures." HRC Br. at 1, 11-12. HRC stated that in 2002, "zero percent of the rated companies had such plans" but "by 2008, nineteen percent met this criterion, and by 2013, forty-two percent of companies expressly covered" care related to gender reassignment. *Id.* citing HRC Ex. 30, at 28.[37]

Dr. Bowers, Dr. Hsiao and Dr. Ettner cited acceptance of the WPATH standards of care, which were first published in 1979 and last revised in 2011, as evidence that transsexual surgery is not experimental. Bowers Letter at 1; Hsiao Decl. at ¶ 22; Ettner Decl. at ¶¶ 38, 39; AP Ex. 7, at 165; *see also* AP Ex. 3 (AMA resolution stating that "[h]ealth experts in GID, including WPATH, have rejected the myth that such treatments are "cosmetic" or "experimental" and have recognized that these treatments can provide safe and effective treatment for a serious health condition"). The new evidence indicates that

[36] http://www.dmhc.ca.gov/library/reports/news/dl12k.pdf, accessed May 14, 2014.

[37] HRC Corporate Quality Index (2013), available at http://www.hrc.org/corporate-equality-index, accessed April 25, 2014.

the WPATH standards of care have attained widespread acceptance.[38] S*ee* Hsiao Decl. at ¶ 22 ("the WPATH established standards of care for patients with gender dysphoria … have been endorsed by the American Medical Association, the Endocrine Society, the American Psychological Association, and the American College of Obstetricians and Gynecologists"); AP Ex. 3 (AMA resolution stating that WPATH is "the leading international, interdisciplinary professional organization devoted to the understanding and treatment of gender identity disorders" and that its "internationally accepted Standards of Care for providing medical treatment for people with GID … are recognized within the medical community to be the standard of care for treating people with GID"). Federal courts have recognized the acceptance of the WPATH standards of care. *See, e.g.*, *De'lonta v. Johnson*, 708 F.3d 520, at 522-23 (4th Cir. 2013) (WPATH standards of care "are the generally accepted protocols for the treatment of GID"); *Glenn v. Brumby*, 724 F. Supp. 2d 1284, at 1289 n.4 (N.D. Ga. 2010) ("there is sufficient evidence that statements of WPATH are accepted in the medical community")."[39] The acceptance of the WPATH standards of care also suggests that transsexual surgery is no longer considered experimental.

In its amicus brief, WPATH cited a 2007 study that examined the results of 18 studies published between 1990 and 2006 as showing "that [sex reassignment surgery] can no longer be considered an experimental treatment" and that "it [has] bec[o]me the dominant treatment for transsexuality and the *only* treatment that has been evaluated empirically." WPATH Br. at 7-8, citing AP Ex. 10, at 214-15.[40]

We note that in addition to stating that transsexual surgery was experimental, the NCD and the 1981 report stated that transsexual surgery was "controversial." NCD Record at 18 (1981 report stating that "[o]ver and above the medical and scientific issues, it would also appear that transsexual surgery is controversial in our society"). The AP and the new evidence dispute the relevance of this statement. The AP objected that this point relies on two "polemics" that are "are either completely unscientific or fall far outside the scientific mainstream," and Dr. Ettner stated that the views expressed therein "fall far outside the mainstream psychological, psychiatric, and medical professional consensus,

---

[38] WPATH was "formerly the Harry Benjamin International Gender Dysphoria Association." Ettner Decl. at ¶ 6. Harry Benjamin, M.D. "was an endocrinologist who in conjunction with mental health professionals in New York did pioneering work in the study of transsexualism." *O'Donnabhain v. Comm'r of Internal Revenue*, 134 T.C. 34, 37 n.8 (2010). The 1981 report cites a 1966 study by Dr. Benjamin finding a positive outcome from MF transsexual surgery as "perhaps the first report" on transsexual surgery "in the literature." NCD Record at 15, 21.

[39] The general acceptance of a set of standards of care for the treatment of transsexuals appears to render invalid one of the 1981 report criticisms of the studies it discussed, that "therapeutic techniques are not standardized." NCD Record at 18.

[40] Luk Gijs & Anne Brewaeys, *Surgical Treatment of Gender Dysphoria in Adults and Adolescents: Recent Developments, Effectiveness, and Challenges,* 18 Ann. Rev. Sex Res. 178-224 (2007).

and call into question the objective reasonableness of the NCD." AP Statement at 15-16; Ettner Supp. Decl. at ¶¶ 17-18. CMS has not asserted that the Board's decision may be based on factors "over and above the medical and scientific issues" involved. Considerations of social acceptability (or nonacceptability) of medical procedures appear on their face to be antithetical to Medicare's "medical necessity" inquiry, which is based in science, and such considerations do not enter into our decision that the NCD is not valid.

For the reasons stated above, we conclude that citing the alleged "experimental" nature of transsexual surgery as a basis for noncoverage of all transsexual surgery is not reasonable in light of the unchallenged new evidence and contributes to our conclusion that the NCD is not valid.

Conclusion

For the reasons explained above, we conclude that the AP has shown that NCD 140.3 is not valid under the reasonableness standard.

ATTACHMENT TO DECISION NO. 2576

Overview of the Scientific Literature in the New Evidence

We provide below brief summaries of key findings in some of the studies submitted and reviewed by the Board as new evidence. The key findings in the remaining studies reviewed by the Board (also as new evidence) do not differ in any way material to our decision.

Jan Eldh, et al., *Long Term Follow Up After Sex Reassignment Surgery*, 31 Scand. J. Plast. Reconstr. Surg. Hand Surg. 39-45 (1997), AP Ex. 9. This study was a "long-term follow up of 136 patients operated on for sex reassignment … to evaluate the surgical outcome" that divided MF and FM patients into "two groups according to the surgical technique: those operated on before 1986 and those operated on from 1986–1995." The study found that after 1985 "the outcome of surgery became much better not only because of changes in management but also because of improvements in surgical technique, preoperative planning, and postoperative treatment," that "[m]odern surgical techniques can give good aesthetic and functional results" and that "[p]ersonal and social instability before operation correlated with an unsatisfactory outcome of sex reassignment." *Id.* at 39, 44, 45.

Luk Gijs & Anne Brewaeys, *Surgical Treatment of Gender Dysphoria in Adults and Adolescents: Recent Developments, Effectiveness, and Challenges,* 18 Ann. Rev. Sex Res. 178-224 (2007), AP Ex. 10. This study examined results of 18 international studies published between 1990 and 2006 that reported follow-up data of at least one year from 807 persons who had undergone sex reassignment surgery (193 FM, 614 MF). The purpose of this study was to update and assess the current validity of a conclusion in a 1990 article (based itself on review of 11 studies following post-operation) that transsexual surgery is an effective treatment for the alleviation of gender disorder in adults. This study concluded that "[d]espite methodological shortcomings of many of the studies . . . SRS is an effective treatment for transsexualism and the only treatment that has been evaluated empirically with large clinical case series" and that the "conclusion that SR [sex reassignment] is the most appropriate treatment to alleviate the suffering of extremely gender dysphoric individuals still stands: 96% of the persons who underwent SRS were satisfied and regret was rare." The authors noted that the methodologies and designs of later studies were improved but that true randomized control studies are not feasible, and might be unethical for SRS. *Id.* at 178, 185, 215-16.

Ciro Imbimbo, M.D. Ph.D., et al., *A Report from a Single Institute's 14-Year Experience in Treatment of Male-to-Female Transsexuals*, 6 J. Sex. Med. 2736-45 (2009), AP Ex. 13. This study's aim was "to arrive at a clinical and psychosocial profile of male-to-female transsexuals in Italy through analysis of their personal and clinical experience and evaluation of their postsurgical satisfaction levels SRS." From January 1992 to September 2006, 163 MF patients who had undergone SRS were asked to complete

patient satisfaction questionnaires. The study concluded that the "relatively high satisfaction level" was the result of a combination of "competent surgical skills, a well-conducted preoperative preparation program, and adequate postoperative counseling . . . ." Although postoperative pain and required revision surgeries were reported, the study found that 94% were satisfied with their post-surgical status and did not report regret. *Id.* at 2736, 2740, 2743.

Ladislav Jarolim, et al., *Gender Reassignment Surgery in Male-to-Female Transsexualism: A Retrospective 3-Month Follow-up Study with Anatomical Remarks*, 6 J. Sex. Med. 1635-44 (2009), AP Ex. 14. This study aimed "[t]o evaluate the results of surgical reassignment of genitalia in male-to-female transsexuals" by measuring "[s]exual functions and complications 3 months after surgery." The study followed 134 patients who had undergone surgical procedures between 1992 and 2008 and described the evolution in surgical techniques since the 1950s. Although the study noted potential complications and risks specific to SRS ("such as impairment of urinary continence, fecal continence, intestinal fistula, urinary fistula, and necrosis of the skin graft"), it concluded that "[s]urgical conversion of the genitalia is a safe and important phase of the treatment of male-to-female transsexuals." It also concluded that "[a]n increasing number of patients undergo this treatment because of the extensive progress in surgery involving the genitals and urethra" and that "[f]or male transsexuals, surgery can provide a cosmetically acceptable imitation of female genitals that enables coitus with orgasm." *Id.* at 1635-36,1642-43.

Annika Johansson, et al., *A Five-Year Follow-Up Study of Swedish Adults with Gender Identity Disorder,* 39 Arch. Sex. Behav. 1429-37 (2010), AP Ex. 15. This study evaluated from the perspective of both clinicians and patients the outcome of sex reassignment of "42 [MF and FM] transsexuals [who] completed a follow-up assessment after 5 or more years in the process or 2 or more years after completed sex reassignment surgery." It found that "the outcome was very encouraging from both perspectives … with almost 90% enjoying a stable or improved life situation at follow-up and only six out of 42 (according to the clinician) with a less favorable outcome." *Id.* at 1429, 1436.

G. Kockott, M.D. & E. M. Fahrner, Ph.D., *Transsexuals Who Have Not Undergone Surgery: A Follow-Up Study,* 16 Archives of Sexual Behavior 511-22 (1987), AP Ex. 17. This single-clinic study compared 26 transsexuals who sought but did not undergo surgery with 32 who did; psychosocial adjustment of those who delayed surgery did not improve from the time of diagnosis to follow-up while statistically significant positive changes in gender role, sexual, and socioeconomic adjustment were seen in transsexuals who had had surgery. *Id.* at 511, 517-19, 521.

Anne A. Lawrence, *Patient-Reported Complications and Functional Outcomes of Male-to-Female Sex Reassignment Surgery*, 35 Arch. Sex. Behav. 717-27 (2006), AP Ex. 21. This study "examined preoperative preparations, complications, and physical and

functional outcomes of [MF SRS] based on reports by 232 patients, all of whom underwent penile-inversion vaginoplasty and sensate clitoroplasty, performed by one surgeon using a consistent technique," who were surveyed a mean of three years after surgery. The study found that "[r]eports of significant surgical complications were uncommon," although one third had urinary stream problems, and that "[o[n average, participants expressed high levels of satisfaction with nearly all of the specific physical and functional outcomes of SRS." *Id.* at 717, 719, 724.

Maria Inês Lobato, et al., *Follow-Up of Sex Reassignment Surgery in Transsexuals: A Brazilian Cohort,* 35 Arch. Sex. Behav. 711-15 (2006), AP Ex. 22. This small study examined the "impact of sex reassignment surgery on satisfaction with sexual experience, partnerships, and relationship with family members in … 19 patients who received sex reassignment between 2000 and 2004." The results "indicate[d] that SRS had a positive effect on different dimensions of the patients' lives in all three aspects analyzed: sexual relationships, partnerships, and family relationships." *Id.* at 711-12, 714.

Charles Mate-Kole, et al., *A Controlled Study of Psychological and Social Change after Surgical Gender Reassignment in Selected Male Transsexuals*, 157 Brit. J. Psychiatry 261-64 (1990), AP Ex. 23. This study reviewed 40 patients accepted for gender reassignment surgery, randomly assigned to have surgery early or later such that only half had had surgery by the time of a follow-up two years later. The study found that "[a]lthough the groups were similar initially, significant differences between them emerged at follow-up . . . ." Patients who received surgery were "seen to improve significantly as far as neurotic symptoms are concerned and to become more socially active" in comparison with the patients who had not yet received surgery. *Id.* at 261, 264.

Friedemann Pfafflin & Astrid Junge, *Sex Reassignment: Thirty Years of International Follow-Up Studies After Sex Reassignment Surgery: A Comprehensive Review 1961-1991* (Roberta B. Jacobson & Alf B. Meier trans., 1998) (1992), AP Ex. 25. This overview was completed in 1992 and published in English in 1998. It reviewed "30 years of international follow-up studies of approximately two thousand persons who had undergone sex reassignment surgery," including "more than 70 individual studies and eight published reviews from four continents." In general, more frequent and severe complications were found in the earlier years covered than in later reports. The overview concluded that "[s]ex reassignment, properly indicated and performed, has proven to be a valuable tool in the treatment of individuals with transgenderism," that "gender reassigning treatments are effective" and that "the treatment that includes the whole process of gender reassignment is effective." *Id.* at unnumbered pages 1, 45, 66-67.

Yolanda L.S. Smith, et al., *Sex Reassignment: Outcomes and Predictors of Treatment for Adolescent and Adult Transsexuals,* 35 Psychol. Med. 89-99 (2005), AP Ex. 27. This study evaluated "outcomes of sex reassignment, potential differences between subgroups

of transsexuals, and predictors of treatment course and outcome" in 162 adults (104 MF, 58 FM). The study found that "[a]fter treatment the group was no longer gender dysphoric," had "improved in important areas of function, that 1-4 years after surgery, SR appeared therapeutic and beneficial . . . [and that] the vast majority expressed no regrets about their SR." The study further concluded "that sex reassignment is effective" but that "clinicians need to be alert for non-homosexual male-to-females with unfavourable psychological functioning and physical appearance and inconsistent gender dysphoria reports, as these are risk factors for dropping out and poor post-operative results." *Id.* at 89, 91, 96.

Svetlana Vujovic, M.D., Ph.D., et al., *Transsexualism in Serbia: A Twenty-Year Follow-Up Study*, 6 J. Sex. Med. 1018-23 (2009), AP Ex. 29. This study [a]imed to "describe a transsexual population seeking sex reassignment treatment in Serbia" by analyzing "data collated over a period of 20 years" from 147 transsexuals "applying for sex reassignment" of whom SRS was performed in 83% of MF and in 77% of MF patients. The study concluded that "in our population, there were no cases who regretted sex reassignment treatment," which was attributed to diagnostic procedures used and the "young [adult] age at which our subjects embarked on treatment." *Id.* at 1018-20, 1022.

Steven Weyers, M.D., et al., *Long-term Assessment of the Physical, Mental, and Sexual Health Among Transsexual Women*, J. Sex. Med. 752-60 (2009), AP Ex. 30. This study [a]imed "[t]o gather information on physical, mental, and sexual well-being, health-promoting behavior and satisfaction with gender-related body features of [49] transsexual women [MF] who had undergone SRS" with mean interval since vaginoplasty of 75.46 months. The study found that "sample … functions well after surgery on a physical, emotional, psychological and social level" and that "[o]nly with respect to sexuality do transsexual women appear to suffer from specific difficulties, especially concerning arousal, lubrication and pain." *Id.* at 752, 754, 759.

Navigating This Report

This report is written for multiple audiences, to include behavioral health providers, pediatric professionals and primary care providers, educators and school professionals, policymakers, and researchers. Families, parents, caregivers, and community leaders may also find it useful.

Two sections of this report are likely to be informative for all readers:

- **Executive Summary**, which synthesizes the key conclusions of the report
- **Statements of Professional Consensus on Beneficial and Harmful Practices with Youth of Diverse Sexual Orientation and Gender Identity**, which provides key scientific and treatment recommendations

Other sections of this report may be more accessible or useful to specific audiences and are noted below.

Behavioral health providers: All sections of this report are relevant to these professionals. Those primarily engaged in practice and treatment might focus on Section 2, which summarizes current research with lesbian, gay, bisexual, transgender, queer, questioning, and intersex youth and other sexual- and gender-diverse children and youth (LGBTQI+ youth). It describes evidence-based approaches to support and affirm LGBTQI+ children and youth. Section 3 includes an overview of laws that impact treatment and makes recommendations for targeted training and expanding treatment access.

Community leaders: Section 3 includes policy actions for those interested in supporting LGBTQI+ child and adolescent behavioral health. Appendix C provides selected resources for families and caregivers and those who work closely with them.

Educators and school professionals: Section 2 includes information on important school interventions this group can implement to improve the behavioral health of LGBTQI+ children and youth. Section 3 identifies vital steps that aim to improve behavioral health of LGBTQI+ children and youth.

Families and caregivers: Material in this report could help parents and caregivers understand and support a child's behavioral health. Some parents may find the information on schools and behavioral health in Section 2 useful when seeking support and treatment for their children. Appendix C provides selected resources for families, caregivers, and those who work closely with them.

Pediatric professionals and primary care providers: Providers may find Section 1 on the evidence regarding sexual orientation and gender identity (SOGI) change efforts useful, as well as the research summary and description of behavioral health treatment interventions (Section 2). Appendix C provides selected resources for families, caregivers, and those who work closely with them.

Policymakers: Section 3 targets policymakers interested in taking concrete steps to improve LGBTQI+ child and youth behavioral health. This section is relevant to federal, state, and local policymakers as well as advocates and behavioral health providers interested in public policy. Some policy professionals may find the entire report helpful as background information.

Researchers: The research summary in Section 2 and areas for future study provide an overview of recent evidence and scientific opportunities. Section 3 contains recommendations for future research initiatives.

A glossary of terms used throughout this report can be found in Appendix B.

Table of Contents

Executive Summary

Like all youth, lesbian, gay, bisexual, transgender, queer, questioning, and intersex youth and other sexual- and gender-diverse children and adolescents (LGBTQI+[] youth) deserve to grow up in supportive environments absent stigma and discrimination that allow them to thrive and achieve their human potential. When seeking behavioral health treatment (both mental health and substance use interventions), these children and adolescents, like their peers, and their families deserve the best evidence-based care from knowledgeable health providers without the risk of harm.

This report, *Moving Beyond Change Efforts: Evidence and Action to Support and Affirm LGBTQI+ Youth*, provides behavioral health providers, researchers, policymakers, and other audiences with current knowledge about LGBTQI+ youth, a comprehensive research overview, and important information on behavioral health concerns within this community. More specifically, the report provides details on helpful and harmful interventions for these populations in clinical, community, family, and school settings. In particular, the report documents that attempts to change an individual's sexual orientation and gender identity (SOGI; pronounced "SO-gee" change efforts) are harmful and should not be provided. Additionally, this report discusses evidence-informed policy options that could improve the overall health and well-being of LGBTQI+ youth.

As the abbreviation LGBTQI+ suggests, this population is not homogenous. It includes individuals with many distinct sexual orientations, gender identities, gender expressions, and variations in sex characteristics. Sexual and gender minorities are also diverse with respect to other identities, including age, race, ethnicity, language, national origin, religion, spirituality, ability, and socioeconomic status.[#]

This report is focused on the experiences and needs of LGBTQI+ children and adolescents up to age 17 years (referred to collectively as "youth"). In this report, the term "child" is used to refer to youth aged 3-11 years and "adolescent" is used to refer to youth aged 12-17 years.

Critically, LGBTQI+ youth experience significant physical and behavioral health inequities. Several factors contribute to these inequities and result in minority stress, which is harmful to behavioral health, including:[1,2,3,4]

- Stigma
- Negative social attitudes
- Systemic barriers in health care for LGBTQI+ people
- Rejection and lack of support from families, caregivers, and communities
- Bullying and harassment, and lack of recognition and support in schools

Lack of appropriately trained behavioral health providers and exposure to harmful efforts that attempt to change sexual orientation and/or

[] Even though the evidence is more limited regarding intersex persons, they are included in the acronym LGBTQI+ except when it would be inappropriate to do so, such as within journal article citations or a formal resource name. Additionally, LGBTQI+ is used interchangeably with "sexual and/or gender minority," and persons of "diverse sexual orientation and/or gender identity," (or similar language) throughout this report.

[#] For information regarding the terms used to describe sexual orientation and gender identity, see "Sexual Orientation and Gender Identity" within Youth.gov https://youth.gov/youth-topics/lgbt.

gender identity compound these challenges. Additionally, some transgender and gender-diverse youth require behavioral health support for their experience of gender dysphoria—that is, psychological distress arising from the incongruence between one's body and gender identity.[5]

The conclusions in this report are based on research and professional consensus statements from experts in behavioral health, research, education, and policy. They strengthen and build on the conclusions of a 2015 report published by the U.S. Substance Abuse and Mental Health Services Administration (SAMHSA), *Ending Conversion Therapy: Supporting and Affirming LGBTQ Youth*, the precursor to this report.[6] An overarching and guiding conclusion of this new report is that SOGI change efforts in children and adolescents are harmful and should never be provided. Although the terms "conversion therapy" and "reparative therapy" are commonly used to describe efforts to repress or change someone's sexual orientation or gender identity, these efforts are not therapeutic, and using these terms reinforce disinformation that sexual- and gender-diverse people need repair or conversion. Efforts to change or suppress a person's sexual orientation or gender identity are grounded in the belief that being LGBTQI+ is abnormal. They are dangerous, discredited, and ineffective practices. Therefore, this report utilizes the term "SOGI Change Efforts" to describe so-called "conversion therapy." Recent studies have linked SOGI change efforts to significant harms, such as increased risk of suicidality and suicide attempts, as well as other negative outcomes including severe psychological distress and depression.[7,8,9,10,11,12,13]

An overarching and guiding conclusion of this report is that SOGI change efforts in children and adolescents are harmful and should never be provided.

Further, these practices are not supported by credible evidence and have been disavowed as harmful by behavioral health experts and scientific professional associations. SOGI change efforts do not align with current scientific

understanding of gender as well as the unfounded concept that being in a sexual or gender minority group or identifying as LGBTQI+ is an abnormal aspect of human development. Most importantly, they put young people at risk of serious harm.

The U.S. Department of Health and Human Services is committed to eliminating health inequities within communities, including the LGBTQI+ population. This report reflects that commitment by moving the focus away from SOGI change efforts and toward ensuring that behavioral health care for LGBTQI+ children and adolescents is safe and reflects the most current scientific evidence. This report also provides a roadmap for action centered on evidence-based care and helpful interventions for clinicians, all providers, educators, families, caregivers, and policymakers to improve the behavioral health of LGBTQI+ youth. Further, this report reflects priorities included in President Biden's June 15, 2022, Executive Order on Advancing Equality for Lesbian, Gay, Bisexual, Transgender, Queer, and Intersex Individuals,[14] and the January 20, 2021, Executive Order on Preventing and Combating Discrimination on the Basis of Gender Identity or Sexual Orientation.[15]

Key Findings

This report and its recommendations are based on scientific research distilled into consensus statements by a Subject Matter Expert Consensus Panel (the Panel; see Appendix D for members). After a thorough review of the scientific research; professional health and scientific association statements, guidelines, and reports; and state and national public policies, and in consultation with professionals across a wide range of expertise, the Panel revised and built on key statements from the 2015 report.

The term "evidence-based care" refers to care, practices, or policies that are based on current research evidence, clinical expertise, and expert consensus.

The Panel reaffirmed that:

- Variations in sexual orientation (including identity, behavior, and attraction) and variations in gender (including identity and expression) are part of the normal spectrum of human diversity and do not constitute mental disorders.

Based on recent studies on thousands of individuals who have undergone SOGI change efforts, the Panel concluded that:

- No available research supports the claim that SOGI change efforts are beneficial to children, adolescents, or families.
- Available research indicates that SOGI change efforts are not effective in altering sexual orientation. Further, no available research indicates that change efforts are effective in altering gender identity.
- Available research indicates that SOGI change efforts can cause significant harm.
- SOGI change efforts are inappropriate, ineffective, and harmful practices that should not be provided to children and adolescents.

In the past several years, the research on gender diversity, gender identity, and gender-affirming medical care for children and adolescents has expanded greatly. The Panel found that:

- Gender affirmation, including social transition, and gender-affirming medical care are appropriate and beneficial for many gender minority youth.

Research over the past 20 years has underscored the importance of family and community support to the health of LGBTQI+ youth. Family and community negativity toward sexual diverse sexual orientation and/or gender identity, especially family rejection and school bullying and harassment, can cause harm to the behavioral health of this population. The Panel confirmed that:

- Rejection and lack of social and emotional support from families and caregivers, schools, and communities negatively affects the health of sexual and gender minority youth. Such behaviors can cause harm, particularly family rejection of the youth's sexual and/or gender diversity.

After a comprehensive review of the substantial research assessing the impacts of public policies, the Panel determined that:

- Policies that stigmatize, restrict, or exclude sexual or gender minority youth are harmful to children and adolescents.
- Legal prohibitions on gender-affirming care (including medical treatment) are harmful to LGBTQ+ children and adolescents.

Understanding Sexual Orientation and Gender in Children and Adolescents

Behavioral health providers, parents, schools, policymakers, and communities can best provide support to children, adolescents, and their families and caregivers and improve their behavioral health when they have access to the most current information about sexual orientation, gender identity, and gender expression in youth. The following overview presents the most current understanding, based on scientific evidence of youth sexual orientation, gender identity, and gender expression.

Sexual orientation occurs across a continuum, and same-sex or same-gender attraction and relationships are normal and healthy variations of human sexuality.[16,17] Similarly, a gender identity that differs from assigned sex at birth, as well as a gender expression that is not aligned with usual or expected cultural norms for a particular gender, are normal and healthy variations of human gender identity.[18,19] It is a longstanding finding that being a person of diverse sexual orientation and/or gender identity, or identifying as LGBTQI+, is not pathological.[18,20,21,22,23,24,25]

While many youth have identified with having a diverse sexual orientation in the past, they have not always felt safe enough to share that diversity openly with others.[26,27,28] There is no single developmental trajectory for sexual orientation. Certainty about sexual orientation—e.g., gay/lesbian, bisexual, or straight—increases with age, suggesting "an unfolding of sexual identity during adolescence."[29] Some researchers have found that it has become more common in the 21st century compared to the 20th century for children to self-identify as having a diverse sexual orientation and/or gender identity.[30] What has changed from earlier periods is that youth appear to be publicly acknowledging their sexual orientation earlier as societal attitudes have increasingly become more accepting and open to diverse sexual orientations. Regardless of age, the increase in identifying as an individual of diverse sexual orientation may be tied to the increasing awareness and acceptance of diverse sexual orientations; the expansion of laws, policies, and practices that protect and support individuals regardless of sexual orientation; and an increased willingness and ability among people with diverse sexual orientations to self-identify.[31] Evidence suggests that acceptance of diverse sexual orientations does not make people more likely to identify with a diverse sexual orientation, but rather it increases the likelihood that people feel safer to identify this way publicly.[32,33,34]

Gender development begins in early childhood and continues throughout childhood and adolescence.[35,36] Gender diversity in youth can follow many possible paths. It may emerge as early as a child's preschool years, in late adolescence, or anytime in between.[37,38,39,40] Some gender-diverse children are actively exploring their gender, and there is variation regarding their identity development trajectories and ultimate identity outcomes.[38,39,40] Recent research has found that most gender-diverse children continue to identify as transgender or another gender identity that differs from their sex assigned at birth into adolescence and adulthood.[39,40,41] For those who exhibited diverse gender-typed behavior in childhood, but did not identify as transgender or nonbinary, the majority reported a diverse sexual orientation in adolescence.[42,43] For transgender children who have been supported in their gender identity and gender expression, the vast majority show consistency in their trans identity across time.[40,44]

Some people are born with differences in sex characteristics, such as reproductive anatomy,

chromosomes, or hormones that do not fit typical definitions of male and female. Intersex is an umbrella term used to describe people who can have different gender identities. Individuals with intersex traits may identify as male, female, nonbinary, or a different gender. Intersex individuals may consider themselves transgender if they do not identify with their sex assigned at birth. Like other LGBTQI+ youth, intersex youth experience pervasive stigma and discrimination. While research involving intersex individuals has been limited,[45] the Federal Government has taken steps to reduce this disparity, such as issuing a Request for Information on Promising Practices for Advancing Health Equity for Intersex Individuals in February 2023.[46]

Supportive families and caregivers, peers, and school and community environments are associated with improved psychosocial outcomes for all children and adolescents, and this is especially true for those children and adolescents with minority sexual orientations or gender identities that do not align with their sex assigned at birth.[47,48,49,50,51,52,53] Extensive research indicates that even just one supportive adult, such as a family member, teacher, or mental health provider, can have a positive impact on the mental health of youth of diverse sexual orientation and/or gender identity; such support can reduce adverse mental health impacts including suicide.[49] Additionally, family or caregiver, peer, school, and community support for youth of diverse sexual orientation and/or gender identity promotes better mental health and fewer negative outcomes, and can lead to positive development and emotional resilience.[47,48,49,53]

Behavioral Health: A broad term that includes mental health, resilience, and well-being; the treatment of mental and substance use disorders; and the support of those who experience and/or are in recovery from these conditions, along with their families and communities.

Behavioral Health Concerns Among LGBTQI+ Youth

LGBTQI+ adolescents face the same developmental milestones that accompany adolescence for all youth. However, unlike adolescents with a cisgender[1] and straight/heterosexual orientation, LGBTQI+ adolescents often must navigate an environment lacking awareness and acceptance of their sexual orientation and/or gender identity. Moreover, they might have to do so without family, community, or societal support, for example, through the child welfare system.

Limited research with sexual minority children indicates that mental health inequities may begin in childhood,[30,54] which may be connected to greater prevalence of discrimination and victimization among sexual minority children.[55,56] As a result of experiencing stigma and discrimination, some youth with diverse sexual orientation and/or gender identity are at increased risk for:

- Psychological distress (e.g., depressive symptoms, anxiety, and behavioral disorders)
- Substance use
- Suicidal ideation and attempts
- Victimization, violence, and homelessness

[1] "Cisgender" is a term that describes individuals whose gender identity is congruent with their sex assigned at birth. Please refer to Appendix B for a glossary of terms.

- Involvement with child welfare services, often stemming from family rejection
- Involvement in juvenile justice programs[57,58,59,60,61,62,63,64,65]

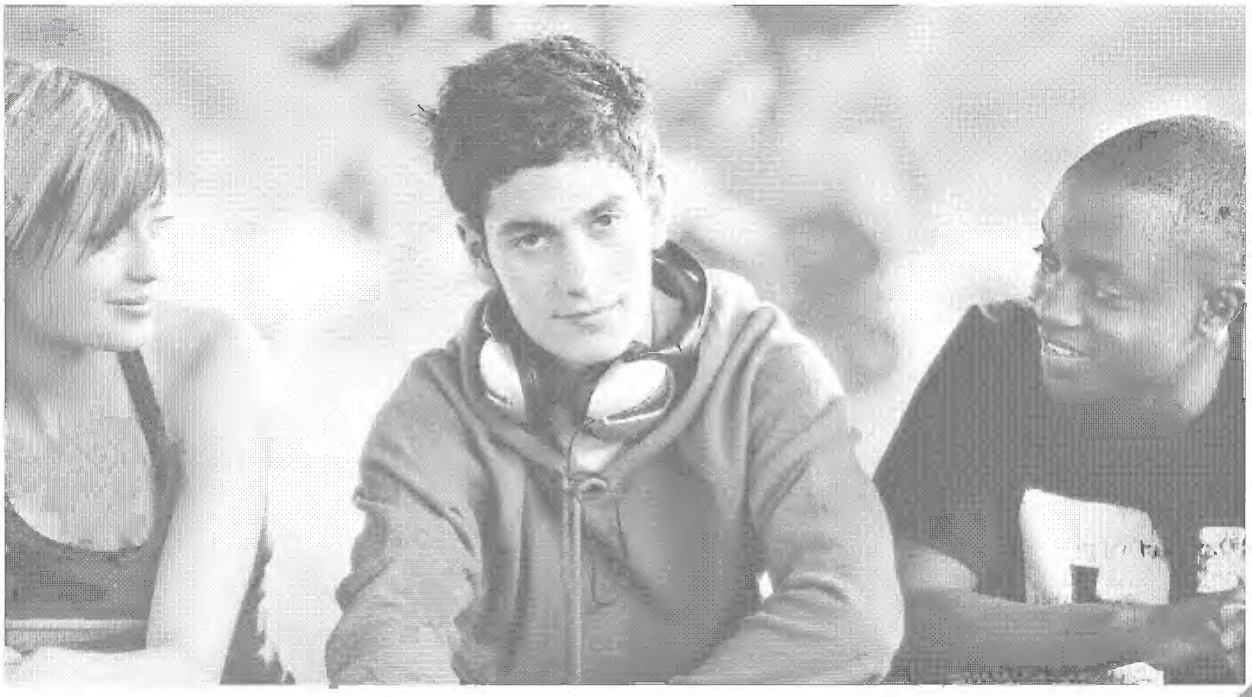
Psychosocial distress is often related to, if not caused by, negative social attitudes or rejection.[66] High levels of parental and caregiver support of youths' sexual orientation and gender identity can mitigate increased risk of behavioral health concerns. For example, transgender and gender-diverse youth with affirming parents and caregivers have similar levels of mental health challenges as their cisgender peers.[67] It is essential to note that youth with diverse sexual orientation and/or gender identity are resilient, and that with sufficient support and access to resources, they can thrive.[68,69]

Some children may experience gender dysphoria, meaning feelings of distress or incongruence between one's gender identity and sex assigned at birth. This distress, rather than the youth's gender diversity, is recognized as a behavioral health concern.[5] For some, the physical changes of adolescence may worsen feelings of gender dysphoria. For others, gender dysphoria or feelings of gender incongruence may begin post-puberty without any childhood history of gender dysphoria or gender diversity.[70]

Developmentally sensitive approaches consider appropriate development of emotional and cognitive capacities, achievement of developmental milestones, and possible emerging or existing behavioral health concerns.

Beneficial Therapeutic Approaches and Interventions With LGBTQI+ Youth

Given scientific findings that SOGI change efforts are harmful and medically inappropriate, the behavioral health approaches below are recommended instead. These approaches are consistent with the Panel's consensus



statements and current research. Several professional and scientific association guidelines recommend these approaches as well.[22,23,24,25,71,72,73,74]

When providing services to children, adolescents, families, and caregivers, appropriate therapeutic approaches include:

- Providing accurate information on sexual orientation, gender identity and expression, and variations in sex characteristics
- Identifying sources of distress, including internalized stigma and minority stress, and working with children, adolescents, families, and caregivers to reduce the distress LGBTQI+ youth experience
- Supporting adaptive coping to improve psychological well-being
- Supporting youth as they learn more about their sexual orientation and gender identity, and supporting families in accessing gender-affirming care for their transgender child when indicated
- Helping children and adolescents navigate their sexual orientation, gender identity, and gender expression within the context of their cultural, religious, and other identities

Interventions should be client-centered, culturally appropriate, and developmentally sensitive. The treatment goal should be to facilitate the best possible level of psychological functioning, rather than identifying with a specific gender or sexual orientation. Appropriate treatment approaches with youth of diverse sexual orientation and/or gender identity should focus on identity development and affirming exploration that allows the child or adolescent the freedom of self-discovery within a context of acceptance and support. It is important to identify the sources of any distress experienced by LGBTQI+ youth and their families and caregivers, and work to reduce this distress.

Working with parents and caregivers is important, as their behaviors and attitudes have significant effects on the mental health and well-being of youth with diverse sexual orientation and/or gender identity. Supportive family, caregivers, community, school, child welfare, and healthcare environments have been shown to positively impact both the short- and long-term health and well-being of LGBTQI+ youth. Families, caregivers, and those working with these youth can benefit from guidance and resources to increase support for sexual- and gender-diverse groups and to reduce stigma and discrimination.

In addition to the appropriate therapeutic approaches described above, social transition is appropriate and beneficial for many transgender and gender-diverse youth.[75,76,77,78] Although professional intervention is not required for youth to take steps in social transition, providers can support families and caregivers to protect youth's safety, ensure emotional, psychological, and social well-being, and help youth and families navigate the potential complexities of exploring and taking steps in social transition.[79] Based on the individual youth's needs, some forms of gender-affirming medical care may be medically necessary. Gender-affirming medical care that is provided in consultation with licensed healthcare providers is supported by extensive research and, based on the individual adolescent's needs, may be medically necessary.[80,81] Withholding timely gender-affirming medical care when indicated, withholding support for a gender-affirming exploratory process, and/or withholding support of social transition when desired, can be harmful because these actions may exacerbate and prolong gender dysphoria.[82,83]

Licensed healthcare providers play an important role in educating adolescents and their parents and caregivers about the various options for medical gender transition. They can also support youth, families, and caregivers in understanding this information and assess their understanding so that parents/caregivers and youth can provide fully informed consent and assent for the proposed care. The support of a behavioral health provider during these processes can aid an adolescent in identifying care needs, adjusting to their changing physical characteristics, and navigating responses from people in different aspects of their life.

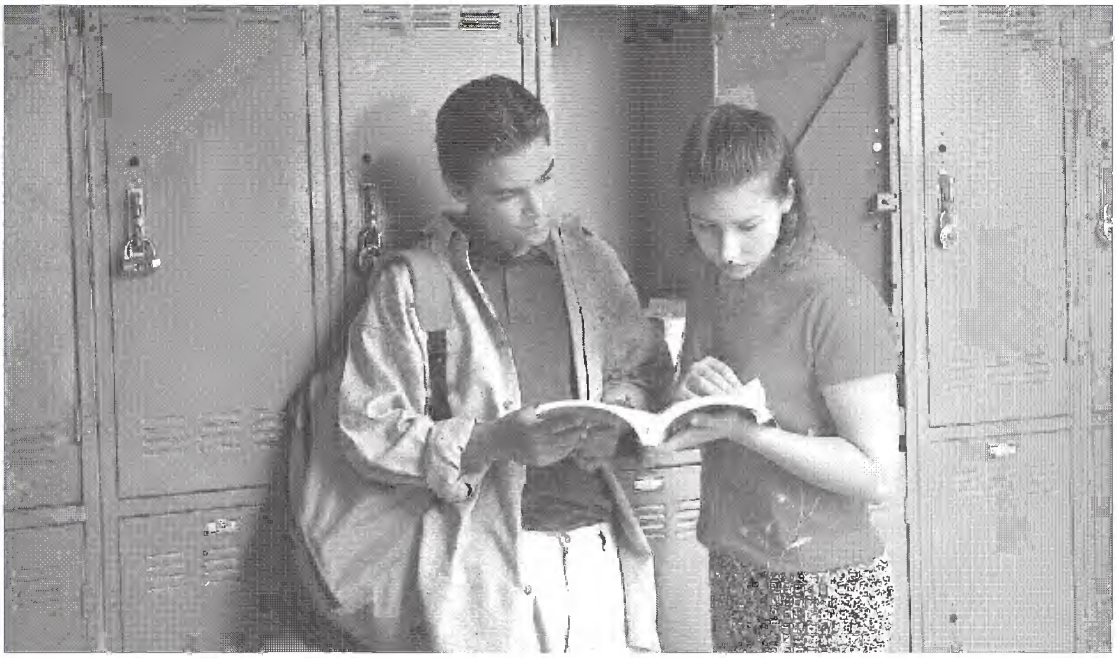
Policy Approaches to Support the Behavioral Health of LGBTQI+ Youth

LGBTQI+ youth and their families can benefit from policies that aim to:

- End harmful and ineffective efforts such as SOGI change efforts and ensure access to evidence-based care
- Promote behavioral health through protective and antidiscrimination policies
- Improve behavioral health through facilitating increased support from families, schools, and communities
- Conduct research that increases knowledge of health inequities with the goal to improve care

Given that SOGI change efforts are not appropriate therapeutic interventions, and are in fact harmful, immediate efforts are required to end their practice. Policy efforts to end SOGI change efforts have included:

- Passing state legislation to ban SOGI change efforts or provide supportive resources
- Introducing federal legislation to ban SOGI change efforts or provide supportive resources
- Banning licensed behavioral health providers from engaging in SOGI change efforts



- Restricting use of state funds and proposing the restriction of federal funds for these efforts
- Defining SOGI change efforts as consumer fraud

Efforts to improve understanding among behavioral health providers and other stakeholders of the harms of SOGI change efforts and the benefits of evidence-based care are essential. Other policy efforts can expand access to LGBTQI+ evidence-based care through reforming insurance and health services, ensuring nondiscrimination in health services programs, and increasing behavioral health and medical professional training in appropriate treatments. Bans on gender-supportive and gender-affirming care are harmful to individuals of diverse sexual orientation and/or gender identity.[84]

Policies can improve behavioral health and reduce health risks in this population by ensuring protection from discrimination, exclusion, and violence in schools and communities, and by expanding civil rights for LGBTQI+ individuals and families. Reducing stigma directed at LGBTQI+ individuals and families through affirmative public information that is respectful of families and youth from diverse religious, cultural, socioeconomic, and racial/ethnic backgrounds is important and consistent with professional ethical guidelines and standards of care. Supporting research to continue the development of evidence-based behavioral interventions for LGBTQI+ youth—especially those from diverse backgrounds—will contribute to the overall health and well-being of this community.

Introduction

This report, *Moving Beyond Change Efforts: Evidence and Action to Support and Affirm LGBTQI+ Youth*, revises and builds on the seminal 2015 SAMHSA publication, *Ending Conversion Therapy: Supporting and Affirming LGBTQ Youth*.[6] Based on the usefulness of the 2015 report, SAMHSA determined that a revision was warranted to reflect advances in scientific research and practice. This report provides an overview of current scientific understanding on sexual orientation and gender identity development and research on the behavioral health of youth of diverse sexual orientation and/or gender identity. The report also includes professional consensus on best practices in behavioral health with lesbian, gay, bisexual, transgender, queer, questioning, and other sexual- and gender-diverse youth (LGBTQI+ youth) and describes actions and policy options based on scientific research to improve their health and well-being.

"Section 1. State of the Evidence on SOGI Change Efforts With Youth" addresses sexual orientation and gender identity (SOGI; pronounced "SO-gee") change efforts. SOGI change efforts include practices that are not supported by credible evidence, are harmful, and have been disavowed by behavioral health experts and professional and scientific associations. "Statements of Professional Consensus on Beneficial and Harmful Practices With Youth of Diverse Sexual Orientation and/or Gender Identity" describes updated statements from experts on best practices in behavioral health for sexual and gender minority youth. "Sexual Orientation and Gender Identity Change Efforts With Youth" is an update on current research regarding SOGI change efforts in youth, and formed the basis for the best practice statements.

"Section 2. Development, Behavioral Health, and Beneficial Therapeutic Approaches With Youth of Diverse Sexual Orientation and/or Gender Identity: A Research Overview" provides an updated and expanded overview of recent research with LGBTQI+ youth beyond change efforts. This section summarizes new developments in research with youth of diverse sexual orientation and/or gender identity, including sexual orientation and gender identity development and behavioral health. It also discusses positive and negative influences on the behavioral health and well-being of LGBTQI+ youth, including factors such as family, school, community, and policy. Importantly, this section also provides information about appropriate and beneficial therapeutic approaches to support the behavioral health and well-being of youth of diverse sexual orientation and/or gender identity and their families.

"Section 3. Policy Approaches to Support and Affirm the Behavioral Health and Well-Being of LGBTQI+ Youth" provides a comprehensive

outline of scientifically supported recommendations for policies to improve the behavioral health and well-being of youth of diverse sexual orientation and/or gender identity, including improving access to comprehensive, supportive care.

SAMHSA aims to reduce the impact of substance use and mental illness on America's communities. As such, SAMHSA endeavors to improve public health and eliminate health inequities, including those affecting LGBTQI+ communities. By addressing the issues included in this report that have a significant impact on the lives and well-being of LGBTQI+ youth, SAMHSA aims to enable families, caregivers, providers, educators, and policymakers to take actions that will reduce the behavioral health risks and inequities facing this vulnerable population.

Revision Process

Ending Conversion Therapy: Supporting and Affirming LGBTQ Youth, a 2015 SAMHSA publication, was reportedly helpful to behavioral health providers, families, school professionals, policymakers, and other audiences.[6] SAMHSA determined that the report's utility could be enhanced and updated to reflect new advances in scientific research and practice. The revision—this report—includes:

- New research on SOGI change efforts
- Latest developments and research in the field of gender identity and sexual orientation development in youth
- Updated guidance for behavioral health providers, families, caregivers, and school-based professionals
- New section on public policy considerations

The 2015 report was based on a meeting of experts led by the American Psychological Association. Building on the successful 2015 process, a revision framework was developed by the contractor that culminated in a 2-day online meeting on September 9-10, 2021. During the meeting, experts in relevant fields considered a comprehensive array of research findings, professional guidelines, the current clinical knowledge base, behavioral health concerns of youth of diverse sexual orientation and/or gender identity, and policy opportunities. During this meeting, the Subject Matter Expert Consensus Panel (the Panel) and scientific writing team, under the direction of the contractor, helped develop and formulate this report.

The experts were identified based on their knowledge of a wide array of topics, including but not limited to:

- Gender identity and sexual orientation development in youth, including nonbinary and transgender individuals
- Youth clinical issues, including those related to gender dysphoria
- Concerns of ethnically, racially, and culturally diverse communities and under-resourced and underserved populations
- Family psychology
- Community and school mental health
- Professional ethics
- Research methods
- Intersection of behavioral health and spiritual diversity
- Legal issues and public policy
- SOGI change efforts

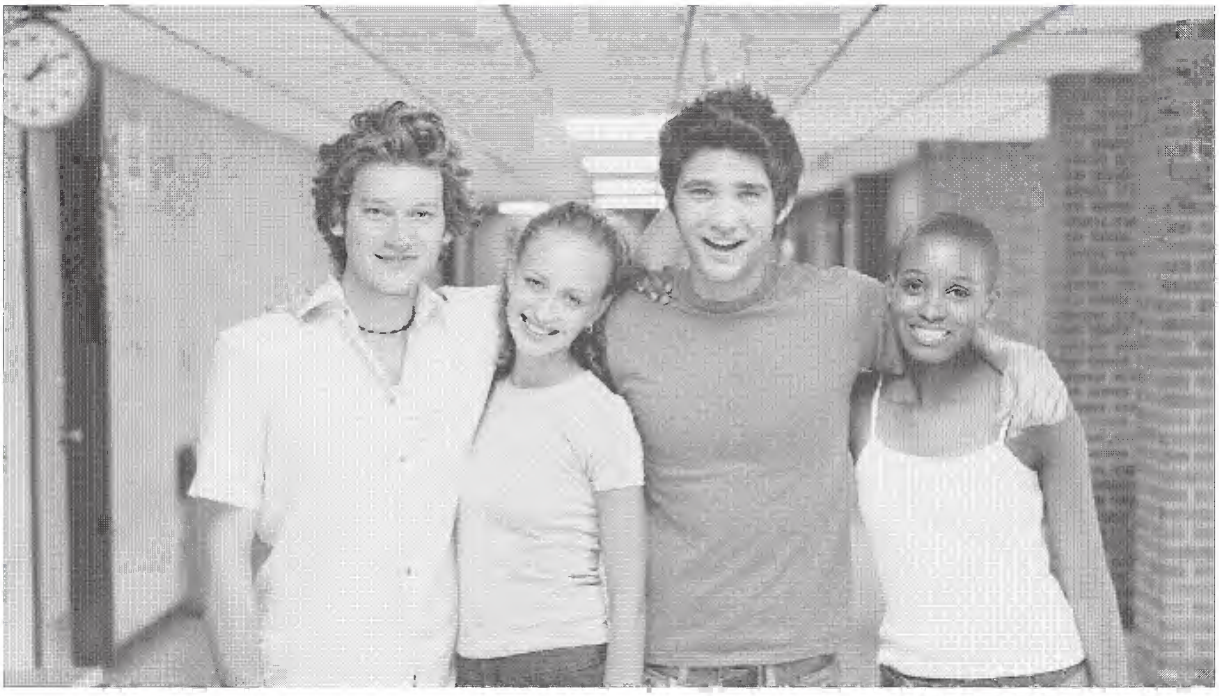
An extensive list of experts was generated from those with expertise in the above areas based on published research and innovation in the key knowledge areas; knowledge of, or participation in, the development of professional guidelines; expertise in clinical practice; referral by other

experts; and behavioral health specialty. SAMHSA also sought input from the experts who contributed to the 2015 report, including the American Psychological Association, and those who could assist in achieving the goals of this report.

Additional input was obtained from professionals in pediatrics, psychology, psychiatry, public health, social work, scientific research methodology, and legal issues and public policy. These individuals included researchers and practitioners in child and adolescent development and mental health, as well as researchers in gender development, gender identity, and sexual orientation in youth. The Panel, which helped develop and formulate this report, included experts with backgrounds in family therapy, ethnic, racial, and cultural diversity, needs of underrepresented populations, faith and psychology, and ethics. The Panel included those who practice in a variety of settings from different behavioral health specialties. (See Appendix D for members.)

As with the process developed for the 2015 consensus panel for the formulation of consensus statements, unanimous consensus was sought, but if it could not be reached, 80 percent support would constitute consensus. Versions of consensus statements were circulated after the September 2021 meeting with multiple opportunities provided for panelists to submit comments and revisions. Final versions were adopted by polling. Unanimous consensus was reached in nearly all instances. The statements of professional consensus are provided in "Section 1. State of the Evidence on SOGI Change Efforts With Youth."

Observers from SAMHSA's senior leadership team, internal experts, and cross-federal experts who had been involved in developing the 2015 report were present for the September 2021 meeting and offered the opportunity to submit written questions and input to the Panel throughout the meeting.



Section 1. State of the Evidence on SOGI Change Efforts With Youth

Statements of Professional Consensus on Beneficial and Harmful Practices With Youth of Diverse Sexual Orientation and/or Gender Identity

Guiding principles and statements of professional consensus regarding sexual orientation and gender identity and expression among youth were developed during the meeting of the Subject Matter Expert Consensus Panel (the Panel) meeting in September 2021 (see Revision Process in the previous section for a description of the Panel meeting and revision process). These statements revise and build on the professional consensus statements developed during a July 2015 American Psychological Association convening, as described in the 2015 report, *Ending Conversion Therapy: Supporting and Affirming LGBTQ Youth*.[6] The 2021 convening and resulting statements reflect updates to current evidence and recommended clinical practice.

Guiding Principles for Behavioral Health Providers

The Panel updated a statement regarding the guiding human rights and scientific principles that provide a foundation for behavioral health providers working with this population. They are based on codes of professional ethics for the fields of psychology, psychiatry, counseling, social work, and pediatrics.[70,74,83,84,85,86,87]

- Behavioral health providers respect human dignity and human rights. Professional ethics necessitate that children and adolescents be supported in their right to explore and actualize their own identities.

Though the terms "conversion therapy" and "reparative therapy" are commonly used, these efforts are not therapeutic and reinforce harmful beliefs that sexual- and gender-diverse people need repair or conversion.

- All children and adolescents should have fair and equitable access to behavioral health services that will benefit their health and welfare without the risk of harm. Children and adolescents have the right to participate in decisions that affect their health care and future lives.
- Behavioral health providers assist children, adolescents, and their families in making informed healthcare decisions by providing developmentally appropriate information and assessing their decision-making capacities and family and community contexts.
- Behavioral health providers strive to provide care that is in the best interest of the child or adolescent.
- Behavioral health providers strive to incorporate cultural awareness, respect, and sensitivity into their work. They recognize that age, gender identity and expression, race, ethnicity, culture, language, national origin, religion, spirituality, sexual orientation, different abilities, and socioeconomic status are important factors to consider when working with children, adolescents, and families.

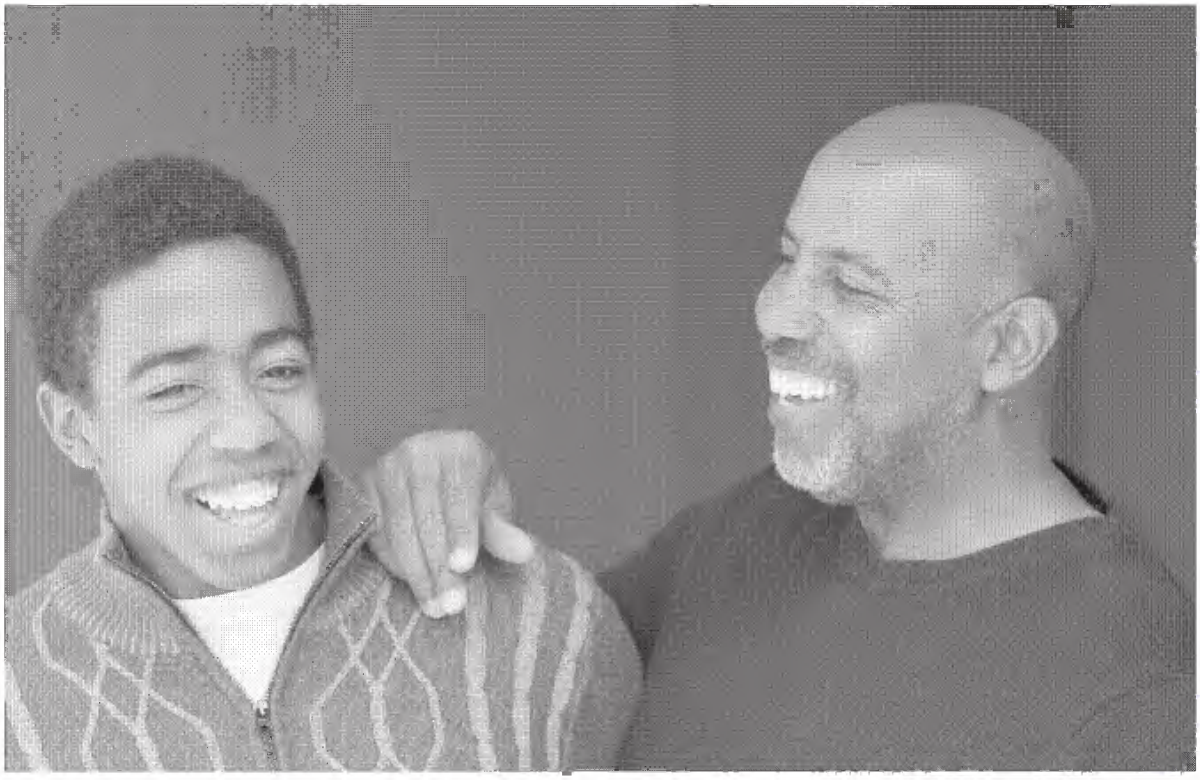
- Behavioral health providers strive to eliminate any impact of bias on their professional interactions and decisions.

Defining Sexual Orientation and Gender Identity Change Efforts

SOGI change efforts, commonly referred to as "conversion therapy" or "reparative therapy," are practices that aim to suppress or alter an individual's sexual orientation or gender to align with heterosexual orientation, cisgender identity, and/or stereotypical gender expression. SOGI change efforts are premised on or motivated by the belief that diversity in sexual orientation and/or gender identity and expression is a deficit, mental illness, or pathology.

SOGI change efforts do not include gender-affirming care. They do not include counseling that facilitates acceptance, social support, or open and affirming exploration and development of one's sexual or gender identity, including navigating sexual orientation and/or gender identity within the context of intersecting identities.

In the field of health care, the term "inappropriate" is used to designate care that is nonbeneficial, not medically indicated, and ineffective in achieving a patient's desired results. Medically inappropriate care is not needed or supported by clinical evidence and can result in negative health outcomes. The term "appropriate" is used to designate care when the expected health benefit exceeds the expected negative consequences by a sufficiently wide margin that the care is worthwhile.[88]



Professional Consensus on Sexual Orientation and Gender Identity Change Efforts With Youth

1. Variations in sexual orientation (including identity, behavior, and/or attraction) and gender (including identity and expression) are part of the normal spectrum of human development and do not constitute mental disorders.
2. Available research indicates that SOGI change efforts can cause significant harm. It also indicates that these efforts are not effective in altering sexual orientation. Further, no available research indicates that SOGI change efforts are effective in altering gender identity. No available research supports the claim that these efforts are beneficial to children, adolescents, or families.
3. SOGI change efforts are inappropriate practices that should not be provided to children and adolescents.
4. Rejection and lack of social and emotional support from families and communities negatively impact the health of sexual and gender minority youth. Such behaviors can cause harm, particularly family rejection of sexual orientation and/or gender diversity.

Professional Consensus on Appropriate Interventions With Youth of Diverse Sexual Orientation and/or Gender Identity and Their Families

1. Appropriate approaches to care for sexual and gender minority youth and their families:
    - Are evidence-based and person-centered
    - Reduce the rejection of sexual and gender minority youth
    - Increase family, school, and community support

    - Are responsive to children's, adolescents', and families' intersectional identities, including age, gender, race, ethnicity, culture, national origin, religion, spirituality, sexual orientation, different abilities, language, and socioeconomic status
2. Appropriate therapeutic approaches for sexual and gender minority youth do the following:
    - Provide accurate information on sexual orientation and gender identity and expression
    - Identify sources of distress for children, adolescents, and families and work with them to reduce it
    - Facilitate exploration and development of one's sexual and/or gender identity
    - Support adaptive coping to improve psychological well-being
    - Help youth navigate their sexual orientation, gender identity, and gender expression within the context of their cultural, religious, and other intersecting identities
3. Gender affirmation, including social transition (e.g., changing one's name, pronoun, and/or appearance), is appropriate and beneficial for gender minority children and adolescents.

Behavioral health providers may want to consult guidelines from major medical and mental health associations such as: American Academy of Child and Adolescent Psychiatry, American Academy of Pediatrics, American College of Physicians, American Counseling Association, American Medical Association, American Psychiatric Association, American Psychoanalytic Association, American Psychological Association, American School Counselor Association, Endocrine Society, National Association of School Psychologists, National Association of Social Workers, Pediatric Endocrine Society, Society for Adolescent Health and Medicine, World Medical Association, and World Professional Association for Transgender Health. (See Appendix C for some of these resources.)

Based on the youth's needs, gender-affirming medical care may be medically necessary. Such care is defined here as a care plan or service that is necessary to assess, maintain, or improve health and well-being and to avoid illness or reduce symptoms based on existing professional guidelines and scientific evidence. Withholding timely gender-affirming care when indicated, withholding support for a gender-affirming exploratory process, or withholding support of social transition when desired can be harmful because those actions may exacerbate and prolong gender dysphoria.

4. Legal prohibitions on gender-affirming care (including medical treatment) are harmful to children and adolescents. Further, policies that stigmatize, restrict, or exclude gender minority youth are harmful to children and adolescents.
5. When working with sexual and gender minority youth, behavioral health providers' ethical and professional responsibilities include delivering care that reflects respect, compassion, and cultural humility. It should be consistent with current professional, evidence-based, multidisciplinary resolutions and guidelines issued by leading health and scientific associations and professional ethical principles.

Person-centered, also known as client-centered, is a long-standing therapeutic approach that affirms and values all aspects of individuals.[89] It emphasizes unconditional positive regard and empathic understanding of all aspects of the person.

Professional Consensus on Education and Training

1. Like all youth, sexual and gender minority youth and their families have diverse cultural, ethnic, racial, religious, and other identities that shape their experiences, values, and behavioral health needs. These are important factors for behavioral health providers to understand and acknowledge. Providers should receive specific training in the development of diverse sexual orientations and gender identities, as well as training on culturally responsive approaches to working with sexual and gender minority youth and their families from diverse backgrounds.
2. While sexual and gender minority youth experience many of the same developmental milestones as other youth, they also encounter unique challenges and may need specific support and resources to thrive. All of those engaged in the care of youth, including parents and caregivers,

healthcare providers and staff, school and education professionals, community leaders, social service providers, legal professionals, and policymakers, can benefit from accurate, scientific, non-pathologizing information about sexual and gender diversity.

Sexual Orientation and Gender Identity Change Efforts With Youth

Over the past decade, additional high-quality research focused on documenting the practice and effects of SOGI change efforts has provided further evidence that these efforts should not be practiced with youth. This section includes a review of recent research on SOGI change efforts and information about their continued use across the United States. It also includes a detailed description of some of the methodological issues relevant to SOGI change efforts research that may be useful for researchers and policymakers. Finally, this section describes guidance from professional organizations disavowing SOGI change efforts.

Research on SOGI Change Efforts

There is now a significant body of research on SOGI change efforts. Overall, it has focused on sexual orientation change efforts more than gender identity change efforts. Although some study populations included both sexual and gender minorities, they often examined SOGI change efforts in ways that obscure whether transgender participants experienced change efforts related to their sexual orientation, gender identity, or both. This is both a methodological shortcoming of some SOGI change efforts research and a reflection of the realities of its practice, where it is not always possible to distinguish between sexual orientation and gender identity change efforts. For example, SOGI change efforts often include attempts to change children's and adolescents' gender expression to be more consistent with the stereotypical norms expected for their assigned sex at birth, with a goal to prevent both a transgender identity and a future diverse sexual orientation.[24,50,90]

In 2009, the American Psychological Association Task Force on Appropriate Therapeutic Responses to Sexual Orientation Change Efforts conducted an authoritative review of peer-reviewed literature published on sexual orientation change efforts.[24] Since its publication, a systematic review of research on sexual orientation change efforts has been published,[7] as well as quantitative and qualitative empirical studies examining sexual orientation change efforts among populations residing in the United States or Canada.[8,9,10,11,91,92,93,94,95,96,97,98,99,100,101,102,103,104]

A 2018 systematic review of research on gender identity change efforts published between 1990 and 2017 identified four studies reporting on its use, which consisted of three case reports and one case series.[105] Since then, three studies investigated gender identity change efforts among populations residing in the United States or Canada.[9,106,107,108] One study examined their use in New Zealand,[109] and several studies examined sexual orientation change efforts with transgender and gender-diverse populations in the United States and Canada.[10,11,103]

Lesbian, gay, bisexual, and other sexual orientations are normal variations of human sexuality and are not mental disorders. Transgender, nonbinary, and other gender identities are normal variations of human gender and are not mental disorders. Therefore, practices seeking to change an individual's sexual orientation, gender identity, and/or gender expression are not indicated and are inappropriate.

Several recent studies of SOGI change efforts reflect major methodological improvements over past work, such as larger sample sizes (e.g., 1,518[8]; 27,715[107]; 25,791[9]), a probability sample,[8] and controlling for other factors that may also cause harm (e.g., other adverse childhood experiences [ACEs]).[8] The majority of these studies were conducted with adults. One study included adolescents and young adults (ages 13-24),[9] and one study was limited to emerging adults ages 21-25 and asked about experiences of SOGI change efforts during adolescence.[10]

Research indicates that sexual orientation change efforts are not effective in altering sexual orientation. Research indicates that these efforts can cause significant harm, including suicide attempts and other negative behavioral health outcomes. No available research supports the claim that sexual orientation change efforts are beneficial to children, adolescents, or families.

Syntheses of research on sexual orientation change efforts have concluded that there is no evidence to support their effectiveness in altering sexual orientation or sexual attractions. A systematic review of peer-reviewed research on sexual orientation change efforts published from 1960 to 2007 concluded that they were not effective and may cause harm.[24]

Recent studies of sexual orientation change efforts corroborate those findings and provide stronger evidence of certain harms. Recent large, methodologically rigorous studies consistently find that exposure to sexual orientation change efforts places individuals at increased risk of suicidality and suicide attempts, as well as other negative outcomes including depression.[8,9,10,11] No studies have found evidence of any benefit of sexual orientation change efforts to children, adolescents, or their families. Other scholars and international organizations have independently conducted reviews of the sexual orientation change efforts literature, reaching the same conclusions.[7,12,13] It is now scientific consensus that sexual orientation change efforts are not effective and can cause significant harm.

No research indicates that gender identity change efforts are effective in altering gender identity. Research indicates that these efforts can cause significant harm, including suicide attempts and other negative behavioral health outcomes. No available research supports the claim that gender identity change efforts are beneficial to children, adolescents, or families.

SOGI change efforts have been used in an attempt to force children's behaviors, dress, and mannerisms to become more consistent with those stereotypically expected of their assigned sex at birth—that is, more stereotypically masculine expression for those assigned male at birth and more stereotypically feminine expression for those assigned female at birth. Historically, SOGI change efforts were the primary clinical approaches used with gender-diverse children, including those experiencing gender dysphoria.[39,50,90]

No research has demonstrated that gender identity change efforts are effective in altering

Despite evidence of harm, diverse populations across the United States, including children and adolescents, continue to be exposed to SOGI change efforts from a variety of licensed and unlicensed practitioners.

gender identity; there is also no evidence of any benefits of such practices to children, adolescents, or their families. Recent large, methodologically sound studies have investigated harms associated with gender identity change efforts.[9,107,108] These studies indicate that exposure to gender identity change efforts—in childhood, adolescence, and/or adulthood—is associated with harm, including suicidality, suicide attempt, and other negative mental health outcomes such as severe psychological distress.

Research that asked transgender participants about prior exposure to sexual orientation change efforts also reported that these efforts were associated with negative mental health outcomes including suicidal ideation and attempts.[10,11] Although this report focuses primarily on studies in the United States, a recent study in New Zealand corroborates findings of lasting harm associated with gender identity change efforts.[109] The findings of harm associated with SOGI change efforts—practices that exemplify anti-LGBTQI+ stigma and rejection—are bolstered by the extensive literature connecting minority stress, family/community rejection, and a lack of acceptance to negative health outcomes among youth of diverse sexual orientation and/or gender identity.[102,110,111]

Despite scientific consensus regarding the harms of SOGI change efforts and no evidence to support claims of its effectiveness or benefits, these efforts continue to be practiced across the United States by diverse health professionals and unlicensed community members.[8,9,106] It is estimated that anywhere from 3.5 to 18 percent of adults of diverse sexual orientation and/or gender identity have been exposed to SOGI change efforts; the single national probability sample reported a prevalence of 7 percent.[8] Its frequency of use among transgender and nonbinary populations is higher than that observed in cisgender LGB populations,[96,103,106,107] including in studies with adolescents and young adults.[9,10]

Though earlier reviews reported that most of the individuals who experienced sexual orientation change efforts were white men of higher socioeconomic status,[24] recent studies that rely on large national samples suggest greater diversity, indicating that women, people of color, and people from lower income levels are also affected by SOGI change efforts in the United States.[8,9,96,107]

Studies with individuals from religious traditions in which sexual orientation diversity and gender diversity are seen as contrary to faith teachings have often reported a greater prevalence of SOGI change efforts than studies that include individuals regardless of religious affiliation.[24,92,100,112] Based on these findings, it is likely that exposure to SOGI change efforts is greater among individuals from some religious backgrounds than those from more secular backgrounds.[24,91,100,112] However, current

Relative to young people who had not experienced SOGI change efforts, those who reported undergoing these efforts were more than twice as likely to report having attempted suicide and having multiple suicide attempts.[9]

research does not provide for estimates of prevalence.[91]

Of note, research indicates that younger generations may be at similar risk of exposure to SOGI change efforts as generations of youth before them.[8,103] As of 2018, adolescents and young adults from all regions of the United States reported exposure to these efforts.[9] A study of young adults of diverse sexual orientation and/or gender identity from community settings in the San Francisco area found that more than half had experienced SOGI change efforts from parents and caregivers, while just more than one-fifth had also experienced these efforts from an external source such as a religious leader or a behavioral health provider.[10]

Younger generations continue to be exposed to SOGI change efforts. Studies published recently show that adolescents and young adults across all regions of the United States continue to be exposed.[8,9,105]

Additionally, current research finds that SOGI change efforts result in negative consequences regardless of who attempts to effectuate the change. These change efforts are harmful whether undertaken by parents and caregivers, behavioral health providers, or other community members.[10,107] These findings indicate that efforts to reduce the harm caused by these practices would be most effective with a broad focus to include all forms of SOGI change efforts, as well as to reduce the stigma against LGBTQI+ people that drives their continued practice.

Methodological Considerations When Studying SOGI Change Efforts

Prospective, experimental research studies such as randomized controlled trials (RCTs) are considered a rigorous methodology for evaluating efficacy because these methods minimize selection bias and permit accurate estimates of causal effects. However, RCTs are not always an appropriate or ethical research design.[113] This is particularly true when multiple research studies indicate that a treatment or intervention is known to carry the risk to cause harm.[114]

To date, there have been no experimental research studies of SOGI change efforts with children or adolescents, nor would they be ethical to conduct. This is because there is sufficient evidence of harm associated with SOGI change efforts to conclude that they should not be provided to children and adolescents, and because previous studies have found no benefits. Coupled with the fact that professional consensus has established that diversity in sexual orientation and gender identity are normal variations for which treatment is unwarranted, an RCT is even more inappropriate to conduct. These ethical concerns are amplified in research with youth. Government regulations concerning research with children set strict limits and conditions on studies that could inappropriate to conduct. These ethical concerns are amplified in research with youth. Government regulations concerning research with children set strict limits and

conditions on studies that could pose harm to children and adolescents.[115]

There are valid ways to assess harm from SOGI change efforts without conducting an RCT or other rigorous quasi-experimental design (e.g., a nonrandomized design). Harm associated with an event or treatment can be evaluated through retrospective ("looking back") studies that examine the impact of those events and treatments by comparing outcomes for those who experienced them against people like them who did not. Mechanisms such as case studies, patient registries, and self-report surveys are also valid means to detect and report harms of a treatment.[114]

Most of the research using high-quality methodologies published since 2014 on sexual orientation or gender identity change efforts has been retrospective and employed cross-sectional designs, with adults asked to report their past experiences with change efforts at one point in time. This study design is appropriate for gathering evidence of harm. However, there are limitations to these study designs. Although they can identify harms, they cannot determine with certainty whether those harms are solely attributable to the SOGI change efforts. For example, research that relies on retrospective self-reports must address limits or differences in the accuracy of recollection of past events or experiences.

Sampling design—that is, how a research study recruits participants—can also limit the generalizability of the findings (i.e., the degree to which the results of a study can be applied to a broader group of people or situations). Much, though not all, of the research on SOGI change efforts uses what is called a "convenience sampling design," meaning it is unknown how representative the research participants are of all who have undergone these efforts. There is also natural bias in such samples because these are naturally occurring groups that share a common or similar social environment.

Current research on SOGI change efforts uses methodologies appropriate for the study of harm. Consistent findings across studies provide solid evidence that SOGI change efforts are harmful to the health of sexual and gender minority people, including children and adolescents.

Nonetheless, the public can have increased confidence in the research findings when many studies using a variety of research designs, conducted by independent research teams, consistently conclude that a "treatment" is associated with harm. This is the case with research on SOGI change efforts. Indeed, a strength of the existing research on these change efforts is the consistent finding that SOGI change efforts are associated with harms. This has been found across studies conducted by independent research teams using different methods and sampling strategies.

Despite methodological concerns that exist within specific studies, when taken together, the evidence is strong that SOGI change efforts are harmful to the health of people of diverse sexual orientation and/or gender identity, including children and adolescents. In recent decades, scholars and ethicists have proposed criteria for identifying potentially harmful behavioral health treatments when limited data exist. Potentially harmful treatments are defined as those that:

- Cause psychological or physical harm to the client or others
- Result in harmful effects that are long-lasting
- Have had independent research teams find and replicate the harmful effects[116]

This is the case with SOGI change efforts. Ineffective treatments—those that may not directly cause further harm but do not improve the health or well-being of the individual receiving treatment—may also be considered harmful in so far that they deprive an individual of needed care.[117,118]

Three sets of criteria have been proposed to identify potentially harmful treatments for children:

1. Criteria drawn from ACEs, revised to include experiences with therapists
2. Criteria drawn from studies of maltreatment and neglect
3. Criteria based on the plausibility of an intervention and its (in)congruence with what is known about child development.[119]

SOGI change efforts with children and adolescents meet all three criteria for identifying potentially harmful treatments for children.

Given the lack of evidence of efficacy and the potential risk of serious harm, every major medical, psychiatric, psychological, and professional mental health organization has taken measures to end sexual orientation change efforts and gender identity change efforts.

Consensus of Professional Organizations

Associations that have taken measures to end sexual orientation change efforts and/or gender identity change efforts include, among others:

- **Medical associations,** such as the American Academy of Child and Adolescent Psychiatry, American Academy of Family Physicians, American Academy of Pediatrics, American College of Physicians, American Medical Association, American Psychiatric Association, and the Society for Adolescent Health and Medicine
- **Psychological associations,** such as the American Psychoanalytic Association, American Psychological Association, and National Association of School Psychologists
- **Counselor associations,** such as the American School Counselor Association and American Counseling Association
- **Social worker associations,** such as the National Association of Social Workers
- **International health organizations,** such as the Pan American Health Organization (of the World Health Organization), World Professional Association for Transgender Health, and World Psychiatric Association

Conclusion

There is sufficient evidence to conclude that SOGI change efforts are inappropriate, harmful practices based on the knowledge that:

- These efforts are founded on a view of sexual and gender diversity that runs counter to scientific consensus.
- Research demonstrates that sexual orientation change efforts are ineffective, and no research demonstrates the effectiveness of gender identity change efforts.
- There is a growing body of evidence that exposure to SOGI change efforts can cause significant, lasting harm.

Other supportive behavioral health approaches are recommended for individual or family distress associated with sexual orientation and gender identity, as discussed in "Beneficial Therapeutic Approaches and Interventions in LGBTQI+ Youth and Their Families" in Section 2.

Section 2. Development, Behavioral Health, and Beneficial Therapeutic Approaches With Youth of Diverse Sexual Orientation and/or Gender Identity: A Research Overview

Sexual Orientation

Sexual orientation consists of sexual identity, sexual and romantic attraction, and sexual behavior. Great shifts in the understanding of sexual orientation have occurred over the past century.[120] Though a diverse sexual orientation was once considered abnormal or a medical problem, scientists now understand that sexuality occurs on a continuum and that variations in sexual orientation are part of the normal and healthy range of human sexuality.[16,17,23,24,121]

Although some people experience changes in sexual awareness, attractions, behaviors, and identities over time, this does not mean that sexual orientation can be willfully changed through their own or others' efforts, such as through sexual orientation and gender identity (SOGI; pronounced "SO-gee") change efforts.[23]

Today, many terms are used to describe sexual orientation. In addition to terms such as lesbian, gay, bisexual, and straight, many young people use a wider range of descriptive identity labels for their sexual orientation such as pansexual, asexual, queer, and questioning, among others.[122,123,124] Research with large, national samples of adolescents has found that approximately one-quarter of adolescents of diverse sexual orientation and/or gender identity use newer descriptive labels for their sexual orientation and/or gender identity.[124,125] Use of a wider range of descriptive sexual orientation labels appears to be more common among gender-diverse adolescents than among cisgender adolescents.[123]

The number of people in the United States who feel safe or comfortable to self-identify as a sexual minority is increasing, and most of this increase is occurring among women, people of color, and younger generations.[31] Nearly 5 percent of adults in the United States identify as lesbian, gay, or bisexual; this represents an increase of nearly 60 percent of individuals who were comfortable self-identifying as LGB than on surveys conducted 8 years earlier. Among U.S. high school students, nearly 15 percent identify as lesbian, gay, or bisexual or are unsure of their sexual orientation; this is nearly double the number of students who were comfortable self-identifying as non-heterosexual in surveys

Sexual orientation and gender are distinct yet related.

Everyone has a sexual orientation, including identity, attraction, and behavior, and a gender, including identity and expression. Individuals can belong to both a sexual minority population (i.e., lesbian, bisexual, gay, and other non-heterosexual orientations) and a gender minority population (i.e., transgender, nonbinary, and other diverse genders). Importantly, gender does not determine a person's sexual orientation. Gender-diverse populations include individuals with many different sexual orientations, including those who identify as straight/heterosexual and those who identify with a sexual minority identity.

Though they are distinct, gender and sexual orientation are related. Many adolescents and young adults who are gender diverse also identify with a sexual minority identity.

conducted 8 years prior.[59] The true size of sexual minority populations is likely higher than reported in these surveys. Stigmatizing societal attitudes and concerns about confidentiality may limit accurate reporting of sexual orientation identity and behavior.[126] Additionally, many surveys ask about only a limited number of sexual orientation options (e.g., lesbian, gay, bisexual, or heterosexual), which may miss individuals who use other terms (e.g., pansexual, asexual, or queer).[122,124] The increase in openly identifying as a sexual minority does not suggest that people are more likely to have the innate characteristics of being a sexual minority, but rather that individuals are increasingly able to publicly identify as LGBTQI+ because of increasing awareness and acceptance of diverse sexual orientations; the expansion of laws, policies, and practices that protect and support individuals regardless of sexual orientation; and an increased willingness and ability among LGBTQI+ people to self-identify due to decreased stigmatization and greater access to civil rights.[31]

How many people in the United States are sexual and gender minorities?

An estimated 11.4 to 12.2 million adults identify as LGBTQ+ in the United States, a number roughly equivalent to the population of Ohio.

An estimated 1.99 million adolescents ages 13 to 17 identify as LGBT in the United States, which is roughly equivalent to the combined populations of Dallas, Texas, and Detroit, Michigan.[31,127,128]

Sexual Orientation Development in Youth

Sexual orientation is usually conceptualized to begin at or near adolescence with the development of sexual feelings.[24] The average age at which sexual minority individuals reach important sexual orientation identity development milestones, such as becoming aware of same-sex attractions and coming out to others, commonly occurs during adolescence.[129,130] Various factors affect the trajectory of development related to sexual orientation, and there is no single or simple trajectory experienced by all individuals.[131,132,133,134,135] Recent generations of sexual minority individuals tend to reach milestones related to sexual orientation identity development and coming out (e.g., first becoming aware of their attractions, disclosing or sharing one's sexual orientation- or gender-diverse identity, first sexual minority relationship) at similar ages in adolescence.[129] In addition, it is becoming increasingly common for children to identify as lesbian, gay, or bisexual in childhood.[18] Youth's earlier public self-identification as having a minority sexual orientation is likely due to reduced stigma related to sexual orientation diversity. As more youth self-identify as sexual minorities, scholars have called for supporting the emotional and mental health needs that children express related to their sexual orientation.[136]

Sexual identity development is influenced by cultural factors that may differ across racial and ethnic groups. However, most research on sexual orientation identity development has included primarily white youth without examining differences related to race and ethnicity or cultural background.[124] As such, our cultural and scientific understandings of common experiences and developmental trajectories of sexual minority populations may better reflect the experiences of white sexual minority groups and be less relevant to the experiences of sexual minority people of color.[137] Limited research has examined the dual or multiple identity development processes among sexual minority youth of color.[138] Development related to racial/ethnic identity and sexual identity may occur concurrently among adolescents, though

involve different processes.[139,140,141] A variety of studies have identified cultural constructs and culturally specific expectations that have been identified as influencing sexual identity development among youth of color include familism (i.e., family needs take precedence over individual needs) and specific cultural understandings and expectations of masculinity among Black and Latino adolescent boys in particular.[138,142,143,144]

Significant physical, cognitive, and social development occurs during adolescence. Sexual minority adolescents face the same developmental tasks that accompany adolescence for all youth, including sexual identity development. However, sexual minority adolescents must also navigate an environment lacking awareness and acceptance of socially marginalized sexual identities, potentially without family, community, or societal support.[145,146]

Sexual identity development includes processes of identity formation (i.e., becoming aware of sexual attractions, exploring sexual feelings) and identity integration (i.e., integrating sexual identity within the larger view of self).[145] For sexual minority adolescents, difficulty with the identity development process, such as difficulty accepting one's sexual orientation and dissonance between one's self-image and cultural, religious, and societal beliefs about sexual minorities, can increase negative views of one's own and others' sexual minority identities and lead to adopting negative societal attitudes and beliefs about being a sexual minority.[147]

Sexual orientation conflict has been linked to negative psychosocial outcomes in adolescents and young adults.[146] Furthermore, a negative self-image as a sexual minority youth contributes to the relationship between sexuality-specific stressors (e.g., family

When discussing the concept of gender, scientists distinguish among a person's sex assigned at birth, gender identity, and gender expression.[24,25,125]

- **Sex assigned at birth is typically based on the appearance of external genital anatomy; male, female, or intersex are possible ways to identify sex.**
- **Gender identity refers to a person's deep internal sense of being female, male, a combination of both, somewhere in between, or neither.**
- **Gender expression refers to the external way a person communicates their gender, such as with clothing, hair, mannerisms, activities, or social roles. A person's gender expression may or may not be consistent with culturally prescribed gender roles or their sex assigned at birth and may or may not reflect their gender identity.**

rejection, victimization) and poorer mental health outcomes.[146,147]

Positive identity development, however, is associated with better mental health among sexual minority adolescents.[145,148] For example, one study found that for sexual minority college students, those who reported strong religious beliefs also reported lower psychological distress, but only among those students who had high levels of self-acceptance of their sexual orientation.[149] Strong religious beliefs on their own were not protective in terms of psychological distress for students who reported lower levels of self-acceptance of their sexual orientation.

Important areas of focus for behavioral health providers who work with adolescents include helping them address negative views about aspects of their identity and supporting positive identity development. For behavioral health providers who work with sexual minority adolescents, this includes reducing the client's negative views of their own sexual orientation identity and supporting positive identity development. This encompasses the integration of sexual orientation identity into the adolescent's larger sense of self, alongside intersecting identities (e.g., cultural, racial/ethnic, and other identities).

Gender

Transgender is a term that refers to individuals whose gender identities are incongruent with their sex assigned at birth.[75] The term gender diverse is a broader term that includes transgender individuals, as well as others whose gender behaviors, appearances, or identities are incongruent with those culturally expected based on sex assigned at birth.[75]

Significant advances have occurred over time in the scientific understanding of gender. It is now understood that gender diversity—identifying with a gender that does not align with sex assigned at birth, and/or having a gender expression that varies from that which is culturally expected for one's gender or sex assigned at birth—is part of the normal and healthy spectrum of human diversity, is not pathological, and does not require clinical attention on its own.[19,22,25,150]

Gender diversity was depathologized with changes made to the 5th revision of the Diagnostic and Statistical Manual of Mental Disorders (DSM-5) and the 11th revision of the International Classification of Diseases (ICD-11).[151,152] These changes make it clear that gender diversity is not a disorder. Instead,

current guidelines focus on treating and supporting individuals who may experience feelings of distress (i.e., gender dysphoria) or incongruence between their gender identity and body or sex assigned at birth, as well as any distress associated with stigma and discrimination.[25] Note that throughout this report, "gender dysphoria" (not capitalized) refers to the general concept of distress associated with incongruence between one's gender identity and body or sex assigned at birth, while "Gender Dysphoria" (capitalized) refers to the DSM diagnosis.

Access to gender affirmation can alleviate or improve distress due to feelings of gender incongruence. Gender affirmation refers to processes by which an individual is recognized and affirmed in the gender with which they identify.

Gender affirmation can include psychological, social, medical, and legal aspects. Access to gender affirmation can reduce gender dysphoria and improve mental and physical health outcomes among transgender and gender-diverse people and is protective against the negative effects of gender-related stigma and discrimination.[153,154] There is substantial evidence of the behavioral health benefits of access to gender affirmation for transgender and gender-diverse children, adolescents, and adults.[51,52,53,80,81,155,156]

The belief that people can only belong to one gender category—male or female—has been prevalent in many contemporary Western societies. However, over the past several decades there has been a growing scientific understanding that sex and gender are more complex. Some people are born with sex characteristics that fall outside of male and female categories, and gender identity occurs on a spectrum.[157,158,159,160,161]

Scientists now recognize that many gender identities and gender expressions exist, and have always existed in a wide range of cultures across history.[157,162,163,164]

Terms such as nonbinary, gender queer, gender fluid, agender, bi-gender, and others are used by many individuals to express their gender identity.[162,164]

Identifying with more than one identity is also common.[165] There are also many culturally specific terms that have long been used for third gender or nonbinary identities and gender roles, including two-spirit among some Indigenous North American cultures, fa'afafine in Samoan culture, and māhū in Native Hawaiian culture.[165,166,167,168]

What about intersex youth?

Intersex is an umbrella term used to describe people born with differences in sex characteristics, such as reproductive anatomy, chromosomes, or hormones that do not fit typical definitions of male and female. Intersex people can have many different gender identities.

Individuals with intersex traits may identify as male, female, nonbinary, or a different gender. Intersex individuals may consider themselves transgender if they do not identify with their sex assigned at birth.

Like other LGBTQI+ youth, intersex youth experience pervasive stigma and discrimination. The Federal Government has taken steps to reduce disparities facing people who are intersex, such as issuing a Request for Information on Promising Practices for Advancing Health Equity for Intersex Individuals in February 2023.[46]

Identifying as nonbinary appears to be more common among younger generations.[165] This may be related to greater visibility and social acceptance of gender diversity.[122] One study with a large national sample found that nearly one-quarter of adolescents of diverse sexual orientation and/or gender identity self-identified as nonbinary.[124] Of note, some people who describe themselves as nonbinary or another gender consider themselves transgender, while others do not.[158]

In this report, "transgender and gender diverse" is used as a broad term that refers to people whose gender identity and/or gender expression are incongruent with their sex assigned at birth, including binary transgender people, nonbinary people, and cisgender people with a diverse gender expression.

Estimates of the size of the transgender and gender-diverse population in the United States vary. It is only in recent years that some national, population-based surveys have started to include questions to assess gender identity, and the practice remains far from widespread. It is estimated that between 0.1 and 2.0 percent of adults in the United States identify as transgender.[124,169] These figures likely underestimate the size of the transgender and gender-diverse populations, because much of this research has not used current best practices for asking separately about current gender identity and sex assigned at birth and did not consistently include gender-diverse individuals who do not identify with the term transgender.[170,171] Recent population-based research with adults of diverse sexual orientation and/or gender identity has found that 1.2 million adults in the United States identify as nonbinary, including people who both do and do not consider themselves transgender.[158]

Research with high school students has found that between 1.1 and 9.2 percent identify as transgender, nonbinary, or another gender identity that differed from their sex assigned at birth.[122,171,172,173] Studies that specifically asked about identifying as nonbinary and other gender identities in addition to identifying as transgender reported larger proportions of transgender and gender-diverse youth, emphasizing the importance of asking about nonbinary and other diverse gender identities.[169,171,174]

Gender Development in Youth

Gender-related development begins in early childhood and progresses through adolescence.[21] Processes of gender-related identity development among transgender and other gender-diverse populations are varied, non-linear, and not necessarily anchored to specific ages or developmental periods.[37,38] For some individuals, gender identity appears stable across development, while others experience changes in their gender identity over time.

Youth who start to think of themselves as transgender or gender diverse may share this identity with others, and take steps in social transition across a wide range of ages.[29,30,177,178] There is no single developmental trajectory for transgender and gender-diverse youth—that is, there is healthy and normal variation in the age that youth recognize themselves as gender diverse.[25]

Individuals who exhibit gender diversity in childhood include those who:

- Consistently identify with a gender that differs from their sex assigned at birth
- Identify with the gender that aligns with their sex assigned at birth and have a diverse gender expression
- Are exploring their gender identity and/or gender expression[179,180]

While earlier research from clinics specializing in childhood gender identity suggested that many individuals who exhibited gender diversity in childhood did not later identify as transgender in adolescence, significant methodological weaknesses preclude use of these findings to identify trajectories of gender identity development and their associated frequencies.[180] However, more recent research and clinical expertise suggests that children who consistently identify with a gender different from their sex assigned at birth typically express a similar clarity in adolescence.[50,77,150,179,181,182] Research also indicates that children whose gender expression differs from social norms, but who do not identify as transgender or nonbinary, are more likely to have a diverse sexual orientation in adulthood.[24,183,184]

A significant body of research demonstrates that affirming a child's current gender identity and gender expression, as well as supporting their process of understanding more about their identity, is beneficial for all children. The benefits of providing affirming mental health care include reducing the risk of suicide in transgender and gender-diverse youth. Given the significant mental health risks that gender minority youth face when affirming mental health care is not available, affirming mental health care is appropriate and necessary even for youth who may later identify differently in adulthood.[78,179,185,186,187]

Younger generations understand, experience, and communicate their gender-related experiences in different ways than previous generations. These understandings of gender include an increased recognition of the complexity of gender, sexuality, and identity and fewer stereotypes or expectations of what it means to be a certain gender.[157,175,176]

Children who identify as transgender early in their development are increasingly supported and affirmed in their identities by many families at young ages. Research with transgender youth who have socially transitioned—that is, who present as their gender identity in everyday life—provides evidence that early in childhood, gender-related development is similar among transgender and cisgender children with the same gender identity, regardless of sex assigned at birth.[188,189,190] These similar areas of gender-related development between transgender and cisgender children include consistency and strength of identification with their gender and expression of gender preferences, stereotypes, behaviors, and beliefs.[40]

Other youth identify as transgender or gender diverse for the first time in adolescence.[35,177,191,192,193] Puberty can be a pivotal time when youth become more aware of their gender and experience physical changes that can trigger or exacerbate dysphoria.[194] Some individuals who initially identify as transgender or gender diverse in adolescence do not have a history of gender diversity or gender "non-conforming" behaviors or preferences in childhood.[178] This can make disclosure of a gender identity that differs from sex assigned at birth in adolescence surprising to parents, guardians, and others.

Some adolescents who identify as transgender or gender diverse report that they felt different at a young age but expressed or engaged in behaviors that were stereotypical for their sex assigned at birth earlier in life, while others do not feel differently about their gender until adolescence.[35,177] Given the advances in scientific understanding of the normal and healthy diversity of gender identities, understanding the current experiences of youth whose gender incongruence presents in adolescence is an important area of study. No singular narrative can describe the totality of transgender and gender-diverse youth experiences.

Identity development is among the key tasks of adolescence for all adolescents, including those who are transgender and gender diverse. Self-acceptance of one's gender identity, identity pride, and valuing self are factors that promote resilience among transgender and gender-diverse adolescents.[146,195,196,197] However, transgender and gender-diverse adolescents may experience identity conflict when reconciling a gender identity that may diverge from the expectations of their family, peers, and community. This can be particularly pertinent for transgender and gender-diverse adolescents of color, who often experience multiple forms of discrimination (e.g., racial discrimination when seeking out supportive services, or anti-transgender stigma in one's racial/ethnic or cultural community) and may perceive incompatibility between their gender identity and racial/ethnic identities.[141,199]

Conversely, racial/ethnic identity development processes may beneficially impact how youth navigate gender identity development, such as experience coping with adversity and developing a sense of pride in one's identity.[196] While self-acceptance and identity pride are associated with well-being, adopting negative societal attitudes and beliefs about being transgender or gender diverse and having a negative gender-related self-concept have been connected to mental health challenges and greater substance use among transgender and gender-diverse adolescents.[200,201]

Minority stressors experienced due to anti-LGBTQ+ stigma include major life events, such as assault because of one's sexual orientation, gender identity, or gender expression, as well as everyday forms of discrimination and non-affirmation, such as receiving poor services, being assumed to be straight, or being misgendered. Minority stress is also caused by policies that limit the opportunities, resources, and well-being of LGBTQI+ populations.[111,198]

Important areas of focus for behavioral health providers who work with adolescents includes helping them address negative views about aspects of their identity and supporting positive identity development. Therefore, important areas of focus for behavioral health providers who work with transgender and gender-diverse adolescents are reducing negative views of their own gender identity and supporting positive identity development.[199,200,201] As with adolescents of diverse sexual orientations, this includes integration of gender identity and gender self-concept into their larger sense of self, alongside cultural, racial/ethnic, and other identities.

Research on how gender identity development varies by gender, race and ethnicity, and other cultural, social, and environmental factors remains in its early stages. Some studies have identified potential differences in developmental trajectory by gender.[35] Many studies have disproportionately low representation of transgender girls and other gender-diverse youth assigned male at birth, suggesting that transgender girls and women are coming out at later ages.[202,203,204]

One study investigating age upon accessing gender-affirming medical care found that it was influenced by contextual factors, such as family religion, having a helpful caregiver, as well as developmental milestones reached upon recognition of gender incongruence and age at coming out or disclosing gender identity.[205] Another study of young transgender women found differences by racial/ethnic group, suggesting that youth of color may achieve some social milestones (e.g., disclosure of gender identity) at younger ages than white youth.[206]

Most research with transgender and gender-diverse youth has been conducted with mostly white, higher income families living in urban areas who have access to specialized pediatric gender clinics. In recent years, more research has been conducted with nonclinical populations of children.[36] Given the tremendous variation in attitudes and expectations related to gender by cultural group and family background, more research is needed with racially and ethnically diverse children and families, lower income families, and families from different cultural and religious backgrounds to better understand the experiences and needs of diverse gender minority children and adolescents and to ensure access to evidence-based care.

Health and Well-Being of LGBTQI+ Youth

In the United States and worldwide, sexual- and gender-diverse populations experience inequities in many behavioral health outcomes.[207,208] This report uses the phrase "health inequities" as opposed to "health disparities" to refer to unnecessary and avoidable health differences.[209] These health inequities are not caused by one's sexual orientation, gender identity, or gender expression, but rather by anti-LGBTQI+ stigma that is embedded in proposed and enacted laws, policies, and societal attitudes.

The Minority Stress Model provides an empirically validated conceptual model for understanding how stress due to anti-LGBTQI+ stigma, coupled with general life stressors, puts individuals of diverse sexual orientation and/or gender identity at increased risk for negative behavioral health outcomes.[111,210,211] These external experiences of minority stress cause cognitive, affective, and behavioral reactions, such as internalized stigma, identity concealment, and social isolation, all of which are associated with poorer mental health.[154,210,212,213,214]

Despite the impact of anti-LGBTQI+ stigma, which individuals can experience in tandem with other forms of discrimination, many youth and adults of diverse sexual orientation and/or gender identity can adapt, thrive, and demonstrate resilience despite risk exposure, high levels of stress, and other forms of adversity.[215] Resilience refers to a dynamic process of adapting positively within the context of significant adversity.[216] Resilience among sexual- and gender-diverse populations is promoted through:

- Self-acceptance of sexual orientation and gender identity, self-esteem, and identity pride
- Social support and sexuality- and gender-specific support from family, peers, schools, and community organizations
- School and community connectedness
- Inclusive and supportive federal and state policies[60,66,148,217]

It is important to recognize that sexual and gender minorities are not a single, homogeneous population. In addition to including individuals with many distinct sexual orientations, gender identities, and gender expressions, LGBTQI+ populations are also diverse with respect to other identities, including age, race, ethnicity, immigration status, language, national origin, religion, spirituality, ability, and socioeconomic status. Individuals with multiple minority identities experience unique stigma and stressors, as well as unique opportunities for resilience.[197,218,219,220]

To support individual LGBTQI+ youth in achieving their optimal health and well-being, and to take action to address health inequities among LGBTQI+ populations, behavioral and other healthcare providers, families, school administrators, boards, and educators, community leaders, and policymakers must understand the health concerns that may affect LGBTQI+ youth and be knowledgeable about the factors that lead to risk and resilience among LGBTQI+ youth. The following sections provide an overview of behavioral health concerns among LGBTQI+ youth, as well as what is known about the influence of families, school, religion and spirituality, community climate and policies, and gender affirmation on the behavioral health of LGBTQI+ youth.

Behavioral Health Concerns Among LGBTQI+ Youth

Variations in sexual orientation (identity, behavior, and/or attraction) and gender (identity and expression) are part of the normal spectrum of human development and do not constitute mental disorders. However, youth of diverse sexual orientation and/or gender identity are at elevated risk for mental illness and substance use due to experiences of discrimination related to sexual orientation, gender identity, rejection, trauma, violence, and a lack of support from families, school systems, and communities.[111] Transgender and gender-diverse children and adolescents may also experience psychological distress related to gender dysphoria.[25] It is important to emphasize that youth of diverse sexual orientation and/or gender identity are

resilient, and that with sufficient support and access to resources, they can thrive.[68,69] Behavioral health concerns that behavioral health providers can be aware of and attend to among sexual- and gender-diverse youth are summarized below.

Behavioral Health Concerns Among LGBTQI+ Children

Recent research has begun to investigate behavioral health among sexual- and gender-diverse children and has found that inequities in behavioral health may begin in childhood. While some sexual- and gender-diverse children are distressed, others are not. Among those who are distressed, the source of distress varies.

Several studies found that more children who self-identify as gay, bisexual, or questioning reported distress, including mood disorders, non-suicidal self-injury, suicide ideation, and suicide attempts than did children who do not identify as gay, bisexual, or questioning.[30,54] Additionally, two longitudinal studies found that children who later identified as a sexual minority began experiencing mental health challenges as early as age 11.[55,56] Other studies indicate that mental health concerns among sexual minority children may be linked to experiences of victimization, such as bullying behaviors perpetrated by peers.[221,222]

Gender-diverse children appear to have elevated rates of mental health concerns, including symptoms of anxiety and depression, history of self-harm, and suicidality, compared to cisgender children.[223,224,225] When gender-diverse children have behavioral health concerns, these may be related to invalidation or rejection of their gender diversity, or distress related to current anatomical dysphoria and/or anticipation of future pubertal development incongruent with their current gender. Alternatively, their mental health concerns may be entirely unrelated to their gender.[25,50]

At the same time, research also suggests that gender-diverse children who receive meaningful gender identity support do not necessarily experience elevated rates of depression and anxiety.[51,226] Research with a national sample of socially transitioned prepubescent transgender children found this group to have developmentally normative levels of depression, only minimal elevations in anxiety, and comparable levels of self-worth, suggesting that behavioral health concerns are not inevitable among this group.[51,226]

Behavioral Health Concerns Among LGBTQI+ Adolescents

As LGBTQI+ adolescents navigate the challenges of adolescence, some experience a variety of behavioral health concerns and psychosocial challenges. Compared to their heterosexual and cisgender counterparts, some adolescents of diverse sexual orientation and/or gender identity are at disproportionate risk of behavioral health symptoms, driven by increased exposure to stigma, rejection, and victimization.[48,227,228,229,230] It is also important to note that behavioral health concerns may be unrelated to sexual and gender diversity. Exposure to SOGI change efforts is a key risk factor that has been shown to increase risk of

suicide attempt among adolescents and young adults of diverse sexual orientation and/or gender identity.[9,10,49,229]

Compared to heterosexual and cisgender peers, adolescents of diverse sexual orientation and/or gender identity are more likely to experience psychological distress, symptoms of depression, and symptoms of anxiety.[57,65] Studies indicate large differences in rates of suicidal ideation and attempts among adolescents in the United States by sexual orientation and gender identity. The Youth Risk Behavior Surveillance System (YRBSS) documented increased odds of suicide risk among both sexual minority and gender minority high school students compared to heterosexual and cisgender students, including suicide attempt requiring medical treatment.[227,228,230,231]A recent public health study with data from six states found that while suicide rates are dropping, sexual minority adolescents in this study were three times as likely to attempt suicide relative to heterosexual adolescents.[58] Research with gender minority adolescents has documented that between 25 percent and 51 percent of transgender and gender-diverse adolescents have attempted suicide, with the highest rates among transgender boys and nonbinary youth.[192,232,233,234]

Research using YRBSS data indicates that some adolescents of diverse sexual orientation and/or gender identity are more likely than heterosexual and cisgender adolescents to engage in substance use.[228,229,231,235,236] Research found that adolescents of diverse sexual orientation and/or gender identity also experience greater incidence of eating disorders and disordered eating behaviors than their heterosexual and cisgender counterparts.[237]

Adverse mental health outcomes tend to be more prevalent among gender minority youth compared to sexual minority youth due to specific stigma and discrimination against transgender individuals.[61] The higher rates of substance use and suicidality are partly explained by experiences of discrimination, victimization, and higher rates of depressive symptoms reported by transgender and gender-diverse adolescents as compared to cisgender adolescents.[60,233,238,239,240]

Among transgender and gender-diverse adolescents, some research suggests that mental health outcomes may be worse among nonbinary adolescents and transgender boys.[61,232,241,242] Gender dysphoria, which can initiate or intensify in adolescence, can cause psychological distress among transgender and gender-diverse adolescents.[25] Increased experiences of victimization, rejection, and exposure to discriminatory policies may also drive the higher rates of adverse mental health seen among transgender and gender-diverse adolescents compared to sexual minority adolescents.[228,242,243]

Trauma is also a common behavioral health concern among adolescents of diverse sexual orientation and/or gender identity, who have an increased likelihood of experiencing child maltreatment, school-based victimization, violence, and homelessness, and who are overrepresented in both the child welfare system and the juvenile correctional system.[63,64,227,228,231,243,244,245,246,247]

A number of studies suggest that some neurodiverse youth are gender diverse.[224,248,249,250,251] The most recent clinical guidelines suggest that such youth benefit from an individualized approach to treatment.

The fact that research consistently demonstrates large inequities in behavioral health among LGBTQI+ adolescents indicates that this is a vulnerable population that needs psychosocial support, equitable social conditions, and access to affirming mental health care. At the same

time, it is important to emphasize that many LGBTQI+ adolescents are resilient and although experiencing discrimination and behavioral health challenges can thrive.[68,69,252,253]

Influences on Health and Well-Being

The increased risks of behavioral health distress that LGBTQI+ youth face are not a function of their identities. Rather, these risks stem from the stresses of stigma, discrimination, rejection, and violence.[240] The presence of sexual orientation- and gender-related stressors—and opportunities for emotional support and connection—encompasses multiple social systems, including, for instance, family, culture, values, school, and community networks.[254,255,256] Therefore, when LGBTQI+ youth are evaluated by a behavioral health provider, assessment should routinely include family, school, and community systems in which they live to identify both sources of distress and sources of support and connection as protective factors.[256] By increasing LGBTQI+ youth's access to support and resilience-promoting resources across their daily environments, and decreasing exposure to stigma and discrimination in communities and healthcare systems, more LGBTQI+ youth can achieve optimal health and well-being.

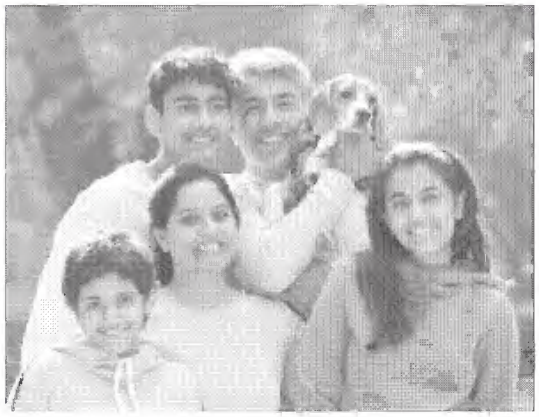
Family

Family response to youth's sexual orientation, gender identity, or gender expression has a significant impact on the youth's well-being, with effects that appear to extend into young adulthood.

Parents, caregivers, and families can serve as both a source of stress and a source of support for youth of diverse sexual orientation and/or gender identity.[40,53,257] Negative parental responses to sexual orientation, gender identity, and/or gender expression are associated with mental health concerns including psychological distress, depression, suicidality, and substance use.[10,253] Alternatively, parent-child relationships characterized by closeness and support are an important correlate of mental well-being.

Strong parental support for a child's gender identity may offset the mental health challenges commonly documented among gender-diverse children.[51,226] The use of a transgender or gender-diverse adolescent's chosen—rather than given—name has been linked to decreased depressive symptoms, suicidal ideation, and suicidal behavior.[49,52] Among adolescents of diverse sexual orientation and/or gender identity, high levels of sexual orientation and gender identity acceptance from parents and other relatives has been associated with reduced suicidality.[49,258,259] Further, the behavioral health benefits from high levels of family acceptance of youth's diverse sexual orientation and/or gender identity appear to last through young adulthood.[103] The limited research that has focused on family members outside of parents and primary caregivers suggests that siblings and extended family members can be key sources of support for youth of diverse sexual orientation and/or gender identity.[260,261]

Studies have found that some adolescents of diverse sexual orientation and/or gender identity report strikingly high rates of adverse childhood experiences (ACEs). High ACE scores and parental rejection have been associated with



suicidality in youth of diverse sexual orientation and/or gender identity[262] and may put these adolescents at greater risk for being victimized in other settings.[263] Notably, though some scholars and practitioners consider SOGI change efforts from family members potentially traumatic events, ACE measures do not capture youth's experiences of SOGI change efforts.[120]

It is important to note that some LGBTQI+ youth who lack family and/or parental support find resilient ways to access needed support and guidance. Many people of diverse sexual orientation and/or gender identity, including those with and without supportive families of origin, form "chosen families" with sexual- and gender-diverse friends who provide social support and resources.[266] In urban areas across the United States, LGBTQI+ adolescents and young adults of color—particularly Black and Latino youth—may join informal communities and LGBTQI+ family structures.

Religion & Spirituality

When considering family and community influences, a child's or adolescent's religious background is an important factor. Religious beliefs and background are far-reaching influences that encompass multiple arenas of one's life, including personal and family religious identity, beliefs, and coping; family attitudes, beliefs, and relationships; and community character and support. Religious views of sexual and gender diversity in the United States vary widely[269,270] and can have a large influence on sexual- and gender-diverse adolescents' mental health and well-being.[147,269,270] When working with youth of diverse sexual orientation and/or gender identity, it is important to consider the intersection of religion with youth's racial and ethnic identity and cultural background.[271,272]

Religion and spirituality are complex, nuanced aspects of human diversity. Parents from all backgrounds have a full range of reactions to their child's sexual orientation and gender identity and expression regardless of religious or spiritual traditions (e.g., confusion, desire for information, questions about social implications, love and loyalty, coming to terms with differences, growth and expansion of spiritual understanding, and for some a sense of loss).[273,274] Rather than focus on faith beliefs, where they might lack expertise, behavioral health providers can focus on encouraging key measurable behaviors among families and caregivers that have been found to be supportive and protective for children, as well as informing families how some of their behaviors and interactions might lead to negative behavioral health outcomes.[102,258,273]

Youth of diverse sexual orientation and gender—and particularly those youth of color—are overrepresented among youth experiencing homelessness, as well as across multiple state-based systems[214,264,265]

- **Up to 40% of all youth experiencing homelessness and housing instability are youth of diverse sexual orientation and gender.**
- **Up to one-third of youth in foster care systems are youth of diverse sexual orientation and gender.**
- **Up to one-fifth of youth in the juvenile justice system are youth of diverse sexual orientation and gender.**

Parent or caregiver rejection due to sexual orientation and gender diversity is just one of many reasons for these inequities; other factors such as parental mental health and substance use, poverty, and racism are common drivers of housing instability and system involvement among youth of diverse sexual orientation and gender.

School

LGBTQI+ adolescents may experience a myriad of sexual orientation- and gender-related stressors in the school environment, where they spend a large portion of their time. Despite increasing cultural visibility and acceptance of people of diverse sexual orientation and/or gender identity, the climates of U.S. secondary schools remain generally unsupportive and unsafe for many sexual- and gender-diverse youth, who experience high levels of verbal and physical harassment and assault, sexual harassment, social exclusion and isolation, and other interpersonal problems with peers.[48]

School bullying and victimization is often linked to nonconformity to gender norms.[275] Across racial/ethnic groups, approximately half of all sexual- and gender-diverse students of color were bullied or harassed based on their racial/ethnic identity.[48] Further, sexual- and gender-diverse students of color were at greater risk of experiencing multiple forms of victimization and were more likely to feel unsafe at school than their white sexual- and gender-diverse peers.[48]

This mistreatment has a significant effect on sexual- and gender-diverse adolescents' mental health and well-being. Victimization due to sexual orientation or gender expression is associated with depressive symptoms, low self-esteem, and suicidality,[111,275,276] as is not having access to appropriate bathrooms and feeling unsafe in bathrooms and other school facilities.[277,278,279]

Experiences of victimization and discrimination are also linked to negative academic outcomes among sexual- and gender-diverse youth.[184] Victimization from peers and school staff, combined with discriminatory policies, likely contributes to the over-representation of sexual and gender minorities in the juvenile justice system.[48,279] Sexual- and gender-diverse youth of color, particularly girls, are extremely overrepresented among incarcerated youth.[214,279, 280] Research shows that youth of diverse sexual orientation and/or gender identity are not only more likely to experience exclusionary discipline at school, but also appear to be sanctioned more harshly than heterosexual, cisgender teens for the same behavior and are at an increased risk for juvenile justice involvement.[248,281]

School and peer networks can also be a place where youth of diverse sexual orientation and/or gender identity find support. High levels of support from friends, classmates, and school professionals is associated with better mental health and lower suicidality among youth of

School resources that support the health and well-being of youth of diverse sexual orientation and/or gender identity include:

- **The presence of Gender and Sexuality Alliances (GSAs) or other similar supportive peer networks**
- **Antidiscrimination and antibullying policies that explicitly include sexual orientation, gender identity, and gender expression**
- **Policies that allow youth to use their chosen name, pronouns, and facilities that align with their gender identity**
- **Educators who are trained and accept and support students of diverse sexual orientation and/or gender identity**
- **Inclusive curricula resources, such as including the history of people and families with diverse sexual orientation and/or gender identity, and age-appropriate health curricula that discuss sexual orientation and gender identity.[39,43]**

diverse sexual orientation and/or gender identity.[49] Additionally, when youth have access to high levels of peer or school support, this may reduce the negative impact that experiencing victimization has on their mental health.[276] Friends of diverse sexual orientation and/or gender identity may be of particular importance, because they are more likely to provide support for sexuality- and gender-related stress.[282,283] Many youth of diverse sexual orientation and/or gender identity connect with peers and access social support online that may be unavailable to them in person.[284,285] Online sources of support have become increasingly important for youth of diverse sexual orientation and/or gender identity during the COVID-19 pandemic.[286]

School policies and resources that create an inclusive, safe environment positively influence student behavioral health and well-being.[287,288] Specifically, these school policies reduce substance use and planned suicide and suicide attempts.[287] GSA is a student-led, school-based club that aims to provide a safe space for LGBTQI+ students. "GSA" originally referred to "Gay-Straight Alliance," but many GSAs now use the acronym to refer to "Gender and Sexuality Alliance" to acknowledge the full spectrum of sexual orientation and gender diversity.[289]

Both the presence of and participation in a GSA has beneficial outcomes for sexual- and gender-diverse students and others, including increased feelings of safety, lower truancy, and decreased threats of violence in school.[48,287] School policies associated with improved health and well-being of students of diverse sexual orientation and/or gender identity include:

- Antidiscrimination and antibullying policies that enumerate sexual orientation, gender identity, and gender expression
- Policies that allow youth to use facilities that align with their gender identity and/or that provide gender-neutral facilities
- Policies that allow students to use their chosen name and pronouns[278,279]

Training school staff and educators about how to support youth of diverse sexual orientation and/or gender identity is related to lower suicide attempts among these students when provided.[287] Finally, curricula that are inclusive of students and families of diverse sexual orientation and/or gender identity are associated with beneficial outcomes such as fewer

In the most recent National School Climate Survey of LGBTQ+ youth, the Gay, Lesbian & Straight Education Network (GLSEN) found that:

- **60% felt unsafe**
- **69% were verbally harassed**
- **58% were sexually harassed**
- **26% were physically harassed**
- **11% were physically assaulted**
- **45% were cyberbullied**

60% of students of diverse sexual orientation and gender surveyed experienced policies that are discriminatory based on sexual orientation, gender identity, or gender expression at school. Transgender and gender-diverse students were most likely to report incidences with discriminatory policies and practices, including being prevented from using their chosen name and pronouns, and bathrooms and locker rooms aligned with their gender identity.[48]

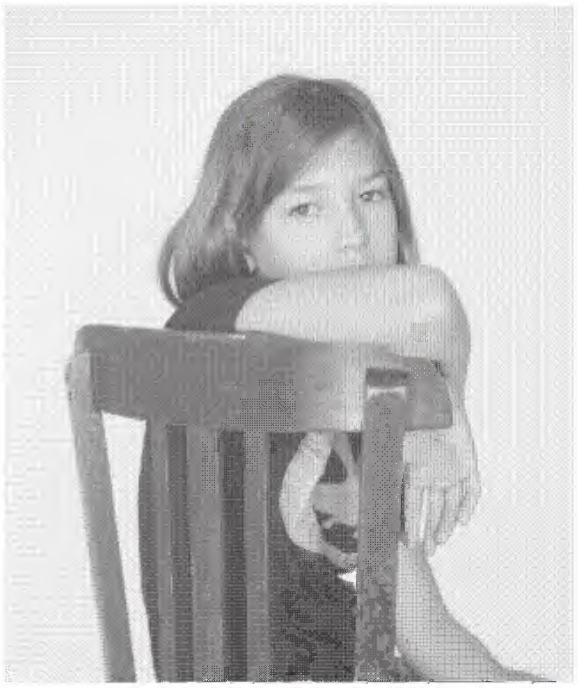
instances of biased language against students of diverse sexual orientation and/or gender identity, students feeling safer, fewer reported instances of victimization, increased peer acceptance, and lower levels of depression; these benefits may be related to the curricula helping to reduce negative stereotypes against LGBTQI+ students.[48] These policies and practices not only are associated with benefits for students of diverse sexual orientation and/or gender identity but also have school-wide beneficial effects across behavioral health and psychosocial outcomes among heterosexual youth.[287]

Community Climate & Policies

Community climate and policies also have an impact on the health and well-being of youth of diverse sexual orientation and/or gender identity. Community climate—defined by the presence or absence of supportive policies, places of worship that are open and inclusive, other LGBTQI+ people, and anti-LGBTQI+ rhetoric—is associated with behavioral health outcomes among LGBTQI+ adolescents. Studies have found that adolescents of diverse sexual orientation and/or gender identity living in areas with a more supportive community climate have better mental health and are less likely to use substances.[290,291]

State and federal laws and policies also affect the health and well-being of sexual- and gender-diverse populations, including youth.[292] More research has been conducted with adults, where supportive and protective policies—such as protection from discrimination in schools and ability to change name and gender on identity documents—have consistently been linked with

better mental health, reduced substance use, and increased access to health care.[205,293,294] Meanwhile, policies that permit discrimination against people of diverse sexual orientation and/or gender identity are linked with poorer behavioral health outcomes.[85] It appears that state and federal laws and policies have a similar effect on youth of diverse sexual orientation and/or gender identity, with the presence of supportive laws and policies associated with reduced suicidality among high school students.[295,296]



Gender Affirmation

In addition to benefiting from gender-affirming support from families, communities, peers, and school professionals as described above, taking desired steps in social transition and access to medical gender transition for those for whom it is medically necessary is associated with better mental health among transgender and gender-diverse youth.[51,67,80,81,155,226,297,298,299,300,301,302,303]

Social transition and medical gender transition are discussed in greater detail in the next section. Improving access to gender affirmation for gender-diverse youth across the various domains of their lives may reduce the mental health inequities seen in this population.

Beneficial Therapeutic Approaches and Interventions in LGBTQI+ Youth and Their Families

Behavioral health professionals provide youth and their families with developmentally sensitive, culturally appropriate, and client-centered interventions that emphasize acceptance, support, and understanding and that match the child and adolescent's cognitive and emotional development.

Appropriate therapeutic approaches with LGBTQI+ youth do the following:

- Provide accurate information on sexual orientation and gender identity and expression.
- Identify sources of distress, including internalized stigma and minority stress, and work with children, adolescents and families to reduce distress experienced by children and adolescents.
- Support adaptive coping to improve psychological well-being.
- Support youth as they learn more about their sexual orientation and gender identity, and supporting families in accessing gender-affirming care for their transgender child when indicated.
- Help children and adolescents navigate their sexual orientation, gender identity, and gender expression within the context of their intersecting identities.

Client-Centered Individual Approaches

Behavioral health providers offer developmentally sensitive, affirmative interventions to youth. Developmentally sensitive approaches account for appropriate developmental emotional and cognitive

capacities, developmental milestones, and emerging or existing behavioral health concerns.

Affirmative approaches recognize and communicate that being of diverse sexual orientation and/or gender identity does not constitute a mental disorder, and that variations in sexual orientation, gender identity, gender expression, and sex characteristics are normal aspects of human diversity, including nonbinary gender identities.[75,304,305,306] Affirmative approaches recognize that when behavioral health issues exist, they often stem from stigma and negative experiences rather than being intrinsic to the child or adolescent.[76] When working with children and adolescents, providers examine not only risk factors but also sources of resilience across the multiple environments that influence the health and well-being of young people.[306]

Effective approaches support youth in identity exploration and development without seeking predetermined outcomes related to sexual orientation, gender identity, or gender expression.[189,305] Key aims are to dispel negative stereotypes and provide accurate information in developmentally appropriate terms for children and adolescents.

Scientists and researchers are constantly discovering more about sexual orientation, gender identity, and expression. For some youth, a focus on identity development and

exploration that allows them the freedom of self-discovery within a context of acceptance and support is vital to improving behavioral health and well-being.[307] It is important to note, however, that identity exploration is not relevant or needed by all youth or a required focus of therapy for youth of diverse sexual orientation and/or gender identity. Additionally, it is important for behavioral health providers to respect what the identity exploration process looks like to each individual. Taking steps in social transition is one way for gender-diverse youth to explore their gender (see "Social Transition" section below).

Practices that attempt to change or prevent youth from identifying as sexual- and gender-diverse or from expressing their sexual orientation and gender identity are harmful and are never appropriate.[10,307] This includes approaches that discourage youth from identifying as transgender or gender-diverse and/or from expressing their gender identity. Sometimes these are misleadingly referred to as "exploratory therapy." Additionally, providers support youth in age-appropriate tasks, such as integrating sexual orientation and gender identities with other identities, safely navigating coming out or sharing their identities with others, and fostering positive relationships with caregivers, families, and peers.[79,307]

Exposure to laws and policies that do not support youth of diverse sexual orientation and/or gender identity, and other negative experiences, including bullying and family rejection, drive risk for certain behavioral health concerns among these youth.[55,308,309] Behavioral health providers should assess for ACEs, other family rejecting behaviors, additional experiences of victimization, trauma-related disorders, and suicidality, and be prepared to address these concerns with LGBTQI+ youth in treatment. Appropriate interventions may aim to reduce or remove stressors a child or adolescent is experiencing that are associated with poor behavioral health. Alternatively, interventions may aim to change the cognitive, affective, and behavioral ways that youth of diverse sexual orientation and/or gender identity react to these stressors.[214]

Several cognitive behavioral therapy (CBT) interventions for youth of diverse sexual orientation and/or gender identity have been developed, including EQuIP,[310] AFFIRM,[311] and Rainbow SPARX.[312] LGBTQ-affirmative CBT appears to be particularly efficacious for Black, Latino, and Asian American and Pacific Islander young people of diverse sexual orientation and/or gender identity, potentially because the focus on stressors may also help young people of color navigate stressors related to being a racial/ethnic minority.[214,313] There is also evidence supporting the use of mindfulness-based coping for sexual orientation-related school-based victimization.[314] Evidence-based trauma-focused interventions designed for youth of diverse sexual orientation and/or gender identity and their families can reduce symptoms of past trauma and enhance coping and well-being.[315]

Behavioral health providers should be aware of and share crisis services specific to LGBTQI+ youth, local resources for LGBTQI+ youth, and online platforms where LGBTQI+ youth can find affirming social connections and support. Given the increased rates of suicidality seen among youth of diverse sexual orientation and/or gender identity, LGBTQI+ crisis services, such as those provided by The Trevor Project are vital. The Trevor Project offers direct suicide and crisis intervention services for LGBTQI+ youth by phone, text, or online chat.[214,316]

Behavioral health providers should be aware of available community resources that support LGBTQI+ youth and their families, such as local

LGBTQI+ community centers, GSAs in schools, and support groups for youth and/or their caregivers, as well as online platforms. In addition to crisis services, The Trevor Project provides a safe social-networking community for LGBTQI+ youth and their friends and allies. This online platform became even more critical during the pandemic because it allowed youth to find affirming connections even when physically isolated. PFLAG, which is the largest organization in the United States focused on providing support, education, and advocacy for LGBTQI+ people and their loved ones and has more than 325,000 members with hundreds of local chapters. PFLAG can serve as another resource of support for LGBTQI+ youth and their families.[317]

Behavioral health providers should describe their treatment plan and interventions to children, adolescents, and their parents and families to ensure they understand the goals, potential benefits, and any risks of treatment. Behavioral health providers should obtain informed consent with all parties—including minors—for treatment, and should always involve parents and caregivers in decisions about a minor's care if the minor is not old enough to legally give consent.[318] When obtaining informed consent/assent, it is important to be aware of and attend to power dynamics between parents/caregivers and youth, as well as between the provider and youth. Interventions that attempt to change sexual orientation, gender identity, or gender expression, or any other form of SOGI change efforts are inappropriate and can cause significant harm. Informed consent/assent for clinical care would include ensuring understanding of various components, including associated risks, expected benefits, and alternative treatment options; therefore, by definition, informed consent/assent cannot be provided for an intervention known to cause

significant harm and does not have any known benefit to the client.[319]

Family Approaches

Wherever it is safe to do so for the child, parental and caregiver involvement is an important part of supporting LGBTQI+ youth. Parental and caregiver attitudes and behaviors play a significant role in the adjustment of children and adolescents. Parent and caregiver distress may be the cause of a referral for treatment.[24,102,258] Reducing family rejection, hostility, and violence (verbal or physical), and increasing family acceptance and support, contributes to the mental health and safety of the child and adolescent.[53,102,258,320]

Interventions that increase family and community support and understanding while decreasing rejection directed at LGBTQI+ youth are recommended for families. Behavioral health providers supply family members with accurate, developmentally appropriate information regarding diversity in sexual orientation and gender, and strive to dispel myths regarding the lives, health, and psychological well-being of individuals of diverse sexual orientation and/or

gender identity.[304,307] Family therapy that provides anticipatory guidance to parents and caregivers about the significant mental health risks caused by rejection of their child's sexual orientation and gender identity is vital.[102,258] Understanding and addressing parent and caregiver concerns regarding current or future sexual orientation and gender identity is important. Further, behavioral health providers can attempt to help families and caregivers modify rejecting behaviors by explaining the link between family rejection and negative health problems, identifying rejecting and accepting behaviors, and providing recommendations for increasing supportive behaviors on the part of the family.

Some affirming approaches to family therapy that include youth of diverse sexual orientation and/or gender identity aim to demonstrate how family members' identities—such as their race and ethnicity, immigration, socioeconomic status, and more—affect their ability to understand and support their youth.[321,322] Attachment-based approaches to family therapy have been used with suicidal sexual minority adolescents.[323] Trauma-focused CBT is an evidence-based treatment for trauma-impacted youth aged 3 to 17 and their parents or primary caregivers. This intervention has been adapted for use specifically with youth of diverse sexual orientation and/or gender identity by integrating the treatment framework with the Family Acceptance Project.[315]

Family therapists and researchers often focus on reframing family concerns—even their disapproval and rejection of sexual orientation and gender diversity—as a manifestation of care and love and focus on teaching non-rejecting ways to communicate those positive emotions. For example, providers can help the family create an atmosphere of mutual respect as a natural extension of seeing each person as having intrinsic worth.[324] This can help ensure the safety of each person from being hurt or bullied in the home. This communicates an important message to a young person that their safety is important to the provider and to the family. Eventually, this mutual respect and

support can be extended to other settings, such as neighborhoods, community institutions, and schools. Safety in this context is not only physical safety, but also emotional safety.[324]

Behavioral health providers may wish to increase their own competence in working with communities with diverse values and beliefs, and focus on viewing these values and beliefs with humility and mutual respect.[325] This includes understanding how to translate between psychology and deeply held values rather than judging those beliefs. Certain language, such as acceptance and/or affirmation, might not resonate with some communities, whereas the concept of unconditional love might.[324]

Many parents and caregivers must also navigate their own process of "coming out" and resolve fears of discrimination or negative social reactions if they disclose their child's sexual- and gender-diverse identity within their communities, at work, and to other family members.[326] Parents and caregivers often have fears for their child's emotional and physical safety, among other worries for their future.[37,327] Behavioral health providers can help parents plan in an affirmative way for the unique life challenges that they may face as parents of an LGBTQI+ child.

Further, behavioral health providers can address other stresses, such as managing life celebrations and transitions and coping with feelings of loss, and aid parents in advocating for their children in school situations—for example, when they face bullying or harassment. Groups for multiple families led by behavioral health providers, as well as online groups or forums for parents and caregivers of LGBTQI+ children and adolescents, may be helpful to build connections and share resources.[328]

Additional Approaches With Gender-Diverse Youth

Social Transition

Social gender transition refers to living daily life in line with one's gender identity, and the processes by which a child or adolescent is acknowledged by others as this gender.[39,40] Social transition can include a range of gender-related changes that individuals may make, and often includes adopting a name, pronouns, and clothing consistent with one's gender identity.[35,39,40] There is no one way or right way to socially transition. Transgender and gender-diverse youth may seek out social transition at different ages and stages of development.[34] Social gender transition does not require assessment or intervention from health professionals. However, providers can help families protect children's safety, ensure emotional, psychological, and social well-being, and help children and families navigate possible complexities of exploring and taking steps in social transition.[80]

Taking steps in social transition allows youth the ability to explore and make meaning of how they experience their gender, which is an important

Gender affirmation, including social transition (e.g., changing one's name, pronoun, and/or appearance) and gender-affirming medical care, is appropriate and beneficial for many gender minority children and adolescents. Based on the individual child's or adolescent's needs, gender-affirming medical care may be medically necessary. Withholding timely gender-affirming care when indicated, withholding support for a gender-affirming exploratory process, and/or withholding support of social transition when desired, can be harmful. These actions may exacerbate and prolong gender dysphoria.

part of developing a positive identity and sense of self. For some youth, desires for their name, pronouns, and appearance continue to change and evolve over time; for others, these remain stable over time.[35,39,40] For gender-diverse children who want to socially transition, social transition appears to serve a protective function and contribute to positive mental health and well-being.[51,67,78,229]

Given this, experts increasingly agree that children should not be denied the opportunity to explore and/or express their gender through social transition steps when desired by the child.[75,185,186,329] The possibility that a children's gender identity can be dynamic and may change over time should not be used as a justification to restrict a child from taking social transition steps. Children should be affirmed in how they currently identify and express their gender and be supported throughout their development and exploratory process, including the potential for future changes in how they identify and express their gender.[180,185,186] Behavioral health specialists in pediatric gender care can offer psychosocial support, insights, and guidance regarding the appropriateness of gender-related needs of gender-diverse children at different developmental stages.[25]

Withholding support for a gender-affirming exploratory process and/or for social transition when desired, can be harmful because those actions may exacerbate and prolong gender dysphoria.[78,299,329] At the same time, parents and caregivers may have valid concerns about reactions from others, including bullying and safety. When weighing factors related to social gender transition, concerns related to social transition should be weighed against the risks of not affirming a child's experienced gender, including increased distress or feelings of dysphoria, social isolation, depression, or suicide due to lack of social support.[29] Whether or not a child socially transitions or desires to, behavioral health providers can help explain to parents and caregivers how gender development is dynamic for some but not all children and highlight the importance of being open to and accepting of the possibility that their youth may remain stable in their feelings or may desire to make changes again in the future.[305]

Medical Gender Transition

Gender-affirming medical care is often medically necessary for individuals with a diagnosis of gender dysphoria, and can refer to a range of evidence-based interventions provided in consultation with licensed medical providers. Such care is defined here as a care plan or service that is necessary to assess, maintain, or improve health and well-being and to avoid illness or reduce symptoms based on existing professional guidelines and scientific evidence. The appropriateness of medical interventions varies by the individual's age, developmental stage, and experience of dysphoria, and decisions about providing gender-affirming care are reached with the involvement of an adolescent's parent or legal guardian.[332] No medical interventions are currently undertaken

Gender-Affirming Care: A specialized model of care used in the treatment of gender dysphoria that uses evidence-informed treatment options to promote patient health and prevent the risk of poor mental and physical health outcomes.[330,331] Not all youth need to undergo medical intervention; indeed, this is often not the case. Gender-affirming care is highly individualized and focuses on the needs of each individual by including psychoeducation about gender and sexuality (appropriate to the age and developmental level).

or recommended for gender-diverse children before the initial onset of puberty.[74,75] Gender-affirming medical care, including both pubertal suppression and hormone therapy, has proven effective in improving the well-being of young transgender and gender-diverse adolescents both during and well after initiation of treatment.[81,82,156,296,297,298,299,300,302,303,333]

Recent research indicates that gender-affirming care has a positive impact on mental health. Current professional guidelines provide information on the appropriate application of gender-affirming care interventions.[25] It is widely held that withholding gender-affirming care for an adolescent who needs this care is detrimental to their mental health.[77,186] Withholding timely gender-affirming care when indicated may cause harm by exacerbating and prolonging gender dysphoria.[83,84]

Behavioral health providers play an important role in educating adolescents and their parents, caregivers, and supporting families on this information as well as in assessing their understanding so that they can give full informed consent and assent.[187,334] This education includes information on:

- Various options for medical gender transition
- Up-to-date information about the effects of treatment
- Benefits on well-being
- Potential side effects

The support of a behavioral health provider during these processes can aid adolescents in identifying care needs, adjusting to their changing physical characteristics, and navigating responses from people in different aspects of their lives. Continued mental health care should be offered when an adolescent's gender care needs require continued affirming exploration and/or when other psychological, psychiatric or family problems exist. Given that pubertal suppression or administration of hormone therapy occurs over many years during important developmental periods, the need for behavioral health care, and type of behavioral health intervention needed, may change with time as new questions arise.[335] Transgender and gender-diverse youth, like all youth, should have the option to access psychological treatment if they choose. However, if there are no concerns, this may not be necessary.

For additional information and guidance related to youth and medical gender transition, see "Ensuring Comprehensive Care and Support for Transgender and Gender-Diverse Children and Adolescents" from the American Academy of Pediatrics[76] and the most recent guidelines from the World Professional Association on Transgender Health (WPATH; www.wpath.org).[25]

Future Directions for Research

As recommended by the U.S. Surgeon General in the 2021 report *Protecting Youth Mental Health*, future research must prioritize data and research with youth populations who are at-risk for adverse mental health outcomes.[336] This includes LGBTQI+ youth broadly, as well as LGBTQI+ youth who are also racial/ethnic minorities, have experienced poverty during childhood, have disabilities/different abilities, and are involved in child welfare or juvenile justice systems. Areas of opportunity for future research, as well as the validity and quality of existing research, are discussed in several sections of this report. Methodologically rigorous peer-reviewed research is vital to improving our understanding of the complexities of sexual orientation and gender among children and adolescents. Several potential areas for future research are identified below.

Documenting Sexual Orientation and Gender Diversity in Youth

To better understand the experiences and needs of LGBTQI+ youth, research focused on youth in the general population should regularly assess sexual orientation, gender identity, and gender expression as demographic indicators. Given the expansive range of descriptive identity terms that people today use to describe their sexual orientation and gender (e.g., pansexual, asexual, nonbinary, gender queer), asking about sexual orientation and gender in ways that include these identities and provide an option for open-ended responses will ensure that LGBTQI+ youth are appropriately included and represented in research.

Development of Sexual Orientation and Gender Identity

There remains much to learn about the development of sexual orientation and gender identity in youth. Basic research on the developmental pathways of these identities is necessary. How these identities are embedded in cognitive and emotional development and other developmental processes would aid in the understanding of human development as well as developing and refining appropriate interventions to support behavioral health. Such research must be inclusive of nonbinary identities. To better understand the various developmental trajectories of gender-diverse youth, prospective, longitudinal studies that follow gender-related development of youth over time are needed.

Culturally Specific Mitigation of Distress Relating to Sexual Orientation, Gender Identity, and Gender Expression

SOGI change efforts are harmful practices that are never appropriate with LGBTQI+ youth, and efforts are needed to end these practices. Families experiencing conflict related to their youth's sexual orientation, gender identity, and gender expression need access to alternative interventions to mitigate this distress that are appropriate and beneficial for youth and families. More targeted research that acknowledges the intersections of identity, including race, ethnicity, culture, faith, and socioeconomic status could shed light on positive, appropriate, whole-family therapeutic approaches to addressing these issues.

Researchers should evaluate these practices and integrate them into behavioral health care. Researchers should also work collaboratively with young people and families from faith communities to better understand the interplay between values and traditions and the safety and well-being of LGBTQI+ youth. The work of the Family Acceptance Project, cited in this report, speaks to the necessity of an increased focus on approaches specific to various communities, including those that are culturally and religiously diverse. These include conversations about sexual orientation, gender identity, and gender expression and how to support LGBTQI+ youth in culturally congruent ways.

Addressing Health Inequities Within LGBTQI+ Youth Populations

LGBTQI+ youth experiencing homelessness, in juvenile justice facilities, or otherwise in out-of-home care may lack permanent and stable family connections in part because of family distress or rejection relating to their LGBTQI+ identity. These vulnerable populations, as well as low-income and racial and ethnic minority LGBTQI+ youth, are often neglected in research studies that most often recruit youth who are already connected to clinics or providers. Future researchers interested in research with sexual- and gender-diverse youth should address this need for more representative sampling and better recruitment efforts.

Building Resilience and Promoting Health and Well-Being

Beyond ending harmful practices with LGBTQI+ youth and addressing health inequities, more research is needed that focuses on the ways LGBTQI+ youth are thriving. Greater understanding is needed of the factors that contribute to resilience and positive behavioral and physical health outcomes among LGBTQI+ youth, as is an increased focus on the development, evaluation, and dissemination of health-promoting interventions. Research using participatory methodologies to collaborate with LGBTQI+ youth to identify their needs, priorities, and ideas for intervention strategies is vital to increase the relevance, quality, and impact of research and interventions with this population.

Long-Term Outcomes

More research would be beneficial to further explore the developmental trajectories of sexual orientation, gender identity, and gender expression. Additionally, future research could focus on better understanding the long-term medical and behavioral health outcomes associated with early experiences of family and community distress due to sexual orientation and gender identity and expression. Other recommended areas of opportunity for longitudinal research include:

- Long-term outcomes from early social transition and pubertal suppression
- Rigorous evaluation of current practices and protocols, including affirmative models, structural interventions, and culturally specific models
- Harms associated with laws and policies that bar youth from participating at school or in extracurricular activities in a way that is consistent with their gender identity
- Prospective research focusing on younger children, in partnership with pediatric clinics, schools, and other community-based institutions
- Methods of supporting positive behavioral health for LGBTQI+ youth, including building resiliency against suicidality, self-harm, risky behaviors, depression, anxiety, substance use, and other behavioral health issues

Integration, Collaboration, and Dissemination

Researchers and clinicians should examine and evaluate the best methods for integrating and disseminating best and promising practices for addressing sexual orientation and gender identity and expression among youth, and how to successfully collaborate with parents, guardians, caregivers, providers, and community leaders. This could include conducting research with these populations focused on knowledge, attitudes, and beliefs relating to efforts to change sexual orientation, gender identity, or gender expression.

Finally, the behavioral health community can work to support community-based organizations to develop common ground and consensus on these topics to promote health and well-being within youth populations. This might include:

- Support for LGBTQI+ youth programming and services across the country
- Outreach to parents, caregivers, and families with accurate information about supporting LGBTQI+ youth's behavioral health
- Inclusion of LGBTQI+-specific questions in national behavioral and mental health surveys

Section 3: Policy Approaches to Support the Behavioral Health and Well-Being of LGBTQI+ Youth

Introduction and Foundational Principles[1]

Moving from evidence to action necessitates scientifically grounded public policies. This section focuses on selected policy levers that aim to improve the behavioral health of LGBTQI+ youth.

U.S. Department of Health and Human Services (HHS) policy priorities for improving the mental health of and reducing substance use by LGBTQI+ youth are based on efforts to ensure LGBTQI+ civil rights and to increase access to, affordability of, and equity in health care. Such policies include implementation of the June 15, 2022, Executive Order on Advancing Equality for Lesbian, Gay, Bisexual, Transgender, Queer, and Intersex Individuals,[14] the January 20, 2021, Executive Order on Preventing and Combating Discrimination on the Basis of Gender Identity or Sexual Orientation,[15] and the January 20, 2021, Executive Order on Advancing Racial Equity and Support for Underserved Communities Through the Federal Government.[337]

HHS policies include protection against discrimination based on sexual orientation and gender identity as found in the Affordable Care Act (ACA).[338] HHS also has other policies and programs specific to nondiscrimination on the basis of sexual orientation and gender identity.[339,340] For example, HHS issued a Notice of Proposed Rulemaking related to Section 1557 of the ACA, to further prevent discrimination on the basis of sexual orientation and gender identity.[341]

To further strengthen protections for LGBTQI+ youth, their parents, and caregivers, on March 2, 2022, HHS Secretary Xavier Becerra issued a statement reaffirming HHS efforts to support and protect LGBTQI+ youth and assist their parents, caretakers, and families in accessing gender affirming care.[342]

SOGI change efforts are inappropriate practices that should not be provided to children or adolescents.

A Memorandum issued by the Children's Bureau at the Administration for Children and Families for child welfare professionals and healthcare providers aims to protect LGBTQI+ youth.[343] HHS has also issued guidance stating that denying health care based on gender identity or restricting doctors and healthcare providers from providing care because of a patient's gender identity may constitute prohibited discrimination.[344]

The following key policy areas have been identified by the federal government, researchers, and advocates:

- End harmful and ineffective efforts such as sexual orientation and gender identity (SOGI) change efforts.
- Ensure access to evidence-based care.
- Promote behavioral health by strengthening nondiscrimination policies.

[1] All statements in text boxes are Consensus Statements provided in Section 1 of this document.

- Improve behavioral health through support from families, schools, and communities.
- Advance research that improves care.

Ending Sexual Orientation and Gender Identity Change Efforts

SOGI change efforts are ineffective and harmful to children and adolescents (see Sections 1 and 2). The continued practice of these efforts puts LGBTQI+ youth at risk of significant harm and prevents them and their families from receiving appropriate evidenced-based behavioral health care that is consistent with existing professional guidelines.

Based on scientific evidence and broad professional and scientific consensus, many federal, state, and local governments have taken steps to regulate and eliminate the practice of SOGI change efforts directed at children and adolescents. These efforts include legislative bans, executive orders, and pathways to civil court claims alleging consumer fraud, among others.

Several bills and resolutions have been introduced in Congress in the past decade to discourage SOGI change efforts or to require nondiscrimination in the provision of behavioral health services to sexual- and gender-diverse youth. This legislation would ban federal funding, encourage state bans, or define SOGI change efforts as consumer fraud.

On June 15, 2022, the Biden Administration issued the Executive Order on Advancing Equality for Lesbian, Gay, Bisexual, Transgender, Queer, and Intersex Individuals.[14] It includes a charge to HHS to take steps to end SOGI change efforts in the United States, by exploring guidance for federally funded programs, supporting provider training and technical assistance, and providing public information about harms and alternatives.

At the state level, as of January 2023, 20 states and the District of Columbia have passed laws to protect minors from the practice of SOGI change efforts. An additional six states and one territory have partial bans.[345] These laws bar behavioral health providers from practicing SOGI change efforts with minors. Some states provide protections for vulnerable adults, impose restrictions on the use of state and federal funds, and offer consumer protection provisions. At the local level, about 90 municipal and county governments prohibit SOGI change efforts.[346]

Advocates have suggested federal, state, and local policy efforts to end SOGI change efforts that include the following:

- Legislative restrictions on the use of federal or state funding for SOGI change efforts by state health programs (including Medicaid funds), by recipients

of such funding, or through health insurance reimbursements (see for example, H.R. 2328, "Prohibition of Medicaid Funding for Conversion Therapy Act" from the 117th Congress).[347]

- Policies that prohibit SOGI change efforts with minors receiving care in programs that receive federal funds to serve youth, such as community mental health centers, and juvenile justice, child welfare, and foster care programs.
- Clarification that existing nondiscrimination policies prohibit the practice of SOGI change efforts with minors. These legal claims of discrimination have been based on the theory that providing this ineffective and harmful therapy is due solely to an individual's sexual orientation or gender identity.

In addition to federal and state legislative and regulatory action, consumer protection laws have been suggested as a mechanism for ending the use of SOGI change efforts. This strategy extends beyond prohibiting change efforts by behavioral health professionals to affect any commercial act (for a fee), including those by unlicensed practitioners and groups.

These efforts derive from a civil action in which a New Jersey court ruled in 2015 that an organization's sexual orientation change efforts program violated the state's consumer fraud law through multiple misrepresentations.[348] The Court ruled as a matter of law that scientific evidence demonstrated that being gay, lesbian, or bisexual was not a mental disease or disorder and could not be changed. Thus, the Court found that a fraudulent misrepresentation was made every time an individual accepts payment for sexual orientation change efforts because being gay, lesbian, or bisexual is not a disease and cannot be "cured." The Court awarded the plaintiffs financial compensation and prohibited the organization from providing sexual orientation change efforts.[348]

Available research indicates SOGI change efforts can cause significant harm. Available research indicates that these efforts are not effective in altering sexual orientation; no available research indicates that they are effective in altering gender identity. No available research supports the claim that SOGI change efforts are beneficial to children, adolescents, or families.

Efforts to protect consumers through consumer protection laws have been taken at the federal and state levels. At the federal level, the Biden Administration is encouraging the Federal Trade Commission (FTC) to consider whether SOGI change efforts are an unfair and deceptive practice and whether to issue consumer warnings or notices. Additionally, in the 117th Congress, bills were introduced that define SOGI change efforts as unfair or deceptive acts or practices under the jurisdiction of the FTC Act (Therapeutic Fraud Prevention Act of 2021; HR.4146 and S.2242). Some advocates believe that the FTC can act even without new legislation. In 2016, a complaint was filed with the FTC alleging fraudulent misrepresentation by a group that advertises change efforts.[349,350]

At the state level, Illinois passed a ban on SOGI change efforts with minors (Illinois Public Act 099-0411).[351] The law specifies that advertisements for sexual orientation change efforts that represent being gay, lesbian, or bisexual as a disease or disorder for minors and adults is a violation of the state's consumer fraud and deceptive business act. As of January 1,

2023, jurisdictions banning SOGI change efforts with minors included California, Colorado, Connecticut, Delaware, District of Columbia, Hawaii, Illinois, Maine, Maryland, Massachusetts, Nevada, New Hampshire, New Jersey, New Mexico, New York, Oregon, Rhode Island, Utah, Vermont, Virginia, and Washington. Additionally, jurisdictions with partial bans on SOGI change efforts included Michigan, Minnesota, North Carolina, North Dakota, Pennsylvania, Puerto Rico, and Wisconsin.[345]

Ensuring Access to Evidence-based Care

Beyond ending harmful practices such as SOGI change efforts, it is vital that LGBTQI+ youth have access to evidence-based care. Removing limits to appropriate care is multifaceted and may vary based on multiple factors, including other health inequities such as those based on income and race/ethnicity, among others. Policy levers to improve access include:

- Preventing bans on gender-affirming care
- Improving access to gender-affirming care in health plan benefits across all payors
- Ensuring LGBTQI+ youth can access appropriate care and support in child welfare programs
- Increasing professional training and education to improve access to and quality of behavioral health care especially for gender-diverse and transgender youth

Preventing Bans on Gender-Affirming Care

Gender-affirming care is supported by extensive research, and based on the individual child's or adolescent's needs, may be medically necessary. Evidence has demonstrated mental health benefits associated with receipt of gender-affirming care, such as reduced depression and decreased risk for suicide. Withholding timely gender-affirming care when indicated, withholding support for a gender-affirming exploratory process, and/or withholding support for social transition when desired can be harmful.[25,352,353,354] However, some states have introduced or passed laws that ban access to this medically necessary care.[107,355]

Policies that seek to categorically ban gender-affirming medical care or penalize providers, parents, and caregivers who provide or seek gender-affirming medical care pose serious risks.[353,354] Prohibitions on or penalties for providing or seeking out medically necessary and therapeutically indicated best practices place behavioral health and medical providers and parents and caregivers in situations that conflict with evidence-based professional guidelines, ethics, and standards.[354] Lack of access to such care poses serious behavioral health risks to youth of diverse sexual

Groups that have stated opposition to policies that limit access to or ban appropriate gender-affirming care include American Academy of Child and Adolescent Psychiatry, American Academy of Family Physicians, American Academy of Pediatrics, American College of Obstetricians and Gynecologists, American College of Physicians, American Medical Association, American Osteopathic Association, American Psychiatric Association, American Psychological Association, Endocrine Society and Pediatric Endocrine Society, U.S. Professional Association for Transgender Health, and World Professional Association for Transgender Health.[106,356,361]

orientation and/or gender identity and their families, parents, and caregivers, such as an increased risk of suicidal ideation, depression, and trauma.[107,343,353,354,356]

As noted above, the Biden Administration has taken multiple steps to improve behavioral health care by ensuring access to medically necessary and evidence-based care for LGBTQI+ youth. This includes policies to address state restrictions in such care. For example, the June 15, 2022, Executive Order on Advancing Equality for Lesbian, Gay, Bisexual, Transgender, Queer, and Intersex Individuals includes a charge to HHS to ensure that LGBTQI+ youth and their families have access to medically necessary care including mental health care, consistent with applicable law.[14]

HHS has taken steps to maintain access to evidence-based care, especially for transgender youth. HHS has provided child welfare professionals, healthcare providers, and states and localities with information on the federal protections that exist to ensure that civil rights are protected and LGBTQI+ youth receive medically necessary and evidence-based care.[343,344]

As an example of efforts to maintain access to evidence-based care, the U.S. Department of Justice (DOJ) intervened in a federal lawsuit challenging a recently enacted Alabama law, Senate Bill (S.B.) 184, that makes it a felony to cause or provide gender-affirming care to transgender youth under the age of 19.[357,358] In May 2022, the court issued a preliminary injunction preventing the law from being enforced Additionally, the DOJ filed a statement of interest and amicus brief in a case challenging an Arkansas law banning gender-affirming care.[357,359]

State bans on gender-affirming care are unlike laws banning SOGI change efforts. Legal bans on SOGI change efforts are consistent with existing professional guidelines and resolutions and prohibit potentially harmful efforts while permitting behavioral health providers to deliver evidence-based care to LGBTQI+ youth. Numerous professional associations and experts have spoken out against laws or other government actions that limit access to, penalize, or ban appropriate gender-affirming care (see text box).

Improving Access to Behavioral Health and Gender-Affirming Care

LGBTQI+ youth and adults face serious barriers to accessing behavioral health care as well as gender-affirming care. Access to care is especially limited for gender-diverse youth and their families who seek gender-affirming care.[360] The Federal Government and many states have taken steps to reduce barriers to gender-affirming care, improve behavioral health equity, and reduce healthcare discrimination. Several federal and state laws have been interpreted to or expressly prohibit insurance discrimination based on SOGI.

The Executive Order on Advancing Equality for Lesbian, Gay, Bisexual, Transgender, Queer, and Intersex Individuals makes family counseling and support of LGBTQI+ youth a public health priority.[14] This Executive Order charges HHS to seek ways to increase the availability of such family counseling and support programs in federally funded, human services, and child welfare programs among other actions.

Aligned with the Executive Order on Preventing and Combating Discrimination on the Basis of Gender Identity or Sexual Orientation,[15] HHS issued a Notice of Proposed Rulemaking in July 2022 related to Section 1557 of the ACA, which prohibits discrimination on the basis of race, color, national origin, sex, disability, or age in

certain health programs and activities. The Proposed Rulemaking would codify protections against discrimination on the basis of sex as including discrimination on the basis of sexual orientation and gender identity, which is consistent with the Supreme Court's decision in *Bostock*.[341] This type of federal policy addressing sex, sexual orientation, and gender identity nondiscrimination can help mitigate gaps in state protections.

Almost half of all states prohibit the exclusion of gender-affirming care by private health insurance plans subject to state oversight.[362] Other state laws include protections against discrimination in private health insurance by expressly prohibiting discrimination based on sexual orientation and gender identity.[362,363,364] Experts have also suggested that states and localities provide such benefits to their own employees and dependents and, while almost half have such protections, many do not.[365]

Research on health coverage in private insurance and federal and state health financed programs indicates that youth and adults might not have access to comprehensive gender-affirming care or in-network providers with LGBTQI+ expertise.[247,360,362,363,364,366,367,368,369,370] Consequently, experts have suggested that legislative and regulatory steps be taken to ensure that all such plans reimburse medically necessary treatment for LGBTQI+ individuals of all ages, including gender-affirming care.[365,370]

One way to improve treatment options is through state initiatives, such as explicitly including gender-affirming care as a covered service in the state's benchmark plan in individual and small group market plans. In 2021, the Centers for Medicare & Medicaid Services (CMS) approved Colorado's expansion of the Essential Health Benefit (EHB) benchmark plan that aims to improve access for client-centered gender-affirming care.[368] This change to the EHB benchmark plan aims to expand access to a wider range of services for transgender individuals in addition to benefits already covered. The state is also expanding covered services in the state benchmark plan to include mental wellness exams, which will help all individuals not only those who are LGBTQI+.[369]

Training and Education to Improve Care

A key priority is to expand the number of behavioral health providers who have the expertise to work with LGBTQI+ children, youth, and their families. Research indicates that only a small percentage of gender-diverse youth seeking transition medical services receive them as minors.[366] One aspect of this problem is the lack of behavioral health providers with training and expertise in this area.

Federal Government initiatives have expanded education and training opportunities and the June 15, 2022, Executive Order on Advancing Equality for Lesbian, Gay, Bisexual, Transgender, Queer, and Intersex Individuals charges HHS with providing training and technical assistance in promising evidenced-based care, including mental health care.[14] The SAMHSA Center of Excellence on LGBTQ+ Behavioral Health Equity provides training and consultation for a variety of behavioral health providers.[371] Scientific associations have developed resources and practice guidelines on treatment of LGBTQI+ children, adolescents, and adults that are useful for professional education and practice (see Appendix C).

Several training programs offer education to a wide variety of providers working with LGBTQI+ youth and their families.[371] These trainings can continue to be expanded to improve professional competence in providing services to this population. For example, APA Division 17 (Counseling Psychology) Special Task Group Making Room at the Table: Trans/Nonbinary Pipeline to Counseling Psychology developed "*A Resource for Incorporating Trans and Gender-Diverse Issues in Counseling Psychology Curricula*."[372]

National and state professional associations, including HHS grantees, also maintain webpages with training information on LGBTQI+ issues, including postgraduate and peer education resources.[372,373] Such programs could also expand specialty workforce training opportunities in pediatric and LGBTQI+ concerns across the professional lifecycle from graduate student to seasoned practitioner.

Given the diversity within children, adolescents, and their families, trainings that recognize differences in culture, ethnicity, geography, race, and other factors are critical for effective behavioral health treatment. Increasing cultural responsiveness is especially important to address unique stressors and behavioral health inequities within the sexual- and gender-diverse community, especially in communities of color.[199,374]

Behavioral health providers with competence in the related aspects of religion, spirituality, and sexual- and gender-diverse issues could assist families and individuals in reducing identity and family conflicts that can arise.[374,375,376,377,378,379,380,381] Linkages among community institutions, professional and scientific groups, behavioral health providers, and LGBTQI+ groups that are respectful and open can improve therapeutic services for LGBTQI+ youth and families. One possibility includes collaborations among behavioral health and community leaders and professionals in gender-affirming care to increase understanding about clients from a variety of cultural traditions.[382] Providing education in universities and educational facilities attuned to diverse communities may be a start to initiating dialogue and improving care. Some success has been achieved with dialogues seeking common ground between scientists and such groups rooted in common goals such as child health and optimal child development.[382,383]

Improving Behavioral Health through Antidiscrimination Policies

Youth of diverse sexual orientation and/or gender identity are negatively affected by policies that sanction or sustain discrimination based on sexual orientation and gender identity,[2] even increasing the risk of suicide,[59,292] Although stigma and discrimination can lead to behavioral health concerns, poor behavioral health is not inherent to sexual and gender minorities. Additionally, exposure to school-based bullying and exclusion based on sexual- and gender-diverse prejudice has an adverse impact on the behavioral health of school-aged

Policies that stigmatize, restrict, or exclude gender minority youth are harmful to children and adolescents.

youth.[48,384,385] Transgender and gender-diverse youth face additional discrimination and disadvantage due to the longstanding stigma toward gender-diverse individuals.[356] However, appropriate protections from discrimination allow individuals of diverse sexual orientation and/or gender identity of all ages to thrive.[194,213,355]

Important scientific research indicates that policies that reduce discrimination and advance equal rights have positive effects on behavioral health. Research studies indicate that enacting protective policies that safeguard individuals from discrimination and violence lead to improved physical and mental health for sexual- and gender-diverse youth and adults.[211,386,387,388] Federal and state laws that equalize civil rights and the status of LGBTQI+ individuals are linked to the improved behavioral health noted above. Some states require health insurance plans to cover gender-affirming care and include protections against discrimination in private health insurance by expressly prohibiting discrimination based on sexual orientation and gender identity.[362]

Steps have been taken at the federal, state, and local levels to expand equalizing policies. At the federal level, the Biden Administration has issued important Executive Orders, memoranda, and public statements to reduce discrimination toward individuals with diverse sexual orientations and/or gender identities and support LGBTQI+ civil rights.[14,338,342,343,389,390,391] In the 117th Congress, The Equality Act (H.R. 5) was introduced and would have explicitly prohibited discrimination toward LGBTQI+ individuals.[392] Some states have adopted antidiscrimination and antibullying policies and expanded benefits for LGBTQI+ state employees.[393] State efforts have also included:

- Bans on discrimination by state-licensed healthcare providers
- Bans on SOGI change efforts
- Nondiscrimination laws based on sexual orientation and gender identity
- Supports for same-sex families
- Antibullying laws
- Inclusive curriculum in schools

Local governments have also taken steps to reduce bias and discrimination based on sexual orientation and gender identity and expand protective policies at the local level.[365]

Improving Behavioral Health Through Support for Families, Caregivers, Schools, and Communities

Research summarized earlier in this report indicates that families, schools, and communities contribute to the behavioral health of LGBTQI+ youth. Efforts can facilitate positive behavioral health by providing a climate of support and acceptance. Families, schools, and communities can undermine behavioral health through rejection or discrimination, which have adverse health effects. Policies that increase the dissemination of resources to families, communities, and schools to encourage support and acceptance of LGBTQI+ youth is a high priority. For example, the June 15, 2022, Executive Order on Advancing Equality for Lesbian, Gay, Bisexual, Transgender, Queer, and Intersex Individuals includes initiatives that aim to increase such family counseling and information.[14]

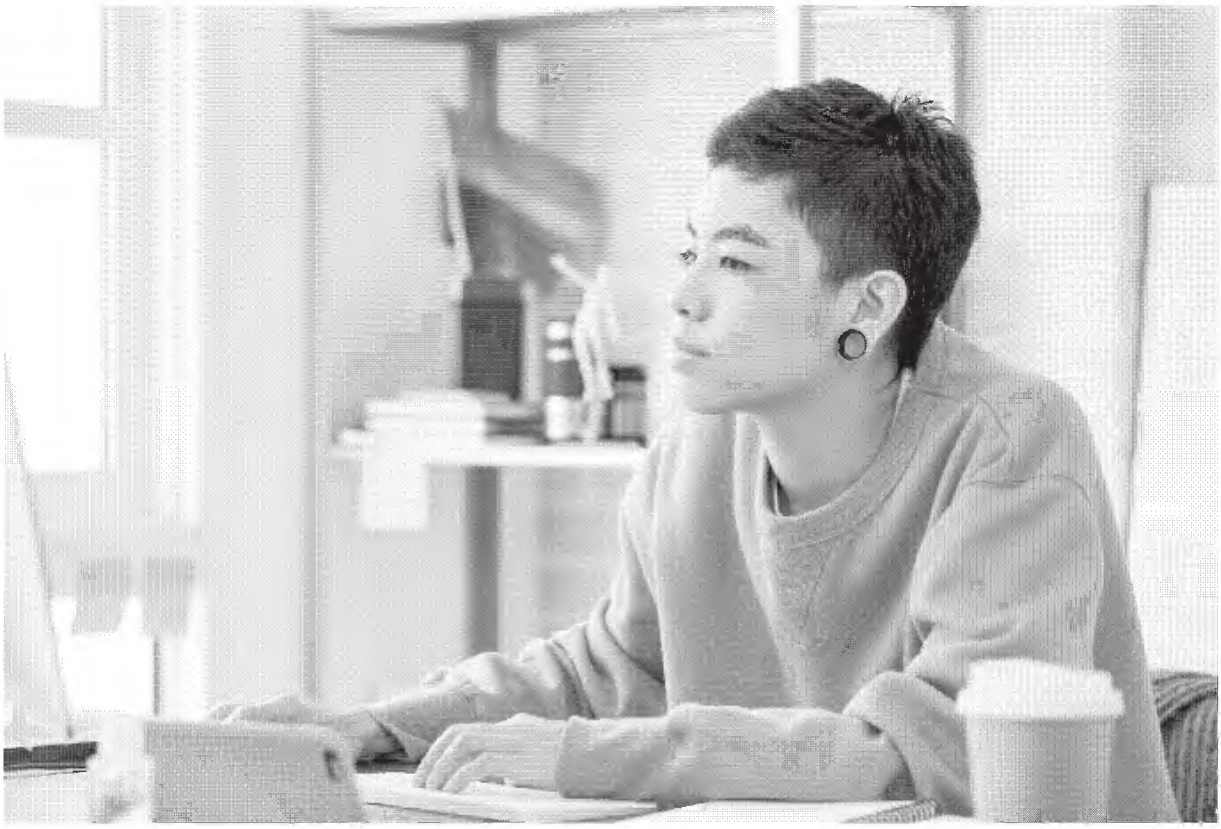
Interventions to Support Children and Families

Families play an important protective role in child development and benefit from information

about how to appropriately help their children. The Family Acceptance Project provides such resources through publications for diverse families, which are available in multiple languages.[394] Other resources include Lead with Love, PATHS and AFFIRM Caregiver (see Appendix C), and information offered by SAMHSA[395] and the Centers for Disease Control and Prevention.[396] The American Psychological Association provides a guide for parents in choosing an appropriate therapist with gender expertise.[397]

Education for families, caregivers, child welfare professionals, and individuals can be tailored to the specific needs of diverse communities.[397,398,399] One option is a public health campaign to educate parents and caregivers on appropriate treatment options that are safe and effective for youth. Such a program can alert families, caregivers, child welfare professionals, schools, and communities on the risks of family rejection and SOGI change efforts and the benefits of recognizing sexual orientation and gender development and access to affirming care.

Healthcare providers can offer age-specific guidance to parents and guardians to help them understand growth- and development-related expectations associated with healthy behaviors and disease prevention; this is known as anticipatory guidance.[400] Pediatricians and behavioral health providers have urged for more anticipatory guidance[401] that pediatricians and early childhood and educational providers can provide to inform parents about sexual orientation and gender identity, as well as their LGBTQI+ child's needs. This would aim to enhance family support and reduce rejection.[402]



The American Academy of Pediatrics urges pediatricians to assess risk factors related to child maltreatment in their general assessments of children and adolescents.[403] Seeking gender-affirming assessment, consultation, and care is not maltreatment.[352,353] The Information Memorandum issued March 2, 2022, by HHS makes clear that state child welfare systems should support LGBTQI+ youth and ensure their safety.[354]

Interventions to Support Youth in Schools

Education and behavioral health associations, professionals, and researchers across the country have urged proactive steps to support and protect LGBTQI+ youth and other students through the inclusion of policies, resources, and training that provide information, safety, and support.[356,361,404,405] These policies have been evaluated over the past decade in nationwide samples and are found to reduce victimization and behavioral health problems and improve mental health.[198,287,288,406,407]

The Society for Research in Child Development,[356] the American Psychological Association,[361] the American Counseling Association,[406] the National Association of School Psychologists, and medical professionals recommend crucial educational policies to create a positive and healthy environment for all youth, especially those who are LGBTQI+ or have emerging sexual orientation or gender identities. These include the following:

1. Establish and implement supportive policies that provide guidelines for respectful interactions (in-person and online), promote acceptance of all sexual orientations and gender identities and expressions, promote the use of identified pronouns, and respect confidentiality and privacy.
2. Enable full participation and access to school activities including athletics and resources for all students and school personnel consistent with their gender identity, including use of school facilities (e.g., bathrooms, locker rooms) that align with their gender identity.
3. Establish protective policies, such as antibullying and antidiscrimination policies, that explicitly include protections for sexual orientation, gender identity, and gender expression.
4. Provide high-quality, evidence-informed LGBTQI+ professional development for school staff.
5. Develop school resources for LGBTQI+ youth and connect to supportive resources and information, such as GSAs, school clubs that are inclusive of LGBTQI+ people, and age-appropriate curriculum that is inclusive of LGBTQI+ people.

   Title IX prohibits sex-based discrimination in any school or any other education program that receives funding from the Federal Government. HHS and the Department of Education have clarified legal requirements with their interpretation of Title IX prohibiting discrimination on the basis of sexual orientation and gender identity. Strong antidiscrimination policies can protect LGBTQI+ youth and their families from discrimination in federal programs.

The Federal government has created a website with information on bullying prevention, including information on bullying of LGBTQI+ youth, ways to create safe school environments, and applicable federal civil rights laws: stopbullying.gov. Such nondiscrimination efforts to ensure the safety and well-being of LGBTQI+ youth and their families in schools and other federal programs are consistent with existing

behavioral health research and professional association recommendations.[355,356,407]

Some states and localities have established such education policies, but they are far from universal. More states have added protective policies over the past 7 years, but a majority of states do not have policies to protect LGBTQI+ students from bullying or discrimination. Inclusive policies are still rare at the state level. Some states are considering and enacting laws and policies that are inconsistent with the above empirically based recommendations, such as those that prevent discussion of LGBTQI+ issues or exclude LGBTQI+ youth from activities or athletics. Given the strength of the evidence of the benefits of the protective policies, policies that stigmatize youth of diverse sexual orientation and/or gender identity pose risks to their health.[354,355,356]

Future Directions: Research to Improve Care

Scientific research can advance our understanding of LGBTQI+ youth and improve their behavioral health through prevention and new interventions.

Increasing Research Insights Through Inclusive Demographic Questions

Health policy experts have called for data collection and priorities that are inclusive of LGBTQI+ people to ensure research accuracy and health equity.[408,409,410,411] Inclusive data collection and research policies support consistent collection of demographic information, including information about respondent sexual orientation and gender identity, regardless of whether the survey is focused on LGBTQI+ populations. Having accurate data and information about sexual orientation and gender identity improves public policies by identifying specific behavioral health needs, preventing adverse health conditions, and addressing health inequities. This is especially true when addressing the diversity within children, adolescents, and their families based on cultural background, ethnicity, race, geography, and other aspects of identity.

Progress has been made in federal, state, and municipal data collection and research as demographic information on sexual orientation and gender identity has been added to some research tools and health records.[412] In 2023, the Federal Government released the first-ever Federal Evidence Agenda for LGBTQI+ Equity, a roadmap that federal agencies will use to ensure they are collecting the data and evidence they need to improve the lives of LGBTQI+ Americans.[413] Other existing efforts include the Centers for Disease Control and Prevention's Youth Risk Behavior Survey (YRBS), which includes national, state, and local surveys, assesses key behavioral and other health risks in youth and includes questions on sexual orientation and sex of sex partners in the national survey.[414] However, although the state and local surveys are currently conducted in 47 states and 28 large urban school districts, not all states and local jurisdictions include sexual orientation and sex of sex partner questions. Questions on gender identity and self-identification as transgender are available for states and local jurisdictions to include in their YRBS surveys, consistent with the Protection of Pupil Rights Amendment, and utilization of those questions has been increasing during each administration of the survey.

There are resources for addressing this gap in data collection on sexual orientation and gender identity. The National Academies report, *Measuring Sex, Gender Identity, and Sexual Orientation,* commissioned by the National Institutes of Health (NIH), provides recommendations on how to formulate appropriate questions regarding sexual

orientation and gender identity to address the complexity of diversity within these communities.[31] For example, an important recommendation is ensuring that approaches to SOGI measurement and data collection are tested and validated in youth populations. Given the diversity of the LGBTQI+ population, it is important to use an intersectional approach that considers multiple aspects of diversity and demography (e.g., cultural background, values, ethnicity, geography, and race).

Selected LGBTQI+ Research Topics

Studies of LGBTQI+ youth have begun to examine important developmental and clinical needs in these populations. Focused research can expand our understanding of these youth and guide clinical interventions. For example, studies of development of transgender children provide new windows into our understanding of gender development and well-being in childhood.[189] Research to elucidate how intersecting sociocultural factors and experiences (e.g., race, ethnicity, socioeconomic status, cultural background and values) influence sexual orientation and gender development is in its early stages. To better understand the needs of sexual and gender minority children and adolescents, new lines of research can include sexual- and gender-diverse children and adolescents from diverse family backgrounds, especially from general populations rather than those limited to samples of people receiving clinical care.

Intersex individuals face known health disparities although research that specifically focuses on intersex individuals is limited and needs to be expanded both broadly and across time within longitudinal studies.[45,415] The Administration's Federal Evidence Agenda on LGBTQI+ Equity identified a lack of national surveys that collect data about "variations in sex characteristics or intersex people" and underscored the need to collect those data.[413]

Limited research has considered economic impact of SOGI change efforts, which could be expanded. A recent study found negative economic consequences for those adolescents and young adults who experience SOGI change efforts when compared to those with no intervention or affirming interventions. These negative economic impacts include the costs associated with adverse events as well as the expense of the efforts.[416] Further, despite its lack of efficacy and its serious harms to clients, SOGI change efforts appear to be lucrative, which may serve as an inducement to some providers.[416]

Evaluations of clinical approaches and development of best practices can be fostered by funding research collaborations; this type of research can lead to improved care.[214,417] Key research areas should also include suicide prevention, evidence-based trauma-focused interventions, and approaches to counter minority stress. Studies of community-based populations provide an emerging understanding of the key developmental concerns. A resource for those conducting LGBTQI+ research is the NIH Sexual and Gender Minority Research Office. NIH has also developed tools to study social determinants of health.[418] A National Academies report includes recommendations on key areas of LGBTQI+ research.[31]

Summary and Conclusions

SAMHSA is committed to eliminating health inequities experienced by marginalized communities, including LGBTQI+ youth. To build a healthy and supportive environment for all youth, families, caregivers, providers, and educators need resources and accurate information to inform healthy decision making. Two key strategies that can help prevent adverse outcomes and support healthy development for LGBTQI+ youth are:

1. Strong and positive family, school, and community engagement
2. Appropriate and supportive therapeutic interventions by physical and behavioral health providers

Policies at the local, state, and federal levels are needed to foster supportive, affirming environments and ensure access to appropriate care.

These strategies must and can be grounded in research. Being a sexual or gender minority, or identifying as LGBTQI+, is not a mental disorder. Variations in sexual orientation, gender identity, and gender expression are normal and healthy. Sexual- and gender-diverse youth have unique health and behavioral health needs and may experience distress due to discrimination and barriers to support that remain widespread for LGBTQI+ youth. In addition, transgender and gender-diverse youth may experience distress caused by the incongruence between their gender identity and physical body.

Current research, evolving clinical expertise, and expert consensus underscore that efforts to attempt to change a youth's sexual orientation, gender identity, or gender expression are never appropriate. No evidence supports the efficacy of such interventions, and evidence shows that they can cause severe harm. Appropriate therapeutic approaches to working with LGBTQI+ youth include:

- Providing accurate information on sexual orientation and gender identity and expression
- Identifying sources of and working to reduce distress
- Supporting adaptive coping
- Supporting youth as they learn more about their sexual orientation and gender identity, and supporting families in accessing gender-affirming care for their transgender child when indicated
- Helping youth navigate sexual orientation, gender identity and expression within the context of other intersecting identities

Additionally, providers can help increase family and school support, and reduce family, community, and social rejection of LGBTQI+ youth. Social transition and medical interventions, including pubertal suppression and hormone therapy, are additional therapeutic approaches that may be medically necessary, appropriate, and beneficial for gender minority youth based on the individual youth's needs. Withholding timely gender-affirming medical care when indicated, withholding support for a gender-affirming exploratory process, and/or withholding support of social transition when desired, can be harmful. These actions may exacerbate gender dysphoria.

Beyond ending harmful change efforts, it is important to build greater social acceptance of LGBTQI+ youth across all environments where they live, learn, and play; adopt appropriate and

supportive interventions; and provide targeted resources and accurate developmentally informed information for children, adolescents, their families, and providers. Building better supportive environments and working to eliminate negative social attitudes will reduce health inequities and improve the health and well-being of LGBTQI+ youth.

Appendix B: Glossary of Terms

Agender: Describes individuals who do not identify as any gender.

Asexual: Describes individuals who do not experience sexual attraction. An individual can also be aromantic, meaning that they do not experience romantic attraction.

Behavioral health: A broad term that includes mental health, resilience, and well-being; the treatment of mental and substance use disorders; and the support of those who experience and/or are in recovery from these conditions, along with their families and communities.

Behavioral health provider: A broad term used here to describe individuals across settings and disciplines who are engaged in the provision of care and/or support related to behavioral health. Behavioral health providers include both licensed and non-licensed professionals, including mental health counselors, marriage and family therapists, pastoral counselors, psychiatrists, psychologists, psychiatric nurses, school counselors and health providers, peer support professionals, social workers, substance use counselors, addiction medicine specialists, and all staff of mental health and substance use treatment facilities.

Bisexual: Describes an individual who has the capacity to form enduring physical, romantic, and/or emotional attractions to those of the same gender or to those of another gender.

Cisgender: Describes individuals whose gender identity is congruent with their sex assigned at birth.

Developmentally sensitive approaches: Clinical and educational approaches that account for the appropriate developing emotional and cognitive capacities, developmental milestones, and emerging or existing behavioral health concerns.

Diverse sexual orientation and/or gender identity: A term to describe persons who are lesbian, gay, bisexual, transgender, queer, intersex, those who are questioning their sexual orientation or gender identity, and others who are not cisgender or straight/heterosexual. Diverse sexual orientation and/or gender identity is used interchangeably with "LGBTQI+" and "sexual and/or gender minority" (or similar language) throughout this report.

Fa'afafine: Describes individuals assigned male sex at birth who identify themselves as having a third gender or nonbinary in Samoan culture.

Gay: Describes individuals whose enduring physical, romantic, and/or emotional attractions are to people of the same gender.

Gender-affirming care: A specialized model of care used in the treatment of gender dysphoria that uses evidence-informed treatment options to promote patient health and prevent the risk of poor mental and physical health outcomes. Not all youth need to undergo medical intervention; indeed, this is often not the case. Gender-affirming care is highly individualized and focuses on the needs of each individual. Gender-affirming care may include psychoeducation about gender and sexuality (appropriate to the age and developmental level), parental and family support, social interventions, and gender-affirming medical interventions.

Gender diverse: A broad term that includes individuals whose gender identities and/or gender expressions are incongruent with those culturally expected based on sex assigned at birth. This includes those who are exploring their gender and is used interchangeably with "gender minority."

Gender expression: The external ways a person communicates their gender, such as clothing, hair, mannerisms, activities, or social roles.

Gender fluid: A term used to describe individuals whose gender changes over time.

Gender identity: A person's deep internal sense of being female, male, or another identity.

Genderqueer: Describes individuals who experience their gender identity and/or gender expression as falling outside the categories of man and woman.

Intersex: An umbrella term used to describe people with variations in sex characteristics, including chromosomes or hormones that do not fit typical definitions of male and female.

Lesbian: A woman who has romantic and/or sexual orientation toward women.

LGBTQI+: Lesbian, gay, bisexual, transgender, queer, intersex, those who are questioning their sexual orientation or gender identity, and others who are not cisgender or straight/heterosexual. LGBTQI+ is used interchangeably with "sexual and/or gender minority" and persons of "diverse sexual orientation and/or gender identity" (or similar language) throughout this report.

Māhū: Describes individuals who identify as a third gender or nonbinary in Native Hawaiian culture.

Nonbinary: Describes individuals whose gender identity is not exclusively male or female. Individuals may identify as nonbinary or other identities, including, but not limited to, genderqueer, two-spirit, agender, bigender, and genderfluid.

Pansexual: Describes individuals who experience sexual, romantic, physical, and/or spiritual attraction for members of all gender identities/expressions.

Queer: Historically, this has been a pejorative term used to describe LGBTQI+ people, but is now used by some people, particularly younger people, whose sexual orientation is not exclusively straight/heterosexual. Some people may use queer, or more commonly genderqueer, to describe their gender identity and/or gender expression.

Questioning: A term used to describe individuals who are unsure about their sexual orientation and/or gender identity.

Sex assigned at birth: The assignment of male, female, or intersex when an individual is born, typically made based on the appearance of external genital anatomy.

Sexual and/or gender minority: Sexual and gender minority populations include, but are not limited to, individuals who identify as lesbian, gay, bisexual, asexual, transgender, Two-Spirit, queer, and/or intersex. Individuals with same-sex or -gender attractions or behaviors and those with a difference in sex development are also included. Sexual and gender minority is used interchangeably with "LGBTQI+" and persons of "diverse sexual orientation and/or gender identity" (or similar) throughout this report.

Sexual orientation and gender identity change efforts (SOGI change efforts): Practices that aim to suppress or alter an individual's sexual orientation or gender to align with heterosexual orientation, cisgender identity, and/or stereotypical gender expression. Though not therapeutic, these practices are often referred to as "conversion therapy" or "reparative therapy."

Sexual orientation: A person's emotional, sexual, and/or relational attraction to others.

Transgender: Describes individuals whose gender identity is incongruent with their sex assigned at birth.

Two-Spirit: Two Spirit refers to someone who is Native and expresses their gender identity or spiritual identity in indigenous, non-Western ways. This term can only be applied to a person who is Native. A Two Spirit person has specific traditional roles and responsibilities within their tribe. Not all Native LGBTQ people identify as Two Spirit.

Victimization: The act or process of singling someone out for cruel or unfair treatment, typically through physical or emotional abuse.

This glossary is not an exhaustive list of terminology relevant for LGBTQI+ youth. Additional key terms and concepts are defined at Youth.gov.

Appendix D: Contributions

This report was prepared for SAMHSA by Leed Management Consulting, Inc. (LMCi) under contract number HHSS283201700609I/HHSS28342001T with SAMHSA, U.S. Department of Health and Human Services (HHS). Arlin Hatch, CAPT, USPHS, PhD, served as the Task Lead, Aida Balsano, PhD, served as the Deputy Task Lead, and Brian Altman, JD, served as Senior Advisor. David Lamont Wilson, BFA, served as the Contracting Officer Representative, and Marion Pierce, BA, served as the Alternate Contracting Officer Representative.

Laura Jadwin-Cakmak, MPH, was the lead scientific writer for this report, with substantial contributions from Judith Glassgold, PsyD; assistance from the subject matter expert panelists; technical, bibliographic, and editorial assistance from Kathi E. Hanna, PhD; and support from Karen Braxton, MA, as task lead from LMCi.

The Subject Matter Expert Consensus Panel was convened by Judith Glassgold, PsyD, the lead subject matter expert, remotely from September 9 to 10, 2021, with technical support from LMCi. The Panel included researchers and practitioners in child and adolescent development and mental health, as well as researchers in gender development, gender identity, and sexual orientation in children and adolescents. The Panel also included experts with a background in family therapy, ethnic and racial diversity, the needs of underrepresented populations, the intersection of behavioral health and spiritual diversity, and ethics. Panel members were Renata Arrington-Sanders, MD, MPH, ScM; Laura Edwards-Leeper, PhD; Gary Harper, PhD, MPH; Laura Kuper, PhD; Scott Leibowitz, MD; Christy Mallory, JD; Robin Lin Miller, PhD; Kristina Olson, PhD; Thomas Plante, PhD; Clifford Rosky, JD; Caitlin Ryan, PhD, ACSW; Russell Toomey, PhD; and Mark Yarhouse, PsyD.

SAMHSA subject matter experts provided input on the report: Brian Altman, JD; Amy Andre, MA, MBA; Mitchell Berger, MPH; Victoria Chau, PhD, MPH; Jeff Coady, CAPT, USPHS, PsyD, ABPP; Ed Craft, DrPh, Med, LCPC; Trina Dutta, MPP, MPH; and Michelle Kim Leff, CAPT, USPHS, MD, MBA. Elliot Kennedy, JD, from the Administration for Community Living, provided consultation and served as the SAMHSA Task Lead for the 2015 report, *Ending Conversion Therapy: Supporting and Affirming LGBTQ Youth*, on which this revision is based.

Proclamation 10355 of March 30, 2022

Transgender Day of Visibility, 2022

By the President of the United States of America

A Proclamation

To everyone celebrating Transgender Day of Visibility, I want you to know that your President sees you. The First Lady, the Vice President, the Second Gentleman, and my entire Administration see you for who you are—made in the image of God and deserving of dignity, respect, and support. On this day and every day, we recognize the resilience, strength, and joy of transgender, nonbinary, and gender nonconforming people. We celebrate the activism and determination that have fueled the fight for transgender equality. We acknowledge the adversity and discrimination that the transgender community continues to face across our Nation and around the world.

Visibility matters, and so many transgender, nonbinary, and gender nonconforming Americans are thriving. Like never before, they are sharing their stories in books and magazines; breaking glass ceilings of representation on television and movie screens; enlisting—once again—to serve proudly and openly in our military; getting elected and making policy at every level of government; and running businesses, curing diseases, and serving our communities in countless other ways.

Despite this progress, transgender Americans continue to face discrimination, harassment, and barriers to opportunity. Transgender women and girls—especially transgender women and girls of color—continue to face epidemic levels of violence, and 2021 marked the deadliest year on record for transgender Americans. Each of these lives lost was precious. Each of them deserved freedom, justice, and joy. We must honor their lives with action by advancing equity and civil rights for all transgender people.

In the past year, hundreds of anti-transgender bills in States were proposed across America, most of them targeting transgender kids. The onslaught has continued this year. These bills are wrong. Efforts to criminalize supportive medical care for transgender kids, to ban transgender children from playing sports, and to outlaw discussing LGBTQI+ people in schools undermine their humanity and corrode our Nation's values. Studies have shown that these political attacks are damaging to the mental health and well-being of transgender youth, putting children and their families at greater risk of bullying and discrimination.

My entire Administration is committed to ensuring that transgender people enjoy the freedom and equality that are promised to everyone in America. That is why I signed an Executive Order Preventing and Combating Discrimination on the Basis of Gender Identity or Sexual Orientation. We are expanding Federal non-discrimination protections; promoting strategies to address violence against the transgender community and advance gender equity and equality; and disseminating new resources to enhance inclusion, opportunity, and safety for transgender people. Additionally, Americans will soon be able to select more inclusive gender markers on their passports. I continue to call on the Congress to swiftly pass the bipartisan Equality Act, which will ensure that LGBTQI+ individuals and families cannot be denied housing, employment, education, credit, and more because of who they are or who

they love. We will continue to work to help transgender people around the world live free from discrimination and violence.

On this Transgender Day of Visibility, we honor transgender people who are fighting for freedom, equality, dignity, and respect. We also celebrate the parents, teachers, coaches, doctors, and other allies who affirm the identities of their transgender children and help these young people reach their potential. Transgender people are some of the bravest Americans I know, and our Nation and the world are stronger, more vibrant, and more prosperous because of them. To transgender Americans of all ages, I want you to know that you are so brave. You belong. I have your back.

NOW, THEREFORE, I, JOSEPH R. BIDEN JR., President of the United States of America, by virtue of the authority vested in me by the Constitution and the laws of the United States, do hereby proclaim March 31, 2022, as Transgender Day of Visibility. I call upon all Americans to join us in lifting up the lives and voices of transgender people throughout our Nation and to work toward eliminating discrimination against all transgender, gender nonconforming, and nonbinary people—and all people.

IN WITNESS WHEREOF, I have hereunto set my hand this thirtieth day of March, in the year of our Lord two thousand twenty-two, and of the Independence of the United States of America the two hundred and forty-sixth.

Proclamation 10538 of March 30, 2023

Transgender Day of Visibility, 2023

By the President of the United States of America

A Proclamation

Transgender Day of Visibility celebrates the joy, strength, and absolute courage of some of the bravest people I know—people who have too often had to put their jobs, relationships, and lives on the line just to be their true selves. Today, we show millions of transgender and nonbinary Americans that we see them, they belong, and they should be treated with dignity and respect. Their courage has given countless others strength, but no one should have to be brave just to be themselves. Every American deserves that freedom.

Transgender Americans shape our Nation's soul—proudly serving in the military, curing deadly diseases, holding elected office, running thriving businesses, fighting for justice, raising families, and much more. As kids, they deserve what every child deserves: the chance to learn in safe and supportive schools, to develop meaningful friendships, and to live openly and honestly. As adults, they deserve the same rights enjoyed by every American, including equal access to health care, housing, and jobs and the chance to age with grace as senior citizens. But today, too many transgender Americans are still denied those rights and freedoms. A wave of discriminatory State laws is targeting transgender youth, terrifying families and hurting kids who are not hurting anyone. An epidemic of violence against transgender women and girls, in particular women and girls of color, has taken lives far too soon. Last year's Club Q shooting in Colorado was another painful example of this kind of violence—a stain on the conscience of our Nation.

My Administration has fought to end these injustices from day one, working to ensure that transgender people and the entire LGBTQI+ community can live openly and safely. On my first day as President, I issued an Executive Order directing the Federal Government to root out discrimination against LGBTQI+ people and their families. We have appointed a record number of openly LGBTQI+ leaders, and I was proud to rescind the ban on openly transgender people serving in the military. We are also working to make public spaces and travel more accessible, including with more inclusive gender markers on United States passports. We are improving access to public services and entitlements like Social Security. We are cracking down on discrimination in housing and education. And last December, I signed the Respect for Marriage Act into law, ensuring that every American can marry the person they love and have that marriage accepted, period.

Meanwhile, we are also working to ease the tremendous strain that discrimination, bullying, and harassment can put on transgender children—more than half of whom seriously considered suicide in the last year. The Department of Education is, for example, helping ensure that transgender students have equal opportunities to learn and thrive at school, and the Department of Justice is pushing back against extreme laws that seek to ban evidence-based gender-affirming health care.

There is much more to do. I continue to call on the Congress to finally pass the Equality Act and extend long-overdue civil rights protections to all LGBTQI+ Americans to ensure they can live with safety and dignity.

Together, we also have to keep challenging the hundreds of hateful State laws that have been introduced across the country, making sure every child knows that they are made in the image of God, that they are loved, and that we are standing up for them.

America is founded on the idea that all people are created equal and deserve to be treated equally throughout their lives. We have never fully lived up to that, but we have never walked away from it either. Today, as we celebrate transgender people, we also celebrate every American's fundamental right to be themselves, bringing us closer to realizing America's full promise.

NOW, THEREFORE, I, JOSEPH R. BIDEN JR., President of the United States of America, by virtue of the authority vested in me by the Constitution and the laws of the United States, do hereby proclaim March 31, 2023, as Transgender Day of Visibility. I call upon all Americans to join us in lifting up the lives and voices of transgender people throughout our Nation and to work toward eliminating violence and discrimination against all transgender, gender nonconforming, and nonbinary people.

IN WITNESS WHEREOF, I have hereunto set my hand this thirtieth day of March, in the year of our Lord two thousand twenty-three, and of the Independence of the United States of America the two hundred and forty-seventh.

Pl. Trial Ex. 078

Executive Order 13988 of January 20, 2021

Preventing and Combating Discrimination on the Basis of Gender Identity or Sexual Orientation

By the authority vested in me as President by the Constitution and the laws of the United States of America, it is hereby ordered as follows:

Section 1. *Policy*. Every person should be treated with respect and dignity and should be able to live without fear, no matter who they are or whom they love. Children should be able to learn without worrying about whether they will be denied access to the restroom, the locker room, or school sports. Adults should be able to earn a living and pursue a vocation knowing that they will not be fired, demoted, or mistreated because of whom they go home to or because how they dress does not conform to sex-based stereotypes. People should be able to access healthcare and secure a roof over their heads without being subjected to sex discrimination. All persons should receive equal treatment under the law, no matter their gender identity or sexual orientation.

These principles are reflected in the Constitution, which promises equal protection of the laws. These principles are also enshrined in our Nation's anti-discrimination laws, among them Title VII of the Civil Rights Act of 1964, as amended (42 U.S.C. 2000e *et seq.*). In *Bostock* v. *Clayton County*, 590 U.S.__(2020), the Supreme Court held that Title VII's prohibition on discrimination "because of . . . sex" covers discrimination on the basis of gender identity and sexual orientation. Under *Bostock's* reasoning, laws that prohibit sex discrimination—including Title IX of the Education Amendments of 1972, as amended (20 U.S.C. 1681 *et seq.*), the Fair Housing Act, as amended (42 U.S.C. 3601 *et seq.*), and section 412 of the Immigration and Nationality Act, as amended (8 U.S.C. 1522), along with their respective implementing regulations—prohibit discrimination on the basis of gender identity or sexual orientation, so long as the laws do not contain sufficient indications to the contrary.

Discrimination on the basis of gender identity or sexual orientation manifests differently for different individuals, and it often overlaps with other forms of prohibited discrimination, including discrimination on the basis of race or disability. For example, transgender Black Americans face unconscionably high levels of workplace discrimination, homelessness, and violence, including fatal violence.

It is the policy of my Administration to prevent and combat discrimination on the basis of gender identity or sexual orientation, and to fully enforce Title VII and other laws that prohibit discrimination on the basis of gender identity or sexual orientation. It is also the policy of my Administration to address overlapping forms of discrimination.

Sec. 2. *Enforcing Prohibitions on Sex Discrimination on the Basis of Gender Identity or Sexual Orientation*. (a) The head of each agency shall, as soon as practicable and in consultation with the Attorney General, as appropriate, review all existing orders, regulations, guidance documents, policies, programs, or other agency actions ("agency actions") that:

(i) were promulgated or are administered by the agency under Title VII or any other statute or regulation that prohibits sex discrimination, including any that relate to the agency's own compliance with such statutes or regulations; and

(ii) are or may be inconsistent with the policy set forth in section 1 of this order.

(b) The head of each agency shall, as soon as practicable and as appropriate and consistent with applicable law, including the Administrative Procedure Act (5 U.S.C. 551 *et seq.*), consider whether to revise, suspend, or rescind such agency actions, or promulgate new agency actions, as necessary to fully implement statutes that prohibit sex discrimination and the policy set forth in section 1 of this order.

(c) The head of each agency shall, as soon as practicable, also consider whether there are additional actions that the agency should take to ensure that it is fully implementing the policy set forth in section 1 of this order. If an agency takes an action described in this subsection or subsection (b) of this section, it shall seek to ensure that it is accounting for, and taking appropriate steps to combat, overlapping forms of discrimination, such as discrimination on the basis of race or disability.

(d) Within 100 days of the date of this order, the head of each agency shall develop, in consultation with the Attorney General, as appropriate, a plan to carry out actions that the agency has identified pursuant to subsections (b) and (c) of this section, as appropriate and consistent with applicable law.

Sec. 3. *Definition.* "Agency" means any authority of the United States that is an "agency" under 44 U.S.C. 3502(1), other than those considered to be independent regulatory agencies, as defined in 44 U.S.C. 3502(5).

Sec. 4. *General Provisions.* (a) Nothing in this order shall be construed to impair or otherwise affect:

(i) the authority granted by law to an executive department or agency, or the head thereof; or

(ii) the functions of the Director of the Office of Management and Budget relating to budgetary, administrative, or legislative proposals.

(b) This order shall be implemented consistent with applicable law and subject to the availability of appropriations.

(c) This order is not intended to, and does not, create any right or benefit, substantive or procedural, enforceable at law or in equity by any party against the United States, its departments, agencies, or entities, its officers, employees, or agents, or any other person.

U.S. COMMISSION ON CIVIL RIGHTS

The U.S. Commission on Civil Rights is an independent, bipartisan agency established by Congress in 1957. It is directed to:

- Investigate complaints alleging that citizens are being deprived of their right to vote by reason of their race, color, religion, sex, age, disability, or national origin, or by reason of fraudulent practices.
- Study and collect information relating to discrimination or a denial of equal protection of the laws under the Constitution because of race, color, religion, sex, age, disability, or national origin, or in the administration of justice.
- Appraise federal laws and policies with respect to discrimination or denial of equal protection of the laws because of race, color, religion, sex, age, disability, or national origin, or in the administration of justice.
- Serve as a national clearinghouse for information in respect to discrimination or denial of equal protection of the laws because of race, color, religion, sex, age, disability, or national origin.
- Submit reports, findings, and recommendations to the President and Congress.
- Issue public service announcements to discourage discrimination or denial of equal protection of the laws.

Working for Inclusion: Time for Congress to Enact Federal Legislation to Address Workplace Discrimination Against Lesbian, Gay, Bisexual, and Transgender Americans

Briefing Before
The United States Commission on Civil Rights
Held in Washington, DC

Briefing Report

[*This page intentionally left blank*]

UNITED STATES COMMISSION ON CIVIL RIGHTS

1331 PENNSYLVANIA AVE., NW • SUITE 1150 • WASHINGTON, DC 20425
WWW.USCCR.GOV

Letter of Transmittal

President Donald J. Trump
Vice President Mike Pence
Speaker of the House Paul Ryan
Senate Majority Leader Mitch McConnell

On behalf of the United States Commission on Civil Rights ("the Commission"), I am pleased to transmit our briefing report, *Working for Inclusion: Time for Congress to Enact Federal Legislation to Address Workplace Discrimination Against Lesbian, Gay, Bisexual, and Transgender Americans*. The report is also available in full on the Commission's website at www.usccr.gov.

The report examines the main social and economic arguments made for and against enacting federal legislation to provide federal nondiscrimination workplace protections for lesbian, gay, bisexual, and transgender (LGBT) employees.

The majority of the Commission voted for key findings including that LGBT workers have faced a long, serious, and pervasive history of official and unofficial employment discrimination by federal, state, and local governments and private employers. Such discrimination persists and has wide-ranging, damaging implications for the quality of life for many LGBT Americans, their children and families, and communities. An inconsistent and irreconcilable patchwork of state laws against LGBT workplace discrimination and federal court decisions interpreting existing federal law render LGBT employees insufficiently protected from workplace discrimination.

Our primary recommendation is directed to Congress: In order to effectively and consistently protect LGBT employees from workplace discrimination, Congress should immediately enact a federal law explicitly banning discrimination in the workplace based on sexual orientation and gender identity. We also make particular recommendations that federal agencies should issue and —where relevant—reaffirm specific guidance for federal and private employers outlining protections for LGBT individuals in the workforce, including specifically enumerating

protections for transgender persons; federal agencies should also collect workplace discrimination data about LGBT employees.

We at the Commission are pleased to share our views, informed by careful research and investigation, to help ensure that all Americans enjoy civil rights protections to which we are entitled.

For the Commission,

Catherine E. Lhamon

Chair

TABLE OF CONTENTS

EXECUTIVE SUMMARY

American employees spend a large part of our awake hours at work. At the same time, the majority of lesbian, gay, bisexual, and transgender (LGBT)[1] workers live in states that do not offer explicit LGBT-specific nondiscrimination protections in employment. The briefing testimony and written materials submitted to the Commission, along with extensive social science research and surveys, reflect the reality that many LGBT Americans are forced to deal with prejudice and discrimination every day in the workplace. Over the past several decades, there has been increasing national support for extending equal protections to LGBT individuals. According to a 2013 poll released by Project Right Side and Americans for Workplace Opportunity, a majority of people (88 percent), regardless of political affiliation, agreed that LGBT individuals should be judged based on their performance in the workplace.[2] Congress has not enacted federal antidiscrimination workplace protections for LGBT employees. This report highlights the main social and economic arguments made by proponents and opponents for enacting federal legislation and makes findings and recommendations regarding civil rights status for LGBT employees.

Over the past forty years, Congress has introduced multiple iterations of legislation that would prohibit workplace discrimination against LGBT Americans, but has not passed such legislation. On March 16, 2015, the Commission held a briefing to examine workplace discrimination against LGBT Americans.[3] The purpose of the briefing was to gather information about existing state, local, and federal laws and policies, and the impacts of discrimination on LGBT employees. The Commission also sought to hear from multiple perspectives in support of and against enacting federal legislation to address workplace discrimination against LGBT employees.[4]

---

[1] This report uses the acronym of LGBT to include individuals who are lesbian, gay. bisexual, or transgender. At times, this report refers to "LGB" to refer only to those individuals because, for example, the particular study being discussed may have been limited to that sub-group.

[3] U.S. Commission on Civil Rights. *Briefing: Examining Workplace Discrimination Against LGBT Americans,* (Washington, DC, March 16, 2015), http://www.usccr.gov/calendar/trnscrpt/Discrimination_LGBT_03-16-2015.pdf (*hereinafter cited* as Briefing Transcript).

[4] During the briefing, the Commission heard from three panels of experts. These experts discussed 1) the federal government's compliance with laws, regulations, and presidential Executive Orders that prohibit discrimination against LGBT Americans; 2) the impacts for LGBT employees who reside in states that do not have specific state nondiscrimination protections; and 3) policy issues, including whether Congress should pass federal legislation and the appropriate language for such federal legislation. *Ibid.*

Proponents in favor of a national law that specifically forbids discriminating against employees based on their sexual orientation[5] or gender identity[6] contend that federal legislation is necessary to provide LGBT workers equal rights and equal dignity in the workplace similar to other workers. Proponents of federal legislation further argue that although the federal government, states, corporations, and businesses are increasingly creating and enforcing LGBT-inclusive policies, this progress is at best sporadic and uneven. As these policies are enacted separately and independently, the lack of national legal protections leaves many to hide who they are for fear of discrimination—including termination—in the workplace. They also assert that while the nation has experienced some great strides in LGBT equality over the past several years, widespread discrimination and animus towards LGBT communities is still prevalent. Additionally, researchers have found that LGBT individuals who live in jurisdictions without worker protections also experience poverty at higher rates than heterosexuals in those jurisdictions. At the same time, lesbians and gay men living in jurisdictions that do offer employment protections were less likely to be impoverished compared to heterosexuals.[7] These findings suggest anti-discrimination protections and a social climate of acceptance may mitigate disparities.

Proponents further note that existing state and federal laws leave many LGBT employees unprotected from workplace discrimination.[8] Recently, the Equal Employment Opportunity Commission (EEOC) interpreted existing federal law prohibiting sex discrimination (Title VII of the Civil Rights Act) to include claims of discrimination based on sexual orientation and gender identity.[9] The U.S. Court of Appeals for the Seventh Circuit is currently the sole Circuit to hold that sexual orientation falls within the existing language of Title VII.[10] Yet, other Circuit Courts

[5] Sexual orientation may be defined as "one's emotional or physical attraction to the same and/or opposite sex." Office of Personnel Management, U.S. Equal Employment Opportunity Commission, U.S. Office of Special Counsel, and Merit Systems Protection Board, *Addressing Sexual Orientation and Gender Identity Discrimination in Federal Civilian Employment: A Guide to Employment Rights, Protections, and Responsibilities*, rev. June 2015, http://www.opm.gov/policy-data-oversight/diversity-and-inclusion/reference-materials/addressing-sexual-orientation-and-gender-identity-discrimination-in-federal-civilian-employment.pdf, p. 2.

[6] Gender identity may be defined as "one's inner sense of one's own gender, which may or may not match the sex assigned at birth. Different people choose to express their gender identity differently. For some, gender may be expressed through, for example, dress, grooming, mannerisms, speech patterns, and social interactions. Gender expression usually ranges between masculine and feminine, and some transgender people express their gender consistent with how they identify internally, rather than in accordance with the sex they were assigned at birth." *Ibid.*

[9] *See, Baldwin v. Foxx,* EEOC Doc No. 0120133080, 2015 WL 4397641 (EEOC Jul. 16, 2015) (discussing Title VII, Civil Rights Act of 1964, 42 U.S.C. § 2000e *et seq*).

[10] *Hively v. Ivy Tech Comty. Coll. of Ind.*, 853 F.3d 339, 350-51 (7th Cir. 2017). At the time of publication, this question was also pending before the U.S. Court of Appeals for the Second Circuit. See discussion *infra* in Chapter 2.

have held that Title VII does not include such protections.[11] In practice, this means that employees may or may not have access to a federal forum to hear their allegations of discrimination based on sexual orientation and gender identity. Additionally, twenty-eight states do not have state law protections prohibiting workplace discrimination based on sexual orientation, and thirty states do not have state law protections for being transgender or gender-nonconforming.[12] Proponents of federal legislation argue:

> Today, it's possible for a lesbian couple to get legally married on Saturday and then be fired on Monday for putting a wedding picture on their desk.[13]

> [D]iscrimination has no place in our nation and yet right now in 2015 in many states, like Florida, a person can be fired simply for being lesbian, gay, bisexual or transgender. As a result, millions of LGBT Americans go to work every day fearing that without any warning they could lose their jobs not because of their work performance but simply because of who they are or who they love . . . . Passing ENDA[14] would eliminate the patchwork of differing state and often absurd state legislation and provide consistent workplace protections across the country.[15]

Opponents to enactment of a specific federal non-discrimination law question whether the Constitution allows Congress to legislate non-discriminatory workplace protections for LGBT workers and argue that these protections, if any, should be governed by localities and businesses. They argue that federal legislation protecting sexual orientation and gender identity would infringe upon business owners' First Amendment rights and not permit them to run organizations that are consistent with their values.[16] Further, they argue that while all individuals should be respected, federal antidiscrimination legislation is bad policy because it is inconsistent with free-market principles protecting the freedom of contract and against overregulation by the government.[17] Ryan Anderson of the Heritage Foundation argues that a "fundamental principle" guiding American labor law is the "doctrine of 'at will' employment" that permits employers to dismiss employees

at any time.[18] He argues that antidiscrimination laws would threaten this principle and negatively affect the business community. Hans Bader of the Competitive Enterprise Institute claims that "[s]ince American business seldom discriminates based on sexual orientation, the potential benefits of ENDA [the Employment Non-Discrimination Act] are limited, at best. But ENDA would impose real and substantial costs on business, and it could trigger conflicts with free speech and religious freedom."[19] Bader contends that the principles of free-market competition will offer enough protections to LGBT employees, since many private companies have already prohibited discrimination on the basis of sexual orientation, and to appear anti-gay may be perceived as bad for business.[20] Finally, opponents also raise concerns about the potential for increased legal costs and workplace disruptions that they believe such federal legislation would cause.[21]

After examining the current state of LGBT workplace protections, the Commission highlights the following findings and recommendations, discussed in full in Chapter 4:

Highlighted findings:

- Historians, researchers, and courts have extensively documented that lesbian, gay, bisexual, and transgender (LGBT) workers have faced a long, serious, and pervasive history of official and unofficial employment discrimination by both federal, state, and local governments and private employers.
- Federal data sources do not effectively capture rates of LGBT employment or rates of LGBT employment discrimination.
- An inconsistent and irreconcilable patchwork of state laws against anti-LGBT workplace discrimination and federal court decisions interpreting existing federal law render LGBT employees insufficiently protected from workplace discrimination.

Highlighted recommendations:

- In order to effectively and consistently protect LGBT employees from workplace discrimination, Congress should immediately enact a federal law explicitly banning discrimination in the workplace based on sexual orientation and gender identity.
- In addition to Congressional action, federal agencies including the Departments of Justice and Labor, the Equal Employment Opportunity Commission, and the Office of Personnel Management should issue and—where relevant—reaffirm specific guidance for federal

and private employers outlining protections for LGBT individuals in the workforce, including specifically enumerating protections for transgender persons.

- Workplace discrimination data should be collected through the inclusion of sexual orientation and gender identity questions in population-based surveys of the workforce such as the Census, American Community Survey, and surveys fielded by the Bureau of Labor Statistics and other agencies.

[*This page intentionally left blank*]

CHAPTER 1: INTRODUCTION TO LGBT EMPLOYMENT IN AMERICA

This introductory chapter: 1) seeks to quantify the number of LGBT employees in the United States, 2) discusses the extent and impact of workplace discrimination against LGBT employees, 3) lists the existing state laws addressing LGBT employees, and 4) discusses the prior efforts to enact federal legislation.

Number of Lesbian, Gay, Bisexual, and Transgender Employees

The exact number of individuals who self-identify as LGBT is not known. Historically, many national surveys have not included questions exploring sexual orientation or gender identity.[22] In fact, early estimates of LGBT couples were made by examining U.S. Census responses identifying households with cohabitating unmarried couples of the same sex.[23] Most recently, the U.S. Census Bureau sent a draft of the 2020 Census and American Community Survey collection report to Congress in March 2017.[24] It appeared that the Census Bureau was going to collect LGBT demographic information, but later that same day, the Census Bureau stated that it mistakenly included those categories for collection.[25] Advocates have argued that alongside adding LGBT questions to the Census, the American Community Survey and surveys fielded by the Bureau of Labor Statistics should include questions on sexual orientation and gender identity.[26]

A 2013 survey conducted by the Centers for Disease Control and Prevention's National Center for Health Statistics found that 3.4 percent of Americans identify themselves as gay or lesbian (1.6 percent), bisexual (0.7 percent) or other (1.1 percent).[27] More recently, a 2017 Gallup survey found

[26] Statement of Stacey Long Simmons, Director of Public Policy & Government Affairs at National LGBTQ Task Force, U.S. Commission on Civil Rights, *Briefing: Examining Workplace Discrimination Against LGBT Americans,* (Washington, DC, March 16, 2015) at 5 (*hereinafter cited* as Simmons Statement).

[27] Brian W. Ward, James M. Dahlhamer, Adena M. Galinsky, Sarah J. Joestl, "Sexual Orientation and Health Among U.S. Adults: National Health Interview Survey, 2013," National Center for Health Statistics, 2014, https://www.cdc.gov/nchs/data/nhsr/nhsr077.pdf, p. 1. The National Health Interview Survey of 34,557 adults aged

that the portion of American adults who identified as LGBT increased from 3.5 percent in 2012 to 4.1 percent in 2016.[28] According to Gallup, these figures are from "the largest representative sample of LGBT Americans collected in the U.S."[29] This means there are an estimated 10 million adults who now identify as LGBT in the U.S., which is approximately 1.75 million more individuals than in 2012. This increase is largely due to millennials (defined as those born between 1980 and 1998) being more than twice as likely as previous generations to self-identify as LGBT.[30]

Population estimates of LGBT communities may be non-inclusive due to several factors, because of the multiple dimensions of sexuality.[31] First, self-identification is only one aspect of measuring sexual orientation and gender identity. For example, research shows that when surveys are inclusive of the complex dynamics of identity, behavior, attraction, and relationships, these surveys yield very different (and often larger) population estimates compared to those that only utilize self-identification measures.[32] Other studies suggest that sexual orientation and gender identity are on a continuum (*i.e.*, not static) for some individuals, therefore, they do not self-identify with categories that traditionally appear on surveys.[33] Thus, depending on which definition(s) and measure(s) a researcher chooses, estimates may vary. These disparate results can also be due to "how comfortable and confident survey respondents feel about the confidentiality and privacy of data collected."[34]

Based on these estimates (and considering the likelihood of underreporting, as mentioned above), it is fair to say that LGBT Americans comprise a significant portion of private and public sector employees.[35] In addition to the difficulties described above, the exact number of LGBT employees

---

18–64 added questions on sexual orientation in 2013 to create an "ongoing collection of information on sexual orientation" to enable a "more consistent, long-term monitoring" of the goal of "improving the health, safety, and well-being of LGB persons." The "other" category represents the "something else" response, "don't know" response, or respondent refused to answer. *Ibid.* at 2.

is also not fully known due to fear of coming out at work which could subject individuals to harassment or discrimination by colleagues or their employer. According to a survey from the Pew Research Center, "only one-third of employed LGBT adults say all or most of the people they closely work with are aware of their sexual orientation or gender identity."[36] Further, over a third of respondents say no one at work knows their sexual orientation or gender identity.[37] Only approximately 5.8 percent of self-identified bisexual survey respondents were generally open about their sexual orientation to their coworkers.[38] A 2014 report authored by the Human Rights Campaign found that most (53 percent) of LGBT employees are open about their sexuality with only a few people or are entirely "closeted" at work.[39]

Nevertheless, the best available data suggests a general range of 5.4 million to 8.2 million for estimating employees who self-identify as LGBT. The National LGBTQ Taskforce estimates there are 5.4 million LGBT workers in the United States.[40] For the upper-range, the 2015 Williams Institute report[41] estimates that up to 9.5 million adults self-identify as LGBT[42] and the 2017 Gallup poll estimates 10 million adults, or 4.1 percent of U.S. adults.[43] This puts the LGBT workforce at approximately over eight million LGBT employees. As of September 2009, state and local governments employed approximately 19.7 million workers.[44] This estimate includes about 5.2 million state employees and 14.5 million local government employees.[45] The Williams Institute

In 2012, the Office of Personnel Management (OPM) began asking federal employees to self-identify whether they are LGBT on its annual survey of federal workers.[47] As of 2015, OPM estimates that 3 percent of the federal civilian workforce is LGBT.[48] With regard to military service, the University of Southern California estimates that nearly 71,000 LGBT service members were serving in the military, or 2.8 percent of the total work force of the United States military as of 2016.[49] The Williams Institute estimates that nearly 150,000 transgender military personnel have served or are currently serving in the military.[50]

Extent of Discrimination Against LGBT Employees

Studies have found that discrimination in the workplace has a negative effect on LGBT employees.[51] LGBT individuals often face lower wages, increased difficulty in finding jobs, promotion denials, and/or job terminations due to their sexual orientation or gender identity. Studies have found that anywhere from 21 to 47 percent of LGBT adults faced employment discrimination because they were gay or transgender.[52] A summary of numerous studies of LGBT employee survey respondents showed that ten to 28 percent reported receiving negative performance evaluations or were passed over for promotion because they were gay or transgender, and seven to 41 percent experienced verbal and/or physical abuse in the workplace.[53] More staggering is that 90 percent of transgender employees report experiencing some form of harassment or mistreatment on the job.[54] For instance, 23 percent of employed transgender workers reported mistreatment such as "being forced to use a restroom that did not match their gender

identity, being told to present in the wrong gender in order to keep their job, or having a boss or coworker share private information about their transgender status without their permission."[55]

Discrimination against LGBT employees can begin with the job application process. Researchers found discrimination against LGBT employee applicants, for example, in a study when researchers sent two sets of matched resumes to major employers, where one resume suggested the applicant was gay (*e.g.*, by disclosing leadership experience at an LGBT student organization), employers were far less likely to positively receive "gay" applicants than "straight" ones. Results revealed that those with indications of being LGBT received approximately 30 percent fewer callbacks.[56]

Discrimination against LGBT employees affects all occupations. LGBT individuals across the country and in a variety of professions report being discriminatorily terminated from their jobs. As with all discrimination claims, there may be conflicting narratives between employee and employer. Pointing to either administrative (*i.e.*, EEOC) or court rulings to determine rates of discrimination is also difficult: the EEOC only recently ruled that people claiming discrimination on the basis of sexual orientation or gender identity have the right to sue under Title VII. As discussed in more detail below, only one Circuit has held that sexual orientation claims may be brought under Title VII, and the Circuit courts are divided on whether claims of gender identity fall under Title VII.

At the same time, there is evidence that discrimination is occurring. Every year (since January 2013 when the EEOC began collecting data), there has been a steady increase in the number of merit resolutions rulings and reasonable cause claims reported to the EEOC for LGBT plaintiffs (see Table 2). While the EEOC does not publish their decisions, these numbers suggest that these cases had favorable outcomes to LGBT plaintiffs alleging discrimination or the EEOC determined that there was reasonable cause to believe discrimination occurred based upon investigation.

Results from the 2008 General Social Survey (GSS)[57] found that 42 percent of LGB employees experienced at least one form of employment discrimination at some point in their lives.[58] Moreover, the survey found 25 percent of LGB-identified respondents employed by federal, state, or local governments reported having experienced workplace discrimination due to their sexual orientation in the prior five years.[59]

*The data for FY 2013 is for the last three quarters only. EEOC began tracking information on charges filed alleging discrimination related to gender identity and/or sexual orientation for charges received on or after January 1, 2013. Note: Charges may have multiple allegations under multiple statutes, so totals will not tally with breakdowns of specific bases or issues and are subject to updates. Monetary benefits include amounts which have been recovered exclusively or partially on non-LGBT claims included in the charge.
Source: Jeanne Goldberg (Senior Attorney Advisor, Office of the Legal Counsel, EEOC), in discussion with USCCR staff, April 17, 2017.

According to the Williams Institute, in 2008 approximately 38 percent of LGB people who were open about their sexual orientation in the workplace have experienced discrimination or harassment in the workplace.[60] Seven percent of LGB Americans report losing jobs because of their sexual orientation.[61] According to the National Center for Transgender Equality and the National Gay and Lesbian Task Force, for transgender employees the statistics are significantly higher, with 90 percent reporting experiencing harassment, mistreatment, or discrimination at

[60] *Ibid.*
[61] *Ibid.*

work, or taking actions to avoid it (*e.g.*, hiding their identity), due to their gender identity.[62] In addition, 2013 data from the Pew Research Center indicates that 21 percent of LGBT Americans feel that an employer has treated them unfairly due to their sexual orientation or gender identity.[63]

Employment discrimination also significantly affects LGBT youth and their long-term career opportunities. Bill Bettencourt from the Center for the Study of Social Policy explained that "[t]he lack of sufficient supportive career options for LGBT young people unfortunately leads to a path that impacts our criminal system and society as a whole."[64] According to a 2011-2012 Williams Institute survey, approximately 40 percent of homeless youth are LGBT.[65] Respondents most frequently cited family rejection of their sexual orientation or gender identity as a factor leading to their homelessness,[66] and 32 percent indicated abuse from their families as a reason cited for leaving.[67] Bettencourt argued that "[n]o matter what kinds of system improvements we put in place to support these young people in achieving some independence and becoming responsible citizens, without workplace supports we are doomed to fail them. Even when they can get jobs, if they cannot be themselves in the workplace, too often their productivity is impacted, as well as their ability to keep a job."[68]

ECONOMIC IMPACTS FROM WORKPLACE DISCRIMINATION

Workplace discrimination against LGBT communities can cause job instability and high turnover, resulting in greater unemployment and poverty rates as well as substantial wage gaps between LGBT and heterosexual workers. On average gay men earn from ten to 32 percent less than similarly qualified heterosexual males.[69] Older gay and lesbian adults experience higher poverty rates than their heterosexual counterparts.[70] In the 2015 U.S. Transgender Survey released by the

Randy Albelda, M.V. Lee Badgett, Alyssa Schneebaum, Gary J. Gates, "Poverty in the Lesbian, Gay, and Bisexual Community."

National Center for Transgender Equality, transgender individuals were three times as likely to be unemployed and more than twice as likely to live in poverty compared to general rates in the U.S.[71] Nearly 30 percent of respondents in the survey reported being homeless.[72] The National Commission on Employment Policies estimated that discrimination against LGBT employees can be quantified as causing a $47 million loss in annual profits, attributable to training expenditures and unemployment benefits. Others have estimated that hostile work environments cost companies $1.4 billion in lost output per year due to a decline in productivity.[73]

Financially, discrimination also creates a large burden on national economic growth. Discrimination can lead to increased turnover for a business. For instance, approximately 53 percent of LGBT employees are "closeted."[74] Closeted LGBT employees "who felt isolated at work" are 73 percent more likely than their heterosexual counterparts to leave a position within three years.[75] Due to direct and indirect costs (*e.g.*, exit interviews, severance pay, temporary staffing, loss of productivity, training new employees) replacing employees can be quite costly.[76] Replacing employees due to discrimination can cost anywhere from $5,000 to $10,000 for an hourly worker, and between $75,000 to $211,000 for an executive who makes $100,000 a year.[77] Another analysis found the annual cost of employee turnover due to various forms of workplace discrimination could cost U.S. employers upwards of $64 billion annually.[78] There are also legal costs associated with discrimination for all businesses. Employers who find themselves tied up in discrimination lawsuits can experience significant financial costs. In 2010, the Annual Workplace Class Action Litigation Report found that the cost of the top-ten private plaintiff employment discrimination lawsuits totaled $346.4 million, which increased from $84.4 million just a year

before.[79] In 2013, the cost of the top-ten private plaintiff employment discrimination lawsuits totaled $638 million.[80]

Studies have found that policies protecting against discrimination on the basis of sexual orientation and/or gender identity have a positive impact on businesses in terms of employee morale, the work environment, and profits. Utilizing data from the Organization for Economic Co-operation and Development (OECD), Out Now Global estimates that—as a nation—the U.S. could save $8.93 billion if LGBT workers felt comfortable being out at work.[81] They argue these savings would be the result of LGBT workers being able to be out to all of their colleagues without fear of harassment or discrimination. Further, the report estimates that businesses would have a direct benefit as well. Out Now Global found that for businesses with 10,000 employees their savings could be between $127 thousand and $944 thousand; for businesses with 50,000 employees, their savings estimated between $633 thousand and $4.7 million; businesses with 100,000 employees, $1.3 million and $9.4 million; and for those with 250,000 employees, $3.2 million and $23.6 million in savings.[82]

Businesses have also cited that having a diverse staff positively affects office operations. Such benefits include: recruitment and retention, ideas and innovation, customer service, productivity, customer base, and employee relations and morale.[83] Additionally, nondiscrimination policies have positive effects on LGBT workers, including high job satisfaction, high commitment to the company, high life satisfaction, high psychological adjustment, and less conflict between work

This calculation uses the midpoint between the Center for American Progress' estimate of 16.1% of annual salary to replace low-skilled employees and Oxford Economics' estimate of 120% of annual salary to replace average to high-skilled employees. Boushey, *supra* note 76, at p. 2; Oxford Economics, "The Cost of Brain Drain: Understanding the financial impact of staff turnover," February 2014, http://www.oxfordeconomics.com/my-oxford/projects/264283. The calculation is for moving the "out to none" population to being "out to all" for the national full time workforce, with 38% of U.S. respondents stating they are currently "out to all," assuming that the LGBT community comprises 6% of the adult population. Lukenbill, G, "Untold millions: Positioning your business for the gay and lesbian consumer revolution" Harper Collins: New York; U.S. Census Bureau, "Annual estimates of the population by five-year age groups and sex for the United States," May 2007.

[82] The achievable savings for companies of the sizes indicated where the lower amount is if all workers are defined as low-skilled (Boushey, *supra* note 76, at 2), and the upper level in the calculation is the average figure found in 2014 as the costs to replace staff (Oxford Economics, *supra* note 81).

[83] Brad Sears and Christy Mallory, "Economic Motives for Adopting LGBT-Related Workplace Policies," Williams Institute, October 2011, http://williamsinstitute.law.ucla.edu/wp-content/uploads/Mallory-Sears-Corp-Statements-Oct2011.pdf, p. 2–3.

and home.[84] A 2014 Human Rights Campaign report found that one in four LGBT employees reported staying at a job specifically because of its inclusive environment.[85]

Implementing these policies affects employee morale and satisfaction, thereby affecting productivity. Of the top 50 Fortune 500 companies that implemented nondiscrimination policies, a majority of those companies stated that these policies increased overall profitability.[86] When polled, a majority of small business owners believe laws that prohibit discrimination against LGBT employees can improve their bottom line.[87] Further, more than two-thirds of small business owners believe there should be a federal law prohibiting employment discrimination against LGBT individuals.[88]

INTENSIFIED DISCRIMINATION AGAINST TRANSGENDER INDIVIDUALS

Due to the lack of cultural awareness on transgender issues and stigma, many transgender workers face particular difficulty obtaining jobs, retaining jobs, and receiving promotions. Mara Keisling, Executive Director of the National Center for Transgender Equality, offered testimony to the Commission explaining some of the hardships that the transgender community faces:

> [W]hat I think is important for everybody to understand -- that right now in 2015, more than at any time in my 15-year career -- in this moment, transgender people are traumatized. They are traumatized economically, they are traumatized culturally and they are very much traumatized physically. . . . We are really a resilient and determined people. You have to be when you are as marginalized as transgender people are, and . . . our testimony shows how transgender people are under siege and traumatized economically with an unemployment rate twice the national average or four times [more] likely than non-trans people to live on less than $10,000 a year.[89]

The Commission also received testimony that showed how these difficulties are "exacerbated for transgender people who are also members of other vulnerable communities, such as being a person

of color; undocumented; living with HIV/AIDS; or a senior or youth."[90] A survey by the National Center for Transgender Equality and the National Gay and Lesbian Task Force found that 44 percent of transgender employees were passed over for a job, 23 percent were denied a promotion, and 26 percent were fired due to their gender identity.[91] Respondents, who reported having lost a job due to bias, further reported being currently unemployed at much higher percentages than the general population (26 to seven percent respectively).[92] This finding suggests that transgender individuals struggle to regain employment after they have been discriminatorily terminated.

Transgender individuals are unemployed at three times the rate of the general population,[93] and transgender people of color are jobless at up to four times the rate of the general population, according to the National Transgender Discrimination Survey.[94] The same survey found that employment discrimination negatively affects transgender workers in many ways. These issues include hiring, retention, promotion, and suffering from underemployment. Further, many transgender workers report experiencing hostile work environments where they are often mistreated, harassed, physically or sexually assaulted, forced to present as a gender they do not identify with, asked inappropriate questions, and deliberately taunted by the use of incorrect pronouns by their coworkers.[95] Due to the increased stigma of being transgender and these barriers listed above, unemployment is particularly detrimental to transgender individuals. Further, many transgender individuals consider themselves underemployed because they are overqualified for their position. For example, transgender people report often taking such jobs because of difficulties of being hired. According to a 2011 report, transgender respondents who were unemployed have nearly double the rate of engaging in survival sex work, four times the rate of homelessness, and 85 percent more incarceration compared to those who were employed.[96] In addition, they are disproportionately more likely to be HIV positive, smoke, use drugs or drink heavily, and have multiple suicide attempts.[97]

Charge Number 430-2014-01900, Determination (Aug. 4, 2017), *available at* http://transgenderlegal.org/media/uploads/doc_729.pdf. In this case, the EEOC issued a determination that a transgender employee of Sam's Club "was subjected to a hostile work environment because of her sex," after the evidence demonstrated that the employee "was harassed in that [employer] officials repeatedly referred to [the employee] by using masculine pronouns when speaking with her or providing her written correspondence. Despite [the employee's] complaints to have this behavior stopped, the derogatory masculine references continued."

[96] Grant, *supra* note 54, at 65.

[97] *Ibid.*

Data released in 2016 from the largest national survey of transgender Americans by the National Center for Transgender Equality show:[98]

1. In the past year, 30 percent of respondents who had a job claimed they were fired, denied a promotion, or experienced other forms of mistreatment (*e.g.*, verbal harassment, physical or sexual assault at work) due to their gender identity; 13 percent of respondents claimed a lost job.
2. In the past year, 15 percent of respondents were verbally harassed, physically attacked, and/or sexually assaulted while at work.
3. 77 percent of respondents who had a job in the past year hid their gender identity, delayed their transition, or quit their job, due to fear of negative repercussions.
4. Due to perceived bias in employment, 20 percent of those surveyed felt forced to have to work in the "underground economy" (*e.g.*, sex work or dealing drugs).

Kylar Broadus, a transgender man and the Senior Public Policy Counsel with the National LGBTQ Task Force, presented some of these findings along with his personal experiences of discrimination before the United States Senate in 2012 and again at the March 2015 briefing of the U.S. Commission on Civil Rights. After announcing his transition to coworkers, Broadus reported that he was harassed daily, forbidden from talking to certain individuals, and heavily monitored by his supervisor, despite the fact that his work performance had not suffered. Six months later, Broadus lost his job. He was unemployed for a year before finding another job and suffered post-traumatic stress disorder because of the negative treatment at work.[99] Fifteen years later, he stated that he is still dealing with the financial repercussions due to extended underemployment and has not been able to pay off his student loans.[100]

As a part of the National LGBTQ Task Force, he seeks to ensure that there are clear directives to employers regarding protections for LGBT Americans. In his own words:

> [W]hile we worked hard, all of us, to provide protections there are not enough protections and they're slim, particularly for transgender individuals, and [] there are unclear directives. And as we've seen with past laws enacted in the United States, when there are unclear directives to employers then the laws that are there become very murky . . . We

need clear expressed federal protections for transgender Americans. After all, we are people and we are human beings and we deserve the right to make a living.[101]

Broadus' experiences are not unique; many transgender individuals have reported enduring similar mistreatment in the workplace (Figure 1). Further, they report feeling forced to take jobs for which they are overqualified and to make significantly less money compared to cisgender[102] individuals. Figure 2 shows the large disparity in the percentage of transgender individuals with household incomes less than $10,000 compared to the general population.

Recently, additional issues transgender individuals face in the workplace have become more prominent in national media. These news accounts cover efforts from transgender individuals to be treated fairly and have their gender identities recognized, which includes the use of their correct names and pronouns as well as being allowed to adhere to the appropriate dress code.[103] OPM encourages federal agencies to eliminate "gender-specific dress and appearance rules" to ensure that all employees are comfortable.[104] Additionally, many advocates are fighting for employer-provided healthcare benefits to include sex reassignment surgery, counseling, and hormone therapy.[105]

Existing State Laws for LGBT Employees

Most states use Title VII of the Civil Rights Act of 1964 as the model for state anti-discrimination laws. Accordingly, most states have enacted legislation to prohibit discrimination on the basis of

race, sex, and religion along with other protections provided by federal law. Some states have adopted protections against discrimination based on sexual orientation and/or gender identity, but a sizable minority of states have not extended any anti-discrimination protections to LGBT individuals. Where they exist, these state protections may be in the form of a state statute, a state executive order, an administrative order, or state policy for state employees. Such legislation or orders vary between states. Local jurisdictions (such as cities or counties) may also have passed ordinances. Twenty states plus the District of Columbia have state laws that offer employment protections for all LGBT employees.[106] An additional two states have laws prohibiting sexual orientation discrimination, but exclude transgender protections.[107] Eight states have an executive order, administrative order, or a state policy that protects only LGBT state employees. An additional three states offer LGB protections to state employees, but do not address transgender employees. And 17 states offer no protections on the basis of sexual orientation or gender identity, but cities and local municipalities may offer their own protections (see Table 3).[108]

Failed Efforts to Enact Federal Legislation

Since 1974, seven separate pieces of legislation to prohibit LGBT employment discrimination on the basis of actual or perceived sexual orientation or gender identity have been introduced in Congress. Table 4 below summarizes introduced LGBT workplace protection legislation from 1974 through 2017 (see Appendix A for full explanation and language of the various legislation). The first two iterations of this federal legislation—frequently dubbed the Employment Non-Discrimination Act (ENDA) or the Equality Act—prohibited employment discrimination on the basis of sexual orientation alone.[109] In 2009, gender identity protections were added and if enacted, the legislation would offer protections for all LGBT individuals.[110] These proposed bills sought to provide employment protections to LGBT workers as well as to offer a legal avenue for employees to file formal complaints alleging sexual orientation and gender identity discrimination in the workplace.[111] Closely modeled after existing civil rights legislation such as Title VII of the Civil Rights Act and the Americans with Disabilities Act, the various incarnations of these bills sought to enhance protections beyond those provided by local policies and state laws.[112]

[109] Equality Act, H.R. 14752, 93rd Cong. (1974), *available at* https://www.congress.gov/bill/93rd-congress/house-bill/14752; Employment Non-Discrimination Act of 1994, H.R. 4636, 103rd Cong. (1994), *available at* https://www.congress.gov/bill/103rd-congress/house-bill/4636.

[111] *Id.*
[112] Seth Althauser and Sarah Greenberg, "FAQ: Employment Non-Discrimination Act: What You Need to Know," Center for American Progress, July 2011, https://www.americanprogress.org/issues/lgbt/news/2011/07/19/9988/faq-the-employment-non-discrimination-act/#r1.

No version has ever successfully passed both the House and the Senate (see Table 4).[113] The failure of these bills can be attributed to opponents against enacting new federal legislation, and after the Supreme Court's *Hobby Lobby* decision, some prominent LGBT activist organizations opposed the breadth of the exemptions afforded to religious groups.[114] For instance, some opponents to enacting federal legislation prohibiting employment discrimination argue that the expansion of these laws would constitute another example of government overreach against private businesses.[115] In his testimony to the Commission, Roger Clegg of the Center for Equal Opportunity stated his opposition to ENDA on the premise that:

> [p]eople should be able to use their private property the way that they want to use their private property—and that employers should be able to make personnel decisions without interference from the government . . . . And there should be a presumption against the government, at any level, stepping in and saying . . . we know better than you whom you should hire and whom you should promote. And there should be an especially strong presumption against the federal government passing a law that second guesses employers in this regard.[116]

Others argue that passing federal legislation prohibiting sexual orientation and gender identity discrimination creates a new protected class on the basis of someone's choice. For instance, at the 2009 House Education and Labor Committee Hearing, Rep. John Kline of Minnesota argued that it would create "an entirely new protected class that is vaguely defined and often subjective . . . . Attempting to legislate individual perceptions is truly uncharted territory and it does not take a legal scholar to recognize that such vaguely defined protections will lead to an explosion in litigation and inconsistent judicial decisions."[117]

In response to the 2015 version of the bill, some LGBT groups such as the National LGBTQ Task Force withdrew support because they felt that the religious exemptions were too broad. Other

groups such as the American Civil Liberties Union (ACLU), Lambda Legal, the National Center for Lesbian Rights, and the Transgender Law Center all raised similar concerns and wanted the bill to offer the same amount of protections given to other minority groups (*e.g.*, minority races, religions).[118] Ian Thompson, a legislative representative at the ACLU, stated that "[i]n none of those other categories is there this kind of broad, sweeping religious exemption that gives a stamp of legitimacy to discrimination, and we feel adamantly that there should not be for this type of discrimination against LGBT people."[119]

Table 4 Summary of Introduced LGBT Employment Non-Discrimination Legislation[a]

In May 2017, 241 Democratic members of Congress reintroduced the Equality Act in both the Senate and House.[120] If this bill passes, it would include broad societal protections on the basis of sex (including pregnancy and childbirth), sexual orientation, and gender identity in employment, housing, public accommodations, federal jury service, and public education.[121] One of the co-sponsors of the bill, Rep. David Cicilline of Rhode Island, stated: "The Equality Act represents a simple idea that everyone, including members of the LGBT community, is entitled to equal treatment under the law, and the right to live free of discrimination."[122] Unlike other iterations of this bill, this version does not have religious exemptions. The bill states that the Religious Freedom Restoration Act (RFRA) cannot be used to block protections against discrimination. The bill states: "The Religious Freedom Restoration Act of 1993 (42 U.S.C. 2000bb et seq.) shall not provide a claim concerning, or a defense to a claim under, a covered title, or provide a basis for challenging the application or enforcement of a covered title."[123] A more detailed discussion on the advantages and disadvantages of federal legislation can be found in Chapter 3.

CHAPTER 2: EXISTING FEDERAL NON-DISCRIMINATION LAW

Title VII of the Civil Rights Act and LGBT Employees

Title VII of the Civil Rights Act of 1964 states: "It shall be an unlawful employment practice for an employer (1) to fail or refuse to hire or to discharge any individual, or otherwise to discriminate against any individual with respect to his compensation, terms, conditions, or privileges of employment, because of such individual's race, color, religion, sex, or national origin."[124] As discussed below, the question for LGBT employees is whether discrimination based on sexual orientation or gender identity falls within Title VII's prohibition against discriminating on the basis of "sex."

The EEOC's "congressionally mandated role is to enforce Title VII of the Civil Rights Act of 1964, as well as the other federal employment non-discrimination laws."[125] Employees who believe that they have been discriminated against can file claims for discrimination with the EEOC. The EEOC has authority to issue administrative decisions and resolve charges of discrimination. While the EEOC receives all claims, the Department of Justice (DOJ) enforces Title VII in cases involving state or local government employees.[126] In January 2013, the EEOC began tracking information on filed claims alleging discrimination on the basis of sexual orientation or gender identity.[127] The data for claims (or charges) based on LGBT discrimination filed with the EEOC FY 2013-2016 can be found above in Chapter 1.

Title VII contains a religious exemption that recognizes the right of religious organizations to preferentially hire individuals of a particular religion.[128] The Supreme Court recognized in *Corporation of the Presiding Bishop of the Church of Jesus Christ of Latter-day Saints v. Amos*

---

[124] 42 U.S.C. § 2000e-2(a). Of note, Title VII's protections do not apply to all employers. Congress exempted employers with 15 or fewer employees, 42 U.S.C. § 2000e(a), and certain religious employers from Title VII. 42 U.S.C. § 2000e-1(a).

[125] Jeanne Goldberg, Senior Attorney Advisor, Office of Legal Counsel at EEOC, testimony, Briefing Transcript, p. 10.

[126] U.S. Department of Justice, Laws Enforced by the Employment Litigation Section, https://www.justice.gov/crt/laws-enforced-employment-litigation-section (last updated Oct. 25, 2017).

[127] Mary Beth Maxwell, Principal Deputy Assistant Secretary for Policy at the Department of Labor, testimony, Briefing Transcript, p. 30.

[128] Title VII states its provisions do not apply to "a religious corporation, association, educational institution, or society with respect to the employment of individuals of a particular religion to perform work connected with carrying on of the corporation, association, educational institution, or society of its activities." 42 U.S.C § 2000e-1(a). Under the statute, religion is defined to include "all aspects of religious observance and practice, as well as belief." 42 U.S.C § 2000e(j). The EEOC defines religious practices "to include moral or ethical beliefs as to what is right and wrong which are sincerely held with the strength of traditional religious views." 29 C.F.R. § 1605.1.

that the scope of this exemption is not limited to jobs that might be considered primarily religious, but includes "all activities of religious employers."[129]

In *Hosanna-Tabor v. E.E.O.C.*, the Supreme Court also recognized that the "ministerial exception" to antidiscrimination laws is required by the Religious Clauses of the First Amendment.[130] The Supreme Court ruled that having to "accept or retain an unwanted minister, or punishing a church for failing to do so," would infringe on the Free Exercise Clause, which "protects a religious group's right to shape its own faith and mission through its appointments," and the Establishment Clause, "which prohibits government involvement in such ecclesiastical decisions."[131] Determining whether the ministerial exception applies in a particular case requires a fact-specific analysis, but *Hosanna-Tabor* makes clear that it is not limited to only those who meet the popular conception of clergy.[132]

"Because of Sex" Court and Administrative Decisions

TITLE VII AND SEXUAL ORIENTATION

In April 2017, the Seventh Circuit held that claims of discrimination based on sexual orientation could be brought under the existing language of Title VII.[133] Until then, all federal circuit courts of appeals that had considered the question had uniformly rejected claims that workplace actions based upon sexual orientation constitute discrimination under Title VII.[134] In May 2017, in *Zarda*

[133] *Hively*, 853 F.3d at 350-51 (holding that "the logic of the Supreme Court's decisions, as well as the common-sense reality that it is actually impossible to discriminate on the basis of sexual orientation without discriminating on the basis of sex" meant that discrimination on the basis of sexual orientation is actionable under Title VII.). The employer in the *Hively* case has not asked the Supreme Court to review the Seventh Circuit's decision, and the time for seeking a petition of *certiorari* has passed.

[134] *See, e.g., Christiansen v. Omnicom Group, Inc.*, 852 F.3d 195, 199 (2d Cir. 2017) (declining to revisit past circuit precedent that holds sexual orientation discrimination does not fall under Title VII); *Evans v. Georgia Regional Hospital*, 850 F.3d 1248, 1255 (11th Cir. 2017) ("[T]here is no sexual orientation action under Title VII."); *Vickers v. Fairfield Med. Ctr.*, 453 F.3d 757, 764 (6th Cir. 2006) ("[R]ecognition of Vickers' claim would have the effect of *de facto* amending Title VII to encompass sexual orientation as a prohibited basis for discrimination."); *Medina v. Income Support Div., New Mexico*, 413 F.3d 1131, 1135 (10th Cir. 2005) ("Title VII"s protections . . . do not extend to harassment due to a person's sexuality."); *Bibby v. Phila. Coca Cola Bottling Co.*, 260 F.3d 257, 261 (3d Cir. 2001) (affirming decision of district court granting summary judgment to defendant where plaintiff claimed he was harassed on the basis of his sexual orientation); *Higgins v. New Balance Athletic Shoe, Inc.*, 194 F.3d 252, 259 (1st Cir. 1999) ("Title VII does not proscribe harassment simply because of sexual orientation."); *Hopkins v. Balt. Gas &*

v. Altitude Express, the U.S. Court of Appeals for the Second Circuit voted to review *en banc* whether Title VII protects against discrimination on the basis of sexual orientation.[135] Even where courts rejected sexual orientation claims, in some courts, allegations based on gender non-conformity were deemed actionable.[136] Those courts that have held that discrimination based on gender non-conformity is actionable have generally relied on the rationale that discrimination based on "sex stereotyping" is actionable, as the Supreme Court found in *Price Waterhouse v. Hopkins*. In *Price Waterhouse v. Hopkins*, the Supreme Court held that sex discrimination includes employment decisions based upon a woman's failure to conform to "sex stereotypes."[137] Hopkins was a female senior manager whose firm denied her partnership because the partners believed she did not act sufficiently feminine. The firm advised Hopkins she would have a better chance at being elected partner if she would, among other things, "take a course at charm school," "walk more femininely," "talk more femininely," and "wear makeup."[138]

In an earlier decision, the Supreme Court held that "[i]n forbidding employers to discriminate against individuals because of their sex, Congress intended to strike at the entire spectrum of disparate treatment of men and women resulting from sex stereotypes."[139] The Supreme Court therefore reasoned that "[a]n employer who objects to aggressiveness in women but whose positions require this trait places women in an intolerable and impermissible catch 22: out of a job if they behave aggressively and out of a job if they do not. Title VII lifts women out of this bind."[140] "[W]e are beyond the day," concluded the Court, "when an employer could evaluate employees by assuming or insisting that they matched the stereotype associated with their group."[141] In 1998, the Supreme Court also held that Title VII sexual harassment of an employee by a person of the same sex is actionable, regardless of the victim's or harasser's sex.[142]

[141] *Id.*

[142] *Oncale v. Sundowner Offshore Servs., Inc.*, 523 U.S. 75, 79-80 (1998). The plaintiff in *Oncale* worked on an oil platform crew, and was forcibly subjected to sex-related humiliating actions by co-workers in the presence of the rest of the crew. The Court focused on "whether members of one sex are exposed to disadvantageous terms or conditions of employment to which members of the other sex are not exposed." *Id.* at 80 (quoting *Harris v. Forklift Sys., Inc.*, 510 U.S. 17, 25 (1993) (Ginsburg, J., concurring)). Justice Scalia, writing for the Court, recognized this ruling expanded the textual meaning of "sex" beyond what the sponsors of the law may have intended:

In practice, some courts have found that the distinctions among sex stereotyping, sexual orientation, gender non-conformity, same-sex harassment, and gender identity are confusing, difficult to apply, and depending on the facts, not necessarily distinct.[143] "The challenge facing the lower courts since *Price Waterhouse* is finding a way to protect against the entire spectrum of gender stereotyping while not protecting against the stereotype that people should be attracted only to those of the opposite gender."[144] The Seventh Circuit recently described the efforts of courts to sort through the distinction between sexual orientation discrimination versus gender non-conformity discrimination as follows:

> [C]ourts have gone about this task in different ways—either by disallowing any claims where sexual orientation and gender non-conformity are intertwined, (and, for some courts, by not allowing claims from lesbian, gay, or bisexual employees at all), or by trying to tease apart the two claims and focusing only on the gender stereotype allegations. In both methods, the opinions tend to turn circles around themselves because, in fact, it is exceptionally difficult to distinguish between these two types of claims.[145]

In 2015, the Equal Employment Opportunity Commission concluded that a person's claim alleging sexual orientation discrimination falls within Title VII on the basis of alleged sex discrimination.[146] The practical impact of the EEOC's ruling is that all employees covered by EEOC jurisdiction may now file administrative claims under Title VII before the agency alleging discrimination based on sexual orientation. The EEOC's decision is not binding on courts, however courts may, and often do, defer to the EEOC. In its decision, the EEOC identified the following three legal bases for recognizing sexual orientation discrimination under Title VII:

- First, the EEOC concluded that "sexual orientation is inherently a 'sex-based consideration,' and an allegation of discrimination based on sexual orientation is necessarily an allegation of sex discrimination under Title VII."[147] The very concept of sexual orientation is based upon a person's sexual attractions, and cannot be defined or

---

> As some courts have observed, male-on-male sexual harassment in the workplace was assuredly not the principal evil Congress was concerned with when it enacted Title VII. But statutory prohibitions often go beyond the principal evil to cover reasonably comparable evils, and it is ultimately the provisions of our laws rather than the principal concerns of our legislators by which we are governed.

understood without reference to "sex." Therefore, sexual orientation is "inseparable from and inescapably linked to sex."[148]

- Second, the EEOC determined that sexual orientation discrimination is associational discrimination on the basis of sex. "For example, a gay man who alleges that his employer took an adverse employment action against him because he associated with or dated men states a claim for sex discrimination under Title VII; the fact that the employee is a man instead of a woman motivated the employer's discrimination against him."[149] In other words, "an employee alleging discrimination on the basis of sexual orientation is alleging that his or her employer took his or her sex into account by treating him or her differently for *associating* with a person of the same sex."[150] The EEOC compared such discrimination to associational race discrimination courts have long recognized.[151]
- Third, the EEOC clarified that there is little to no distinction between sexual orientation discrimination and gender stereotype discrimination (which is actionable under *Price Waterhouse*). According to the EEOC, gender stereotypes involve more than assumptions about over-masculine or feminine behavior: "Sexual orientation discrimination and harassment '[are] often, if not always, motivated by a desire to enforce heterosexually defined gender norms.'"[152]

TITLE VII AND GENDER IDENTITY

Courts' view of claims based on sex stereotyping and gender identity have changed over time, with some courts allowing these claims to proceed under Title VII and some finding that Title VII does not cover these claims. For its part, the EEOC held in 2012 that claims based on gender identity may be brought under Title VII's prohibition against discrimination "because of sex."[153] In 2017, Attorney General Jeff Sessions withdrew guidance issued by Attorney General Eric Holder in 2014 and stated that going forward the Department of Justice would take the position that Title VII "encompasses discrimination between men and women but does not encompass discrimination based on gender identity *per se*, including transgender status."[154]

In the late 1970s and early 1980s, the first circuit courts to consider Title VII claims brought by plaintiffs seeking protection from discrimination based on their gender identities adopted the

position that the plain meaning of the term "sex" did not extend to discrimination based on "transsexualism."[155] In *Holloway*, an employee of Arthur Andersen who was assigned male at birth brought suit under Title VII, alleging her employer discharged her after she began her transition from living as a man to living as a woman.[156] The Ninth Circuit held that "[a] transsexual individual's decision to undergo sex change surgery does not bring that individual, nor transsexuals as a class, within the scope of Title VII."[157]

Similarly, in the *Sommers* case—where a transgender woman was discharged because she "misrepresented herself as an anatomical female when she applied for the job"[158]—the Eighth Circuit viewed "the major thrust of the 'sex' amendment was towards providing equal opportunities for women."[159] The Eighth Circuit court held, "[b]ecause Congress has not shown an intention to protect transsexuals, we hold that discrimination based on one's transsexualism does not fall within the protective purview of the Act."[160] Thus, the focus of these early cases was on what Congress intended the scope of the term "sex" to encompass.

As discussed above, in 1989, in *Price Waterhouse*, the Supreme Court held that sex discrimination includes employment decisions based upon a woman's failure to conform to "sex stereotypes."[161] Of importance here, in *Price Waterhouse*, the Supreme Court used the terms "sex" and "gender" interchangeably.[162] With regard to congressional intent, the Supreme Court stated that "Congress' intent to forbid employers to take *gender* into account in making employment decisions *appears on the face of the statute*."[163]

After *Price Waterhouse*, courts began analyzing gender identity discrimination claims under Title VII in two ways. The first approach recognizes open identification as a member of the opposite sex as a deviation from preconceived gender norms. This category is an extension of the *Price Waterhouse* framework whereby it is unlawful to discriminate against an individual for failing to conform to sex stereotypes. An example of cases falling into the first category is the Ninth Circuit's decision in *Schwenk v. Hartford*.[164] The Ninth Circuit relied on the "logic and language of *Price*

[164] 204 F.3d at 1187.

Waterhouse" to conclude that openly expressing one's identity as a member of the opposite sex is therefore no different from the failure to conform with sex stereotypes in *Price Waterhouse*.[165]

Under the second approach, courts have continued to analyze cases using the pre-*Price Waterhouse* view of differentiating between "sex" and "gender," and associating transgender status with one or the other. The cases interpreting "sex" to include "gender identity" hold transgender status is protected, whereas the cases interpreting "sex" to mean biological sex hold it is not. The Tenth Circuit followed this approach in *Etsitty v. Utah Transit Auth.*:

> [T]here is nothing in the record to support the conclusion that the plain meaning of "sex" encompasses anything more than male and female. In light of the traditional binary conception of sex, transsexuals may not claim protection under Title VII from discrimination based solely on their status as a transsexual.[166]

The court did suggest, without deciding, that an actionable claim may arise based on discrimination against a transgender individual for failing to conform to the gender stereotypes of his or her biological sex.[167] More recently courts have, even while differentiating between "sex" and "gender," held the analysis employed by *Etsitty* to be too narrow.[168]

Currently, six federal circuit courts of appeals have adjudicated the merits of a Title VII claim asserted by transgender individuals. The Sixth, Ninth, and Eleventh Circuits all hold Title VII prohibits discrimination against a transgender employee on the basis of the reasoning announced in *Price Waterhouse*.[169] In contrast, the Seventh, Eighth, and Tenth Circuits have held there is no Title VII protection for transgender individuals.[170]

---

[165] *Id.* at 1201-02. *See also Smith v. City of Salem*, 378 F.3d 566, 574 (6th Cir. 2004); *Glenn v. Brumby*, 663 F.3d 1312, 1316 (11th Cir. 2011) ("'The very acts that define transgender people as transgender are those that contradict stereotypes of gender-appropriate appearance and behavior.' There is thus a congruence between discriminating against transgender and transsexual individuals and discrimination on the basis of gender-based behavioral norms.") (quoting Ilona M. Turner, *Sex Stereotyping Per Se: Transgender Employees and Title VII*, 95 Cal. L. Rev. 561, 563 (2007)) (alteration and internal citations omitted).

[166] 502 F.3d 1215, 1222 (10th Cir. 2007).

[167] *Id.* at 1224.

[168] For example, the court in *Fabian v. Hosp. of Cent. Conn.* reasoned the definition of "sex" extends beyond the biological distinctions between male and female, but also to the social and cultural manifestations associated with a particular biological sex. 172 F.Supp.3d 509, 526 (D. Conn. 2016). An unlawful adverse employment action is also made "because of . . . sex" when motivated by a recent gender reassignment surgery. *Schroer v. Billington*, 577 F.Supp.2d 293, 308 (D.D.C. 2008) ("[T]he Library's refusal to hire Schroer after being advised that she planned to change her anatomical sex by undergoing sex reassignment surgery was *literally* discrimination 'because of . . . sex.'") (emphasis in original).

[169] *See Smith*, 378 F.3d at 574; *Schwenk*, 204 F.3d at 1201-02; *Glenn*, 663 F.3d at 1316.

[170] *See Ulane v. Eastern Airlines, Inc.*, 742 F.2d 1081, 1084 (7th Cir. 1984); *Sommers*, 667 F.2d at 750; *Etsitty*, 502 F.3d at 1222. Both the *Ulane* and *Sommers* decisions, however, were decided pre-*Price Waterhouse*, and the continued force of those opinions is therefore uncertain.

NON-DISCRIMINATION AND RELIGIOUS BELIEFS

The right to be free of discrimination at work may conflict with other protected rights of co-employees and/or employers. For example, in *Cruzan v. Special Sch. Dist. No. 1*, a female employee alleged the employer's policy allowing a transgender woman to use the women's restroom created a hostile work environment and discriminated against her on the basis of religion.[171] The court upheld the lower court's grant of summary judgment to the employer because the evidence was not sufficient to show a hostile work environment and because the employee did not notify the employer of her religious objections.[172]

More recently, a district court in the Eastern District of Michigan granted summary judgment to a funeral home that terminated a transgender woman who was willing to comply with the female, but not the male, dress code. The court held enforcement of Title VII in these circumstances was not allowed because under the Religious Freedom Restoration Act, it imposed a substantial burden on the owner's sincerely held religious belief that a person's sex is a "God-given gift" and people should not deny or attempt to change their sex.[173]

Additional Legal Protections for LGBT Employees in the Federal Workplace

Multiple federal departments have responsibilities for ensuring non-discrimination against LGBT employees working within the federal government. For instance, the Department of Labor has made efforts to protect LGBT employees from discrimination and remove barriers for the LGBT workforce through policy, education, and training.[174] To this end, the Office of Diversity and Inclusion within OPM has issued publications regarding the treatment of LGBT employees in the federal workplace. Additionally, same-sex marriage benefits in federal employment are addressed in agency-specific EEO policies following the *U.S. v. Windsor* and *Obergefell v. Hodges* decisions to ensure equal benefits for same-sex married couples. For instance, the Department of Labor changed its policies to ensure implementation and compliance where necessary.[175]

PRESIDENTIAL EXECUTIVE ORDERS

Since the late 1960s, Presidents have issued Executive Orders to address workplace discrimination within the executive branch and/or by federal contractors and subcontractors. Presidents use executive orders "to achieve policy goals, set uniform standards for managing the executive branch, or outline a policy view intended to influence the behavior of private citizens."[176] Executive orders provide a uniform policy for the federal government, but generally are not enforceable in courts.

In 1969, President Nixon issued Executive Order 11,478, which required all executive department and agencies to adopt an affirmative program to prohibit employment discrimination.[177] In 1998, President Clinton amended Nixon's Executive Order to include "sexual orientation."[178] On the same day, President Clinton issued a caveat noting that the amended Executive Order "does not and cannot create any new enforcement rights (such as the ability to proceed before the Equal Employment Opportunity Commission)."[179] The Clinton Executive Order did play a significant role toward employment equality within federal agencies.[180] For example, it directed agencies to revise their policies to ensure that employment decisions for federal civilian employees are not made on the basis of sexual orientation.

In 2014, President Obama issued Executive Order 13,672, reaffirming non-discrimination against employees in all aspects of federal employment, including upgrades, demotions, promotions, transfers, recruitment, recruitment advertising, layoff, termination, pay and other forms of compensation, and selection for various types of training.[181] This Executive Order added "gender identity" to the list of categories already protected from employment discrimination and thus

[181] E.O. 13,672, July 21, 2014, Further Amendment to Executive Order 11,478, Equal Employment Opportunity in the Federal Government, and Executive Order 11,246, Equal Employment Opportunity, July 21, 2014, *available at* https://obamawhitehouse.archives.gov/the-press-office/2014/07/21/executive-order-further-amendments-executive-order-11478-equal-employmen. *See also* Remarks by the President at Signing of Executive Order on LGBT Workplace Discrimination, July 21, 2014, *available at* https://obamawhitehouse.archives.gov/the-press-office/2014/07/21/remarks-president-signing-executive-order-lgbt-workplace-discrimination.

clarified that protections extend protection to transgender individuals.[182] In support of the Executive Order, the White House issued a statement saying that prohibiting LGBT employment discrimination is not only critical to promoting equality, but also plays an important role in supporting businesses and strengthening the economy.[183]

Additionally, the Obama Executive Order prohibits federal contractors from engaging in discrimination on the bases of both gender identity and sexual orientation.[184] The Department of Labor enforces this provision, and in 2014, the Office of Federal Contract Compliance Programs issued a regulation governing non-discrimination by federal contractors and subcontractors.[185] To satisfy their obligations under the final rule, federal contractors or federally assisted contractors must: 1) include an updated equal opportunity clause in new or modified subcontracts and purchase orders, 2) ensure that applicants and employees are not discriminated against by reason of their sexual orientation and gender identity, 3) update the equal opportunity language in job solicitations, and 4) post updated notices.[186] Only federal contracts entered into after April 8, 2015, are impacted by the Final Rule.[187]

The development of the Obama Executive Order was criticized by several religious organizations, which fought for inclusion of a religious exemption.[188] While the Obama Executive Order did not specifically grant exemptions to religious contractors, it did not amend President Bush's Executive Order 13,279, which protects the right of faith-based social service programs receiving federal funding to limit "employment of individuals [to] a particular religion."[189]

Further, opponents of extending federal legislation were supportive of President Trump's Executive Order that revoked President Obama's Executive Order 13,673, also known as the Fair Pay and Safe Workplaces order, which required federal contracting agencies to consider violations of federal and state labor laws when considering contract rewards.[190] In 2016, the Department of Labor regulations implementing Executive Order 13,673 required companies seeking federal contracts to report workplace law violations, including Title VII violations, which the Department

had previously interpreted as banning discrimination based on sexual orientation and gender identity.[191] Camilla Taylor, Senior Counsel for Lambda Legal, argued that while President Trump did not specifically overturn the order that protected LGBT employees who work for federal contractors, he made the policy increasingly difficult to enforce.[192]

TRANSGENDER GUIDANCE FOR FEDERAL AGENCIES

In March 2015, OPM issued "Guidance Regarding the Employment of Transgender Individuals in the Federal Workplace," which defines terms and addresses questions agencies may have related to the employment of transgender individuals within the Federal workforce:

> The guidance outlines a series of core concepts including gender identity, transgender, and transition and defines common terms related to the transition process. The guidance also provides information on issues such as employee confidentiality and privacy, dress and appearance, sanitary and related facilities, recordkeeping, and insurance benefits.[193]

OFCCP has also issued guidance stating that the current laws banning discrimination on the basis of sex should include transgender workers.[194] At the Commission's briefing, Mary Beth Maxwell, Principal Deputy Assistant Secretary for Policy at the DOL, stated that former Secretary Thomas Perez directed DOL to update enforcement protocols and antidiscrimination guidance to clarify that "we provide the full protection of the federal nondiscrimination laws that we enforce to transgender individuals."[195]

FEDERAL AGENCIES' EMPLOYMENT POLICIES INCLUSIVE OF GENDER IDENTITY AND SEXUAL ORIENTATION

Federal agencies' Equal Employment Opportunity (EEO) policies and No Fear Act statements generally list prohibitions of discrimination based on race, color, sex, religion, national origin, age, disability, marital status, or political affiliation. Many federal agencies now also specifically include gender identity or sexual orientation.

Of the ten federal agencies with the largest numbers of employees, all have gender identity and/or sexual orientation language within their EEO policies. OPM guidance encourages federal agencies to update their EEO statements and policies to include prohibitions against discrimination based on sexual orientation and gender identity.[196]

Table 5 depicts information regarding EEO and No Fear Act policies of the ten largest federal agencies by number of employees. The Notification and Federal Antidiscrimination and Retaliation Act of 2002 (No Fear Act) was implemented in October 2003. The EEOC states that the Act "imposes additional duties upon Federal agency employers intended to reinvigorate their longstanding obligation to provide a work environment free of discrimination and retaliation."[197]

Private Workplace Protections for LGBT Employees

Many private companies have adopted and implemented workplace policies or practices that prohibit discrimination on the basis of sexual orientation and/or gender identity.[208] According to written testimony by The Leadership Conference on Civil and Human Rights to the Senate, by 2012, 86 percent of Fortune 500 companies prohibited sexual orientation discrimination and more than 50 percent also prohibited discrimination based on gender identity.[209]

For the past fifteen years, the Human Rights Campaign has released a list that ranks the Fortune 500, Fortune 1000, and the top 200 revenue-grossing law firms on the basis of the "best places to work for LGBT equality."[210] The ranking is based on what they call the "corporate equality index" (CEI) that utilizes several criteria.[211] First, businesses are rated if they have equal employment opportunity policies that include: sexual orientation and gender identity for all operations (domestic and global), and contractor/vendor standards that include sexual orientation and gender identity. The second set of criteria is based on employment benefits that are equivalent to spousal and partner benefits such as equivalent medical benefits (*e.g.*, dental, vision, legal dependent

[210] Human Rights Campaign Foundation, *supra* note 105, at 10. Commission staff is unaware of other reports that are as comprehensive and robust as the HRC's CEI reports regarding the inclusive private employers' policies, practices, and benefits for LGBT employees in the United States. Started in 2002, these reports are nationally recognized benchmarks for businesses to gauge their level of LGBT workplace inclusion against competitors.
[211] *Ibid.* at 16-18. A tool established by the Human Rights Campaign that rates U.S. businesses on their treatment of gay, lesbian, bisexual, and transgender employees, consumers, and investors.

coverage, COBRA) and other "soft" benefits (*e.g.*, bereavement leave, employer-provided supplemental life insurance for partner, adoption assistance, qualified joint and survivor annuity for partners).

Regarding transgender protections specifically, the Human Rights Campaign rates corporations on the basis of providing transgender employees equal health coverage. This includes use of insurance contracts and/or policy documentation that are based on the World Professional Association for Transgender Health Standards of Care, use of documentation that clearly communicates inclusive insurance options, and whether such coverage is readily available to employees. They state that benefits should include services related to gender transition (*e.g.*, medically necessary services related to sex affirmation/reassignment such as short-term medical leave, pharmaceutical coverage, coverage for medical visits, coverage for reconstructive surgical procedures related to sex reassignment, and coverage for routine non-transition services).[212]

According to the Human Rights Campaign 2017 CEI report, as of 2016, 92 percent of Fortune 500 companies included sexual orientation and 82 percent included gender identity in their non-discrimination policies.[213] Half of these Fortune 500 companies offer transgender-inclusive health care benefits, including surgical procedures. For the 2017 CEI report, the 327 Fortune 500 companies that submitted surveys had an average score of 91 out of a possible 100. However, when analyzing the scores of all Fortune 500 companies, it found substantially lower scores. The average score for all Fortune 500 companies (reporting and non-reporting) was 66; and those companies that did not respond to the survey had an average score of 14 (see Table 6).[214]

Table 6 Equality at Fortune-Ranked Companies

	All Fortune 500	Fortune 500 Participants	Fortune 500 Non-Responders
Sexual Orientation in U.S. Non-Discrimination Policy	92%	99%	75%

Some question whether the high percentages of the United States' largest companies having antidiscrimination policies evidences nondiscrimination and equality. For instance, there is only one openly gay chief executive officer (CEO) of a Fortune 500 company, which is Apple's Tim Cook.[215] Todd Sears, a former financial advisor at Merrill Lynch who now runs Out on the Street, an organization that helps companies recruit and retain LGBT employees, argues that, "when people see that 90 percent of companies have nondiscrimination policies in place, that's great. But to me, a better indicator, is, how many senior leaders are there who are gay and who are out? If LGBT people look around and they don't see other LGBT people who are out, if they don't hear inclusive messages, they're not going to feel valued."[216]

CHAPTER 3: VIEWPOINTS IN FAVOR AND AGAINST FEDERAL LEGISLATION

Ensuring Equal Rights and the Normative Argument

Advocates who favor federal legislation protecting employees against discrimination based on sexual orientation and gender identity assert that passing comprehensive protections for LGBT Americans that include anti-discrimination employment provisions is essential to ensure equal rights for all citizens.[217] Selisse Berry from Out and Equal Workplace Advocates, a panelist at our briefing, noted that "we live in an interesting time. LGBT people can be married in 37 states and we can still be fired in 29 states simply because of who we love and who we are."[218] At the time of the briefing, in March 2015, same-sex marriage was a state-by-state determination. Since that time, the Supreme Court has determined that states must license marriage between two people of the same sex and recognize same-sex marriages performed in other states.[219] Kate Kendell, the Executive Director for the National Center for Lesbian Rights, stated that "[b]oth methodological and anecdotal information enforces that LGBT, particularly transgender employees, even in this moment of great acceleration of LGBT rights, [still] suffer in the employment realm."[220]

The debate concerning extending specific anti-discrimination protections to LGBT Americans often draws comparisons to enacting the Civil Rights Act and issues of racial discrimination in the United States. Opponents of enacting federal legislation argue that discrimination against LGBT communities is not analogous to discrimination based on race or sex. For instance, the Family Research Council argues that unlike race and sex which are considered "inborn, involuntary and immutable" sexual orientation and gender identity are not.[221] Further, these opponents argue, unlike historical discrimination against an individual's race or sex, the LGBT community cannot make similar discrimination claims. Peter Sprigg of the Family Research Council argues that

> [t]he bad name given to the word 'discrimination' relates primarily to our country's shameful history of racial discrimination, including over two centuries of slavery and

> another century of segregation. Homosexuals can claim no comparable disadvantage. Until less than a century ago, women were not even granted the most fundamental right of voting. Again, homosexuals have no comparable claim. Protecting against religious discrimination advances the cause of religious liberty which was enshrined in our nation's Constitution at the Founding. No comparable guarantee of sexual liberty is found in the Constitution.[222]

Thus, they argue that members of LGBT communities do not need federal legislation to prohibit workplace discrimination. During his testimony before the Commission, Ryan Anderson of the Heritage Foundation argued that "[t]he Civil Rights Act of 1964 barring discrimination on the basis of race was a proper response. America has no similar history of society-wide legal prohibition on employment based on sexual orientation or gender identity."[223]

Proponents argue discrimination against LGBT communities is similar to historical discrimination based on race and sex. Many studies support the claim of historic and continuing employment discrimination against employees on the basis of sexual orientation and gender identity. Historians, researchers, and the courts have all recognized that LGBT workers have faced a long, serious, and pervasive history of employment discrimination.[224] Scholars have argued that not only did LGBT individuals face societal stigma, but also faced various forms of institutional discrimination including being barred from federal or state government employment.[225] Gary Gates, the Research Director at UCLA Law School's Williams Institute, found that judicial opinions from appellate courts in seven states—California, Connecticut, Iowa, Maryland, Montana, Oregon, and Washington, including six of those states' highest courts—have all agreed that LGBT individuals have faced a long history of discrimination, regardless of how the court ultimately ruled on whether sexual orientation is a suspect classification.[226] For example, Maryland's highest court in 2007 recognized that "[h]omosexual persons have been the object of societal prejudice by private actors as well as by the judicial and legislative branches of federal and state governments."[227] Additionally the court found that "homosexual persons, at least in terms of contemporary history, have been a

disfavored group in both public and private spheres of our society."[228] In 2004, a concurring opinion filed by a justice of the Supreme Court of Montana described how LGBT people have been marginalized by their "government and institutions," and cited a number of cases documenting discrimination by state and local governments to demonstrate how "gays and lesbians historically have been the focus of discriminatory treatment in the workplace."[229]

The Supreme Court and federal courts have also recognized that LGBT employees have historically faced issues of workplace discrimination. For instance, the Ninth Circuit held that "[d]iscrimination against homosexuals has been pervasive in both the public and private sectors. Legislative bodies have excluded homosexuals from certain jobs and schools, housing, churches, and have prevented homosexual marriage."[230] The court concluded that "the discrimination faced by homosexuals in our society is plainly no less pernicious or intense than the discrimination faced by other groups already treated as suspect classes, such as aliens or people of a particular national origin."[231]

The Sixth Circuit in 1995 concluded "[h]omosexuals have suffered a history of pervasive irrational and invidious discrimination in government and private employment, in political organization and in all facets of society in general, based on their sexual orientation."[232] Additionally, that same year, a District of Columbia Court of Appeals judge cited examples of such discrimination in a dissent, including that: "[b]eing identified with homosexuality has been the basis of refusals to hire, the ruin of careers, undesirable military discharges, denials of occupational licenses, denials of the right to adopt, to the custody of children and visitation rights, denials of national security clearances and denials of the right to enter the country."[233]

Further, according to Congressional testimony by M.V. Lee Badgett, economist and research director of the Williams Institute and director of the Center for Public Policy and Administration, following over a decade of research and twelve studies, gay male workers were paid significantly less on average than their heterosexual male counterparts.[234] Data on the earnings for lesbians tend to be more inconsistent. Several studies show that lesbian or bisexual women do not earn less than

Lee Badgett), *available at*: http://williamsinstitute.law.ucla.edu/wp-content/uploads/Badgett-HR2015-testimony-Sept-2007.pdf.

heterosexual women.[235] Badgett et al., argue that this does not imply the absence of employment discrimination. They argue that these findings suggest that since lesbians may not be constrained by the same gender expectations that result from being in relationships with men, they may make different decisions than heterosexual women (*e.g.*, choosing to delay or not have children, invest more into training, go into male-dominated professions) which may hide effects of discrimination.[236] Regardless, lesbian, bisexual, and heterosexual women all earn less than either gay or heterosexual men.[237] Moreover, when transgender individuals are surveyed separately the disparities are even more apparent. In six surveys conducted between 1996 and 2006, 20 percent to 57 percent of transgender respondents reported having experienced employment discrimination during some point in their life. At the time of the report, no detailed wage and income studies have been conducted regarding the transgender community, but convenience samples of the transgender population find that six percent to 60 percent of respondents report being unemployed, and 22 percent to 64 percent earn less than $25,000 per year.[238]

Another argument for extending LGBT protections is grounded in the principle of equal access to public markets and equal dignity of persons. Some researchers argue that as a society we have implemented legal safeguards intended to ensure equal access to necessities (*e.g.*, food, shelter, work) through federal and state statutes and common law principles.[239] This demonstrates that, as a society, we acknowledge the necessity for all citizens to have access to public accommodations, housing, and employment regardless of arbitrary characteristics like race, religion, nationality, disability, sex, and—with increasing consistency—sexual orientation and gender identity. Thus, the argument is that discrimination against LGBT persons is a clear violation of the normative principle of equal access and ultimately is dangerous and dehumanizing.

Conversely, Richard Epstein, Professor of Law at New York University School of Law and Senior Fellow at The Hoover Institution, argues that workplace antidiscrimination legislation would interfere with business owners' freedom of contract.[240] Epstein argues that in a free market society,

the markets will correct the injustices of discrimination and discriminatory practices by punishing those who discriminate (*e.g.*, loss of profits, loss of qualified workforce), and thus result in economic equality for all.[241] In addition, he argues that antidiscrimination legislation is too costly, burdensome, and inefficient for the federal government to legislate over business practices.[242] In a somewhat similar vein, Andrew Koppelman, Professor of Law and Political Science at Northwestern University, argues that "[t]he general principle governing transactions between private parties should be freedom of association, for reasons of both liberty and efficiency. Any departure from that rule, such as a prohibition of discrimination, has the burden of proof."[243] However, Koppelman argues that Epstein does not consider the pervasive nature of discrimination and prejudice in our culture.[244] While some groups may be subject to historic and current pervasive discrimination, Epstein argues that economic equality cannot be achieved because those who choose not to prohibit discrimination still comprise the majority share of the market as a whole. Koppelman argues that when discriminators dominate the market, which at the present time it is for LGBT employees, then legal intervention is arguably justified.[245] He posits that not only can antidiscrimination laws help mitigate a society's pattern of stigma and marginalization that marks some members in society as inferior to others; but also, since "[h]abits of discrimination are hard to break, and legal intervention can help to break them."[246]

Further, the principle of the equal dignity of persons incorporates the "fundamental assumption that human beings are to be treated with dignity and respect"[247] and the equally fundamental assumption that all humans are to be treated with "equal dignity in the eyes of the law."[248] This principle is perhaps one of the most basic and foundational tenets of a free and democratic society, and a cornerstone of American society.[249] One viewpoint holds that "we can all accept that invidious sex discrimination violates equal dignity, and it is logically impossible to accept that notion without also accepting that sexual orientation [and gender identity] discrimination violates equal dignity."[250] Likewise, as stated by panelist Kylar Broadus, "[t]he bottom line is that it boils

down to we're all human beings on this planet and that in the United States you have to have a job to survive and that protections are needed."[251]

Employment discrimination can have long-lasting material effects, especially if it hinders individuals from securing steady employment. Those who suffer from chronic and cyclical under- and unemployment are more likely to be impoverished and often have secondary effects (*e.g.*, long-term earnings losses, declines in psychological and physical well-being, social withdrawal, family disruption) that can create additional difficulties for individuals and their families.[252] According to a 2015 study, Badgett and Schneebaum found that non-married gay and bisexual men earn less than non-married heterosexual men.[253] Looking at the poverty rates among same-sex and opposite-sex couples, same-sex white male couples tend to fare better (3.3 percent),[254] but the researchers found that lesbian couples have higher rates of poverty (7.9 percent) than heterosexual couples (5.8 percent). Critically, breaking these numbers down by race exposes even deeper inequities. Researchers found that African American lesbian couples have a poverty rate of 24.7 percent and gay African American couples have a rate of 14.5 percent, making them 3.1 and 1.8 times more likely to be in poverty compared to heterosexual African American couples (eight percent), respectively.[255]

Researchers have shown that state-employment protections for LGBT workers correlate with reduced poverty rates for those workers. In 2013, researchers found that in states where employment protections exist for LGBT workers, the poverty rate for both married opposite-sex couples and same-sex (both female and male) couples decreased.[256] In contrast, in states without protections, male same-sex couples tend to have slightly lower rates than opposite-sex couples, however, female same-sex couples are nine percent more likely to be in poverty than married opposite-sex couples.[257] Throughout the report, researchers found that employment discrimination protections seem to have a positive effect on all workers, but especially LGBT workers. For instance, poverty rates for both heterosexual and LGBT workers were shown to be lower in states with employment discrimination protections as opposed to states without protections, where

[257] *Ibid.*

LGBT poverty is significantly higher than the poverty rate of heterosexual citizens.[258] Kate Kendell, Executive Director of the National Center for Lesbian Rights, noted

> many of the calls that we get are from individuals in these 29 States where there are no protections. If they live in a State where there are protections, it's an easy answer for them. We encourage them to file a complaint. We refer them to attorneys that do LGBT employment discrimination cases. There is recourse they can take. And then our resource is really just to hook them up with the knowledge base and with someone who can be their advocate. Most of what we—the calls that we get are in States where there is no protection. And it's only been recently in light of the EEOC's Macy ruling that we've seen an expansion of Title VII perhaps being available as a vehicle. Many, many times the most difficult answer that we give to people when they call saying that they've suffered some adverse employment action is, I'm sorry, there is nothing we can do. There is no protection in your State.[259]

Some opponents argue that discrimination against LGBT Americans has declined to the point that federal legislation has become unnecessary.[260] However, Coffman et al., argue that the magnitude of antigay sentiment is substantially underestimated.[261] They found that many individuals when asked sensitive questions are less likely to answer honestly, especially if the opinion is considered socially undesirable. When Coffman et al., utilized a "veiled" methodology[262] they found that antigay sentiments were reported at much higher rates. Specifically regarding the workplace, they found that respondents were 67 percent more likely to disapprove of an openly gay manager and 71 percent more likely to say it should be legal to discriminate in hiring on the basis of sexual orientation. In FY 2015, the EEOC received 1,412 claims alleging sex discrimination based on sexual orientation and/or gender identity/transgender status.[263] This represented an overall increase of approximately 28 percent of the total LGBT charges filed in 2014 (1,100).

Gina Duncan, the Transgender Inclusion Director of Equality Florida, the state's largest LGBT advocacy organization, touted the work of her organization in increasing legislative employment

[262] The researchers refer to their methodology as "veiled" to mean that they utilized a method to reduce social desirability bias by being able to obscure a participant's identity from being matched to their answers. They utilized the item count technique that has been proven effective by Miller, JD, "A new survey technique for studying deviant behavior," PhD Diss. G Wash U, 1984.

[263] U.S. Equal Employment Opportunity Commission, "What You Should Know About EEOC and the Enforcement Protections for LGBT Workers," *available at* https://www.eeoc.gov/eeoc/newsroom/wysk/enforcement_protections_lgbt_workers.cfm.

protections,[264] but at the Commission's briefing, she expressed concerns regarding the continued opposition she faced:

> The gender identity and expression piece of most legislation passed and pending has come under the most scrutiny and opposition and, frankly, the understanding of the transgender community is minimal among our elected officials, locally and at the statewide level. In lobbying in Tallahassee for legislation, I am often told I'm the first transgender person a lawmaker has ever met and I say, that you know of. The issue of public accommodations, *i.e.*, public bathrooms, as they relate to transgender citizens is always the baseless point of opposition that we must overcome to pass fully inclusive laws in Florida and in states across the country.[265]

Members of Congress have also made equal rights arguments in favor of passing a non-discrimination federal statute to extend workplace protections to all members of LGBT communities. For example, Rep. Alan Lowenthal sees the Equality Act as providing the same protections that all persons have under the 1964 Civil Rights Act, related to race. He stated that passing the Act would give

> the lesbian, gay, and trans community the same civil rights status as those other groups that had been denied equal access and equal opportunity under the law. I think it's the most comprehensive and sweeping way to ensure equal opportunities and equal protection under the law for all people. I think it's the right thing to do, because if you don't do it under the Equality Act, you're going to have to do [it] piece by piece, through piecemeal legislation. That's what's happened up until now.[266]

What Does Existing Federal Law (Title VII) Mean for Additional Federal Legislation?

Some proponents of workplace protection legislation argue that the primary need for federal legislation stems from the need to halt inconsistent and irreconcilable decisions which exist under the growing patchwork of employment discrimination decisions across the nation. As discussed in detail above, "courts have not taken a uniform position by any means with respect to the interpretations of Title VII discrimination."[267] The court decisions, in particular, are often

---

[264] Ms. Duncan stated that Equality Florida has worked to pass fully inclusive human rights ordinances across the state and that as of the time of the briefing, over 55% of the population of Florida is now protected against discrimination in employment, housing, and public accommodations. [267] Goldberg testimony, Briefing Transcript at 32.

confusing and contradictory regarding whether discrimination based on sexual orientation or gender identity can be alleged under Title VII, as reported to the Commission:

1. Jeanne Goldberg, Senior Attorney Advisor in the Office of the Legal Counsel of the EEOC, stated that court decisions are "not consistent," especially "on the sexual orientation issue." She went on to state that what federal legislation "would add as a general proposition is explicit protections and would therefore provide clarity and consistency across the country for our stakeholders, both employees and employers." She concluded that "at this point in time," such clarity does not exist.[268]
2. Kate Kendell, Director of the National Center for Lesbian Rights, put it more starkly: "Most of . . . the calls that we get are in States where there is no protection . . . Many, many times the most difficult answer that we give to people when they call saying that they've suffered some adverse employment action is, I'm sorry, there is nothing we can do. There is no protection in your State."[269]

Debates have also arisen as to what extent federal legislation protecting against discrimination based on sexual orientation and gender identity should replicate existing federal legislation terms—specifically whether the *bona fide* occupational qualification exception or the religious exemption found in Title VII should be included. Discussion in this area also concerns whether such federal legislation is constitutional, with proponents relying on the court decisions holding that the Civil Rights Act was constitutional, and opponents arguing that the histories and policies surrounding protections of race are different than for protections based on a person being LGBT. These points of view are discussed further herein.

BONA FIDE OCCUPATIONAL QUALIFICATION EXCEPTION

Title VII of the Civil Rights Act allows for employment decisions to be made on the basis of sex, religion, or national origin (but not race or color) if sex, religion, or national origin is a *bona fide* occupational qualification reasonably necessary for the operation of the business.[270] This is a "narrow" exception that allows an employer to "discriminate on the basis of 'religion, sex, or national origin in those certain instances where religion, sex, or national origin is . . . reasonably necessary to the normal operation of that particular business or enterprise.'"[271] The employer bears

[270] 42 U.S.C. § 2000e-2(e)(1).

[271] *Automobile Workers v. Johnson Controls, Inc.*, 499 U.S. 187, 200–01, 111 S. Ct. 1196 (1991) (*"Johnson Controls"*) (quoting 42 U.S.C. § 2000e–2(e)(1)). In *Johnson Controls,* a female plant worker in a battery manufacturing plant sued her employer because of a company policy that prohibited all women from working near lead—which entailed a health risk of harm to any fetus carried by a female employee—unless the employee documented her infertility. The Supreme Court held that even "the professed moral and ethical concerns about the welfare of the next generation do not suffice to establish a BFOQ of female sterility. Decisions about the welfare of

the burden of establishing the affirmative defense that a particular qualification falls within the exception.[272] The 2017 version of the Equality Act (and ENDA) did not include such an exception to discriminate on the basis of sexual orientation, and modifies the BFOQ exception as to sex to state that "individuals are recognized as qualified in accordance with their gender identity."[273] While some have argued that any federal legislation should include this exception,[274] a representative of the EEOC indicated that employers have not raised the issue in the cases she is aware of.[275] In Goldberg's testimony to the Commission, she stated that employers generally do not raise BFOQ exceptions as an excuse.[276] Thus, with the infrequency of this qualification, it makes it unlikely to be relevant regarding this specific issue. Others have argued that sexual orientation and gender identity more closely align with race, and thus, there are no *bona fide* reasons to discriminate.[277] Some would support only an extremely narrow exception similar to the BFOQ exception for discrimination based on gender.[278] Of note, courts have held that a customer preference invokes the exception only when it is based on the company's inability to perform the primary function or service it offers.[279]

RELIGIOUS LIBERTY AND FREE EXERCISE CONCERNS

Title VII of the Civil Rights Act allows a religious employer to discriminate on the basis of religion when it hires an employee.[280] For example, a Christian organization may require its employees to

---

future children must be left to the parents who conceive, bear, support, and raise them rather than to the employers who hire those parents." *Id.* at 206. It further stated "our cases have stressed that discrimination on the basis of sex because of safety concerns is allowed only in narrow circumstances." *Id.* at 202.

[272] *See Dothard v. Rawlinson*, 433 U.S. 321 (1977), in which a prison rejected the application of female correctional counselor (prison guard) because she failed to meet the minimum 120-pound weight requirement of an Alabama statute. In deciding for the employee, the Court determined that the employer failed to rebut the *prima facie* case of discrimination on the basis that the height and weight requirements are job-related in that they have a relationship to the strength essential to efficient job performance as a correctional counselor, produced no evidence correlating such requirements with the requisite amount of strength thought essential to good job performance and, in fact, had not offered evidence of any kind in specific justification of the statutory standards.

Pan-Am*, 442 F.2d 385 (5th Cir. 1971) ("Similarly, we do not feel that the fact that Pan Am's passengers prefer female stewardesses should alter our judgment [that the *bona fide* occupational exception applies]. On this subject, EEOC guidelines state that a BFOQ ought not be based on 'the refusal to hire an individual because of the preferences of co-workers, the employer, clients or customers.'").

[280] Title VII of the Civil Rights Act of 1964 (Pub. L. 88-352).

be Christians.[281] The previously introduced version of ENDA (2013) included a religious exemption based upon the Title VII religious exemption.[282] The inclusion of this provision was criticized by some as not sufficiently protective of religious liberty. According to Ryan Anderson of the Heritage Foundation, "[w]hile ENDA provides some religious liberty protections, they are inadequate and vaguely defined . . . The religious liberty language in ENDA has been subject to repeated litigation with conflicting rulings by different courts as to which religious institutions are considered religious enough . . . the bill would not protect those who wish to run their businesses and other organizations in keeping with their moral or religious values."[283]

There are also multiple, conflicting viewpoints within the LGBT community on whether any religious exemption should be included. Many, but not all, LGBT advocacy groups withdrew their support for the religious exemption in ENDA after the Supreme Court's decision in *Hobby Lobby*.[284] The heart of these advocacy groups' concerns is that:

> ENDA's discriminatory provision, unprecedented in federal laws prohibiting employment discrimination, could provide religiously affiliated organizations—including hospitals, nursing homes and universities—a blank check to engage in workplace discrimination against LGBT people. The provision essentially says that anti-LGBT discrimination is different—more acceptable and legitimate—than discrimination against individuals based on their race or sex. If ENDA were to pass and be signed into law with this provision, the most important federal law for the LGBT community in American history would leave too many jobs, and too many LGBT workers, without protection. Moreover, it actually might lessen non-discrimination protections now provided for LGBT people by Title VII of CRA and very likely would generate confusion rather than clarity in federal law. Finally, such a discrimination provision in federal law likely would invite states and municipalities to follow the unequal federal lead. All of this is unacceptable.

> The Supreme Court's decision in Hobby Lobby has made it all the more important that we not accept this inappropriate provision. Because opponents of LGBT equality are already misreading that decision as having broadly endorsed rights to discriminate against others, we cannot accept a bill that sanctions discrimination and declares that discrimination against LGBT people is more acceptable than other kinds of discrimination.[285]

Finally, some would use the exact same language as found in Title VII and have argued that the existing Title VII case law properly defines the line for which religious organizations should be able to use such an exception. As Alan Brownstein, law professor at University of California, Davis, testified before the Commission:

> I've written that there's a parallel between religion and sexual orientation both because there's a conduct dimension to both religion and sexual orientation, because both are relational and involve obligations based on relationships, because the protection of both religious liberty and the rights of the LGBT community are usually challenged by the same kind of slippery slope arguments that have been used to defeat both. So, I think there's some basis for saying not that discrimination against LGBT people is somehow sui generis and unique, and we need a separate regime of exemptions for the LGBT community. But I think one could argue that there's an analogy and a parallel between religion and sexual orientation so that the same religious exemptions that would apply with regard to discrimination on the basis of religion in hiring ought also to apply with regard to discrimination on the basis of sexual orientation.[286]

Constitutionality of Federal Legislation

Although not a focus of the Commission's investigation, opponents of legislation affording workplace nondiscrimination protections to LGBT Americans question the constitutionality of such a law.[287] In particular, they object to use of the Commerce Clause and Section 5 of the Fourteenth Amendment as the constitutional basis.[288] Article 1, Section 8, clause 3 of the U.S.

[286] Alan Brownstein, Law Professor at University of California, Davis, Briefing Transcript, pp. 284-85.

[287] Clegg testimony, Briefing Transcript at 101-104.

[288] Section 5 of the 14th Amendment provides Congress "power to enforce, by appropriate legislation, the provisions of this [amendment]" which, in Section 1, provides that, "No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property, without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws." Section 5 of the 14th Amendment provides Congress the power to enforce, by appropriate legislation, the substantive provisions of the Amendment. U.S. CONST., amend. XIV, sec. 5.

Constitution describes the enumerated power of Congress "[t]o regulate Commerce with foreign Nations, and among the several States, and with the Indian Tribes."[289] In *U.S. v. Lopez*,[290] the U.S. Supreme Court articulated that one test for determining whether an activity is within Congress' power to regulate under the Commerce Clause is "whether it substantially affects interstate commerce." Organizations and individuals who oppose this legislation believe that "Congress is going to have a hard time meeting those standards."[291] The Supreme Court also opined that "the power of Congress to promote interstate commerce also includes the power to regulate the local incidents thereof, including local activities in both the States of origin or destination, which might have a substantial and harmful effect upon that commerce."[292]

Proponents of anti-discrimination workplace protections for LGBT Americans counter that the interconnectedness of our national economy strengthens the argument that LGBT workplace protections affect interstate commerce:

> More so than ever, our economy is interconnected. We no longer live in a world in which goods and services are produced in one particular area; they stay in that area. Mom and pop shops are virtually a thing of the past when you're talking about production that is solely within a given area.[293]

Similarly, as discussed throughout this report, LGBT employees work throughout the United States and are employed by corporations that conduct business across state lines. For example, Northrop Grumman employs LGBT workers and "is located in all 50 states."[294] Such factual evidence seems to support the use of the Commerce Clause as the basis for federal anti-discrimination legislation.

In sum, as stated by briefing panelist Brownstein, "we fought that battle [about interstate commerce and nondiscrimination laws] and we've concluded as a society that the rights of employees, and the rights of people who seek public accommodations outweigh the rights of employers."[295]

Are Existing Public Sector Protections Enough?

While there have been formal restrictions and barriers in the private sector against LGBT employees, there also has been a long history of LGBT workers being barred from employment in the federal government.[296] The Merit Systems Protections Board cited a 2012 OPM survey that "found that lesbian, gay, bisexual, and transgender federal employee perceptions of the workplace were generally less positive than other employees."[297] When surveying federal LGBT employees, scholars Lewis and Pitts found that many LGBT workers do not believe they are given the same treatment as their heterosexual colleagues. They gave more negative responses to every question about their jobs, organizations, leaders, and co-workers.

> LGBT employees are 1 to 3 percentage points less likely than heterosexuals to think their performance appraisals are fair and to be satisfied with their pay; 3 to 6 points less likely to be satisfied with their advancement opportunities or to feel that merit drives rewards in their agencies; 4 to 6 points less likely to think highly of their immediate supervisors, agency leadership, or organizations; and 4 to 8 points less likely to be satisfied with their agencies' treatment of diversity, [prohibited personnel practices] and employee empowerment. They are also 3 to 8 percentage points more likely to say that they are planning to look for a new job outside their agency. Given the low percentages reporting dissatisfaction, LGBTs are one quarter more likely than heterosexuals to express dissatisfaction on most measures.[298]

Additionally, outside of reporting EEOC claims, the federal government does not appear to collect data regarding whether the efforts to ensure federal anti-discrimination policies are fully implemented. Advocates argue that it would be helpful if "every federal agency [were] charged with collecting information on sexual orientation and gender identity in all of their surveys."[299] According to the National LGBTQ Task Force, collecting additional data on sexual orientation and gender among LGBT federal employees, federal contractors, and federally assisted contractors could be "spearheaded by a presidential Executive Order calling for agencies to determine best methods for integrating these demographic questions into their data collection instruments" and to examine the "levels of filing" of complaints and what is happening in federal enforcement and oversight.[300] It is worth noting that adding demographic measures may not be a wanted change for all LGBT people in fear of privacy concerns. Due to the societal stigma of embodying an LGBT

identity and the fear of prejudice, some LGBT individuals may not want to disclose their sexual orientation or gender identity in surveys.

Outside of federal employment, an estimated one million LGBT employees work in the public sector for state and local governments.[301] Of these employees, only 45 percent of American workers live in a jurisdiction prohibiting sexual orientation discrimination in employment, and only 34 percent of workers live in a jurisdiction prohibiting gender identity discrimination.[302] These workers may face a patchwork of employment protections, depending on what state or local jurisdiction they work for. For instance, Lisa Howe, Executive Director of the Nashville LGBT Chamber of Commerce, explained at the briefing how state-by-state protections do not offer adequate protections for all LGBT workers. She reported that in Tennessee there are "very few protections . . . for contractors or anything like that. So in Nashville the metro government did pass a policy to extend sexual orientation, gender identity onto the employment—the discrimination policies for their contractors and the state overturned it and said that local governments do not have that authority."[303]

Even though some states have policies for state and local LGBT employees, researchers have found that discrimination is still pervasive and occurs nearly as frequently as discrimination in the private sector.[304] Looking at public sector complaints in 123 jurisdictions, Mallory and Sears found that the rate of discrimination complaints filed by LGB state and local employees was slightly lower than, but similar to, that of filings by LGB employees in the private sector.[305] They found that the frequency is similar with state and local government employment, but state filings are slightly lower (2.8 complaints for state government and 3.2 complaints for local government for every 10,000 LGB employees). Mallory and Sears found the rate of sexual orientation and gender identity complaints occurred at a similar rate as discrimination claims based on race and sex.[306] They further discussed that the actual rate of discrimination against LGBT employees may be drastically underreported for several reasons. First, some state and local agencies lack the resources and staff necessary to effectively enforce nondiscrimination laws. Panelist Roger Clegg brought up this point in his testimony, stating that having to resort to litigation and regulation is "very

expensive and distortive media."[307] This argument may be likely to have bipartisan support for those in favor and those who oppose federal legislation. Second, LGBT people may be hesitant to file complaints because of a perception of judicial unresponsiveness. Third, LGBT people may choose not to file complaints in order to avoid further "outing" themselves and thus risk suffering further negative consequences in the workplace.

Are Private Sector Policies Enough?

Opponents of federal legislation assert that "while racial integration might not have been forthcoming apart from the Civil Rights Act, in the case of sexual orientation, voluntary actions and market forces have emerged that undermine the clamor for federal action."[308] Proponents of federal legislation disagree, arguing that although the federal government, corporations, and businesses are increasingly creating and enforcing LGBT-inclusive policies, LGBT workers still lack an array of national legal protections, leaving many to hide who they are for fear of discrimination in the workplace. These proponents note that private sector policies are necessary, but not sufficient to create a national climate of inclusion. Proponents for federal legislation argue that voluntary measures implemented by some major corporations are not enough, since the effects of workplace discrimination against members of the LGBT community remain very serious. For individuals, workplace discrimination can drastically increase psychological stress and other mental health problems. A fifth of LGBT respondents to the Human Rights Campaign Foundation's 2014 survey reported feeling exhausted from expending time and energy hiding their identities and a third felt distracted from their duties at work due to negative workplace environments.[309] As the Director of Human Rights Campaign's Workplace Equality Program has stated "[t]he inclusive policies coming from the boardroom have not fully made it into the everyday culture of the American workplace."[310]

Further, business policies are not enforceable in courts, and businesses may decide not to follow their own policies. The Director of the Public Policy at the National LGBTQ Task Force shared the story of an insurance company receptionist, who was terminated the same day an agency executive saw him kiss his partner in the work parking lot.[311] The employer had a general company policy of non-discrimination; yet according to testimony before the Commission, the employee perceived that he had no recourse to challenge the termination decision. This case occurred in 2002, therefore it was before the EEOC's decision to extend workplace protections based on sexual

[311] Simmons Statement at 7.

orientation. Panelist Long-Simmons used this example to highlight the importance of enacting federal legislation to protect LGBT workers since businesses merely having a stated policy may not offer these employees full protections.

Lastly, even though the EEOC has held that claims of discrimination based on sexual orientation and gender identity can be brought under Title VII, for employees to "truly benefit from these legal protections, explicit statutes must be enacted to make sure that the law is clear to everyone, including employers, workers, and courts."[312] "Courts are not strictly bound to follow the [EEOC's] interpretation of the law."[313] Given the current inconsistent Circuit court decisions, should a private employer in some jurisdictions not agree with the EEOC's decision, it could refuse to abide by it, which may result in a court overturning the EEOC's decision.[314]

How Would Federal Legislation Impact the Economy?

ECONOMIC SUPPORT OF FEDERAL LEGISLATION

There is substantial support for federal legislation in the business community. As Mary Beth Maxwell, the former Principal Deputy Assistant Secretary for Policy at the Department of Labor put it, "Equality in the workplace is not only the right thing to do; it turns out to be good business."[315] Sylvester Mendoza, Director of Global Inclusion and Strategic Alliances at Northrop Grumman, stated that discrimination "has no place in the workplace, and we believe in doing everything possible to eliminate discrimination against any employee, including members of the LGBT community."[316] Northrop Grumman's zero tolerance policy offers protections to their employees from "discrimination based on sex, gender, gender identity, expression, and sexual orientation."[317] They feel that diversity and inclusion are strengths necessary to a global corporation. By providing an inclusive working environment, Northrop Grumman believes that employees "bring their whole authentic selves to work every day, contributing diverse ideas, perspectives, and talents to solve our customers' toughest challenges."[318] While this policy is an example of a positive and inclusive step towards workplace equality for LGBT employees, this policy only protects Northrop's workers from discrimination. Thus, this example illustrates how

[317] *Ibid.* at 167.
[318] *Ibid.*

the need to eliminate patchwork protections for LGBT employees is imperative so all employees can have the reassurance of being protected from discrimination.

There are many companies like Northrop Grumman who believe that discrimination against LGBT employees and applicants leads to less qualified staff.[319] Discrimination lowers motivation to invest in future education. Not only does this affect individuals, it also lowers a company's overall skilled staff and the entire U.S. labor force. Furthermore, this leads to a decrease in productivity and, therefore, a decrease in profit and economic growth. LGBT and heterosexual employees alike who work for businesses that discriminate show high rates of absenteeism and are generally less committed to their respective businesses.[320] Accordingly, many businesses support federal legislation:

1. 63 percent of small businesses support legislation to legally protect LGBT employees regardless of employer's religious beliefs.[321]
2. Almost six in ten small-business owners also believe that employment nondiscrimination laws improve or would improve their businesses' bottom lines by allowing access to the most talented individuals, regardless of sexual orientation or gender identity.[322]

Employment protection policies often cost companies little to nothing to implement or maintain antidiscrimination policies. Eighty-six percent of small businesses that do not already have such an antidiscrimination policy state that these policies cost them "nothing or next to nothing," while only two percent of small businesses with such policies say there is a "small but significant" cost associated with antidiscrimination policies. None of the businesses surveyed reported a substantial cost. [323]

Furthermore, findings suggest there are economic benefits in extending LGBT employees' equal benefits and adding protective inclusion and diversity policies. As discussed previously, employees perceive these policies as positive, thus contribute positively to business profits. Moreover, with the increasing numbers of same-sex households, the buying power of LGBT consumers is also growing. Studies suggest there has been a 20 percent increase in LGBT market growth from 2006 to 2012, which equates to approximately $790 billion.[324] Further, surveys suggest that consumers (both LGBT and allies) see acceptance and tolerance positively, thereby

increasing customer flow and money earned for the economy.[325] A majority of heterosexual and LGBT consumers state that friendliness and support of equal rights for the LGBT community influence the decision to purchase products or services from a business. In a national survey in 2011, 87 percent of LGBT individuals and 75 percent of heterosexuals say they consider choosing a brand known to provide equal benefits to employees regardless of sexual orientation or gender identity.[326] In the same survey, researchers found that brand loyalty is important to LGBT consumers. They found that 71 percent LGBT adults said that they are likely to remain loyal if the business is believed to be "very friendly" and "supportive" of the LGBT community, regardless if the less-friendly company is cheaper and/or more conveniently located.[327]

Conversely, the potential for boycotts of a company's products or services has impacted many businesses' view of supporting LGBT rights. For decades, most companies rarely targeted or advertised to the LGBT community, choosing instead to stay away from partisan issues to avoid taking a position that might isolate a segment of their customer base.[328] Today though, customers increasingly see their dollars as an extension of their power in the voting booth.[329] Social media campaigns have bolstered boycotts, which have allowed people around the country to organize protests and boycott products.[330] As the Chief Executive of the Center for Talent Innovation has noted "[t]here's enormous value in figuring out how to be seen and to act as a LGBT-friendly company."[331] However, even with the positive voluntary measures that companies have implemented to end discrimination against LGBT employees, as stated previously, many people are not covered and discrimination remains a significant problem for these communities.

ECONOMIC OPPOSITION TO FEDERAL LEGISLATION

Opponents of the Employment Non-Discrimination Act and the Equality Act argue that anti-discrimination laws against LGBT people will prove economically disadvantageous to businesses and the economy.[332] Some believe that anti-discrimination laws will be counterproductive and result in less frequent hiring of LGBT employees because of the risk of costly lawsuits. Their concern is that employers will hire a non-LGBT person over an LGBT person because the former does not present the risk of later lawsuits claiming discrimination.[333] Additionally, opponents argue that employers may not want to lay off employees who are protected by the Employment Non-Discrimination Act, even if the layoff is for legitimate reasons, because the employee could sue for wrongful termination. Because of this, opponents argue businesses will be stuck with "unproductive or superfluous workers," which will cause further economic stress.[334] Opponents believe this reluctance to fire people would also result in hiring fewer LGBT individuals because employers feel such employees cannot be fired. The end result of federal legislation on hiring and firing employees, according to those opposed to federal legislation, will be less job creation in the market as a whole.[335]

Opponents of federal legislation are concerned that there may be additional litigation due to what they perceive as the subjective nature of sexual orientation and gender identity, which is more difficult for an employer to identify than sex or race. According to some opponents, this means that an LGBT employee who is fired could, theoretically, bring more lawsuits against a former employer, which could harm all businesses, including those that already have antidiscrimination policies in place.[336] One author asserts that, even if the employer were to win a wrongful termination suit, the business would still have to pay at least $250,000 in attorney fees. Additional costs, though minimal, could also come from training seminars on a new federal law and the cost of following strict guidelines.[337]

[337] Michaluk, *supra* note 333; Small Business Majority, *supra* note 87.

At the Commission's briefing, panelists noted that in states that have enacted LGBT anti-discrimination protections, there has not been a flood of litigation in response. Kate Kendell stated:

> We have a number of states that have passed laws that prohibit discrimination based on gender identity . . . And there hasn't been some—there hasn't been a huge flood of litigation, nor has there been inane interpretations. What these laws do, is they set a tone for how we think people should be treated on the job. And by existing, they stop the very discrimination that they're meant to redress. And then in extreme cases, people then are free and have the ability to bring cases. The ability to answer the question, what kind of country do we want to live in? With the statute that says, we want to live in a country where people, all sorts of people, including people based on sexual orientation or gender live free, honored for who they are and able to do their jobs to the highest of their ability. And their ability is what matters, not who they are. That seems to me to be a good thing for this country to do.[338]

Of note, the number of EEOC claims alleging sexual orientation and/or gender identity discrimination counters against the narrative of additional lawsuits. The EEOC reports that it "receives close to 95,000 charges a year on all of the statutes we enforce . . . in those three quarters of fiscal year 2013 and looking at a snapshot of 2014, we are talking about a fraction, really small fraction—talking about 800 charges altogether raising these issues, and, obviously, a number of them may not be meritorious."[339] After the EEOC held that sexual orientation and gender identity fall within Title VII, the number of charges filed alleging discrimination on these bases did rise to 1,768 for FY 2016, which is approximately 1.8 percent of all charges filed with the EEOC.

Another concern about the effect of federal legislation and additional federal regulation on business hiring and firing could negatively impact the free market system.[340] The "at-will" employment concept in which businesses fire and rehire at any time follows this economy philosophy. They argue that businesses hire the most qualified regardless of sexual orientation or gender identity because it is in their best interest to do so.[341] This belief holds that "the free market is already correcting what bureaucratic red tape cannot fix."[342]

New Developments in Federal Legislation

In May 2017, the Equality Act was reintroduced in Congress.[343] This newest version extends protections for LGBT individuals not only in the workplace, but also in public accommodations, housing, federally funded programs, jury service, and credit. This is significant and worth noting in this report since the right of transgender persons to access the bathroom that correctly aligns with their gender identity has gained national attention. Kylar Broadus, Senior Public Policy Counsel of the Transgender Civil Rights Project, at the briefing explained the frustrating dilemma in simply trying to access a bathroom. He told the Commission: "I didn't go to the bathroom for years [in public facilities] because I would be accosted by police at every place and thrown out of the women's room."[344] While a full discussion of these issues is beyond the scope of this report, we acknowledge them for contextual reasons.

Specifically regarding the workplace, transgender rights advocates argue that employers should allow transgender workers to use the restroom that conforms to their gender identity and/or allow them access to private, single user facilities.[345] And the American public seems to also agree. A 2016 survey found broad, bi-partisan support for LGBT nondiscrimination laws, with 72 percent of Americans saying they favor laws that would protect LGBT individuals from discrimination in jobs, public accommodations, and housing.[346] Further, a majority (53 percent) of Americans oppose laws that require transgender persons to use the bathroom that corresponds to their assigned sex at birth rather than their gender identity.[347] A lack of a clear policy surrounding the use of restrooms for transgender employees (and citizens more broadly) creates an uncomfortable and sometimes hostile atmosphere for transgender people. Mara Keisling from the National Center for Transgender Equality, stated the explicit connection between bathroom rights and workplace protections. In her testimony she stated: "If you're allowed to have a job and you can't be fired but they don't have to let you use a bathroom at work, you can't work."[348]

Access to restrooms for transgender people is also a health issue relevant to both employees and businesses. The Department of Labor's (DOL) Occupational Safety and Health Administration (OSHA) released guidelines in 2015 for employers to ensure all employees have access to facilities they need. The report states: "all employees, including transgender employees, should have access to restrooms that correspond to their gender identity." The department argues that lack of access

to proper and hygienic restrooms can cause health problems or risks to physical safety for affected individuals.[349] For instance, the National Center for Transgender Equality found that in the past year, 8 percent of respondents reported having a urinary tract infection, kidney infection, or another kidney-related problem as a result of avoiding restrooms.[350] Further, the DOL's Office of Federal Contract Compliance Program (OFCCP) released a fact sheet stating that gender identity is protected under their policy prohibiting sex discrimination. Its new rule requires "contractors to allow workers to use bathrooms, changing rooms, showers, and similar facilities consistent with the gender with which the workers identify."[351] These policies by the Department of Labor reflect some of the ongoing policy struggles in this realm—for both state and local laws—that inhibit an individual's access to a bathroom that corresponds with the individual's gender identity (e.g., Texas and North Carolina).[352] However, some private companies have instituted their own policies regarding their public and employee bathrooms (*e.g.*, Target and Starbucks)[353] to compensate for the lack of federal protections.

Over the past several years, the business community has become more vocal about social issues, both for and against LGBT rights. Corporations have taken positions on state religious freedom restoration laws, which allow businesses to discriminate against customers on the basis of religion that many see as anti-gay. For example, corporations like Hobby Lobby and Chick-Fil-A have both come under fire by advocates for touting anti-LGBT rhetoric and adopting non-inclusive policies.[354] Conversely, many corporations have publicly declared support for extending employment protections for LGBT workers and customers. Todd Sears, founder and principal of Out Leadership, argues that these actions from the business community are "the new normal . . . [and] it's not just that companies are speaking out, there's actually a price to not speaking out."[355] For instance, after then-North Carolina Governor Pat McCory passed the HB 2 bill that blocked local governments from passing anti-discrimination laws protecting LGBT people, repealed existing municipal housing and employment protections for LGBT people, and forced transgender

[355] Hoover, *supra* note 329.

people to utilize public bathrooms based on the sex on their birth certificates rather than their gender identities, many companies refused to continue doing business in the state. When businesses and corporate investors oppose legislation, such as when the National Basketball Association pulled its 2017 All-Star Game out of North Carolina in opposition to HB 2, they are likely to influence local and state policy going forward. For example, when the Georgia state legislature attempted to pass their own religious freedom bill, Governor Nathan Deal vetoed it, stating that it would hurt Georgia business growth.[356] According to the *Associated Press*, the "bathroom bill" has cost North Carolina an estimated $3.76 billion in lost business revenue.[357] Due to the political, economic, and social backlash from HB2, now-Governor Roy Cooper promised during his 2017 gubernatorial campaign that he was going to repeal the bill. However, he did not issue a full repeal. Rather in March 2017 he offered a "compromise" in the form of House Bill 142.[358] This new bill forbids "state agencies, boards, offices, departments, institutions," and "branches of government," including public universities, from regulating "access to multiple occupancy restrooms, showers, or changing facilities."[359] HB 142 further restricts local governments, school boards, and public universities from passing their own LGBT-inclusive policies and bans any city in North Carolina from "regulating private employment practices or regulating public accommodations" until December 1, 2020.[360] This new bill has assuaged some of the concerns from HB 2, for instance the NCAA has decided to return to North Carolina despite the continued discriminatory impacts of this new bill. The NCAA governors argue that HB142 brings North Carolina laws in step with the majority of the other states.[361] However, LGBT advocates argue that the bill "literally does not do one thing to protect the LGBT community and locks in HB2's most basic and offensive provision."[362]

On May 30, 2017 the Seventh Circuit Court of Appeals ruled in favor of a transgender plaintiff regarding bathroom access.[363] The court ruled that restricting the transgender student from using

the bathroom that corresponded to his gender identity was a form of sex discrimination, which is protected under Title IX.[364] While this case was specifically regarding a Wisconsin high school student, the court's decision has sweeping implications for how Title IX will be interpreted in the future, and potentially for the 14th Amendment.[365] Where courts interpret bans against sex discrimination to prohibit discrimination against transgender individuals, their reasoning offers analogies in other contexts in which bans against sex discrimination apply (*e.g.*, workplace, housing, public accommodations).

CHAPTER 4: FINDINGS AND RECOMMENDATIONS

The Commission makes the following findings and recommendations:

Findings and Recommendations

FINDINGS

1. **Overview**

   a) Historians, researchers, and courts have extensively documented that lesbian, gay, bisexual, and transgender (LGBT) workers have faced a long, serious, and pervasive history of official and unofficial employment discrimination by both federal, state, and local governments and private employers.
   b) Anti-LGBT employment discrimination persists and has wide-ranging, damaging implications for the quality of life for many LGBT Americans, their children and families, and communities.
   c) In the absence of explicit federal statutory nondiscrimination protections, LGBT workers face serious barriers to both gaining and keeping jobs and promotions. Workplace discrimination against LGBT communities can cause job instability and high turnover, resulting in greater unemployment and poverty rates as well as substantial wage gaps between LGBT workers and workers outside the LGBT community. Studies have shown that state anti-discrimination laws appear to help reduce these wage gaps.
   d) Federal data sources do not effectively capture rates of LGBT employment or rates of LGBT employment discrimination.

2. **Anti-Discrimination Laws**

   a) An inconsistent and irreconcilable patchwork of state laws against anti-LGBT workplace discrimination and federal court decisions interpreting existing federal law render LGBT employees insufficiently protected from workplace discrimination.
   b) Currently, only 20 states and the District of Columbia prohibit employment discrimination on the basis of sexual orientation and gender identity.
   c) Seventeen states offer no employment protections on the basis of sexual orientation or gender identity, but cities and local municipalities may offer their own protections.
   d) Twenty states and the District of Columbia currently have laws that explicitly prohibit employment discrimination based upon gender identity or expression, and two other states have laws prohibiting sexual orientation discrimination, but exclude transgender protections.

e) Some federal courts have concluded that the existing federal statutory protection against discrimination based on sex, under Title VII of the Civil Rights Act of 1964, includes within its protection discrimination based on sexual orientation and gender identity. Other federal courts have disagreed. These inconsistent interpretations result in different protections available to individuals based on their jurisdiction, and it is not clear when the Supreme Court will resolve the dispute.

f) Public opinion supports Congress enacting a non-discrimination bill to protect against workplace discrimination against LGBT people.

g) In the past Administration, federal agencies including the EEOC and Departments of Justice and Labor interpreted existing federal law to protect LGBT persons against employment discrimination. Under the current administration the Department of Justice has changed its position, while other agencies, including the EEOC, have not yet taken different positions on the issue.

h) In July 2017, the Department of Justice filed an amicus brief arguing that the prohibition against discrimination based on sex found in Title VII of the Civil Rights Act does not include claims based on sexual orientation. In October 2017, Attorney General Jeff Sessions withdrew guidance issued by Attorney General Eric Holder in 2014 and stated that going forward the Department of Justice would take the position that Title VII's prohibition on sex discrimination does not include discrimination based on gender identity. In addition, the current Administration has interpreted related federal civil rights laws, such as Title IX, in ways that depart from an interpretation that nondiscrimination protection on the basis of sex necessarily includes protection on the basis of sexual orientation and/or gender identity.

i) As evidenced by the Department of Justice's change in position with respect to the interpretation of "sex" in Title VII, federal agency policies and positions can be changed depending on the Administration and do not provide the same weight of protection as federal legislation.

j) The lack of binding and enumerated federal employment protections for LGBT workers remains a central vulnerability for LGBT people.

k) It has not been difficult for some private companies to adopt and implement workplace policies or practices that prohibit discrimination on the basis of sexual orientation and/or gender identity. As of 2016, 92 percent of Fortune 500 companies included sexual orientation and 82 percent included gender identity in their equal employment opportunity policies. Businesses that support these policies note such practices are beneficial to their businesses by attracting the most qualified workforce and increasing productivity.

l) There has not been a flood of litigation in response to the passage of LGBT workplace anti-discrimination laws in the states that have adopted them. To the extent litigation does occur, evidentiary requirements limit baseless claims.

RECOMMENDATIONS

a) In order to effectively and consistently protect LGBT employees from workplace discrimination, Congress should immediately enact a federal law explicitly banning discrimination in the workplace based on sexual orientation and gender identity.
b) In addition to Congressional action, federal agencies including the Departments of Justice and Labor, the Equal Employment Opportunity Commission, and the Office of Personnel Management should issue and—where relevant—reaffirm specific guidance for federal and private employers outlining protections for LGBT individuals in the workforce, including specifically enumerating protections for transgender persons.
c) Congress should authorize the necessary appropriations to ensure that all current and future non-discrimination protections are fully enforced by agencies including, but not limited to, the Departments of Justice and Labor and the Equal Employment Opportunity Commission.
d) The Commission strongly supports religious freedom and nondiscrimination on the basis of religion. Title VII offers a workable model for protecting religious freedom in the context of federal statutory nondiscrimination protections in the workplace. In *Hosanna-Tabor Evangelical Lutheran Church and School v. Equal Employment Opportunity Commission the Supreme Court* also unanimously endorsed the common law ministerial exemption, which recognizes the right of religious groups to select their own ministers and clergy. No further expansion of exceptions to nondiscrimination protections in the workplace are necessary or warranted to balance the rights to freedom of religion and to nondiscrimination on the bases either of religion or LGBT status.
e) Workplace discrimination data should be collected through the inclusion of sexual orientation and gender identity questions in population-based surveys of the workforce such as the Census, American Community Survey, and surveys fielded by the Bureau of Labor Statistics and other agencies.

COMMISSIONERS' STATEMENTS, REBUTTALS, AND SURREBUTTALS

Statement of Chair Catherine E. Lhamon, in which Vice-Chair Patricia Timmons-Goodson concurs

Firing a person because of who the person is, rather than for nonperformance of job requirements, offends the concept of equity and ought to be unequivocally unlawful. For lesbian, gay, bisexual, and transgender (LGBT) Americans in too many parts of this country right now, it is not.

Our report notes that public opinion, untethered to political affiliation, supports fair workplace treatment for LGBT individuals.[1] While I appreciate the popular support for equity, in fact our national ideals have always sounded in equity and our federal civil rights laws have, for the past six decades, otherwise strongly protected equity. Failure to include formal federal civil rights protection for LGBT persons, regarding employment among other aspects of life, marks a distinct and unjustifiable outlying gap in the fabric of our laws.

In fact, its absence has led to tortured discussions in federal cases,[2] analyzing whether and how much sex discrimination protection applies to sexual orientation and gender identity. Together with diametrically opposing views on these questions expressed and enforced in the Trump and Obama Administrations, they underscore the need for Congress to act unequivocally to protect all workers from employment discrimination based on who they are.[3]

Congress does not fail to act on a blank slate: it has and has had concrete information about the harms LGBT Americans experience in workplace harassment and discrimination as well as about the degree of uncertainty about federal civil rights coverage applicable to LGBT employees. Over

[1] U.S. Commission on Civil Rights, Working for Inclusion: Time for Congress to Enact Federal Legislation to Address Workplace Discrimination Against Lesbian, Gay, Bisexual, and Transgender Americans, 2017 [*hereinafter* Report] at p. 1.

[2] *See, e.g., Evans v. Georgia Reg'l Hosp.*, 850 F.3d 1248, 1266–67 (11th Cir. 2017) (Rosenbaum, J., concurring and dissenting) (arguing that the decision attempted to create "an artificial line between discrimination because an employee has not behaved in a way that the employer thinks a person of that gender should, on the one hand, and discrimination because an employee is not the way that the employer thinks a person of that gender should be, on the other. . . [which] makes no sense from a practical, textual, or doctrinal point of view."); *Videckis v. Pepperdine Univ.*, 150 *F. Supp.* 3d 1151, 1159 (C.D. Cal. 2015) (collecting cases and concluding that "the line between sex discrimination and sexual orientation discrimination is 'difficult to draw' because that line does not exist, save as a lingering and faulty judicial construct").

[3] At the time of this writing, the United States Supreme Court has pending a petition seeking its review of the question whether Title VII sex discrimination protection covers sexual orientation. *Evans v. Georgia Reg'l Hosp.*, No. 17-370, Petition for Writ of Certiorari (U.S. Sept. 7, 2017). A Supreme Court answer to that question could—or could not—render federal legislation partially duplicative, depending both on whether the Court takes the case and on what it rules if it does. The petitioners have not asked the Court to take up the question of whether Title VII sex discrimination protection covers gender identity, and so there will be a gap of protection regardless of how the Supreme Court acts in this particular case. Because we cannot know in advance whether the Court will review the question or how it will rule, Congress should act now to ensure workplace protection for LGBT Americans.

the four decades during which Congress has considered but not enacted specific workplace protective laws covering LGBT Americans, it has considered workplace vulnerability of LGBT employees as well as the reality that states and cities have specifically enacted laws excluding LGBT persons from coverage. In 1996, when the Supreme Court ruled one such law from Colorado unconstitutional, it concluded that the law, "in making a general announcement that gays and lesbians shall not have any particular protections from the law, inflicts on them immediate, continuing, and real injuries that outrun and belie any legitimate justifications that may be claimed for it."[4] Whereas Congress has not announced that LGBT Americans may not be protected in law, its inaction—in the face of evidence that some courts view existing federal law as inapplicable to these employees—nonetheless leaves these persons notably vulnerable.[5]

Before that Colorado case reached the U.S. Supreme Court, Burke Marshall—who wrote the 1964 Civil Rights Act that included Title VII, was Assistant Attorney General for Civil Rights in the Kennedy Administration, and taught me constitutional law the year of this testimony—testified as an expert in the case in trial court.[6] Marshall testified that "civil rights protections bring those discriminated against 'safely into the mainstream of American society' and enable them 'to participate fully in the life of the United States, including its economic life.'"[7] He further testified that "the purpose of anti-discrimination laws is to upset a social norm of discrimination and 'to create a society that respects and complies by the value of equality . . . which is made a constitutional norm by the . . . 14th amendment and is part of the American tradition of fairness.'"[8] I know, because when I was a third-year law student writing a paper about Title VII coverage of transgender employees, we discussed the questions, that Burke Marshall believed without question that the law he wrote—Title VII—protected transgender persons and lesbian, gay, and bisexual persons, from discrimination. And I know still, all these years later, that LGBT Americans, like all Americans, deserve the legal protection that, in Burke Marshall's expert terms, "respects and complies by the value of equality" in the "American tradition of fairness."[9]

[9] *Id.*

I urge Congress to act to put an end to decades of questions about whether some among us may—finally, today—be equal to all among us.

Resistance to formal federal protection from discrimination for LGBT employees often purports to rely on a putative conflict between religious freedom and nondiscrimination. My own experience of faith, in addition to my love of our Constitution, animates my every action—and I am offended by the notion that our existing constitutional and federal statutory protections for religious freedom prevent like protection for nondiscrimination for lesbian, gay, bisexual, and transgender Americans. I saw the fallacy of that putative conflict play out painfully some thirteen years ago, when I represented students in a south Los Angeles high school whose teachers and administrators discriminated against them because they were gay and lesbian students. Their school staff defended standing by while, among other actions, a student physically attacked another student in class, because the teacher believed the attacked student needed to be taught to be more "manly"; telling a deeply religious Catholic student she would go to hell because she dated another girl; and outing two boys to their parents in the course of disciplining the boys because the boys had been caught kissing in a school building where opposite sex couples were also kissing at the same time but were not disciplined for their behavior. These school staff reported that their religious faith dictated their actions to harm these students, because the students were gay or lesbian. A teacher's decision to tell a devout Catholic girl she would go to hell for dating another girl lowlights the error in the assumption that LGBT persons are not simultaneously persons of faith—and underscores the distinct (and in our system of laws profoundly unconstitutional) harm that privileging one understanding of faith over another can visit on people. The teachers and administrators at that school were and are free to disapprove of same sex relationships, and even of the status of being LGBT, on religious or other bases; they were and are not, however, free to act on that disapproval in ways that harmed the students as people or as learners. Likewise in an employment context, our laws should protect LGBT employees from discrimination while also protecting all of our religious freedom.

Congress and our courts have, many times in our history, reconciled religious objections to civil rights protections without denigrating the rights of Americans to be who they are. In one stark example, the United States Supreme Court quoted the federal trial court judge who sanctioned criminalization of interracial marriage justifying his decision because "'Almighty God created the races white, black, yellow, malay and red, and he placed them on separate continents. . . The fact that he separated the races shows that he did not intend for the races to mix.'"[10] Despite the invocation of a religious basis for upholding a racially discriminatory law, the Court ruled Virginia's laws against interracial marriage unconstitutional because "classifications so directly

[10] *Loving v. Virginia*, 388 U.S. 1, 3 (1967) (quoting *Loving v. Virginia* (Circuit Court of Caroline County, Virginia, 1959)).

subversive of the principle of equality at the heart of the Fourteenth Amendment . . . deprive all the State's citizens of liberty without due process of law."[11] Just as religious objection to interracial marriage or interracial association has not and as a matter of course should not have prevented federal nondiscrimination protection on the basis of race, so religious objection, where it exists, is no impediment to federal nondiscrimination protection for LGBT Americans.

The possibility that questions could arise regarding how to reconcile sincerely held religious views with nondiscrimination protections for LGBT persons does not lead logically to a conclusion that LGBT persons should lack legal protection. We already have strong religious freedom protections both in the Constitution and in federal law. The First Amendment protects against discrimination on the basis of religion, and particular additional protections are included in the Religious Freedom Restoration Act[12] as well as exemptions detailed in our longstanding federal civil rights laws.[13] What we do not have now in federal law is explicit protection for LGBT persons; that gap should be filled while simultaneously ensuring respect for faith in all its forms as well as sexual orientation and gender identity in all of theirs.

It is the Commission's core function to advise Congress, the President, and the American public about federal civil rights policy. I wholeheartedly support the Commission's recommendations including that Congress enact federal legislation as soon as possible to correct the harms we have already borne witness to, guard against future such harms, and fulfill the "American tradition of fairness."[14]

---

Statement of Commissioner David Kladney

This report raises an inevitable question: why would an employer seek to fire, harass, or otherwise reduce the productivity of a successful employee merely because of that person's sexual orientation or gender identity? It makes no sense. Business leaders in many industries continually band together to say LGBT employment discrimination is bad for business. It is better to accept that every person has their own idea of how to express gender and form (or not form) a family.

Business plans for inclusion are encouraging. A representative of Northup Grumman described the way they not only accept LGBT people, but embrace them in office culture.[1] This is exactly what companies should be doing, for their own competitive advantage and because it is right. As business representatives testified they value every employee and cannot afford to turn away well-qualified people who can help them succeed.[2] Many companies make clear they welcome and value LGBT employees.

As business is growing more accepting by the day, why are employment discrimination protections necessary? As this report explains, with all the progress made in this area, employment discrimination still occurs for no valid reason. It is prevalent. As I see it, even if discrimination were rare, we should still have a federal law prohibiting it because it is wrong each and every time it happens.

Business initiative is not enough. The speed at which LGBT rights have advanced belies the progress still needed. Hundreds of companies have come out in support of a law requiring them to do what they have done voluntarily: create a work environment where people can succeed without discrimination.[3] Equal protection requires that LGBT citizens are not left to the whim of their employers. Most of these employers are corporations, large and small, who take advantage of the legal protections and shields the government affords them. As such, they should be required to not discriminate against any qualified United States citizen in employment. To do so is not consistent with the American values.

Relying on companies to do the right thing voluntarily also presumes the progress only moves one direction. It assumes that there can be no backlash to the advancements LGBT people have

achieved. This is not the case. As we see with President Trump's unilateral ban of transgender people from serving in the military, decision makers can act in a willy-nilly fashion without any regard to the best interests of the objective—success of the mission.[4] The varying interpretations of Title VII depending on which presidential administration is interpreting it demonstrate the shifting sands beneath what should be bedrock principles of non-discrimination.[5]

The bottom line is this: people should have the right to work to support themselves and succeed for their families and our country. When people have requisite skills, they should not have to fear that their right to work is contingent on their ability to successfully hide a fundamental aspect of themselves. The purges of people from the federal government because of sexual orientation are not so far in the past.[6] Transgender people in particular still lack basic acknowledgment by the federal government that they deserve protections from discrimination.[7] People in the LGBT community are our friends and members of our families. They are in every community in the world. In this country, where we value equality and fairness, they should be able to live and work freely.

Statement of Commissioner Karen K. Narasaki, in which Vice-Chair Patricia Timmons-Goodson concurs

Fundamental to the founding of our nation is the principle that every person has a universal and inalienable right to "life, liberty, and the pursuit of happiness."[1] In *Obergefell v Hodges*, Justice Kennedy explained that liberty includes the right of individuals "to define and express their identity."[2] Sexual orientation and gender identity are characteristics that are fundamental and essential to one's identity.[3] To deny a person equal protection under the law due to these characteristics—whether in the workplace or elsewhere—violates not only one of our country's most sacred tenets, but the basic dignity and humanity that all people inherently deserve.

Freedom from discrimination based on sexual orientation or gender identity also naturally incorporates many other rights recognized under the Constitution, including the right to privacy[4] and freedom of expression and association. Moreover, international human rights laws complement and reinforce our nation's laws by recognizing that "all human beings are born free and equal in dignity and rights" and therefore LGBT people are entitled to the numerous protections afforded by human rights laws, including the right to be free from discrimination.[5]

Some opponents to legislation protecting LGBT workers and their families from discrimination mistakenly contend sexual orientation and gender identity are unlike other protected categories such as race and sex, which in their view are protected because they are considered immutable.[6]

The first four of these are included largely because they are inborn, involuntary

Whether a person's sexual orientation or gender identity is changeable is not the appropriate inquiry. Rather, as Ninth Circuit Court Judge Norris describes it, it is whether such "traits [] are so central to a person's identity that it would be abhorrent for government to penalize a person for refusing to change them, regardless of how easy that change might be physically."[7] Religion, for example, is not immutable in the classic sense but is central to the identity of many people,[8] which is why the First Amendment protects the right to practice religion[9] and why we have laws prohibiting employment discrimination based on religion.

Our understanding of sexual orientation and gender identity continues to evolve. Because of that, significant progress for LGBT equality has been made in recent decades, but as our report reveals much work remains.[10] As Senior Judge Davis concluded when he sided with transgender youth Gavin Grimm's efforts to use the bathroom that corresponds with his gender identity, it is now up to the resolve of our leaders and our nation to stand for equality and human dignity:

> [S]ome entities will not protect the rights of others unless compelled to do so. Today, hatred, intolerance, and discrimination persist—and are sometimes even

---

and immutable. (Religion, while voluntary, is explicitly protected by the First Amendment to the U.S. Constitution.)."). However, Columbia University sociologist Shamus Khan argues sexual identity, like race, is a social construction. Shamus Khan, Not Born This Way, Aeon (July 23, 2015), https://aeon.co/essays/why-should-gay-rights-depend-on-being-born-this-way ("True, many gay and lesbian people will note that they 'always felt different' or that they knew about their homosexuality for as long as they've been aware of themselves as sexual beings. Is this not evidence of a powerful biological drive? Not necessarily, because it is also consistent with the idea of sexuality as co-determined by biology and environment. Race is a social construct, and its experience is felt from the moment we begin our lives."); *see also G.G. v. Gloucester County Sch. Bd.*, 853 F.3d 729, 730 (4th Cir. 2017) (Davis, J., concurring) ("[Gavin Grimm's] plight has shown us the inequities that arise when the government organizes society by outdated constructs like biological sex and gender.")

[*This page intentionally left blank*]

Statement of Commissioner Michael Yaki

The concept of what constitutes "rights" has been fluid throughout time. At the time of the Founders, the notion of liberty was viewed through a lens of a land-owning white male. Freedom of speech, of religion, the freedom to assemble and speak were all, to be true, radical notions in the day. There was, in fact much debate whether these "rights" should be enshrined at all—these rights being the first ten amendments to the Constitution. Some argued government had no right to put these into the Constitution. Others, perhaps more presciently, were concerned that listing enumerated rights meant *expressio unius est exclusio alterius*—the mention of one thing amounts to the exclusion of others, and thus, nothing else could be considered now or in the future.

As we know now, a Constitution that once counted black Americans as three-fifths the worth a white American for the purposes of apportionment has been changed, through the adoption of the Thirteenth and Fourteenth Amendments, to mean something entirely different. While the Equal Protection Clause of the Fourteenth Amendment does not enumerate to whom those protections extend, jurisprudence over a century has sought to define it to mean the "suspect classes" of race, religion, and national origin. Thus, even now, *expressio unius est exclusio alterius* continues to vex constitutional scholars, Supreme Court justices, and policymakers in terms of who is entitled to equal protection.

For members of the lesbian, gay, bisexual and transgender community, the struggle to receive recognition, to be given the same rights and treatment as other Americans, has been difficult. As an elected official, I voted for the first domestic partnership registry in America, and was proud to officiate at the first ceremonies in San Francisco City Hall. From those first domestic partnerships to the U.S. Supreme Court's recognition of the right to marry[1] less than twenty years later, the strides made by the LGBT community have been significant. The fundamental right to marry, however, has not been met by equal strides in other areas of civil rights—to the point of this report, in the area of employment discrimination. Yet even today, they fight to not be excluded from the broad protections afforded other oppressed groups under the Constitution and our laws.

I. A Seminal Report at a Critical Time

As a prefatory comment, the Commission has been in existence for sixty years. This year, its' sixtieth, marks the first instance in which the Commission has undertaken and published an investigation focused solely upon the civil rights burdens suffered by lesbian, gay, bisexual, and transgender ("LGBT") people.[2] I thank my esteemed colleague, the Honorable Roberta

[1] *Obergefell v. Hodges*, 576 US ___ (2015).
[2] In its 2011 statutory enforcement report, the Commission addressed problems faced by LGBT youth alongside an examination of youth targeted due to sex, race and national origin, disability, and religion. *See* U.S. Commission on

Achtenberg, for bringing this inquiry before the Commission. The Commission's briefing was powerful.[3] Our report[4] is very thoroughly researched and written. It is comprehensive and explains the often-painful, real-life implications of federal, state, and private sector employment discrimination against LGBT people in great detail. The findings and recommendations are clear, succinct, well-grounded, and powerful. This project deservedly takes its place among our finest work.[5]

Our nation's LGBT population has a vulnerability unique among all those whom the Commission is mandated to protect: it is the only class under our jurisdiction which lacks the shelter of at least one powerful, civilian, federal statutory protection. The right to marry does not have transitive properties, at least in terms of the qualities that, to date, the Courts have looked at for protection under the Civil Rights Act of 1964. Yet, it is undisputed that LGBT Americans have faced and still face invidious discrimination at the hands of the government and private sectors. Therefore, the Commission has a special duty to be mindful of civil rights deprivations faced by LGBT Americans, to investigate and publicize those abridgements, and to recommend loudly and clearly to the Congress and the President actions which the federal government must take to remediate and prevent such abuses. With regard to our LGBT community, the Commission has a special obligation to fulfill its role as the conscience of the nation, and sound alarms as current and future developments may dictate.

The Commission's far-reaching report comes at a critical juncture of the incremental march toward full legal equality and social inclusion for LGBT people in this country. The obstacles have been many, as homophobia and transphobia have long permeated the American worldview. Until 1973, the American Psychiatric Association classified a homosexual orientation as a mental disorder[6]—and it considered a transgender identity in the same category until 2012.[7] States had the ability to—and did—criminalize intimate same-sex conduct between consenting adults and imprison "offenders" until the U.S. Supreme Court put an end to so-called "sodomy laws" a mere fourteen

[7] Moleiro and Pinto, n. 6 *supra.*

years ago in 2003.[8] The challenges remain intense, as many powerful fundamentalist Christian and other conservative groups vociferously oppose legal and social equality for LGBT people.

It is in this context, therefore, that sexual orientation was hardly mentioned, let alone even considered for inclusion, when courts began naming those characteristics that required greater scrutiny as they began to interpret the breadth of the Equal Protection Clause. And by omission—by *exclusion alterius*—the issue of sexual orientation remained in the closet of jurisprudence for much of the 20th century.

Since the final quarter of the 20th century, many sectors of American society have been moving, inch by inch, toward the end of marginalization and demonization of LGBT people in society.[9] We can only hope that these changes in social attitudes will erode the pervasive discrimination which LGBT people face in the employment sector. And where changes in social attitude move deliberately, the swifter enactment of laws to protect LGBT people, as this report recommends, becomes more important.

II. The Federal Government's (Forgotten?) History of Perpetuating Employment Discrimination Against LGBT People: 1940s through the 1970s

From the 1940s into the 1970s, the federal government was no mere bystander in the societal discrimination against the LGBT community. To the contrary, it was an overt proponent of employment discrimination against LGBT people. Many "homosexuals and other sex perverts" lost their federal jobs during the "Lavender Scare" that began in the Truman Administration.[10] This purge was fueled when:

[9] *See, e.g.*, GALLUP News, "Gay and Lesbian Rights," 2017, *available at* http://news.gallup.com/poll/1651/gay-lesbian-rights.aspx; Pew Research Center, Religion and Public Life, "Changing Attitudes on Gay Marriage," June 26, 2017, *available at* http://www.pewforum.org/fact-sheet/changing-attitudes-on-gay-marriage/; and Andrew R. Flores, "National Trends in Public Opinion on LGBT Rights in the United States," The Williams Institute, November 2014, *available at* https://williamsinstitute.law.ucla.edu/wp-content/uploads/POP-natl-trends-nov-2014.pdf.

For information on "acceptance" of homosexuality across the globe, with better statistics coming in general from more affluent and less religious nations, *see, e.g.*, Pew Research Center, Global Attitudes and Trends, "The Global Divide on Homosexuality," June 4, 2013, *available at* http://www.pewglobal.org/2013/06/04/the-global-divide-on-homosexuality/. Of note is this Commissioner's objection to the notion of the terminology and concept of "acceptance" of homosexuality or any status on the LGBTQ (lesbian, gay, bisexual, transgender, and queer) spectrum, while recognizing its widespread use in social discourse and academic parlance. These human conditions simply exist. "Accepting" them is not the core issue, as people do not have the right to "accept" people—or not—based upon race, color, sex, national origin, age, disability status, gender identity, sexual orientation, or any other inherent characteristic. People simply are who they are. Merely recognizing their existence and valuing the equality of all individuals, regardless of sexual orientation or gender identity, is at the center of a compassionate value system.

[10] *See, e.g.*, David K. Johnson, The Lavender Scare: The Cold War Persecution of Gays and Lesbians in the Federal Government, The University of Chicago Press, 2004; U.S. Merit Systems Protection Board, "Sexual Orientation and the Federal Workplace: Policy and Perception: A Report to the President and Congress of the United States," May

> the U.S. Senate created a subcommittee, chaired by North Carolina Senator Clyde Hoey, to evaluate the threat homosexuals presented to public civil service and national security. [fn. 10: *See generally* JOHNSON, *supra* note 1, at 101-18 (providing a thorough account of the subcommittee's investigation, the evidence it ignored, and its report).] In December 1950, the Hoey Subcommittee issued its report, entitled *Employment of Homosexuals and Other Sex Perverts in Government*, unanimously concluding that those who engage in acts of homosexuality and other perverted sex activities are unsuitable for employment in the Federal Government. In the committee's view, homosexuals and other sex perverts should be barred from civil service positions, those who were already employed should be fired, and the government should expend resources to aggressively ferret them out. [fn. 11: S. COMM. ON EXPENDITURES IN THE EXEC. DEP'T, SUBCOMM. ON INVESTIGATIONS, 81ST CONG. 2ND SESS., EMPLOYMENT OF HOMOSEXUALS AND OTHER SEX PERVERTS IN GOVERNMENT 4527-4528 (Cong. Rec. Vol. 96 1950). The report stated "It is the opinion of this subcommittee that those who engage in acts of homosexuality and other perverted sex activities are unsuitable for employment in the Federal Government. This conclusion is based upon the fact that persons who indulge in such degraded activity are committing not only illegal and immoral acts, but they also constitute security risks in positions of public trust."][11]

In 1953, President Eisenhower issued Executive Order 10450, "Security Requirements for Government Employment," which effectively prohibited the United States government from retaining or employing in the first instance anyone who engaged in "sexual perversion."[12] Thousands of LGBT federal employees were fired simply due to their sexual orientation, and thousands of applicants were denied jobs.[13] "Although we will never know the exact number of individuals who were denied employment or who had their employment terminated based on their

[11] Sears, Hunter, and Mallory, "Documenting Discrimination on the Basis of Sexual Orientation and Gender Identity in State Employment," p. 5–4, n. 7 *supra*, *available at* https://williamsinstitute.law.ucla.edu/wp-content/uploads/5_History.pdf.

[12] Executive Order 10450, "Security Requirements for Government Employment," Sec. 8(a)(1)(iii), 3 CFR, 1949-1953 Comp., p. 396, April 27, 1953, *available at* https://www.archives.gov/federal-register/codification/executive-order/10450.html.

Ironically, President Eisenhower advocated for the creation of this United States Commission on Civil Rights as part of the Civil Rights Act of 1957 (Pub.L. 85-315, 71 Stat. 634). The juxtaposition of these two actions of his demonstrates just how far removed from the civil rights domain any consideration of LGBT rights remained.

[13] *See, e.g.*, Capehart, Jonathan, "Frank Kameny: American Hero," The Washington Post, October 21, 2011, *available at* https://www.washingtonpost.com/blogs/post-partisan/post/frank-kameny-american-hero/2011/03/04/gIQAH2DRfL_blog.html; and Sears, Hunter, and Mallory, n. 8 *supra*.

actual or assumed sexual orientation, one estimate places this number between 7,000 and 10,000 in the 1950s alone."[14] State and local employment purges were common as well.[15]

The ban remained in full effect for twenty years. In 1973, the U.S. District Court for the District of Columbia ruled, upon motion from two gay men denied continued federal employment, that "the [Civil Service] Commission *is* prohibited from excluding plaintiffs from federal employment unless *particular* circumstances are enumerated which may justify dismissal on charges relating to homosexual conduct."[16]

However,

> [i]t was not until July 1975 that the CSC announced a new approach to determining the suitability of homosexual applicants for Federal employment. The CSC stated that the new guidelines were a significant change from past policies and were a result of court decisions requiring that persons not be disqualified from Federal employment based solely on homosexual conduct. The new guidelines applied the same standards to evaluating sexual conduct, whether heterosexual or homosexual. Although applicants could no longer "be found unsuitable based on unsubstantiated conclusions concerning possible embarrassment for the Federal service, a person may be dismissed or found unsuitable where the evidence exists that sexual conduct affects job fitness." [orig. fn. 86: "Homosexual Hiring is Revised by U.S.," The New York Times, July 4, 1975, p. 45.]
>
> This change in policy was not absolute, however—the CIA and FBI were exempted from its requirements.[17]

LGBT people's access to security clearances may have been negatively impacted by vague, hold-ever rules until as late as 1991[18] or even 1995.[19] No President put forth any openly LGBT candidate for a position requiring Senate confirmation until President Bill Clinton nominated our recent Commissioner Roberta Achtenberg for Assistant Secretary of Fair Housing and Equal Opportunity at Housing and Urban Development in 1993, who prevailed after a deeply homophobic effort to deny her confirmation.[20] We did not have an openly LGBT U.S. Ambassador until James Hormel

was put in place by virtue of President Clinton's recess appointment in 1999,[21] an appointment held up by a vicious and bigoted smear campaign launched by extremist groups. Until the 2011 implementation of the Don't Ask, Don't Tell Repeal Act of 2010, lesbians, gay men, and bisexuals could not serve openly in our military.[22] The U.S. Supreme Court finally capped decades of social and political debate, legislation, and litigation by recognizing that the fundamental right to marriage extends to same-sex couples as recently as 2015.[23]

III. Selected Historical Efforts by LGBT Americans to Foster Inclusivity

The recent progress, of course, has been no accident. It is fueled by the decades of momentum created by brave LGBT Americans who risked prosecution, careers, and families to come together, to stand up publicly against condemnation and criminalization, and to demand their rights to full equality.

Activist Harry Hay and others co-founded the Mattachine Society in 1951 for purposes of furthering societal equality and also personal growth. The Mattachine Society . . . began sponsoring discussion groups in 1951, providing lesbians and gay men an opportunity to share openly, often for the first time, their feelings and experiences. The meetings were frequently emotional and cathartic.[24]

It was 2016 before we had our first openly LGBT Service Secretary, Eric Fanning, Secretary of the Army. *See. e.g.*, Aaron Mehta and Joe Gould, "Senate Confirms Eric Fanning, First Openly Gay Service Secretary," Defense News, May 17, 2016, *available at* https://www.defensenews.com/interviews/2016/05/17/senate-confirms-eric-fanning-first-openly-gay-service-secretary/.

[23] *Obergefell v. Hodges*, n. 1 *supra.*

[24] Craig Kacaorowski, "Mattachine Society," glbtq, Inc., 2004, *available at* http://www.glbtqarchive.com/ssh/mattachine_society_S.pdf. A friend and fellow activist of Mr. Hay's, Phyllis Lyon, said, "He was marvelous. "He was one of the first to remind us we need to stop, to consolidate our efforts," said Lyon, who with her partner Del Martin, founded the nation's first lesbian rights organization, the Daughters of Bilitis in 1955. "He was really the originator of the concept of gays, lesbians, bisexuals and transgender people as a minority to be reckoned with."

The Mattachine Society's visionary Statement of Purpose, which set forth the road map on which the movement for full LGBT inclusion and equality yet travels, states

> It is the purpose of this organization to act by any lawful means:
>
> (a) To secure for homosexuals the right to life, liberty, and the pursuit of happiness, as proclaimed for all men by the Declaration of Independence; and to secure for homosexuals the basic rights and liberties established by the word and the spirit of the Constitution of the United States;
>
> (b) To equalize the status and position of the homosexual with those of the heterosexual by achieving equality under law, equality of opportunity, equality in the society of his fellow men, and be eliminating adverse prejudice, both private and official;
>
> (c) To secure for the homosexual the right, as a human being, to develop and achieve his full potential and dignity, and the right, as a citizen, to make his maximum contribution to the society in which he lives.[25]

This succinct credo has shaped, both by design and by virtue of common sense, the LGBT civil rights movement.

Life-long couple Phyllis Lyon and Del Martin co-founded the Daughters of Bilitis in 1955 for women. They offered private and public meetings regarding homosexuality.[26] Their iconic newsletter, "The Ladder," reached isolated women and offered hope and empowerment for many years.[27] Del Martin and Phyllis Lyon were the first couple married when San Francisco, CA offered same-sex marriage certificates in 2004, and again in 2008 when the state of California recognized marriage equality. Unfortunately, Del Martin did not live to see marriage equality become the law of the land.[28]

The Daughters of Bilitis also rallied the community against abusive police raids on neighborhood LGBT bars.[29] Transgender people, including Marsha P. Johnson and Sylvia Rivera, took their place alongside lesbians and gay men in the public fight for equality at the Stonewall Riots in New York City which ushered in a new era in the march for LGBT equality.[30]

When the Stonewall Riots began in Greenwich Village on June 28, 1969, neighborhood bars where LGBT people gathered across the country were no strangers to police raids. These raids were carried out to, often under the pretext of stopping illegal liquor and cigarette sales, to harass, intimidate and subjugate the LGBT community because they had to create their own public places in which to congregate.[31] When police conducted a raid at the Stonewall Inn on that fateful night,

> [a] crowd had gathered outside the tavern by the time the police were ready to load up their wagons with contraband alcohol, Stonewall employees, and unhappy bar goers. When the cops started to manhandle their unruly prisoners, the onlookers became enraged, throwing coins, stones, and bottles at the officers. The police, a few prisoners, and a writer from the Village Voice who had noticed the fracas from his nearby office, were forced to retreat into the bar, which the mob then tried to set on fire. The cops were eventually rescued with the intervention of the fire department and the riot squad, which dispersed the crowd. But low-level protests lasted for four more days, flaring up for a final time on Wednesday, when the Voice published an inflammatory account of the uprising. Why did the gays of Christopher Street suddenly fight back after decades of persecution? Witness Morty Manford likened the melee to "a slight lancing of the festering wound of anger at this kind of unfair harassment and prejudice." He said, "We had just been kicked and punched around symbolically by the police. They weren't doing this at heterosexual bars. And it's not my fault that the local bar is run by organized crime and is taking payoffs and doesn't have a liquor license."[32]

[32] *Id.*

There were at least two known instances prior to the Stonewall Riots when gay patrons of gathering places resisted arrest.

In May 1959, a skirmish broke out around Cooper's Doughnuts, a shabby all-night Los Angeles coffee shop frequented by hustlers and their customers, when gays threw coffee cups and paper plates at police officers rather than submit to arbitrary arrests. This "was perhaps the first homosexual uprising in the world," according to Gay L.A. . . . Similarly, in the summer of 1966, transvestite patrons of Compton's Cafeteria in San Francisco's Tenderloin district fought with cops who were trying to detain them. Again, the incident failed to generate attention.

Id.

Perhaps buoyed by the energy of post-Stonewall community activism—and understanding that changing the laws that oppressed them could only be done through the political process—LGBT people began to openly enter the world of elected public service in the mid-1970s. In 1974, 21-year old Kathy Kozachenko become the nation's first openly LGBT elected official when she won a seat on the Ann Arbor, MI City Council.[33]

Harvey Milk, a child of Lithuanian Jewish immigrants,[34] a Navy veteran,[35] and the "Mayor of Castro Street,"[36] became California's first openly LGBT public official upon his election to the San Francisco Board of Supervisors in 1977.[37] He was quickly able to garner more than enough votes needed to pass a landmark gay rights ordinance, with ten out of the eleven Supervisors voting in support.[38] His brief eleven months in office came to a tragic end as former Supervisor Dan White—the only Supervisor who voted against the gay rights ordinance—gunned him down, along with Mayor George Moscone, in San Francisco City Hall on November 27, 1978.[39]

Sen. Dianne Feinstein, then the president of the Board of Supervisors who would become mayor upon Moscone's death, was in City Hall when the killings occurred and found Milk's body. "I put my finger to see if there was any pulse, and it went in a bullet hole in his chest," Feinstein told The Chronicle's Carl Nolte in 2003. "I think of it as if it were yesterday. I remember Harvey's body, his blood on me. I see it all." Both Moscone and Milk died instantly.

Id.

Before his brutal end at age forty-eight, Supervisor Milk was aware of death threats. He hoped, unfortunately prophetically, that "[i]f a bullet should enter my brain, let that bullet shatter every closet door."

Jamie McGonnigal, "In Memoriam: 'If a bullet should enter my brain, let that bullet shatter every closet door,'" LGBTQ Nation, November 2011, *available at* https://www.lgbtqnation.com/2011/11/if-a-bullet-should-enter-my-brain-let-that-bullet-shatter-every-closet-door/.

Given the seminal nature of his San Francisco gay rights ordinance banning discrimination in public accommodations, housing, and employment, and the impact of the "White Night Riots"—which erupted in San Francisco on Mary 21, 1979, the night that his killer was given a light sentence for manslaughter—it is safe to say that Dan White's bullets helped to shatter closet doors for generations yet to come.

See, e.g., Martin Stezano, "What Were the White Night Riots?," History, June 2017, *available at* http://www.history.com/news/ask-history/what-were-the-white-night-riots.

Milk's assassination galvanized a generation of LGBT leadership that continue to this day. In 1987, Barney Frank (D-MA) became the first sitting Member of Congress to publicly identify as LGBT.[40] Rep. Frank served in Congress from 1981 to 2013, and "was the primary sponsor of 31 bills that were enacted," including the 2010 Dodd-Frank Act which precipitated an overhaul of the American finance industry.[41] A powerful and outspoken leader, Rep. Frank was Chair of the House Financial Services Committee.[42] In 2012, Rep. Frank became the first sitting Member of Congress to marry a same-sex spouse.[43]

Today, a record six openly LGBT members serve in the U.S. House of Representatives: Reps. David Cicilline (D-RI), Sean Patrick Maloney (D-NY), Mark Pocan (D-WI), Jared Polis (D-CO), Kyrsten Sinema (D-AZ), and Mark Takano (D-CA).[44] November 2012 saw the election of the country's first openly LGBT Senator, the former Representative Tammy Baldwin (D-WI).[45] At the state level, Oregon elected our country's first openly LGBT Governor, Kate Brown, in 2016.[46] That these public officials display integrity and commitment to serving all constituents during this difficult era in progressive politics is more than laudable.

IV. The White House Fuels A Rising Tide of Inequality

Despite this Report's recommendations, and despite the progress made by the LGBT community, it is clear that in today's climate, no gains are safe. No one who values LGBT equality can rest easily, despite decades' worth of advancements. In stark contrast to the time of the Commission's 2015 briefing on these issues, the American political landscape is at an inflection point that can

move our nation forward, or send it backwards in a reactionary reflex to a time prior to the creation of the Commission. Recent progress is being actively and speedily undone.

Actions taken by President Trump and his administration, some of which are highlighted below, underscore the importance and timeliness of the Commission's report, including its Findings and Recommendations. Executive Branch documents on which the proverbial—or literal—ink is barely dry increase the urgency of the Commission's recommendations and decrease the likelihood that they will be honored in the near term. It is vitally important that Congress enact the Commission's recommendation to explicitly ban discrimination in the workplace based on sexual orientation and gender identity."[47] As this Administration revels in the cultural wars that it has created, Congress must act to even out an incomplete and contradictory patchwork of state and local laws, and to acknowledge that nothing akin to the federal government's reprehensible "Lavender Scare"[48] could be repeated.

During the 2016 Presidential campaign, then-candidate Trump worked hard to project the image of a devoted supporter of LGBT people.[49] However, the early record of his administration is replete with actions demonstrating that he is anything but interested in protecting LGBT Americans. This President is quickly building a legacy of transphobic and homophobic public policies.[50] Whether

[49] During the campaign, then-candidate Trump made the following statements:

"'People are people to me, and everyone should be protected,' he told The Washington Post in a May 2016 interview." Anne Gearan, "White House Spokeswoman Says Trump and Alabama's Roy Moore 'Don't Agree' on Gay Rights," The Washington Post, September 28, 2017, *available at* https://www.washingtonpost.com/news/post-politics/wp/2017/09/28/white-house-spokeswoman-says-trump-and-alabamas-roy-moore-dont-agree-on-gay-rights/

"Ask yourself who is really the friend of women and the L.G.B.T. community, Donald Trump with actions or Hillary Clinton with her words?", he said. "I will tell you who the better friend is, and someday I believe that will be proven out, big-league." Haberman, Maggie, "Furious Gay Rights Advocates See Trump's 'True Colors,'" The New York Times, July 26, 2017, *available at* https://www.nytimes.com/2017/07/26/us/politics/furious-gay-rights-advocates-see-trumps-true-colors.html. "I will do everything in my power to protect our L.G.T.B.Q. citizens from the violence and oppression of a hateful foreign ideology." *Id.*

Commentators note that

Trump is only a few months into his presidency, and we've already seen a quiet but steady chipping away of protections for LGBT Americans. This president may have said he would be great for the LGBT community, but actions speak louder than words. And it's clear his veneer of inclusion can't hide the intent of his administration to make the lives of LGBT people, young and old, more difficult.

Lanae Erickson Hatalsky and Nathan Kasai, "Trump's Quiet War Against LGBT Americans," Newsweek, April 24, 2017, *available at* https://www.usnews.com/opinion/civil-wars/articles/2017-04-24/donald-trumps-guerrilla-war-against-against-lgbt-americans. *See also* Emanuella Grinberg, "The First 100 Days in LGBT Rights," CNN, April 28, 2017., *available at* http://www.cnn.com/2017/04/28/politics/first-100-days-lgbt-rights-trnd/index.html.

Depending upon the actions of the judicial nominees whom he may be successful in placing on the federal bench, including, of course, the U.S. Supreme Court, this legacy will likely live long past 2020 or 2024. *See, e.g.*, Mark Joseph Stern, "Obergefell is Already Under Attack," *Slate*, September 20, 2017, *available at* http://www.slate.com/articles/news_and_politics/jurisprudence/2017/09/trump_is_laying_the_groundwork_to_overturn_marriage_equality.html.

or not a specific action which negatively impacts upon LGBT people directly affects workplace discrimination is not germane to this overarching inquiry; all pieces of this puzzle are interconnected, and the removal of one threatens the stability of all.

If Trump meant any word of his pre-election pronouncements, then he should waste little time in using one of his many Executive Orders to implement our specific recommendation that "federal agencies including the Departments of Justice and Labor, the Equal Employment Opportunity Commission, and the Office of Personnel Management should issue and—where relevant—reaffirm specific guidance for federal and private employers outlining protections for LGBT individuals in the workforce, including specifically enumerating protections for transgender persons."[51] Yet it is evident that the difference between candidate Trump and President Trump on the issue of LGBT rights and protections is stark. Already, some federal agencies have already taken actions which contravene the Commission's specific call for protection, changing the terms of engagement and likely rendering the enforcement issues moot.

It is particularly sad and disturbing that the new Administration's first public anti-LGBT action was aimed at children and youth. In February 2017, Attorney General Jeff Sessions and Education Secretary Betsy DeVos, at the direction of the President, rolled back protections of Title IX of the Civil Rights Act of 1964 which the Obama Administration had interpreted as allowing transgender youth to use the school bathrooms that aligned with their gender identities.[52] For an Administration which has trumpeted, through its First Lady, an anti-bullying manifesto, this action seems particularly cruel and hypocritical.

Also sadly, but predictably, the President struck a blow against LGBT workplace protections in March 2017 (and as discussed in the report) when he made it easier for federal contractors to discriminate against LGBT employees or prospective workers. Executive Order 13673 required federal contractors to demonstrate compliance with the antidiscrimination requirements of Executive Order 13672 and other Executive Orders and federal laws.

The U.S. military has historically been a battleground for recognition of LGBT rights. From the first tentative steps of "don't ask, don't tell" of the Clinton Administration to the full integration of LGBT servicepersons during the Obama administration, the rights of LGBT to serve our country has been, unfortunately, a continuing flashpoint of controversy. Yet, until recently, the issue had been swiftly and surely receding. However, the President broadcasted a series of morning tweets on July 26, 2017,[53] apparently issued to the surprise of military leadership—despite the fact that he claimed consultation with them[54]—announcing that transgender people would no longer be allowed to serve in the U.S. military. He cited the "tremendous medical costs" associated with their care and the "disruption" they create as justification.[55] The President's reasoning for reversing existing policy is specious at best and transphobic at worst.

The two leading studies on the question of the military's medical costs associated with transgender service members to be anything but "tremendous." A better word, in the context of the military's astronomical budget, might be "miniscule." The RAND Corporation estimates the annual costs to be in the range of $2.4 to $8 million dollars.[56] The New England Journal of Medicine estimates $5.6 million annually.[57]

These numbers are the size of a speck of dust in the military's annual budget of $496 billion. They still pale in comparison to the military's reported annual expenditure of $64.4 million for Viagra and Cialis.[58] "Tremendous?" No. Taking this to scale, the annual costs projected for transgender

service members is akin to a federal budget rounding error. Further, discharging transgender service members is estimated to cost $960 million—more than the equivalent of over a decade's worth of their medical care.[59] In other words, notwithstanding whether there can even be an economic justification for the transgression of civil rights, the lie behind the President's statements is laid bare by even the most cursory of analysis.

The President cited the "disruption" which, by their very presence in the military, he apparently believes that transgender people create. Again, evidence that transgender people create disruption in the military is lacking. To the contrary, based on analysis of other nations which permit military service by transgender people, the RAND Corporation found that disruption was not inherent and that straightforward policy changes could minimize any impact upon unit cohesion.[60] At least eighteen of our sister nations across the globe allow transgender service members to serve openly.[61]

On the same day on which the President tweeted that transgender service members would be removed, his Department of Justice inserted itself into federal litigation involving civilian workplace protections for LGBT people. The Department, as an uninvited participant, is using the private litigation between a fired gay worker and his former employee as a forum in which to argue that Title IX of the Civil Rights Act of 1964 does not protect LGBT people from employment discrimination. This is starkly and sadly in opposition to a 2015 decision by the Equal Employment Opportunity Commission.[62]

The Commission has recommended that "[w]orkplace discrimination data should be collected through the inclusion of sexual orientation and gender identity questions in population-based surveys of the workforce such as the Census, American Community Survey, and surveys fielded by the Bureau of Labor Statistics and other agencies."[63] This worthy recommendation is likely to be ignored as well. The Census Bureau has already removed planned questions involving gender

---

[59] The Palm Center reports that "[t]he upshot of our analysis is that implementing President Trump's transgender service ban would cost $75,000 per person in order to accrue an annual savings of $656 per person. For the military as a whole, fully implementing President Trump's ban would cost $960 million in pursuit of saving $8.4 million per year." Aaron Belkin, Frank J. Barrett, Mark J. Eitelberg, and Marc J. Ventresca, "Discharging Transgender Troops Would Cost $960 Million," Palm Center, August 2017, p. 1, *available* at http://www.palmcenter.org/wp-content/uploads/2017/08/cost-of-firing-trans-troops-3.pdf.

[63] USCCR Report, p. 73, n. 4 *supra.*

identity and sexual orientation from the 2020 Census.[64] Further, federal survey questions regarding use of services by homeless and elderly LGBT people are on the chopping block. Sadly,

> [c]ombined with the withdrawal of another planned survey evaluating the effectiveness of a homelessness project for lesbian, gay, bisexual and transgender youth, the moves have alarmed watchdogs who worry they may point to a manipulation of government data collection to serve the ideology of a government they view as hostile to their causes.[65]

Even as the approved text of the Commission's report was being prepared for release, the President and his administration took additional actions against LGBT people's right to employment protection.

First, on October 4, 2017, the Department of Justice dismantled a powerful tool for the protection of transgender people in the workplace. It rescinded the Obama-era interpretation of the Civil Rights Act of 1964 Title VII as providing protection for transgender workers.[66] This Administration believes that Title VII "only prohibits discrimination on the basis of a worker's biological sex, and not their gender identity."[67]

Second, on October 6, 2017, the Administration took aim at employment protections for all LGBT people under the guise of "religious liberty." The Commission addressed this critical and highly-charged issue:

> Title VII offers a workable model for protecting religious freedom in the context of federal statutory nondiscrimination protections in the workplace. In *Hosanna-Tabor Evangelical Lutheran Church and School v. Equal Employment Opportunity Commission* the Supreme Court also unanimously endorsed the common law ministerial exemption, which recognizes the right of religious groups to select their own ministers and clergy. No further expansion of exceptions to nondiscrimination protections in the workplace are necessary or warranted to balance the rights to

> freedom of religion and to nondiscrimination on the bases either of religion or LGBT status.[68]

To the contrary, however, the Department of Justice published guidance directing the "interpreting religious liberty protections in federal law" in accordance with the President's May 2016 Executive Order 13798.[69] After setting forth the precept that stating that "individuals and organizations do not give up their religious-liberty [sic] protections by . . . seeking to earn or earning a living; [or] by employing others to do the same"[70] this guidance implicitly allows religious businesses—which openly agitated for this interpretation—to decline to hire LGBT people if the religion holds anti-LGBT beliefs.

Even more alarmingly, the guidance implicitly seeks to expand dramatically the reach of the Religious Freedom Restoration Act ("RFRA"), which, on its face, protects only the First Amendment Free Exercise rights of a "person."[71] The U.S. Supreme Court expanded that reach, holding in *Burwell v. Hobby Lobby*[72] that the federal RFRA prevents the government from dictating the religiously-motivated behavior of "a closely held, for-profit corporation."[73] The guidance rides the *Hobby Lobby* toboggan as it boldly careens down a slippery slope, declaring—in the apparent absence of statutory or judicial authority—"RFRA protects the exercise of religion by individuals and by *corporations, companies, associations, firms, partnerships, societies, and joint stock companies*."[74] It is unclear whether the Attorney General's twisted interpretation has, in fact, any legal authority. But many will take the guidance at face value.

V. Conclusion

As this statement was being written, the President became the first sitting President to address [an] anti-LGBTQ event.[75] He boasted about his new "religious freedom" guidance (as discussed above)

[75] Paige Lavender, "Trump Becomes First Sitting President to Address Anti-LGBTQ Event," The Huffington Post, October 13, 2017, *available at* https://www.huffingtonpost.com/entry/donald-trump-values-voter-summit_us_59e0b596e4b03a7be57fe666?ncid=inblnkushpmg00000009.

to the annual "Values Voter Summit" [76]organized by Family Research Council.[77] He spoke in full view of an audience that had been given pamphlets containing excerpts from "The Health Hazards of Homosexuality" and advertising the website www.HealthHazardsOfHomosexuality.info.[78] The pamphlet included statements that claimed that same-sex marriage "made sodomy a right" and that homosexuality was a mental disorder.[79] In the context of an event hosted by an organization that considers anyone in the LGTB community to be "unnatural"[80] and that the Bible punishes homosexuality[81] is it any wonder that many LGTB Americans would be alarmed when he said that his Administration was "returning moral clarity to our view of the world" and "stopping cold the attacks on Judeo-Christian values."[82]

So this President, who campaigned as a self-professed "friend . . . of the L.G.B.T. community,"[83] who compared himself to Secretary Hillary Clinton by averring, "I will tell you who the better friend is, and someday I believe that will be proven out, big-league,"[84] spoke proudly to an organization labelled an anti-LGBT hate group by the Southern Poverty Law Center.[85] It is in this context that the actions of the Administration become clear.

---

[76] *Id.*

[77] The Southern Poverty Law center states that "[t]he FRC often makes false claims about the LGBT community based on discredited research and junk science. The intention is to denigrate LGBT people as the organization battles against same-sex marriage, hate crime laws, anti-bullying programs and the repeal of the military's "Don't Ask, Don't Tell" policy." Southern Poverty Law Center, *available at* https://www.splcenter.org/fighting-hate/extremist-files/group/family-research-council

This incident underscores the fact that the Commission's report, especially when read in the context of all anti-LGBT actions by the current President and his Administration, is a call to action. The progress has been halted, the roll-backs are in motion, the need for immediate action is real. LGBT people, their allies (long including this Commissioner), and all who care about social justice and true equality for all must exercise vigilance in tracking new developments and participate in all non-violent and legal forms of activism to oppose setbacks. Without the pre-existing benefit of deeply-embedded federal and judicial protections, LGBT people are a fair target for discrimination by the government and private actors alike. It is apparently open season.

Despite the assurances from the candidate in 2016, the President and his Administration have taken actions in 2017 in contravention to the Commission's recommendations before the Commission could even get its report out the door or before this Commissioner could hit save on the final version of this Statement. For many in the LGTB community, it is dismaying that the President and this Administration have taken actions that appear to be committed to targeting LGBT people for the denial of hard-won basic rights and protections as minority members of our society. This behavior is decidedly un-American. It is vicious, spiteful, exclusionary, and—at its most basic—needless. The LGBT civil rights quest has never been about the dreaded boogeyman of "special rights." It is a search for mere equality, not supremacy. It is the oft-repeated story of disqualifying the qualified because of fear, jealous, and hatred.

The breadth and pace of this Administration's actions underscore the need for all fair-minded Americans to practice vigilance and activism. Part of that activism must be work to try to prevent future dangers. Just how far will this President and his Administration go in trying to force LGBT people back into the proverbial closet and reduce their abilities to participate fully and openly in American life—to interfere with their pursuit of happiness? The federal actions since Inauguration Day, and the specter of what may yet be in the offing, especially in appointments to the judiciary, only emphasize the need for federal legislation barring employment discrimination which the Commission recommends. Most telling, a chilling harbinger of what is yet to come, is the President's open embrace of the possible election of a United States Senator[86] with a long history of virulently homophobic beliefs.[87]

---

[86] The President has articulated enthusiastic support for Roy Moore. "'Spoke to Roy Moore of Alabama last night for the first time. Sounds like a really great guy who ran a fantastic race. He will help to #MAGA!' the president tweeted, referring to his own "Make America Great Again" campaign slogan."
Julia Manchester, "Trump: Roy Moore 'Sounds Like a Really Great Guy,'" The Hill, September 27, 2017, *available at* http://thehill.com/homenews/administration/352616-trump-speaks-to-roy-moore-after-primary-victory-tweets-support.

[87] Roy Moore has likened homosexuality to bestiality. *See, e.g.*. Eugene Scott, "How Roy Moore's Rhetoric on Gays, Muslims Harks Back to Alabama's Past," The Washington Post, September 27, 2017, *available at* https://www.washingtonpost.com/news/the-fix/wp/2017/09/27/roy-moores-values-could-take-alabama-back-to-a-place-many-of-its-residents-have-tried-to-get-past/?utm_term=.3e245740a6f9.

It is more apparent than it has been in decades that LGBT people require even farther-reaching, more comprehensive, federal legal protections than just in the workplace. Such safeguards in the arenas of employment, public accommodation, housing, credit, and federally funded programs are feasible via amendments to the Civil Rights Act of 1964, the Fair Housing Act, and other federal laws. Such amendments would place sexual orientation and gender identity under the Acts' umbrellas as protected classes. The bipartisan Equality Act of 2017 seeks to do just that.[88] This is not fringe legislation; there are 197 co-sponsors in the House[89] and 45 co-sponsors in the Senate.[90] The Commission's next step in executing its duty to safeguard the civil rights of LGBT people should be to explore the broader issues which underlie the Equality Act and the remedies which it offers.

If there is any lesson from the recent events in Charlottesville, it is that the ugliness of racism, bigotry, homophobia, and transphobia still resides within a deep dark crevasse of the American soul. It is the duty of leaders in our government, especially the President, to denounce and deny these groups and individuals in the strongest possible terms. It is the duty of leaders in our government, especially the President, to take strong action to dismantle and disarm the leaders and the organizations that give bigotry, hatred, homophobia, and transphobia a voice. And it is the duty of our leaders in government, especially the President, to show that our government will enact laws to protect people from bigotry, hatred, homophobia, and transphobia.

This Commission has a duty to be the federal government's watchdog on civil rights, a mandate placed on it 60 years ago, a charge that requires us to give voice to the oppressed. It has been the Commission's voice that has spoken loudest when the civil rights laws of this country were required to be extended to other groups not named in the testimony surrounding the Civil Rights Act of 1964, as we did for women, as we did for the disabled, and as we do today for the LGBT community. It is a terrible day when the Oval Office chooses not just to ignore what we say on behalf of the American people, but to deliberately, and callously, act in opposition to the extension of these those hard-won civil rights to a group that is deserving and in need of their protection.

While Chief Justice of Alabama, Moore opined that "[h]omosexual conduct by its very nature is immoral, and its consequences are inherently destructive to the natural order of society." In *re D.H. v. H.H.*, Supreme Court of Alabama, Docket No. 1002045, decided February 15, 2002, *available at* http://caselaw.findlaw.com/al-supreme-court/1303306.html.

Dissenting Statement of Commissioner Gail Heriot

I have sympathy for some of the goals of the basic legislative proposal discussed in this Report. In a different world, I might have been able to support at least a more modest version of it. I continue to support Title VII of the Civil Rights Act of 1964's provisions prohibiting discrimination in employment on the basis of race, color, religion, sex and national origin. But, alas, given the ways in which that legislation has been misapplied over the years, I worry about the wisdom of expanding it further unless the expansion comes packaged with general Title VII reform.

For example, under current interpretations of Title VII, employers must endeavor to prevent their employees from engaging in the sexual harassment of their colleagues. That is a worthwhile goal. But the concept of sexual harassment has been given such a broad and vague construction that its effect has been to force employers to squelch not just sexual harassment, but free expression at the workplace.[1] By extending the reach of anti-discrimination laws to sexual orientation and gender identity, the proposed legislation would only compound this problem.

Quite apart from my concerns over the proposed legislation, I have concerns over this report's usefulness as a guide to Congress.[2] The data are not always presented fairly and in context. For example, by focusing on employee *perceptions* of discrimination, it almost certainly overstates the

---

[1] A good example of this is the recent firing of Google software engineer James Damore, which I discuss infra at Part IB(2).

[2] The report is unsatisfying in part because of an unbalanced record. Given that I had no fixed view on this particular issue—that is, I am not categorically against all anti-discrimination laws of this kind— I was looking forward to a balanced panel that could help me clarify my thinking. A balanced briefing on this topic should have had about the same number of witnesses who are generally for, as well as generally against, federal prohibitions on sexual orientation and gender identity discrimination in employment. Yet this briefing had 15 panelists generally in favor of such prohibitions and two generally against them. The Commission secured one of the two witnesses against—Ryan Anderson—at the very last minute, only after Commissioner Kirsanow and I complained vociferously about panel imbalance.

Although I was told that staff made a good-faith effort to secure a balanced panel and that the panel was imbalanced only because too many opponents declined to testify, that appears to be untrue. At a Commission business meeting on February 20, 2015, about three weeks before the briefing, the then-head of the Commission's Office for Civil Rights Research and Evaluation ("OCRE") happily said that she had already confirmed 13 witnesses and was looking to fill only two more slots.

See United States Commission on Civil Rights, Transcript of Business Meeting, February 20, 2015, 19-21, *available at* http://www.usccr.gov/calendar/trnscrpt/UNEDITEDCommissionMeetingTranscript_02-20-15.pdf.

After that meeting, OCRE agreed to provide us with a list of witnesses who had already been invited.

That list showed that only two critics of sexual orientation discrimination laws had been invited as of then. OCRE then tried to argue that the briefing was balanced because some potential panelists from the Human Rights Campaign and the Center for American Progress criticized the proposed federal Employment Non-Discrimination Act for not going far enough. These organizations are nonetheless strong supporters of ENDA's core prohibition on sexual orientation discrimination; the Human Rights Campaign at the time had a large banner on its website that said "Pass ENDA Now," and the proposed witness Gene Robinson of the Center for American Progress has gone so far as to assert that Christian opposition to ENDA would embarrass Jesus. *See* http://www.huffingtonpost.com/bishop-gene-robinson/enda-vote-jesus_b_4234440.html.

The notion that these panelists were interchangeable with conservatives and libertarians or made the panels more balanced was risible. I am forced to conclude that there never was a plan in place for a balanced briefing.

extent of discrimination based on sexual orientation. It states, for example, that "[s]tudies have found that anywhere from 21[3] to 47[4] percent of LGBT adults faced employment discrimination because they were gay or transgender." Rep. at 10. But the cited studies were all based on the *perceptions* of job applicants/employees (and the latter figure was for transgender/gender-nonconforming persons only). When one looks at the Equal Employment Opportunity Commission's statistics on the matter, one learns that "charges" of discrimination are not the same as actual discrimination. The vast majority of charges filed by job applicants/employees with the EEOC are found to be without merit. For Fiscal Year 2016, the EEOC found ***"No Reasonable Cause" for 67.6% of all LGBT-based charges.*** It found ***"Reasonable Cause" for only a tiny number—3.7% of LGBT-based charges.*** An additional 17.1% of charges were not pursued by the charging party.[5]

To be sure, this problem is not unique to LGBT-based charges of discrimination. EEOC data for Fiscal Year 2016 are similar for race-based charges (No Reasonable Cause 73.7%, Reasonable Cause 2.1%), religion-based charges (No Reasonable Cause 70.7%, Reasonable Cause 3.2%), and sex-based charges (No Reasonable Cause 64.2%, Reasonable Cause 3.2%).[6] Dealing with non-meritorious charges is part of the price we pay for our protections against employment discrimination, and it is a price we should be willing to pay in a well-functioning system that seeks to root out non-meritorious claims quickly and efficiently.[7] But in deciding whether to extend Title

---

[3] The 21 percent figure appears to be taken from a Pew Research Survey: http://www.pewresearch.org/fact-tank/2013/11/04/as-congress-considers-action-again-21-of-lgbt-adults-say-they-faced-workplace-discrimination/. The actual question was whether the respondent had been "treated unfairly by an employer because of their sexual orientation or gender identity (5% say this happened within the past year and 16% report that this happened but not within the past year)." Note that some of what respondents consider unfair treatment may not violate employment discrimination laws.

[4] *See* Jaime M. Grant, Lisa A. Mottet & Justin Tanis, Injustice at Every Turn: A Report of the National Transgender Discrimination Survey 51 (2011)("Forty-seven percent (47%) said they had experienced an adverse job outcome, such as being fired, not hired or denied a promotion because of being transgender/gender non-conforming"), *available at* http://www.thetaskforce.org/static_html/downloads/reports/reports/ntds_full.pdf. For a criticism of the methodology in this survey, see *infra* at 107.

[5] The rest of the cases were as follows: In 7.2%, some sort of settlement was arrived at without a finding of reasonable cause on the part of the EEOC. An additional 4.5% were classified as "withdrawals with benefits" in the sense that, while no official findings were ever arrived at, the employer gave the employee at least something in return for the withdrawal. Rep. at 13.

[6] Race-Based Charges, https://www.eeoc.gov/eeoc/statistics/enforcement/race.cfm; Religion-Based Charges, https://www.eeoc.gov/eeoc/statistics/enforcement/religion.cfm; Sex-Based Charges, https://www.eeoc.gov/eeoc/statistics/enforcement/sex.cfm.

[7] Note that as discrimination becomes more rare, the ratio of non-meritorious cases to meritorious cases likely gets higher. Since our system of rooting out non-meritorious cases leaves something to be desired, the downside of having a law against discrimination becomes more prominent. Commissioner Kladney argues that "even if discrimination were rare, we should still have a federal law prohibiting it because it is wrong each and every time it happens." Kladney Statement at 79. I wonder if he really means that. There are all sorts of ways in which an employer can act arbitrarily. Suppose, for example, I refuse to hire Commissioner Kladney because his given name is "David" and my ex-husband's name is David. Or I refuse to hire him because he rooted for the Indians instead of my beloved Cubs in the 2016 World Series . . . or because his wristwatch keeps better time than mine. All are bad reasons to deny someone a job. But the obvious solution for each would be for him to go onto the next opportunity. Since my hypothetical reasons for declining to hire him are so idiosyncratic, he is unlikely to be worse off. Just as there are a lot of fish in the sea, there are a lot of employers out there. If discrimination on the basis of sexual

VII's coverage, it is important that we understand that perceptions of discriminations on the part of job applicants/employees are just that—perceptions. To get a real estimate of the size of the problem of discrimination, one must try to dig deeper.

The misidentified statistics concerning "perceptions" of discrimination are not the only example. Parts of the Report positively bristle with statistics about various aspects of life in the LGBT community. But rather than take those statistics at face value, I would urge the reader to drill down to the material in the footnotes and to approach that material with a critical eye. Gathering statistics on the LGBT community requires researchers to find a broad, representative sample. That isn't as easy as it sounds, particularly for the transgender subset of the population, given its extremely small size. Some of the surveys cited in the report try to get around the difficulty by using problematic methodologies.

One survey cited in this report—*The National Transgender Discrimination Survey*—"decided to pay stipends to workers in homeless shelters, legal aid clinics, mobile health clinics and other service settings to host 'survey parties' to encourage respondents whose economic vulnerability, housing insecurity, or literacy level might pose particular barriers to participation."[8] While I respect the researchers' efforts to try to find hard-to-reach persons, it should not have been surprising that looking in these places tended to uncover lots of respondents with low incomes, spotty employment histories, and other personal difficulties. Would a different approach have yielded a brighter picture of what it is like to be transgender? That question cannot be answered with certainty, though it seems likely. But the Report makes no effort to grapple with these

---

orientation were rare to the point of being idiosyncratic, it's hard to see how Kladney could support its being outlawed, unless he would favor laws that employers can't make stupid decisions.

Commissioner Kladney makes another point in his Statement that deserves comment: He writes that most employers "are corporations, large and small, who take advantage of the legal protections and shields the government affords them" and that "[a]s such, they should be required to not discriminate against any qualified United States citizen in employment. To do so is not consistent with . . . American values." *Id.* This is another one that I have a hard time believing an easy-going guy like Commissioner Kladney really means. I can't imagine anything more inconsistent with American values than to demand that every employer who uses the corporate form (*i.e.* practically all private employers) act consistently with American values. A tolerant, plural society does not impose the values of the majority on everyone. That's what liberalism is supposed to be about (and what I thought it was about back in the days when I was a liberal).

[8] Approximately 500 out of a total of about 7,500 responses came from such efforts. The rest came through an online survey, which was evidently brought to the attention of potential respondents "through direct contacts with more than 800 transgender-led or transgender-serving community based organizations in the U.S." and "through 150 active online community listserves." See Jaime M. Grant, Lisa A. Mottet, & Justin Tanis, Injustice at Every Turn: A Report of the National Transgender Discrimination Survey at 12 (2011), *available at* http://www.thetaskforce.org/static_html/downloads/reports/reports/ntds_full.pdf. This methodology, of course, has its own problems.

The Report cites this survey for a variety of purposes. For example, it cites the survey in stating that "90 percent of transgender employees report experiencing some form of harassment or mistreatment on the job"—a figure it terms "staggering." Report at 11, n.54.

methodological issues, instead accepting at face value these surveys' assertions about the problems faced by transgender persons.[9]

A second example is the U.S. Transgender Survey, which is the largest survey of transgender persons taken to date, conducted in 2015.[10] The researchers responsible for it relied heavily on transgender advocacy organizations to disseminate the survey. That, of course, can lead to problems. We have no way of knowing whether transgender persons who have suffered from discrimination are more likely to respond to such surveys than those who have had no problems. But intuitively it certainly seems likely. The study's authors therefore cautioned readers:

> Although the intention was to recruit a sample that was as representative as possible of transgender people in the U.S., it is important to note that respondents in this study were not randomly sampled and the actual population characteristics of transgender people in the U.S. are not known. Therefore, it is not appropriate to generalize the findings in this study to all transgender people.[11]

This warning about the survey's limitations didn't make it into this Report. For this and other reasons, some of which I will have the opportunity to detail below, many of the factual assertions in this Report need to be taken with a grain of salt.

I. THE CASE FOR ANTI-DISCRIMINATION LEGISLATION FOR SEXUAL ORIENTATION IS SOMEWHAT WEAKER THAN THAT FOR RACE, COLOR, RELIGION, SEX AND NATIONAL ORIGIN IN 1964 AND HAS BEEN MADE WEAKER STILL BY SUBSEQUENT EVENTS. THE CASE FOR ANTI-DISCRIMINATION LEGISLATION FOR GENDER IDENTITY HAS BEEN RENDERED EVEN WEAKER ON ACCOUNT OF OVER-BROAD DRAFTING.

---

[9] The methodological problem with the use of the General Social Survey ("GSS") in this Report is less dramatic, but nonetheless serious. The GSS surveys a large random sample of the country, and its findings concerning the views of Americans in general can usually be considered methodologically sound. But the Williams Institute chose to rely on its data to look at the employment experiences of sexual minorities in particular. Unfortunately, the number of GSS respondents who qualify as members of sexual minorities is tiny—57 self-identified as lesbian, gay or bisexual. In addition, 23 did not identify as lesbian, gay or bisexual, but nonetheless disclosed that they had had same-sex sexual partners. This is out of a total of 3,559 respondents. Even if one can assume that 3,359 respondents can be broadly representative of the American population as a whole, it is not at all clear that 80 can represent lesbian, gay and bisexual Americans.

[10] Rep. at n. 96 and 98.

[11] Sandy E. James, Jody L. Herman, Susan Rankin, Mara Keisling, Lisa Mottet & Ma'ayan Anafi, The Report of the 2015 U.S. Transgender Survey, National Center for Transgender Equality at 26 (2016) *available at* https://www.transequality.org/sites/default/files/docs/usts/USTS%20Full%20Report%20-%20FINAL%201.6.17.pdf. This Report cited the 2015 U.S. Transgender Survey for the proposition that "Transgender individuals are three times as likely to be unemployed and are more than twice as likely to live in poverty compared to the rate in the U.S." Rep. at 15, n.71.

A. A Presumption in Favor of Freedom of Association Should Always Be Applied When Anti-Discrimination Legislation Is Proposed; While that Presumption Can Be (and Has Been) Overcome in the Right Cases, It Takes A Convincing Argument to Do So.

The report quotes Professor Andrew Koppelman for this: "The general principle governing transactions between private parties should be freedom of association, for reasons of both liberty and efficiency. Any departure from that rule, such as a prohibition of discrimination, has the burden of proof."[12]

Koppelman is no conservative. But nearly all conservatives as well as most moderates and liberals would likely agree: If one is going to depart from the ordinary rule that in a free society private parties get to decide for themselves how to order their activities, including how to hire employees for their businesses,[13] one must have a good reason.[14]

---

[12] Report at 49, *quoting* Andrew Koppelman, "Richard Epstein's Imperfect Understanding of Antidiscrimination Law, Library of Law and Liberty," January 2016, *available at* http://www.libertylawsite.org/liberty-forum/richard-epsteins-imperfect-understanding-of-antidiscrimination-law/.

[13] Interestingly, despite widespread agreement that race and sex discrimination are wrong, no one argues that prospective employees (as opposed to employers) should be prohibited from considering the race or sex of a prospective employer in deciding whether to apply for or accept an offer of employment.

[14] One person who seems not to agree is Commissioner Narasaki. Her statement seems to be premised on the notion that the freedom at stake in this area of the law is "freedom *from* discrimination" rather than freedom *of* association. Narasaki Statement at 81. As much as I respect Commissioner Narasaki, our views on the meaning of the word "freedom" and hence on the principles she identifies as fundamental to the founding of our nation could not be more different. Sometimes it is appropriate for the federal or state governments to coerce cooperation from private individuals (*i.e.* limit their freedom of association). But it is important not to lose sight of the fact that we are engaging in coercion, and dressing up coercion as providing "freedom *from*" this or that for others promotes unclear thinking. A free society must be ever vigilant before it encroaches on the freedom of private individuals (including employers) to choose the persons with whom they are willing to associate. As Koppelman put it, the "burden of proof" must always be on the advocates of departures from the basic rule of freedom of association.

As an American, I enjoy the Constitutional right to the free exercise of my religion. But I have no Constitutional right to require particular churches to accept me as one of their own. I have a right of free speech, but that does not include the power to coerce private individuals into buying my book.

Commissioner Narasaki uses *Obergefell v. Hodges*, 576 U.S. ___ (1976), as the starting point for her argument in favor of the proposed Employment Non-Discrimination Act. Since discrimination against same-sex marriage was prohibited in that case, it should be prohibited in employment as well—or so her argument goes. But *Obergefell* was not about the coercion of private individuals. It establishes a right of same-sex couples to marry, but it does not establish a right for individuals to marry someone who doesn't wish to marry them for reasons deemed arbitrary by the state.

For a law coercing individuals to marry someone they don't wish to marry, even if the reason given is arbitrary and capricious, would (I hope) take one heck of a reason. Coercing private employers to hire someone they don't wish to hire, even if their reason is rock stupid, presumably requires a lesser showing of necessity, but the presumption is still against it. In 1964, in passing Title VII to the Civil Rights Act, Congress decided that the problem of race, sex, religion, and national origin discrimination was so serious that the usual presumption in favor of freedom of association was overcome. But note that Congress did not decide that all wrongheaded decisions not to hire should be outlawed. It is still perfectly legal for an employer to be stupid. An employer can choose not to hire a job applicant because the applicant's hairstyle is too old-fashioned, the applicant used to date the employer's weird Cousin Cedric, the applicant is a Republican, the applicant is active in the Sierra Club, or the applicant is a devoted Star Trek fan.

How strong the presumption in favor of freedom of association should be is a question upon which reasonable minds will disagree. I'm not always sure myself. Reasonable individuals are on both sides of the question of whether

The reason for departing from that rule cannot be just that private parties are making bad decisions not to associate (or not to hire). If individuals are free only to make "good" decisions (*i.e.* decisions approved by the government), then they are not free at all. Nor can the reason be that by declining to associate with someone, private individuals have somehow "harmed" that person. While no one is free to physically attack another or to take, destroy, or otherwise injure another's property, declining to confer a benefit on someone (including the benefit of one's association) cannot be equated with imposing a harm. If it could be, the concept of freedom of association would evaporate. Something more is needed to overcome the presumption of freedom.[15]

So under what circumstances is the presumption in favor of free association overcome? A traditional example might be the common law rule that common carriers and public utilities must provide service to all who could pay. These entities were considered special because they tended toward monopoly. If a natural gas utility refuses service to anyone for a reason other than failure to pay, that individual has no practical alternative. If he relies on the free market to provide him with natural gas, he will be waiting a long time, since the town where he resides will likely have only one natural gas provider.

Anti-discrimination laws are a more recent addition to the list of exceptions. Because Title VII applied broadly to the conduct of private employers, it was by far the most controversial part of the Civil Rights Act of 1964. But there was nevertheless a strong argument for Congressional action—especially in the case of discrimination against African Americans. In the view of members of Congress, irrational race discrimination had become so pervasive, it could only be corrected through national legislation: Sometimes extraordinary steps are necessary.

It wasn't just that *some* employers in the South were discriminating on the basis of race: Essentially, all employers of any size were. The complex web of Jim Crow laws made it difficult for Southern employers to employ African-American workers on an equal basis even if they wanted to. If employers had to provide separate bathrooms, shower facilities and even pay

---

sexual orientation should join race, color, religion, sex and national origin as prohibited classifications for Title VII purposes. My only point is that we ought to be able to agree that the presumption should always be in favor of freedom of association (and hence of employer choice) and not coercion. The proponents of legislation thus have the burden of persuading us why sexual orientation should be made part of Title VII, rather than opponents of the legislation having the burden to prove it why it should not. This is why I object to Commissioner Narasaki's quotation at the end of her Statement, which attempts to associate opposition to coercive laws—even well-intentioned coercive laws—with "hatred" and "intolerance." There is massively less hatred in the world than social justice warriors who toss the word "hatred" around carelessly think. As for "intolerance," it is a much more complicated phenomenon than they seem to understand. It is not always the ones the crowd is accusing of intolerance who are the most intolerant.

[15] As Koppelman recognizes, it is not just the value of freedom that drives the presumption in favor of freedom of association. What he calls "efficiency," too, is at stake. It is sometimes tempting for governments to believe that they can make better decisions on behalf of individuals. But it often doesn't turn out the way they thought it would. Sometimes the individuals know more about their particular situation than the government does. What may look to outsiders like invidious discrimination may turn out to be something else entirely.

windows for each race, it is not remarkable that many employers didn't hire African Americans at all or did so only on a limited basis. [16]

That was the intent of those laws—to ensure that whites were hired first into the best jobs. This is what happens when an entire segment of the population is effectively disfranchised. Those who can vote pass laws designed to benefit themselves; those who cannot will be on the losing end of the deal. Discrimination was so pervasive that help wanted ads in newspapers customarily were divided into "Help Wanted—White" and "Help Wanted—Colored." This wasn't subtle stuff.

And it wasn't just employers. Formally or informally, unions were frequently whites only, not just in the South, but also in the North. And employers were obliged to play by union rules. This angle of the discrimination problem was compounded by the Davis-Bacon Act, Pub. L. 71-798,40 Stat. 1494, 40 U.S.C. §§ 3141-48, which requires the federal contractors on public works projects to pay the "prevailing wage" in a given locality. Prevailing wage in practice meant (and continues to mean) union-scale wage. Since union members would ordinarily be more experienced than non-union members, if one had to pay union-scale wages, one might as well hire union members. When these unions were whites only, the system worked to the detriment of African-American workers. [17]

In the view of many members of Congress at the time, the case for protection against sex discrimination may have been somewhat weaker, but it was nevertheless strong. Like race discrimination, sex discrimination was so pervasive it was the norm for help wanted advertisements to separate "Help Wanted—Male" from "Help Wanted—Female."

---

[16] This point tracks an observation made by C. Vann Woodward in The Strange Career of Jim Crow (1955)—the book Martin Luther King called "the bible" of the civil rights movement. Many people argued at the time that Southern culture had always and would always favor racial separation. It didn't matter whether the law required segregation or not; it would have happened without the law.

Woodward disputed this. He showed there was lots of early opposition to Jim Crow laws and without the power of the State to *require* segregation, it would likely not have become as ingrained in Southern culture as it did. To use Woodward's vocabulary, folkways did not dictate stateways. Instead, stateways—that is state laws—profoundly shaped Southern folkways—that is Southern culture. And as long as those laws remained unaltered, southern culture would be frozen in place. The Civil Rights Act of 1964, including Title VII, was a way of uprooting them. While it would be difficult to say that it was the perfect solution to the country's complex race problems, it did manage to accomplish the task of displacing those laws.

[17] Note that to supporters of the Davis-Bacon Act, this was a feature, not a bug. Rep. Robert Bacon, who represented a Long Island House District and for whom the law was named, was motivated in large part by race. In 1927, a contractor from Alabama won a bid to build a Veteran's Bureau in Long Island and brought an African American construction crew with him up from Alabama. Bacon was appalled and began his push to outlaw such competition. *See* David Bernstein, Roots of the Underclass: The Decline of Laissez-Faire Jurisprudence and the Rise of Racist Labor Legislation, 43 Am. U. L. Rev. 85, 115 (1993).

He was not alone. In supporting the proposed legislation, Rep. John J. Cochran of Missouri stated in connection with the proposal that he had "received numerous complaints in recent months about southern contractors employing low-paid colored mechanics getting work and bringing the employees from the South." Hearings on H.R. 7995 and H.R. 9232 Before the House Committee on Labor, 71t Cong. 2d Sess. 17 (26-27). Rep. Clayton Allgood agreed, complaining of "cheap colored labor" that "is in competition with white labor throughout the country." 74 Cong. Rec. 6513 (1931).

Some of this tendency was frozen in place by the law. Progressive Era state legislation often purported to make distinctions between men and women in order to protect the health of the supposedly weaker sex, but at least some of the motivation behind such laws was the desire to exclude women from the most desirable jobs. And while the hey-day of such laws was the early part of the 20th century (at a time when many women could not vote), many remained in place at the time Title VII was passed.[18]

In *Muller v. Oregon*, 208 U.S. 412 (1908), the Supreme Court had unanimously upheld the constitutionality of an Oregon statute restricting women from working for more than 10 hours a day. Justice Josiah Brewer's opinion for the Court stated:

> That woman's physical structure and the performance of maternal functions place her at a disadvantage in the struggle for subsistence is obvious. This is especially true when the burdens of motherhood are upon her. Even when they are not, by abundant testimony of the medical fraternity continuance for a long time on her feet at work, repeating this from day to day, tends to injurious effects upon the body, and as healthy mothers are essential to vigorous offspring, the physical well-being of woman becomes an object of public interest and care in order to preserve the strength and vigor of the race.

208 U.S. at 412.

As such laws multiplied during the Progressive Era and beyond, some feminists, like Suzanne LaFollette, voiced their objections:

> [I]f discriminative laws and customs are to continue to restrict the opportunities of women and hamper them in their undertakings, it makes little difference for whose benefit those laws and customs are supposed to operate, whether for the benefit of men, of the home, of the race, or of women themselves; their effect on the mind of woman and her opportunities will be the same. While society discriminates against her sex, for whatever reason, she can not be free as an individual.
>
> . . . Laws which fix fewer hours of work for women than for men may result . . . in the substitution of men—or children—for women in factories where but few have been employed. Laws prohibiting night-work may reduce the chances of women to get much-needed employment, and may sometimes shut them out of work which would offer higher returns on their labor than anything they might get to do during the day . . .

---

[18] The EEOC took the position that Title VII overruled all discriminatory statutes of this kind unless sex is a *bona fide* occupational qualification. But it took some work to uproot them. In *Megelkoch v. Industrial Welfare Commission*, 442 *F.2d* 1119 (9th Cir. 1971), a woman employee had to challenge California's maximum hour statute for women when her employer refused to promote her on the ground that she couldn't work the same hours as her male colleagues. She won. In *Weeks v. Southern Bell*, 408 *F.2d* 228 (5th Cir. 1969), the court held that a Georgia law imposing weightlifting limits of 30 pounds on women was void under Title VII. *Rosenfeld v. Southern Pacific Co.*, 293 *F. Supp.* 1219, 1223 (C.D. Cal. 1968), aff'd 444 *F.2d* 1219 (9th Cir. 1971), was similar.

Suzanne LaFollette, Concerning Women 19-20 (1926).

Sexual orientation provides an interesting comparison to race and sex. There is no doubt that racial minorities, sexual-orientation minorities, and women (as well as others) have suffered significant discrimination in employment. But there are interesting differences too, and these differences sometimes cut in different directions. For example, members of sexual orientation minorities have traditionally mitigated the effects of discrimination by declining to disclose their membership in a minority to their employer. For most women and members of racial minorities, that was never an option. On the other hand, the stigma associated with membership in a sexual orientation minority has in some ways been greater than the stigma associated with being female or with being a member of a racial minority.

Another interesting contrast: Unlike women and racial minorities, sexual orientation minorities have never been disfranchised on the ground of their sexual orientation. On the other hand, sexual orientation minorities tend to be very small and except in a small number of localities their voting power has been small.

This may be the most significant contrast: Few actual state laws have discriminated on the basis of sexual orientation in employment. Those that have existed have disappeared. This is in contrast to the situation with regard to race and even sex in 1964 when Title VII was promulgated. This is not to say that no government policies ever existed that hampered LGBT individuals from getting desired employment. As the Report indicates, for a time, the federal government took the position that the social stigma suffered by LGBT individuals made them vulnerable to blackmail and hence security risks. Rep. at 61. LGBT individuals applying for some federal jobs therefore had to hide their sexual orientation. If they were hired, their troubles were not over. If their sexual orientation became known, they would be fired.[19] To be fair, however, one must point out that this policy was abandoned decades ago.[20]

---

[19] For a more detailed discussion of the federal policy, see Yaki Statement at 87-96. At this point in time it is unclear how many LGBT individuals were discouraged from applying for, were screened out from, or were fired from a federal job on account of their sexual orientation. But my own mother, who was working for the Department of Defense in the 1950s, remembers a colleague of hers being unceremoniously removed from his job when his sexual orientation was apparently discovered for the first time. She is 92 years old today and has not forgotten the unfairness of it.

[20] The relationship of military serviceman or servicewomen to the federal government is not one of employment. The various legislative proposals discussed in this Report therefore do not apply. But it should be pointed out that it was not until the 1990s that the policy of "Don't Ask, Don't Tell" was implemented, thus allowing closeted gays, lesbians and bisexuals to join the military. Department of Defense Directive 1304.26 (December 21, 1993). It was not until 2011 that openly gay, lesbian and bisexual individuals were permitted to join the military. See Pub. L. 111-321, 124 Stat. 3515, 10 U.S.C. § 654 (2010)(policy went into effect September 20, 2011).

Policies that gave better benefits to married rather than unmarried discriminate on the basis of marital status, not sexual orientation. Most of those who end up with the short end of the stick are not LGBT. But nevertheless at a time that same-sex marriage was unrecognized in most states, LGBT individuals were disproportionately affected. Since *Obergefell v. Hodges*, 576 U.S. ___ (2015), however, all states have recognized same-sex marriage.

The bottom line, as far as I can see, is that the case for an anti-discrimination law for sexual orientation is weaker than the case for race or sex.[21] But, given the history of stigma associated with LGBT status, it is not insubstantial. That makes it a tough decision. What makes it somewhat easier to decide is the fact that Title VII has been misapplied so much over the years, it may be unwise to expand it before reforms are put into place.[22] Will it be possible to draft legislation that will make some version of the proposed Employment Non-Discrimination Act a good idea? I think so. Indeed, it is clear that some members of Congress have been working on the problem. But, in my view, we are not there yet.

On the other hand, the case for "gender identity" coverage is weak—not on the ground that transgender persons have not been historically discriminated against (they have been), but on the ground that the treatment of gender identity in the legislative proposals in this area to date have been overbroad to the point of incoherence.

---

[21] Some have argued that only immutable characteristics should form the basis of anti-discrimination laws. In response those who support the proposed legislation have argued that sexual orientation *is* an immutable characteristic. I have no need to resolve that dispute, since I do not believe that only immutable characteristics should form the basis of anti-discrimination laws (although immutability might well be a factor to consider in determining whether the argument for banning discrimination on that basis is strong enough to overcome the presumption against coercing private parties to associate). From the beginning, Title VII contained a provision banning discrimination based on religion, and yet religion is not an immutable characteristic. Religion and sexual orientation also have something in common in the sense that some employers may have religious or moral objections to working with persons of religious persuasions or sexual orientations they consider to be sinful or otherwise problematic. That raises important and interesting questions that need careful consideration. Rather than attempt to address them here, I refer the reader to my Commission Statement in Peaceful Co-Existence: Reconciling Nondiscrimination Principles with Civil Liberties at (September 2016)(Statement of Gail Heriot), *available at* http://www.usccr.gov/pubs/Peaceful-Coexistence-09-07-16.PDF. The Statement is also *available at* https://papers.ssrn.com/sol3/papers.cfm?abstract_id=2897849.

Commissioner Narasaki makes a different argument—that a characteristic's immutability should not drive whether anti-discrimination laws are appropriate for it (I agree with this part), but that whether the characteristic is "central to a person's identity" should. Narasaki Statement at 81-2. But that dog won't hunt. That notion that "characteristics that are fundamental and essential to one's identity," *id.* at 1, should be made the subject of anti-discrimination laws, without any further justification, runs into the problem of human complexity.

Some people consider their race fundamental to their identities; others regard their race as literally skin deep. Indeed, up until fairly recently, it was the fashion among right-thinking liberals to believe exactly that—that race was unimportant. A few days ago I overheard a young man say to an elderly woman that he had no idea about the origins of his surname and didn't know his ethnicity. On the other hand, I've known individuals who regard their astrological sign, their musical ability, their sense of humor, their extremist political ideology, their artistic ability, their entrepreneurial spirit, their Myers-Briggs personality type, and their facility with the written word to be central to their identities. One could always argue with them about what is fundamental to *their* identities. But usually, if persons say that something is fundamental to their identity, it's best to just accept that it is.

Do individuals regard sexual orientation as central to their identity? The answer is almost certainly that some do and some don't. In some surveys, some individuals acknowledge frequent consensual same-sex activity, but nonetheless do not identify themselves as lesbian, gay or bisexual.

[22] I have expressed no opinion on the extent to which Title VII, through the Supreme Court's decision in *Price Waterhouse v. Hopkins*, 490 U.S. 228 (1989), already offers protection to those who have been discriminated against on the basis of sexual orientation or gender identity. This issue became more of a front-burner issue for the Commission after this Report was approved. At the point of this writing, the Commission is preparing to address the Department of Justice's conclusion that Title VII does not cover sexual orientation and gender identity. Since I have not yet had time to consider the Commission's proposed amendments, I have not addressed them in this Statement.

Prior to 2007, the various versions of the proposed Employment Non-Discrimination Act applied only to sexual orientation and not to gender identity. Since then, however, a number of versions have been introduced that do cover gender identity. Typical of these proposed Employment Non-Discrimination Act of 2013 (S. 815),[23] which defines "gender identity" thusly:

> (7) GENDER IDENTITY.—The term "gender identity" means the gender-related identity, appearance, or mannerisms or other gender-related characteristics of an individual, with or without regard to the individual's designated sex at birth.

The proposed Act goes on to declare it to be "an unlawful employment practice for an employer" "to fail or refuse to hire or to discharge any individual, or otherwise discriminate against any individual . . . because of such individual's actual or perceived . . . gender identity."

That won't work. Race, sex, and sexual orientation (at least where sexual orientation is defined narrowly)[24] are statuses that for the most part are unrelated to how one does a particular job. Gender identity, however, at least as it is defined here, is not a single thing, but a whole range of things. Any "gender-related" "mannerisms" or "characteristics" constitute "gender identity."

The problem is that huge numbers of mannerisms and characteristics are gender-related, and some of them are commonly job-related. In general, we regard aggressiveness to be more characteristic of males than females. That was the whole point of *Price Waterhouse v. Hopkins*, 490 U.S. 228 (1989). The plaintiff in that case alleged that she was not promoted because she was thought to have an aggressive and hence "unladylike" personality, but that she would have been promoted if she had been a male with the same kind of personality. The Court agreed that if she would have been promoted if she had been male, she was discriminated against on the basis of sex within the meaning of Title VII.

By making gender-related characteristics (rather than sex itself) the subject of anti-discrimination laws, the proposed law would radically change the law. Right now it is a violation to fail to promote a woman with an aggressive personality if a man with the same personality would have been promoted. Under the proposed law, it would be a violation to fail to promote someone with a passive personality, if someone with an aggressive personality would have gotten the job.

But there are lots of jobs for which an aggressive personality is a legitimate job qualification, just as there are lots of jobs where a more passive, but nurturing, personality is the right fit. If the federal government prohibits employers from making hiring decisions on the basis of "gender-related characteristics," it will be prohibiting a lot of rational behavior.

---

[23] https://www.congress.gov/bill/113th-congress/senate-bill/815/text.

[24] In the proposed Employment Non-Discrimination Act of 2013 (S. 815), "sexual orientation" was defined this way: "(10) SEXUAL ORIENTATION.—The term "sexual orientation" means homosexuality, heterosexuality, or bisexuality." It does not include such things as pedophilia, necrophilia, or sexual sadism.

I rather suspect this is not what the drafters of the proposed Employment Non-Discrimination Act had in mind. But it is what they wrote. Its supporters may not have thought this out very well. One version actually passed the Senate in 2013. What were they thinking?

B. Expansions of Title VII and Why They Have Made It Risky to Add Sexual Orientation to the Already-Existing List of Race, Color, Religion, Sex and National Origin.

(1) Preferential Treatment

If there is one thing you can depend on it's that the 88th Congress banned both discrimination against women and minorities and discrimination in favor of them. It's not just that the text of Title VII makes this clear (though it does):

> It shall be an unlawful employment practice for an employer—to fail or refuse to hire or to discharge any individual, or otherwise to discriminate against any individual with respect to his compensation, terms, conditions, or privileges of employment, because of such individual's race, color, religion, sex, or national origin; or to limit, segregate, or classify his employees or applicants for employment in any way which would deprive or tend to deprive any individual of employment opportunities or otherwise adversely affect his status as an employee, because of such individual's race, color, religion, sex, or national origin.

42 U.S.C. § 2000e-2(a).

Title VII easily could have been drafted to ban "discrimination against women" or "discrimination against racial minorities." But if it had been, it almost certainly wouldn't have passed. Instead the text proudly declares that discrimination on the basis of race, color, religion, sex, or national origin is prohibited.

If the text hadn't been crystal clear, then the legislative history would have easily clarified matters. For example, when H.R. 7152 reached the floor of the House of Representatives, the very first speech in support of it was delivered by the bill's chief sponsor, Committee on the Judiciary Chairman Emanuel Celler. Part of his speech responded to arguments against the bill, one of which was that it would lead to discrimination against whites. He responded that these arguments were "entirely wrong" and stated:

> Even [a] court could not order that any preference be given to any particular race, religion or other group, but would be limited to ordering an end of discrimination. The statement that a Federal inspector could order the employment only of members of a specific racial or religious group is therefore patently erroneous.
>
> . . . The Bill would do no more than prevent . . . employers from discriminating against *or in favor* of workers because of their race, religion, or national origin.

110 Cong. Rec. 1518 (emphasis added).

Celler's sentiments were echoed repeatedly in the Senate. In their well-known interpretative memorandum on Title VII, Senators Joseph Clark and Clifford Case, bipartisan floor managers for the bill, wrote:

> Title VII would have no effect on established seniority rights. Its effect is prospective, and not retrospective. Thus, for example, if a business has been discriminating in the past and, as a result, has an all-white working force, when the title comes into effect, the employer's obligation would be simply to fill future vacancies on a nondiscriminatory basis. He would not be obliged—*or indeed permitted*—to fire whites in order to hire Negroes, or to prefer Negroes for future vacancies, or, once Negroes are hired, to give them special seniority rights at the expense of the white workers hired earlier.

110 Cong. Rec. at 7213 (emphasis added).

This is why the 5-4 decision in *United Steelworkers v. Weber*, 443 U.S. 193 (1979), was shocking to many. In *Weber*, the Court decided that, despite all this, it was permissible for Kaiser Aluminum and Chemical Corp. and the United Steelworkers to enter into a collective bargaining agreement that permitted whites to enter into their training program *only* on a one-to-one basis with African Americans (regardless of the applicants' comparative credentials and despite the fact that white applicants were more numerous).

The majority decision in Weber triggered one of the most devastating dissents in Supreme Court history:

> [B]y a tour de force reminiscent not of jurists such as Hale, Holmes and Hughes, but of escape artists such as Houdini, the Court eludes clear statutory language, "uncontradicted" legislative history and uniform precedent in concluding that employers are, after all, permitted to consider race in making employment decisions.

United Steelworkers v. Weber, 443 U.S. 193, 219, 222 (1979)(Rehnquist, J., dissenting).

Justice Rehnquist's take-no-prisoners prose showed step by step how Title VII could not fairly be construed to allow racial preferences of any kind, including those practiced by Kaiser and the United Steelworkers. *See also* Bernard D. Meltzer, *The* Weber *Case: The Judicial Abrogation of the Antidiscrimination Standard in Employment*, 47 U. Chi. L. Rev. 423 (1980).

What does *Weber* have to do with the legislative proposals that would prohibit discrimination on the basis of sexual orientation? Perhaps a lot. Americans have learned that when they pass laws that forbid discrimination, what they sometimes get are laws that give preferential treatment to the group that is perceived by those in power as the underdog. For those who oppose preferential treatment, that obviously seems bad. For those who support it, it may seem good. But that may be only at a superficial level. When executive agencies and courts interpret laws to go far beyond

what was originally intended by a statute, no one should be surprised that moderate legislators become gun shy. Further legislative action becomes more difficult.[25]

At least one version of the legislative proposal appears to specifically eschew the use of affirmative action preferential treatment. But after *Weber*, such efforts would need to be ironclad. This one doesn't seem to be.

The proposed Employment Non-Discrimination Act of 2013 (S. 815) states:

> (f) NO PREFERENTIAL TREATMENT OR QUOTAS.—Nothing in this Act shall be construed or interpreted to require or permit . . .
>
> (1) any covered entity to grant preferential treatment to any individual or to any group because of the actual or perceived sexual orientation or gender identity of such individual or group on account of an imbalance which may exist with respect to the total number or percentage of persons of any actual or perceived sexual orientation or gender identity employed by any employer, referred or classified for employment by any employment agency or labor organization, admitted to membership or classified by any labor organization, or admitted to, or employed in, any apprenticeship or other training program, in comparison with the total number of percentage of persons of such actual or perceived sexual orientation or gender identity in any community, State, section, or other area, or in the available work force in any community, State, section, or other area; or
>
> (2) the adoption of implementation by a covered entity of a quota on the basis of actual or perceived sexual orientation or gender identity.

But note that this prohibits preferential treatment only in the context of efforts to match the proportions of those hired or promoted to the proportions found in some outside "community, State, section or other area." Aggressive lawyers might claim that preferential treatment designed to reap the unspecified benefits of diversity rather than to mimic the demographics of any particular "community, State, section or other area" are permissible.

On a blank slate, I would regard this as a weak argument. But in *Regents of the University of California v. Bakke*, 438 U.S. 265 (1978), a Title VI case, Justice Powell drew exactly this distinction. In his controlling opinion, he rejected the idea that the University of California could grant preferential treatment on the basis of race to medical school applicants in order to better match the student body to the racial composition of California. But he upheld the authority of the

---

[25] *See* Daniel B. Rodriguez & Barry R. Weingast, The Positive Political Theory of Legislative History: New Perspectives on the 1964 Civil Rights Act and Its Interpretation, 151 U. Penn. L. Rev. 1417, 1535 (2003) (arguing that, after the judicial expansions of Title VII, some Members of Congress "were likely nervous about agreeing [with Members who supported those expansions] on legislative bargains, which, when they came before the courts, would be rewritten").

University of California to grant preferential treatment on the basis of race in order to reap the pedagogical benefits of diversity.

Justice Rehnquist was right. For the majority in *Weber* to come out as they did required the skills of escape artists like Houdini. Given *Bakke*, however, getting around the proposed Employment Non-Discrimination Act of 2013's ban on preferential treatment or quotas would not be nearly as difficult.

(2) Harassment

It is difficult to defend *Weber* as a matter of statutory interpretation no matter what one thinks of it as a matter of policy. The interpretation was just plain wrong, and painfully so. It would not be fair to put *Meritor Savings Bank v. Vinson*, 477 U.S. 57 (1986), in the same category. For reasons I hope to write about elsewhere, I believe the basic thrust of *Meritor Saving Bank* decision—that at least in some circumstances sexual harassment can be actionable under Title VII—is surely defensible.

The origins of the problems with current doctrine on sexual harassment are more subtle. Five years after *Meritor Savings Bank*, when the ill-conceived Civil Rights Act of 1991 made ordinary monetary damages available under Title VII, sexual harassment lawsuits became much more common, and employers became more fearful of them.

Their fear was mainly of "hostile environment" cases.[26] Employers could be liable for the *cumulative* effect of a series of many rude remarks, slights, and inconveniences, each of which might have come from a different employee (or even a customer). The only way to be sure of not being sued was (and is) to prevent as many as possible of them.

If an employee is upset at the photo of her colleague's bikini-clad wife on his desk, it is in the employer's interest to make him get rid of it.[27] If another employee doesn't like to be told by her

---

[26] The "quid pro quo" kind of sexual harassment case was easier for employers to deal with. These are the cases in which an employee is told that she (or he) must engage in sexual relations if she (or he) wishes to be hired, get a promotion, or avoid dismissal. So long as the employee can demonstrate that a similarly-situated employee of the opposite sex would not have had to submit to this, one can see why such a deal amounts to discrimination on the basis of sex. Note that the shoe can be on the other foot here as well. An employee whose sexual favors are not desired may also have a Title VII complaint, because he (or she) was not given a similar opportunity to be hired, promoted, or avoid dismissal.

To deal with the "quid pro quo" cases, employers need to make it crystal clear to their supervisory personnel that such deals will not be tolerated. As a secondary precaution, they need to make sure that employees know the rules and have someone other than their supervisor to report to if their supervisor breaks those rules.

[27] Bonnie Miller Rubin & Judy Peres, Workplace on Edge Over Harassment, Chicago Tribune (April 3, 1998)("In 1993, a University of Nebraska graduate student was forced to remove a photo of his bikini-clad wife from his desk when two fellow students complained that it offended their sensibilities").

boss that her hair looks nice today, the employer has every incentive to order him to stop.[28] And if a copy of Goya's Naked Maja hanging in the building upsets an employee, the employer's instinct is unlikely to leave it there for others to enjoy. Rather, the picture is likely to be taken down.[29] If the other employees start to complain, the safe solution is to tell them to shut up and arrange for them to take a course in sexual harassment once a year.

"'We advise employers not to focus on the legal definition of harassment, but to have zero tolerance for any behavior extraneous to the workplace. There shouldn't be any touching or sexual joking. Period,'" an employment lawyer told the *Chicago Tribune* in 1998.[30]

When these kinds of actions started to become commonplace, many Americans—indeed a majority—began to wonder if we weren't going down the wrong road. In a 1997 CNN poll, 57% of men and 52% of women agreed that "we have gone too far in making common interactions between employees into cases of sexual harassment."

Since then, the pressure to avoid saying anything that might be construed as offensive has only increased. Sometimes it had served to suppress serious discussions.[31] A recent example is the firing of software engineer James Damore at Google.

Damore wrote what was intended to be an internal discussion memorandum entitled "Google's Ideological Echo Chamber." Contrary to what some media outlets claimed, it was not an anti-diversity or misogynistic screed. In fact, it went out of its way to suggest helpful ways to make employment at Google more attractive to women.

But it dared to question whether women's underrepresentation in software engineering and in leadership positions at Google is wholly due to bias against them. It argued—alluding to a large body of scientific evidence—that fewer women than men may aspire to be software engineers. Damore was careful to acknowledge that there is plenty of variation among men and among women, but as a group, women tend to be more interested in people-oriented jobs. And while Damore's statement says nothing about particular women or particular men, especially those who already work at Google, it happens to be a true statement at the general level. It's certainly worth talking about whether that might account for some of the under-representation of women at Google.[32]

---

[28] *See Ellison v. Brady*, 924 *F.2d* 872 (9th Cir. 1991)("Well-intentioned compliments by co-workers or supervisors can form the basis of a sexual harassment cause of action . . . .").

[30] Bonnie Miller Rubin & Judy Peres, Workplace on Edge Over Harassment, Chicago Tribune (April 3, 1998).
[31] *See* David Bernstein, You Can't Say That!: The Growing Threat to Civil Liberties from Antidiscrimination Laws (2004).
[32] *See, e.g.*, Peter Singer, Why Google Was Wrong: Did James Damore Really Deserve to be Fired for What He Wrote? N.Y. Daily News (August 10, 2017).

But instead the author of the memo was fired. And one of the arguments made for his firing was that his memo violates Title VII: He is creating a hostile atmosphere for women, some observers argued; if he isn't fired, Google may be sued. *See e.g.*, Dan Eaton, Here's Why Google Had the Right to Fire that Employee over his Diversity Memo, cnbc.com (August 8, 2017)("Google Vice President of Diversity, Inclusion & Governance Danielle Brown is correct that an employee has no right to engage in workplace discourse that offends anti-discrimination laws; employees may not engage in unlawful harassment under the guise of protected concerted activity or political grievances."), *available at* https://www.cnbc.com/2017/08/08/heres-why-google-had-the-right-to-fire-that-employee-over-his-diversity-memo-commentary.html.

Some people at Google might have wanted Damore fired even if they had believed Google didn't need to worry about Title VII liability. But the culture—an intolerance of serious discussions about issues relating to sex—has been created in part because cautious people err on the side avoiding litigation. All too often that means appeasing extremists.

Google, of course, is a private entity and is not required to honor Damore's First Amendment rights. But Congress is. Insofar as Title VII liability was what drove Google's decision, Title VII (as interpreted) itself is unconstitutional.

Expanding Title VII's reach to other areas, whether it's to sexual orientation, gender identity or something else, can only compound the problem. Future discussions like that Damore tried to initiate would be squelched.

Consider the following situation: Even ten years ago, if someone had argued that New York City would pass a law requiring landlords to address tenants by the pronouns of the tenant's choice (rather than the pronouns of the landlord's choice or the pronouns that correspond to the tenant's actual anatomical sex), they would have been laughed at. But that has become a reality.[33] Would expanding Title VII cause such a rule to be applied to the workplace around the country? It isn't clear to me why it wouldn't.

Unlike the problem of preferential treatment, the problem of harassment overreach is not treated at all in any version of the legislative proposals considered in this Report.

(3) Disparate Impact

This is another one where the Supreme Court has misapplied Title VII, transforming it from a statute that requires equal treatment into one that presumptively requires equal results. See *Griggs v. Duke Power Co.*, 401 U.S. 424 (1971). The various iterations of the proposed Employment Non-Discrimination Act have attempted to deal with this problem.[34] But for reasons I will discuss more fully below, at least the version that passed the Senate in 2013 ultimately failed in its attempt to do so. In addition, the proposed Equality Act does allow for disparate impact claims.

To explain how all this fits together, one must start at the beginning:

While the passage of Title VII was important and historic, it was not intended to assert federal control over every aspect of the workplace. Its carefully limited purpose was to prohibit employment discrimination based on race, color, religion, sex and national origin. As Representative William M. McCulloch et al. put it:

> [M]anagement prerogatives and union freedoms are to be left undisturbed to the greatest extent possible. Internal affairs of employers and labor organizations must not be interfered with except to the limited extent that correction is required in discrimination practices.[35]

At the time, this was likely seen as an obvious, but important, point. Free enterprise had always been the engine that drove the nation's prosperity. For that and other reasons, the best way for the federal government to promote the general welfare, including the welfare of women and minorities, had usually been to allow peaceable and honest individuals the freedom to run their own business affairs. When exceptions become necessary (as they did in 1964), they were understood by most as precisely that—exceptions. They were not intended to swallow the rule.

Congressional leaders assured their colleagues that Title VII would not interfere with employer discretion to set job qualifications—so long as race, color, religion, sex and national origin were not among them. Senators Clifford Case (R-N.J.) and Joseph Clark (D-Pa.), the bill's co-managers on the Senate floor, emphasized this in an interpretative memorandum:

> There is no requirement in Title VII that employers abandon *bona fide* qualification tests where, because of differences in background and education, members of some

---

[34] The proposed Employment Non-Discrimination Act of 2013 (S. 815), *available at* https://www.congress.gov/bill/113th-congress/senate-bill/815/text. It states: "(g) NO DISPARATE IMPACT CLAIMS.—Only disparate treatment claims may be brought under this Act." For reasons why this language fails to cover disparate impact claims brought under the "gender identity" provisions of the proposal, see infra at 127.

[35] Statement of William M. McCulloch, et al., H.R. Rep. No. 914, 88th Cong., 2d Sess. (1964). McCulloch was the House Judiciary Committee's ranking member and was considered by many to have been indispensable in passing the Act.

> groups are able to perform better on these tests than members of other groups. An employer may set his qualifications as high as he likes, he may test to determine which applicants have these qualifications, and he may hire, assign, and promote on the basis of test performance.

Case & Clark Memorandum, 110 Cong. Rec. 7213.

Note that Case and Clark used the term "*bona fide* qualification tests," meaning qualification tests adopted in good faith, and not "necessary" or "scientifically valid" qualification tests. To Case and Clark the issue was whether the employer chose a particular job qualification *because* he believed it would bring him better employees or *because* he believed it would help him exclude applicants based on their race, color, religion, sex or national origin. *See also* Case & Clark Memorandum, 110 Cong. Rec. 7247 (Title VII "expressly protects the employer's right to insist that any prospective applicant, Negro or white, must meet the applicable job qualifications. Indeed, the very purpose of Title VII is to promote hiring on the basis of job qualifications, rather than on the basis of race or color.").

Congress's intention to outlaw only discriminatory treatment and not disparate impact is made clear from Title VII's central prohibition, which bans discrimination against any individual "because of such individual's race, color religion, sex, or national origin." As Richard K. Berg, one of the government lawyers who worked on Title VII's passage, wrote, to "discriminate" against an individual "because of" his "race, color, religion, sex, or national origin" always requires some level of intentionally, whether the intention is conscious or unconscious.[36]

But just in case Section 703 were to be misinterpreted, the bill was amended in the Senate at the insistence of Republican Leader Everett Dirksen—without whose support the bill likely never would have gotten past the Southern filibuster. Dirksen insisted on adding the word "intentionally" to Section 706(g), which deals with judicial power to enforce the prohibitions of Section 703. As modified, Section 706(g)(1) read:

> (1) If the court finds that the respondent has intentionally engaged in or is intentionally engaging in an unlawful employment practice charged in the complaint, the court may enjoin the respondent from engaging in such unlawful employment practice, and order such affirmative action as may be appropriate, which may include, but is not limited to, reinstatement or hiring of employees, with or without back pay . . . , or any other equitable relief as the court deems appropriate. . . .

42 U.S.C. sec. 2000e-5(g)(1).

---

[36] *See* Richard K. Berg, Equal Employment Opportunity Under the Civil Rights Act of 1964, 31 Brook. L. Rev. 62, 71 (1964) ("Discrimination is by its nature intentional. It involves both an action and a reason for the action. To discriminate 'unintentionally' on grounds of race . . . appears a contradiction in terms").

In explaining why the term "intentionally" was added here, Senator Hubert Humphrey said, "Section 706(g) is amended to require a showing of intentional violation of the title in order to obtain relief. . . . The expressed requirement of intent is designed to make it wholly clear that inadvertent or accidental discrimination will not violate the title or result in entry of court orders." 110 Cong. Rec. 12,723-28 (1964).[37]

In addition, by denying the newly-created EEOC both substantive rulemaking authority and to issue cease and desist orders, Title VII's Congressional supporters attempted to ensure Title VII's reach could not be expanded. The power to issue regulations might be interpreted to authorize limited prophylactic measures, and Congress evidently wished to make it clear that Title VII was already as broad as they intended it to be. The EEOC was to be a mediating agency *only*.

But EEOC officials soon began issuing guidances as an alternative to substantive regulations. Alfred W. Blumrosen, BLACK EMPLOYMENT AND THE LAW 52 (1971). Given most employers' eagerness to stay on the right side of the law, these guidances can be as effective (or even more effective) as regulations at influencing employer practices. An advantage from the EEOC's perspective is that they are not subject to notice and comment requirements and thus tend to receive less public scrutiny or government oversight. They are also difficult to challenge in court.[38] They are, of course, supposed to be interpretations of the Act and not extensions of it. But in practice the EEOC went much further.

Blumrosen, the EEOC's first "Chief of Conciliations" and disparate impact liability's primary architect, was unabashed in describing the extent to which the EEOC was (and in his view should be) aggressive in its interpretation of Title VII:

> Creative administration converted a powerless agency operating under an apparently weak statute into a major force for the elimination of employment discrimination. . . . [Legal education] rarely deals with the affirmative aspects of administration. Rather, the law schools provide elaborate intellectual equipment to *restrict* the efforts of administrators. Constitutional law and administrative law are still largely concerned with what government may not do, rather than with how it should decide what it may do. Students impatient with the negativism of present legal education would be better equipped as lawyers if they would focus sharply on the question of "how we can best fulfill the purposes which brought our agency into being" rather than on the question of "whether the courts will sustain this course of action."

---

[37] Dirksen's amendment and Humphrey's explanation are not in perfect harmony, since the amendment applied only to judicial remedies, while Humphrey's explanation applies generally. Dirksen might possibly have intended to foreclose courts from intervening even in the case of unconscious disparate treatment and to leave such cases entirely to the EEOC's mediation efforts. An employer who engaged in unconscious discrimination would essentially be allowed "one free bite." If the employer continued its practices after EEOC mediation efforts, it would be difficult for the employer to maintain that its actions were unconscious.

[38] The fact that Title VII makes EEOC investigations and mediations confidential, 42 U.S.C. 2000e-8(e), adds to the degree to which EEOC policymaking has tended to escape both public scrutiny and government oversight.

Id. at 53 (emphasis in original).

Blumrosen was part of the generation of civil rights policymakers profoundly influenced by the turbulence of the late 1960s—something that is easy to forget today. He urgently pushed the EEOC to interpret Title VII with an eye toward effectuating what he perceived as a higher purpose—increasing African-American employment as quickly as possible—rather than with an eye towards what the courts would be likely to uphold as consistent with Congressional intent as well as the statute's text. In particular, he pushed a "disparate impact" approach to Title VII. Under it, employer intent didn't matter. If, given the job qualification required by an employer, proportionately fewer African Americans than whites qualify, the employer is in violation of Title VII unless it can demonstrate that it essentially had no choice.

Historian Hugh Davis Graham wrote concerning this period in the EEOC's history:

> "The EEOC legal staff was aware from the beginning that a normal, traditional, and literal interpretation of Title VII could blunt their efforts [based on disparate impact theory] against employers who used either professionally developed tests or *bona fide* seniority systems. The EEOC's own official history of these early years records with unusual candor the commission's fundamental disagreement with its founding charter, especially Title VII's literal requirement that the discrimination be intentional."

Hugh Davis Graham, THE CIVIL RIGHTS ERA: ORIGINS AND DEVELOPMENT OF NATIONAL POLICY at 248-49 (1990).

In *Griggs v. Duke Power Co.*, the Supreme Court deferred to the EEOC's disparate impact approach to Title VII liability. It held, therefore, that under Title VII, "practices, procedures, or tests neutral on their face, *and even neutral in terms of intent*, cannot be maintained if they operate to 'freeze' the status quo of prior discriminatory employment practices." *Id.* (emphasis supplied). "The touchstone is business necessity," it stated. "If an employment practice which operates to exclude Negroes cannot be shown to be related to job performance, the practice is prohibited." *Id.* at 431.[39]

As explained above, this was certainly a misinterpretation of Title VII. *See* Hugh Davis Graham, THE CIVIL RIGHTS ERA: ORIGINS AND DEVELOPMENT OF NATIONAL POLICY at 387 (1990)("Burger's interpretation in 1971 of the legislative intent of Congress in the Civil Rights Act would have been greeted with disbelief in 1964"); Daniel Rodriguez & Barry R. Weingast, *The Positive Political Theory of Legislative History: New Perspectives on the 1964 Civil Rights Act and Its Interpretation*, 151 U. Penn L. Rev. 1417 (2003) (also arguing that the 88th Congress would have been astonished at the result in *Griggs*).

---

[39] The facts of Griggs may well have involved intentional discrimination. But if so, it should have been incumbent upon the plaintiffs to prove their case on that theory.

After *Griggs*, Title VII was interpreted to demand two things: (1) Employers must provide equality of opportunity to all persons regardless of race, color, sex, religion or national origin (the traditional interpretation of Title VII); and (2) In deciding upon job qualifications, employers must provide at least equal results for women and minorities unless they can prove they were driven by business necessity to do otherwise (the disparate impact interpretation). For decades, few remarked on it, but these dual requirements were at war with each other from the beginning. Equality of treatment and equality of results are very different.[40]

One problem with disparate impact theory is that all job qualifications have a disparate impact. It is no exaggeration to state that there is always some protected group that will do comparatively poorly with any particular job qualification. As a group, men are stronger than women, while women are generally more capable of fine handiwork. Chinese Americans and Korean Americans score higher on standardized math tests and other measures of mathematical ability than most other ethnic groups. Subcontinental Indian Americans are disproportionately more likely to have experience in motel management than Norwegian Americans, who more likely have experience growing durum wheat. African Americans are over-represented in many professional athletics as well as in many areas of the entertainment industry. Unitarians are more likely to have college degrees than Baptists. *See Watson v. Fort Worth Bank & Trust*, 487 U.S. 977 (1988)(recognizing that disparate impact liability applies to subjective as well as objective job qualifications).

Some of the disparities are surprising. Cambodian Americans are disproportionately likely to own or work for doughnut shops and hence are more likely to have experience in that industry when it is called for by an employer. *See* Seth Mydans, *Long Beach Journal: From Cambodia to Doughnut Shops*, N.Y. Times, May 26, 1995. The reasons behind other disparities may be more obvious: Non-Muslims are more likely than Muslims to have an interest in wine and hence develop qualifications necessary to get a job in the winemaking industry, because Muslims tend to be non-drinkers.

---

[40] The problem was compounded by establishing a stringent standard of proof for "business necessity" that few employers can dream of achieving in *Albemarle Paper Co. v. Moody*, 422 U.S. 405 (1975). The employer there had hired an expert industrial psychologist to conduct a validation study to justify its use of standardized tests to hire and promote its employees. But the Court found the expert's report was not sufficiently scientifically rigorous. Among other things, the job qualifications had not been validated at the micro-level, i.e. for each of an employer's job categories. But it is nearly impossible for any but the largest employers to generate enough data for statistically significant validation studies. Under *Albemarle*, unless a bank could scientifically prove that high-school graduates make better tellers than high-school dropouts, it could not require a high-school diploma for tellers, since proportionally more whites than African Americans possess such a diploma. Indeed, its proof would have to apply specifically to its own tellers, including its minority tellers, not just to tellers in general. It was Justice Blackmun in his concurrence who tentatively sounded the alarm: "I fear that a too-rigid application of the EEOC Guidelines will leave the employer little choice, save an impossibly expensive and complex validation study, but to engage in a subjective quota system of employment selection." 422 U.S. at 449 (Blackmun, J., concurring in the judgment). While *Wards Cove Packing Co. v. Atonio*, 490 U.S. 642 (1989), appeared to overrule *Albemarle*, the Civil Rights Act of 1991 restored the law to its pre-*Wards Cove* condition.

The result is that the labor market is anything but free and flexible. At any moment, the EEOC—an agency Congress designed to have very limited power—can declare an employer's long-standing job requirements to be a violation of Title VII.[41]

The upshot of this is that hiring and firing practices must be shrouded in secrecy. Employers seldom advertise clear job qualifications for fear they will attract a lawsuit. Performance tests, indeed any kind of innovative hiring practices, are invitations to a lawsuit. Wise employers try to be on good terms with the EEOC, knowing that when everything is potentially illegal, the name of the game is to avoid antagonizing the regulator.

Passing any version of the employment discrimination legislative proposal discussed in this Report can only make the problem worse. Even the proposed Employment Non-Discrimination Act of 2013, which specifically eschews the application of disparate impact liability, has the problem. By defining "gender identity" as "the gender-related identity, appearance, or mannerisms or other gender-related characteristics of an individual, with or without regard to the individual's designated sex at birth," the proposal embeds disparate impact into the proposal's core prohibition.

There is no way to define "gender-related" mannerisms and characteristics except by disparate impact. Not all women wear make-up or skirts, but those characteristics are more commonly associated with women than with men. Not all men sing baritone, have short hair, enjoy watching sports on television, own guns, or wear boxer shorts, but these are all characteristics that are to a greater or lesser extent more common among men than among women.

If a statute prohibits employers from discriminating on the basis of characteristics that have a disparate effect on men and women, there is no need for a separate ability to bring lawsuits based on a disparate impact theory.

II. DATA ARE NOT ALWAYS ACCURATELY AND FAIRLY PRESENTED IN THIS REPORT

There is a lot that is wrong with this Report simply from the standpoint of accurately and fairly reporting the facts. Consider, for example, the very first sentence of the very first section: "American employees spend the majority of our awake hours at work." That isn't true.[42] Assuming

---

[41] Note that disparate impact liability applies to promotions and terminations too. *See George v. Farmers Electric Cooperative, Inc.*, 715 *F.2d* 175 (5th Cir. 1983); *Wilmore v. Wilmington*, 699 *F.2d* 667 (3d Cir. 1983).

[42] Bureau of Labor Statistics, Department of Labor, American Time Use Survey—2016 Results (June 27, 2017), *available at* https://www.bls.gov/news.release/pdf/atus.pdf. The data in that report don't make it easy to calculate exactly how much time American employees spend at work. But it is possible to see or to calculate from Table 4 that full-time workers were 77% of all American workers. They worked just a hair over 5 days a week and an average of 8.15 hours per day on the days they worked (for a total of approximately 40.75 hours). Part-time workers were 33% of the workforce. On average they worked slightly less than 4 days per week and averaged 5.34 hours on the days that they worked.

that the typical American employee sleeps 8 hours a day, that leaves 112 waking hours per week. Assuming a 5-day, approximately 40-hour work week, that is less than half, even before one figures in holidays and vacations. Once one figures in part-time work, the sentence isn't close to true. The point is trivial . . . but it doesn't fill one with a lot of confidence to start the Report that way.[43]

Other errors are somewhat less trivial. Accurately reporting the results of the 2013 survey conducted by the Centers for Disease Control and Prevention's National Center for Health Statistics somehow got botched. The report states that "3.4 percent of Americans identify themselves as gay or lesbian (1.6%), bisexual (0.7%) or 'something else' (1.1%)." The correct figures are that 2.5% percent of Americans identify themselves gay or lesbian (1.6%), bisexual (0.7%) or "something else" (0.2%).[44] Two additional categories were "I don't know" (0.4%) and refused to provide an answer (0.6%).

There are likely more such errors. But I have time to describe only one significant area. Perhaps the most troubling aspect of the report's use of data what looks a bit like a purposeful effort to hide the ball concerning income disparities. In the portion of the report entitled "Economic Impacts from Workplace Discrimination," the report recites, "On average gay men earn from 10 to 32 percent less than similarly qualified heterosexual males."[45] Rep. at 14.[46] By itself, that figure may

---

[43] After I handed in my Statement (and apparently as a result of my criticism), this problem was corrected (along with several other corrections). It is extremely unusual to make anything other than formatting changes to reports that have already voted on by the Commission, since corrected reports need to be resubmitted to the Commission.

[44] The material in the text is as of the date the Commission approved the report. After the due date of the Commission's statements, but before the deadline for rebuttal material, I learned that the staff planned to alter the passage to read, "A 2013 survey conducted by the Center for Disease Control and Prevention's National Center for Health Statistics found that 3.4 percent of Americans identify themselves as gay or lesbian (1.6 percent), bisexual (0.7 percent) or 'other' (1.1 percent)." This is still wrong. Individuals who refuse to answer the question (0.6 percent) or who have reported that they don't know (0.4 percent) did not "identify" themselves as "other." Even those who identify themselves as "something else" may simply mean that they are celibate. Beyond all this, the staff should never make substantive changes to a report after it has been adopted by the Commission without a Commission vote to accept those changes.

[45] When the Report says these studies compare gay men to "similarly qualified heterosexual males" it means that they controlled for things like whether the individuals covered in the study had a high school diploma, some college, a college degree or advanced degree and whether they reside in a metropolitan area. The studies also attempt roughly to control for broad job categories. Only then do the numbers begin to suggest that gay men might be "underpaid" relative to heterosexual men.

But the qualifications controlled for are far too rough to be fair. Not all college degrees are equal. An electrical engineering or computer science degree will ordinarily result in a much higher starting salary than a degree in psychology or communications.

Similarly, the efforts to control for job category are rudimentary. For example, one article divided up individuals into "executive," "specialist," "low-skilled workers," and "everyone else." Nathan Berg & Donald Lien, Measuring the Effect of Sexual Orientation on Income: Evidence of Discrimination?, 20 Contemp. Econ. Pol'y 394 (2002)(Berg & Lien also controlled for race, experience, experience squared, union membership, region of the country, urban status and educational attainment). *See also* John M. Blandford, The Nexus of Sexual Orientation and Gender in the Determination of Earnings, 56 Indus. & Lab. Rel. Rev. 622, 638-39 (2003)(making the point that controls for job category are rudimentary in these studies).

[46] Curiously, the Report does not cite the actual studies it (indirectly) is referring to. Rather, it cites an article that attempts to summarize those studies. Rep. at 14, n.70 (citing M.V. Lee Badgett, Holming Lau, Brad Sears, Deborah

seem to some to indicate discrimination. But a closer examination shows that things are much more complicated.[47]

The Report's sin is one of omission. First of all, it fails to make clear that comparisons between lesbians and heterosexual women run strongly in the opposite direction: ***On average, lesbians substantially out-earn heterosexual women.*** Instead, the Report states only that several studies "*show that lesbian or bisexual women* ***do not earn less*** *than heterosexual women*." Rep. at 50 (boldface added).

For example, in *The Nexus of Sexual Orientation and Gender in the Determination of Earnings*, among full-time workers, the median income for Lesbian/Bisexual women was almost 18% more than that for married or unmarried women.[48] Similarly, *An Investigation into Sexual Orientation Discrimination as an Explanation for Wage Differences* found "women living with partners of the same sex tend to have higher earnings than otherwise similar women."[49] *The Earnings Effects of Sexual Orientation* came to a similar conclusion—that lesbian/bisexual orientation is associated with about a 20% wage premium.[50] There is no shortage of such studies.[51] In *Measuring the Effect*

Ho, Bias in the Workplace: Consistent Evidence of Sexual Orientation and Gender Identity Discrimination, Williams Institute (June 2007), *available at* https://williamsinstitute.law.ucla.edu/research/discrimination/bias-in-the-workplace-consistent-evidence-of-sexual-orientation-and-gender-identity-discrimination/.

[47] Gay men are more likely to have college and advanced degrees than heterosexual men. In addition, gay men are more likely to live in metropolitan areas, where wage scales are higher (and living expenses are also higher). *See, e.g.*, Christopher Carpenter, Samuel Eppink, Does it Get Better? Recent Estimates of Sexual Orientation and Earnings in the United States, *available at* http://onlinelibrary.wiley.com/doi/10.1002/soej.12233/full. The studies referred to by the Report attempt to control for these factors. Some early surveys found that gay men out-earn heterosexual men when such factors are not controlled for. *See, e.g.*, Steve Teichner, Results of Polls, San Francisco Examiner A-19 (June 6, 1989).

[48] John M. Blandford, The Nexus of Sexual Orientation and Gender in the Determination of Earnings, 56 Indus. & Lab. Rel. Rev. 622, 633 (2003). Comparisons are between full-time workers.

[49] Suzanne Heller Clain & Karen Leppel, An Investigation into Sexual Orientation Discrimination as an Explanation for Wage Differences, 33 Applied Econ. 37 (2001). Heller & Leppel noted that Badgett came to the opposite conclusion in 1995 (*i.e.* that lesbian and bisexual women earned less than heterosexual women). They state, however, that Badgett's "finding was not consistently statistically significant across specifications" and that "Badgett's sample included only 34 (4.9%) lesbian or bisexual women, . . . so insignificant results are not surprising." *Id.* at 37. *See* M.V. Lee Badgett, The Wage Effects of Sexual Orientation Discrimination, 48 Indus. & Lab. Rel. Rev. 726 (1995).

[50] Dan A. Black, Hoda R. Makar, Seth G. Sanders & Lowell J. Taylor, The Earnings Effects of Sexual Orientation, 56 Indus. & Lab. Rel. Rev. 449, 463 (2003)("Lesbian/bisexual orientation appears to raise earnings of women by about 20%, a result that is both economically and statistically significant"). Comparisons are between full-time workers. "While gays and lesbians had levels of education similar to those of their heterosexual counterparts, they were half as likely to be married, they were more likely to live in the West and Northeast, and they were more likely to live in large cities. Following Badgett, we use regression analysis to control for these background differences." *Id.* at 452.

[51] *See* Christopher S. Carpenter, Self-Reported Sexual Orientation and Earnings: Evidence from California, 58 Indus. & Lab. Rel. Rev. 258, 263 (2005)("[L]esbian full-time workers report higher average earnings last month ($3,816) than do female unmarried bisexuals ($3,247), married bisexuals ($3,329), unmarried heterosexuals ($3070), or married heterosexuals ($3,631)"). This California-based study had interesting results for men too: Gay men earned more than heterosexual men. The authors wrote: "Among full-time working men, married straight men report the highest average earnings last month, $5,207, followed by gay men ($4,504), bisexual married men ($4,076), unmarried straight men ($3,518), and unmarried bisexual men ($3,382)." *Id.* at 263. But if one combines the heterosexual married men (n=8,810) and heterosexual unmarried men (n=7,158) categories, one gets an average

of Sexual Orientation on Income: Evidence of Discrimination?, the authors found that lesbians, on average, earn more than 30% more than heterosexual women.[52]

Why is that important? The data on lesbian earnings put the data on gay men's earnings in an entirely different light. The Report asks us to take a leap of logic. It tries to suggest that if, once certain basic credentials are controlled for, heterosexual men earn more than gay men, then it must be because of discrimination against gay men. But if lesbians substantially out-earn heterosexual women after such rudimentary controls are put into place, ***there needs to be an explanation for why. If we are to assume adjusted wage disparities prove gay men are being discriminated against, employers discriminate against gay men, then why don't we assume that employers are discriminating in favor of lesbians?*** The most logical explanation for all this is that the initial premise is wrong and that there is a lot more going on with these numbers than discrimination. Indeed, discrimination may not be playing any role at all.

The Report paraphrases Badgett et al. for its attempt at an explanation for why lesbians, in the Report's language "do not earn less than heterosexual women":

> Badgett et al., argue that this does not imply the absence of employment discrimination. They argue that these findings suggest that since lesbians may not be constrained by the same gender expectations that result from being in relationships with men, they may make different decisions than heterosexual women (*e.g.* choosing to delay or not have children, invest more into training, go into male-dominated professions) which may hide effects of discrimination.

Report at 48.

Well, yes, of course. But the Report doesn't seem to realize it has given away the store. Just as lesbians may make different career choices, so might gay men. They may choose a career in nursing instead of a career in mechanical engineering. They may choose not to work overtime in order to earn the money necessary to put a down payment on a five-bedroom house that will fit the children. They may choose to engage in a high-risk entrepreneurial activity—like opening a new restaurant—because they don't expect to be having to support a family in the near future. Just as the fact that lesbians earn more than heterosexual women doesn't eliminate the possibility that they have been discriminated against, the fact the gay men earn less (at least after rudimentary

---

income for heterosexual men of $4,450, which is less than the income for gay men (although greater than the income for the two bisexual categories).

[52] Nathan Berg & Donald Lien, Measuring the Effect of Sexual Orientation on Income: Evidence of Discrimination?, 20 Contemp. Econ. Pol'y 394 (2002). *See also* Christopher S. Carpenter & Samuel T. Eppink, Does It Get Better?: Recent Estimates of Sexual Orientation and Earnings in the United States, 84 Southern Econ. J. 426, 426 (2017)(calling the finding that self-identified lesbians earn significantly more than comparable heterosexual women "well-documented" and reproducing that finding yet again).

controls are used) doesn't prove they have been discriminated against. There can be lots of other explanations.

If we want to understand the situation, we need to be looking at the different jobs that gay and heterosexual men are undertaking. There is certainly evidence gay men are disproportionately attracted to certain jobs. "Numerous scholars have noted the disproportionately high number of gay and lesbian workers in certain occupations" and that "common to both gay men and lesbians is a propensity to concentrate in occupations that provide task independence or require social perceptiveness, or both."[53]

We also need to be looking at differences in college major choice. It is not easy to come up with solid empirical data on the differences in college major choices between gay and heterosexual men. But there is lots of data about the differences in college major choices between women and men. For example, according to the American Enterprise Institute, electrical engineering majors (82% of whom are male) can expect to earn an average of $70,000 in their first 5 years of work. By contrast, psychology majors (only 23.3% of whom are male) can expect only $42,000.[54] Given these differences, it would be surprising if gay and heterosexual men made precisely the same college major choices.[55]

In addition, we need to know which households are rearing children. Who has primary responsibility for providing monetary support for children and who doesn't? Who has primary responsibility for providing direct supervision for children?

The kind of information necessary to undertake such a study is hard to come by. But that is why President Eisenhower and the 85th Congress established the Commission in the first place—in order to conduct research on civil rights issues that otherwise might not get undertaken. Instead of conducting that research, the Commission chose to simply present other people's research on income disparities without proper context.

Here is what John Blandford had to say on the subject in *The Nexus of Sexual Orientation and Gender in the Determination of Earnings* (a study that found both that gay/bisexual men are paid

[53] Andras Tilcsik, Michel Anteby, and Carly R. Knight, "Concealable Stigma and Occupational Segregation: Toward a Theory of Gay and Lesbian Occupations, 60 Administrative Science Quarterly 446 (2015), *available at* http://www.michelanteby.net/files/manteby/files/concealable_stigma.pdf. Although Tilcsik et al. argue that bias against gays does influence these preferences—*e.g.* people who are concerned about being discriminated against are more likely to prefer occupations where they are often able to work independently—the mechanism described in their study is more complex than simple "discrimination drives gays out of certain jobs."

[54] Mark J. Perry, Highest-Paying College Majors, Gender Composition of Students Earning Degrees in those Fields and the Gender Pay Gap, American Enterprise Institute (October 19, 2016), *available at* http://www.aei.org/publication/highest-paying-college-majors-gender-composition-of-students-earning-degrees-in-those-fields-and-the-gender-pay-gap/.

[55] I am not aware of any claims that major choices of gay and heterosexual males are identical. But most of the discussions of the issue involve at least in part informal observations. *See* Manil Suri, Why Is Science So Straight?, N.Y. Times (September 4, 2015).

less than heterosexual men and that lesbian/bisexual women are paid more than heterosexual women):

> The evidence described in this study strains the credibility of the argument that measured wage differentials between heterosexual workers and gay, lesbian, and bisexual workers are owing solely to workplace attitudes about homosexuality. Defending that explanation would require explaining how workplace attitudes could penalize non-heterosexual male workers while simultaneously awarding lesbian and bisexual female workers with a substantial premium. Certainly, workplace attitudes toward sexual orientation may have a gender component; that is, bias against homosexuality and bisexuality may be more strongly expressed against persons of one gender than of another. Nonetheless, it seems unlikely that the wage effects would differ in sign rather than merely in magnitude.
>
> A more probable explanation for the disparate earnings effects of sexual orientation across genders may be found in treating workplace bias as but one orientation-related factor influencing earnings outcomes. Workplace bias that might negatively affect the wages of lesbian and bisexual women appears to be offset by other labor market factors. Most influential among these factors are subtle occupational clustering effects not adequately captured by the two-digit controls in this study or by the one-digit controls employed elsewhere (Badgett 1995). Case-level analysis of occupational patterns associated with sexual orientation points to trends that are both highly nuanced and gender-specific, suggesting that parameter estimates may over-estimate the direct effect of orientation on earnings. Lesbian and bisexual women are revealed to be unusually successful in gaining employment in largely male-dominated—and typically better-remunerated—occupational categories. For gay and bisexual men, in contrast, over-representation in female-identified occupations likely further depresses returns to human capital attributes relative to other male workers.[56]

There are further anomalies in the literature that should give pause those who would rush to judgment about the prevalence of discrimination. For example, among heterosexual males, married men, cohabiting men, and single men have been repeatedly shown to earn very different wages, with married men far outdistancing cohabiting men who in turn do better than single men.[57] And this is true even when age (or years of work experience) and other factors are controlled for. Yet few argue that the differences are caused by discrimination.

---

[56] John M. Blandford, The Nexus of Sexual Orientation and Gender in the Determination of Earnings, 56 Indus. & Lab. Rel. Rev. 622, 638-39 (2003).

[57] *See, e.g.*, Sylvia A. Allegretto & Michelle M. Arthur, An Empirical Analysis of Homosexual/Heterosexual Male Earnings Differentials: Unmarried and Unequal?, 54 Indus. & Lab. Rel. Rev. 631 (2001)(finding that gay men in unmarried partnered relationships earn on average 15.6% less than otherwise similar married heterosexual men, but the come in only 2.4% lower than otherwise similar unmarried partnered heterosexual men); Donna K. Ginther & Madeline Zavodny, Is the Male Marriage Premium Due to Selection?: The Effect of Shotgun Weddings on the Return to Marriage, 14 J. Population Econ. 313 (2001); Sander Korenman & David Neumark, Does Marriage Really Make Men More Productive?, 26 J. Human Res. 282 (1991).

The premium for married men over single or co-habiting men is comparable to the gap between gay and heterosexual men. Yet no one has ever suggested that the reason is that employers are discriminating against co-habiting men or single men. The actual reasons are likely more complex. Among them we might find the following: (1) High-income men have an easier time finding women willing to marry them; (2) The same attributes that are conducive to success in creating and maintaining stable relationships at home are also conducive to success in one's professional life and; (3) Men who have or plan to have children are more likely to seek out higher paying jobs and work long hours to support them rather than seek out the jobs they find most interesting or spend their extra time at leisure activities.

Finally, it is important to point out that the most recent empirical studies on income disparities between gay and heterosexual men have been turning out very different from the studies cited in the article that the Report cites for its conclusion that "on average gay men earn from 10 to 32 percent less than similarly qualified heterosexual males." Indeed, the most recent empirical study of which I am aware—*Does It Get Better?: Recent Estimates of Sexual Orientation and Earnings in the United States*—comes to precisely the opposite conclusion: ***Gay men employed full time on average earn almost 10% more than comparable heterosexual men***. [58]

The findings of that study—conducted by Christopher Carpenter and Samuel T. Eppink—are broadly consistent with some other recent research. For example, in *The Disappearing Gay Income Penalty*, Geoffrey Clarke and Purvi Sevak examined data from the National Health and Nutrition Examination Surveys (NHANES) from 1988 to 2007.[59] They found that while men who reported same-sex sexual activity had lower household income than otherwise similar heterosexual men during the earlier part of the time frame they examined, by the end of that time frame the situation was reversed with the average gay man's earnings topping those of similar heterosexual men. Similarly, Marieka Klawitter's meta-analysis of all published studies on sexual orientation and earnings indicated that both the lesbian premium and gay male penalty were decreasing over time.[60]

One possible explanation for the disappearing wage penalty for gay men is that the stigma associated with being gay. As Carpenter & Eppink put it:

---

[58] This finding was significant at 5%. Christopher S. Carpenter & Samuel T. Eppink, Does It Get Better?: Recent Estimates of Sexual Orientation and Earnings in the United States, 84 Southern Econ. J. 426, 432, tbl. 2 (2017). The authors were working with a database in which individuals had self-identified as either gay, bisexual, other sexual orientation, do not know sexual orientation, or heterosexual, had refused the sexual orientation question, or the sexual orientation information was missing from the data. They controlled for the month of the year in which the answers were given. They also controlled for age and its square, race, Hispanic ethnicity, level of educational attainment, relationship status, young children in the household, older children in the household, region of the country, number of years on the job and its square, firm size, and sector of employment. They also used 26 industry dummies and 26 occupation dummies.

[59] Geoffrey Clarke & Purvi Sevak, The Disappearing Gay Income Penalty, 121 Econ. Letters 542 (2013).

[60] Marieka Klawitter, Meta-Analysis of the Effects of Sexual Orientation on Earnings, 54 Indus. Rel.: J Econ. & Soc'y 4 (2015)(analyzing all such studies up until 2012).

> Improved attitudes toward the lesbian, gay, bisexual, and transgender (LGBT) communities have been some of the most striking and rapid social changes in the United States in the past several decades. These improved attitudes are perhaps most evident in the well-documented shift in public attitudes regarding same-sex marriage: The proportion of adults in the United States who favored same-sex marriage increased from 35 to 55% from 2001 to 2016, the year after the U.S. Supreme Court granted nationwide legal access to same-sex marriage in *Obergefell v. Hodges* in 2015. And historical data from the General Social Survey suggest that these shifts in attitudes began in the early 1990s: while in 1991 fully 72% of adults considered homosexual behavior "always wrong," the associated share reporting this view in 2010 fell to 44%. The share of adults saying homosexual behavior was "not wrong at all" increased over this same period from 14 to 41%.[61]

Ultimately, however, Carpenter & Eppink express doubt that changing attitudes is what is behind their result. They point out that changing attitudes might be expected to decrease the "penalty" for gay men's earnings, but it is not clear why it would produce a premium or why gay men would continue to have lower employment rates than heterosexual men. In addition, changing attitudes would be expected to help lesbians too (by increasing the premium they have over heterosexual women). Yet the findings in the article are instead that the premium has continued at pretty much the same level.[62]

Rebuttal of Commissioner Peter Kirsanow

Commissioner Yaki writes: "Our nation's LGBT population has a vulnerability unique among all those ***whom the Commission is mandated to protect***: it is the only class ***under our jurisdiction*** which lacks the shelter of at least one powerful, civilian, federal statutory protection."[1]

This is wrong. LGBT matters as such are not within the Commission's jurisdiction, which is one reason the Commission had not examined this issue before. The Commission's authorizing statute provides, "The Commission shall investigate allegations in writing under oath or affirmation relating to deprivations—because of color, race, religion, sex, age, disability, or national origin; or as a result of any pattern or practice of fraud; of the right of citizens of the United States to vote and have votes counted".[2] Sexual orientation or gender identity are nowhere mentioned. I understand that my colleagues think this is an important issue that needs to be addressed.[3] Fair enough. But it is not within our jurisdiction.[4]

Constitutional and Secular Concerns Regarding ENDA

It is indisputable that some individuals hold positions regarding LGBT issues out of pure animus. It is also indisputable that there is no system equivalent to Jim Crow that is designed to prevent LGBT people from participating in society. The Commission majority's findings testify to this fact:

> It has not been difficult for some private companies to adopt and implement workplace policies or practices that prohibit discrimination on the basis of sexual orientation and/or gender identity. As of 2016, 92 percent of Fortune 500 companies included sexual orientation and 82 percent included gender identity in their equal employment opportunity policies. Businesses that support these policies note such practices are beneficial to their businesses by attracting the most qualified workforce and increasing productivity.[5]

Had such an overwhelming majority of companies voluntarily adopted similar policies regarding race in 1964, passage of Title VII of the 1964 Civil Rights Act would have been far less

---

[1] Statement of Commissioner Yaki at 90.

[2] 42 U.S.C. § 1975a.

[3] Statement of Commissioner Karen Narasaki at851 ("international human rights laws complement and reinforce our nation's laws by recognizing that 'all human beings are born free and equal in dignity and rights' and therefore LGBT people are entitled to the numerous protections afforded by human rights laws, including the right to be free from discrimination."). It doesn't really matter what international human rights laws say. We are the *Civil* Rights Commission, not the *Human* Rights Commission, and our jurisdiction extends only to the *civilly*-recognized rights listed in our originating statute.

[4] Before Commissioner Yaki cites *Pricewaterhouse* and "sexual orientation discrimination as sex-stereotyping discrimination" to me, *see* discussion of *Pricewaterhouse*, *infra* at 141-43.

[5] Commission Findings at 76; *see also* Statement of Commissioner David Kladney at 83-84.

consequential. Indeed, if EEO policies had so abounded in the early Sixties, passage of Title VII may not have been a legislative imperative. As Roger Clegg from the Center for Equal Opportunity stated in his testimony, it actually is unclear whether Congress has the constitutional authority to prohibit discrimination on the basis of sexual orientation or gender identity. But then, constitutionality seems an increasingly trivial impediment to government action. Congress had the authority to enact the 1964 Civil Rights Act because discrimination against African-Americans was pervasive and, in significant parts of the country, inescapable.[6] LGBT discrimination is not comparable to the pervasive racial discrimination that prompted and gave constitutional authority to passage of the 1964 Civil Rights Act.

My colleagues appear to hold that Title VII ought to evolve into a "general civility code," which the Supreme Court sought to avoid in its decision in *Oncale v. Sundowner*.[7] The Supreme Court cautioned in *Oncale* that any sex-discrimination claims brought under Title VII must be ***because of*** sex, and that "We have never held that workplace harassment, even harassment between men and women, is automatically discrimination because of sex merely because the words used have sexual content or connotations."[8] The report approvingly cites an EEOC decision that a transgender individual was discriminated against on the basis of her sex because coworkers continued to address her using masculine pronouns.[9] The problem with determining that this is discrimination on the basis of sex is the person's sex is *literally* male. It may be a breach of decorum, sensibility, civility, and good manners to refer to the person using masculine pronouns, but it is not *sex* discrimination.

The EEOC and some courts have claimed that discrimination against transgender individuals is sex discrimination prohibited by the "sex stereotyping" interpretation of Title VII, because "A person is defined as transgender precisely because of the perception that his or her behavior transgresses gender stereotypes."[10] If a person is protected by the sex stereotyping theory, it is because he or she supposedly is not conforming to gender stereotypes. For example, a man wearing makeup and a dress or a woman taking testosterone to grow a beard do not conform to gender stereotypes. But a woman would not be transgressing gender stereotypes by wearing a dress, and a man would not be transgressing gender stereotypes by growing a beard.[11] So it cannot perforce

[7] *Oncale v. Sundowner Offshore Services, Inc.*, 523 U.S. 75 (1998).

[8] *Id.* at 80. This is also strong evidence that my colleagues are wrong in interpreting our jurisdiction over sex discrimination as encompassing discrimination on the basis of sexual orientation and gender identity.

[9] *Bost v. Sam's East, Inc.*, Charge No. 430-2014-01900 (E.E.O.C. 2017), at http://transgenderlegal.org/media/uploads/doc_729.pdf.

[10] *Macy v. Holder*, 2012 WL 1435995 (E.E.O.C. 2012), at 9, *quoting Glenn v. Brumby*, 663 F.3d 1312 (11th Cir. 2011).

[11] *See E.E.O.C. v. R.G. & G.R. Funeral Homes, Inc.*, 201 F.Supp.3d 837, 840 (E.D.Mich. 2016).

(a) The EEOC claims the Funeral Home fired Stephens for failing to conform to the masculine gender stereotypes expected as to work clothing and that Stephens has a Title

be discrimination on the basis of sex to refer to a transgender person by the name or pronouns of his or her birth sex, when the only reason this person purportedly is protected by Title VII is because the person is not conforming to gender stereotypes.[12] We are in a wilderness of mirrors.

All of this reveals that it would be helpful for the Supreme Court to revisit *Pricewaterhouse v. Hopkins*, and possibly *Oncale v. Sundowner*. In recent years, *Pricewaterhouse* has been used by the EEOC and some courts to attempt to transform sexual orientation and gender identity into protected classes.[13] Abuses of authority by federal agencies are by this time unremarkable, as is judicial activism. The fact that some courts are now discovering that transgenderism is encompassed within Title VII and Title IX[14] should alert everyone that they are legislating from the bench.[15]

> VII right *not to be subject to gender stereotypes* in the workplace. Yet the EEOC has not challenged the Funeral Home's sex-specific dress code, that requires female employees to wear a skirt-suit and requires males to wear a pants-suit with a neck tie. Rather, the EEOC takes the position that Stephens has a Title VII right to "dress as a woman" (*i.e.*, dress in a stereotypical feminine manner) while working at the Funeral Home, in order to express Stephens's gender identity. If the compelling interest is truly in eliminating gender stereotypes, the Court fails to see why the EEOC couldn't propose a gender-neutral dress code as a reasonable accommodation that would be a *less restrictive* means of furthering that goal under the facts presented here. But the EEOC has not even discussed such an option, maintaining that Stephens must be allowed to wear a skirt-suit in order to *express* Stephens's gender identity. If the compelling governmental interest is truly in *removing or eliminating* gender stereotypes in the workplace in terms of clothing (*i.e.*, making gender "irrelevant"), the EEOC's chosen manner of enforcement in this action does not accomplish that goal.

[12] As the Eastern District of Michigan has noted, this is because "As a practical matter, the EEOC . . . has been proceeding as if gender identity or transgender status is a protected class under Title VII," when this is most assuredly not the case. *E.E.O.C. v. R.G. & G.R. Funeral Homes, Inc.*, 201 F.Supp.3d 837, 860 (E.D. Mich. 2016).

[13] *Fabian v. Hospital of Central Conn.*, 172 F.Supp.3d 509, 522-23 (D.Conn. 2016)("The acknowledgement in *Price Waterhouse* that discrimination by means of gender stereotyping is discrimination 'because of sex' under Title VII eventually led to a significant shift in the direction of decisions examining alleged discrimination on the basis of transgender identity.").

[14] *Johnston v. Univ. of Pittsburgh of Com. System of Higher Educ.*, 97 F.Supp.3d 657, 674 (W.D.Penn. 2015)("nearly every federal court that has considered the question in the Title VII context has found that transgendered individuals are not a protected class under Title VII.").

[15] Former Judge Richard Posner at least had the honesty to admit that this is what judges are doing when they transform sexual orientation and gender identity into protected characteristics. *Hively v. Ivy Tech Com. Coll. of Ind.*, 853 F.3d 339, 357 (7th Cir. 2017)(Posner, J., concurring).

> (b) The majority opinion states that Congress in 1964 "may not have realized or understood the full scope of the words it chose." This could be understood to imply that the statute forbade discrimination against homosexuals but the framers and ratifiers of the statute were not smart enough to realize that. I would prefer to say that theirs was the then-current understanding of the key word—sex. "Sex" in 1964 meant gender, not sexual orientation. What the framers and ratifiers understandably didn't understand was how attitudes toward homosexuals would change in the following half century. They shouldn't be blamed for that failure of foresight. *We* understand the words of Title VII differently not because we're smarter than the statute's framers and ratifiers but because we live in a different era, a different culture. Congress in the 1960s did not foresee the sexual

If my colleagues are correct that these policies are both easy to implement and beneficial to the bottom line, most companies will adopt these policies in short order. Many have.

But they should not be compelled into doing so by judges contorting the plain text of the law to include classifications not set forth by Congress, and by federal agencies that rewrite laws through regulations and subregulatory guidance.[16]

LGBT As A Defined Class

My colleagues and the report repeatedly refer to "LGBT" as a class. In the report and often in public discourse, there is no differentiation between the four groups. Perhaps there is no rational basis for differentiation. But the report seems to make a presumption, unsupported by any empirical analysis whatsoever, that employment and workplace considerations applicable to lesbians are identical to those applicable to gays are identical to those applicable to bisexuals are identical to those applicable to transsexuals. Yet if Congress were to pass ENDA-like legislation, there is a reasonable likelihood the four different groups would not be treated as one indistinguishable mass.

Religious Liberty Concerns Regarding ENDA

There are many people who bear no ill-will toward LGBT persons as persons, but who also, for religious reasons, and in good faith, disagree with the choice to engage in a same-sex relationship or to present as a sex other than their birth sex.[17] Religious liberty will be diminished and

---

revolution of the 2000s. What our court announced in *Doe v. City of Belleville*, 119 F.3d 563, 572 (7th Cir. 1997), is what Congress had declared in 1964: "the traditional notion of 'sex.' "

(c) I would prefer to see us acknowledge openly that today we, who are judges rather than members of Congress, are imposing on a half-century-old statute a meaning of "sex discrimination" that the Congress that enacted it would not have accepted. This is something courts do fairly frequently to avoid statutory obsolescence and concomitantly to avoid placing the entire burden of updating old statutes on the legislative branch. *We should not leave the impression that we are merely the obedient servants of the 88th Congress (1963–1965), carrying out their wishes. We are not.* We are taking advantage of what the last half century has taught. [emphasis added]

[16] Commissioner Heriot has written persuasively that Title IX's prohibition on sex discrimination does not encompass gender identity. It is even less likely that Title VII includes a prohibition on gender identity discrimination. The Americans with Disabilities Act explicitly excludes transgenderism from its coverage. *See Johnson v. Fresh Mark*, 337 F.Supp.2d 996, 1001 (N.D. Ohio 2003), *quoting* 42 U.S.C. § 12211(b)(1).

R.G. & G.R. Funeral Homes, Inc.*, 201 F.Supp.3d 837, 848 (E.D.Mich. 2016)("It is also undisputed that Rost sincerely believes that the "Bible teaches that a person's sex (whether male or female) is an immutable God-given gift and that it is wrong for a person to deny his or her God-given sex." . . . Rost believes that he "would be violating

vulnerable if Congress enacts ENDA or similar legislation. The Commission says in its recommendations:

> The Commission strongly supports religious freedom and nondiscrimination on the basis of religion. Title VII offers a workable model for protecting religious freedom in the context of federal statutory nondiscrimination protections in the workplace. In *Hosanna-Tabor Evangelical Lutheran Church and School v. Equal Employment Opportunity Commission* the Supreme Court also unanimously endorsed the common law ministerial exemption, which recognizes the right of religious groups to select their own ministers and clergy. No further expansion of exceptions to nondiscrimination protections in the workplace are necessary or warranted to balance the rights to freedom of religion and to nondiscrimination on the bases either of religion or LGBT status.

My colleagues' individual statements suggest that "strongly supports" may be overstating the matter a bit. The Chair refers to concerns over conflicts between religious liberty and nondiscrimination as "the fallacy of that putative conflict"—before stating:

> A teacher's decision to tell a devout Catholic girl she would go to hell for dating another girl lowlights the error in the assumption that LGBT persons are not simultaneously persons of faith—and underscores the distinct (and in our system of laws profoundly unconstitutional) harm that privileging one understanding of faith over another can visit on people. The teachers and administrators at that school were and are free to disapprove of same sex relationships, and even of the status of being LGBT, on religious or other bases; they were and are not, however, free to act on that disapproval in ways that harmed the students as people or as learners. Likewise in an employment context, our laws should protect LGBT employees from discrimination while also protecting all of our religious freedom.[18]

The school to which Chair Lhamon refers is a public school.[19] I see nothing in her statement, however, that suggests that she would see the matter differently if it were at a private religious school. In his statement, Commissioner Yaki attacks recent guidance from the Attorney General, describing it as "rid[ing] the Hobby Lobby toboggan as it boldly careens down a slippery slope declaring—in the apparent absence of statutory or judicial authority—'RFRA protects the exercise of religion by individuals and by corporations, companies, associations, firms, partnerships, societies, and joint stock companies.'"[20]

God's commands" if he were to permit one of the Funeral Home's male funeral directors to wear the skirt-suit uniform for female directors while at work because Rost "would be directly involved in supporting the idea that sex is a changeable social construct rather than an immutable God-given gift.").

[18] Statement of Chair Catherine Lhamon at 81.

[19] ACLU of Southern California Stands Up for Gay and Lesbian High School Students Harassed by School Officials on Basis of Sexual Orientation, ACLU of Southern California, Oct. 28, 2004, https://www.aclusocal.org/en/news/aclu-southern-california-stands-gay-and-lesbian-high-school-students-harassed-school-officials.

[20] Statement of Commissioner Yaki at 104 (quoting U.S. Department of Justice Memorandum at 4).

Commissioner Yaki contends that the Attorney General's interpretation is not based in statutory or judicial authority. Apparently it escaped Commissioner Yaki's notice that Justice Alito's analysis in *Hobby Lobby* ***begins*** with settling RFRA's definition of a "person":

> RFRA applies to "a person's" exercise of religion, 42 U.S.C. §§ 2000bb-1(a), (b), and RFRA itself does not define the term "person." We therefore look to the Dictionary Act, which we must consult "[i]n determining the meaning of any Act of Congress, unless the context indicates otherwise." 1 U.S.C. § 1.
>
> Under the Dictionary Act, "the wor[d] 'person' . . . Include[s] corporations, companies, associations, firms, partnerships, societies, and joint stock companies, as well as individuals. *Ibid; see FCC v. AT & T Inc.*, 131 S.Ct. 1177, 1182-1183(2011)('We have no doubt that 'person,' in a legal setting, often refers to artificial entities. The Dictionary Act makes that clear"). Thus, unless there is something about the RFRA context that "indicates otherwise," the Dictionary Act provides a quick, clear, and affirmative answer to the question whether the companies involved in these cases may be heard.
>
> We see nothing in RFRA that suggests a congressional intent to depart from the Dictionary Act definition, and HHS makes little effort to argue otherwise. We have entertained RFRA and free-exercise claims brought by nonprofit corporations, *see Gonzales v. O Centro Espírita Beneficente Uniao do Vegetal*, 546 U.S. 418 (2006) (RFRA); *Hosanna-Tabor Evangelical Lutheran Church and School v. EEOC*, 132 S.Ct. 694 (2012) (Free Exercise); *Church of the Lukumi Babalu Aye, Inc. v. Hialeah*, 508 U.S. 520 (1993) (Free Exercise), and HHS concedes that a nonprofit corporation can be a "person" within the meaning of RFRA. *See* Brief for HHS in No. 13–354, at 17; Reply Brief in No. 13–354, at 7–8.
>
> This concession effectively dispatches any argument that the term "person" as used in RFRA does not reach the closely held corporations involved in these cases. No known understanding of the term "person" includes *some* but not all corporations. The term "person" sometimes encompasses artificial persons (as the Dictionary Act instructs), and it sometimes is limited to natural persons. But no conceivable definition of the term includes natural persons and nonprofit corporations, but not for-profit corporations.[20] *Cf. Clark v. Martinez*, 543 U.S. 371, 378, 125 S.Ct. 716, 160 L.Ed.2d 734 (2005) ("To give th[e] same words a different meaning for each category would be to invent a statute rather than interpret one"). [citations omitted]

In other words, the Attorney General's definition of a "person" has *both* statutory and judicial support. It is taken verbatim from the Dictionary Act, which the Supreme Court stated in Hobby Lobby provided the correct definition of "person" in RFRA.

If this is what the Commission majority thinks when it is in strong support of religious freedom, I hate to think what it thinks in its less sanguine moments. Title VII provides:

> Notwithstanding any other provision of this subchapter, (1) it shall not be an unlawful employment practice for an employer to hire and employ employees, for

> an employment agency to classify, or refer for employment any individual, for a labor organization to classify its membership or to classify or refer for employment any individual, or for an employer, labor organization, or joint labor-management committee controlling apprenticeship or other training or retraining programs to admit or employ any individual in any such program, on the basis of his religion, sex, or national origin in those certain instances where religion, sex, or national origin is a *bona fide* occupational qualification reasonably necessary to the normal operation of that particular business or enterprise, and (2) it shall not be an unlawful employment practice for a school, college, university, or other educational institution or institution of learning to hire and employ employees of a particular religion if such school, college, university, or other educational institution or institution of learning is, in whole or in substantial part, owned, supported, controlled, or managed by a particular religion or by a particular religious corporation, association, or society, or if the curriculum of such school, college, university, or other educational institution or institution of learning is directed toward the propagation of a particular religion.[21]

Title VII's protections for religious liberty require a painstaking case-by-case examination of the circumstances surrounding each claim.[22] Although the exact contours of Title VII's religious employer exemption are disputed, in some circumstances it is interpreted to apply only to cases of discrimination on the basis of religion, not discrimination on the basis of another protected characteristic that is motivated by a religious belief.[23] Under this narrow construction, a Catholic school could fire a teacher who left the Catholic faith, but could not fire a teacher who entered into a civil same-sex marriage if that teacher continued to maintain that she was a member of the Catholic faith. This appears to be what is contemplated by Professor Alan Brownstein, who explained in his written statement, "[T]he Title VII amendment permitting religious discrimination in hiring cannot justify discrimination on the basis of other characteristics prohibited by Title VII, such as race or gender. . . . Pursuant to this understanding, religious organizations operated by faiths whose beliefs condemn homosexual conduct could not discriminate against gay or lesbian job applicants on the ground that the very conduct of such individuals which identified them as members of a protected class violated the dictates of the employer's faith."[24]

---

[21] 42 U.S.C. § 2000e-2(e).

[22] *Spencer v. World Vision, Inc.*, 633 F.3d 723, 729 (9th Cir. 2011)("In sum, when confronted with a section 2000e-1 case, *Townley* and *Kamehameha* require us to analyze, on a case-by-case basis, whether the 'general picture' of an organization is 'primarily religious,' taking into account '[a]ll significant religious and secular characteristics.'"); *E.E.O.C. v. Kamehameha Schools/Bishop Estate*, 990 *F.2d* 458, at n. 7 (9th Cir. 1993)("In view of the narrow reach of the § 2000e-1 exemption, it is not surprising that we have found no case holding the exemption to be applicable where the institution was not wholly or partially owned by a church.").

[24] Written Statement of Alan Brownstein at 3. It should be noted that the discrimination at issue is on the basis of behavior or conduct, not identity, status, or immutable characteristics.

There are no major faiths in the United States that include racial superiority as one of their tenets. There are likely some branches of major faiths that hold views regarding gender roles that are at odds with popular opinion.[25] The vast majority of Christians have no objections to married women working outside the home. Whether or not that would have occurred without federal interference is a fair question, and whether forcing churches to change their views regarding the roles of men and women is an appropriate exercise of governmental power is another.

This is the problem with only providing Title VII's religious exemption in an ENDA-like bill, even for religious employers. If the principal of a Catholic school fired a black Catholic school teacher because of her race, the principal's actions would not be in accord with the teaching of the Catholic Church. If the principal fired a teacher who entered into a same-sex marriage, even though the teacher claimed to be Catholic and knew that the Catholic Church teaches that same-sex marriage is not marriage at all, the principal would not be defying Catholic teaching. And the ability to fire teachers and other employees in these situations is important, because actions speak louder than words.[26] A divorced woman who remarries without receiving an annulment undercuts the Church's teaching that marriage is permanent.[27] An individual who is in a civil same-sex marriage undermines the Church's teaching regarding both the indispensability of a sacramental marriage and the necessity that the spouses be male and female. For the government to come into either case and insist that the school continue to employ the teacher because the teacher identifies as Catholic is an intrusion upon church discipline and an enervation of the faith. Perhaps, to avoid this, the Church can issue a formal excommunication to the employee, although even that is arguably not a declaration that the individual is not Catholic, but rather that he is a Catholic in bad standing. But perhaps the Church hopes to bring the individual to repent of his or her sins, and thus hesitates to impose the ultimate penalty. But the Church still cannot employ this person, because to do so appears to condone his or her *behavior* and thus cause scandal.[28] These are not questions into

---

[25] Popular opinion does not always proceed in the direction one would think or prefer, however. W. Bradford Wilcox and Samuel Sturgeon, "Why would millennial men prefer stay-at-home wives? Race and feminism.", Wash. Post, Apr. 5, 2017 ("the overall trend in the GSS and another survey, Monitoring the Future, is consistent with the idea that a growing minority of younger millennials hold a more traditional view on this male breadwinner-female homemaker item.").

[26] *See Herx v. Diocese of Ft.Wayne-South Bend Inc.*, 48 F.Supp.1168, 1177 (N.D. Ind. 2014).

> (d) Mrs. Herx contends that the Diocese's admission that it didn't renew her contract because she underwent in vitro fertilization treatments creates a triable fact issue as to sex discrimination because the only people who could be terminated for that reason are pregnant women and women trying to become pregnant. . . .According to Mrs. Herx, forbidding non-ministerial employees from undergoing in vitro fertilization discriminates against women because men don't (and can't) undergo the procedure.

[27] *See Little v. Wuerl*, 929 *F.2d* 944 (3rd Cir. 1991).

[28] The term "scandal" has a particular theological meaning within the Catholic Church. *See* CATECHISM OF THE CATHOLIC CHURCH, 2284, 2286, *available at* http://www.vatican.va/archive/ENG0015/_P80.HTM.

> (e) Scandal is an attitude or behavior which leads another to do evil. The person who gives scandal becomes his neighbor's tempter. He damages virtue and integrity; he may even

which the government may intrude, because the government is essentially substituting its own judgment regarding theology and morality for that of the Church. The government is arrogating to itself the authority to decide who is a Catholic in good standing, or a Southern Baptist, or a Jew.[29] This is similar to the New York legislature enacting a statute that transferred the administration of churches from the Russian Orthodox Church to an American metropolitan district.[30] The government is weighing in on an ecclesiastical dispute because it is politically aligned with one branch of the dispute.[31] That is impermissible.[32]

If the contraception mandate included in HHS's ACA-implementing regulations taught us anything, it demonstrated that efforts to make religious organizations and institutions violate their consciences quickly descend into hair-splitting examinations of exactly who is paying for what and where to draw the lines of complicity in what a religion considers sinful behavior.

We live in a time when the country is sharply divided along almost every line imaginable—politics, race, income, sex, religion, and anything that distinguishes one human being from another. It appears there may be no way to bridge many of these divides, because the differences of opinion go the heart of what one holds most dear. My colleagues' solution is for traditionalists to capitulate to secular imperatives, even giving up the modest First Amendment right to be politically incorrect or impolite by referring to someone by the pronouns associated with his birth sex rather than his preferred gender identity.[33] My solution is more modest: follow the Constitution.

> draw his brother into spiritual death. Scandal is a grave offense if by deed or omission another is deliberately led into a grave offense. . . .
>
> (f) Scandal can be provoked by laws or institutions, by fashion or opinion.

[29] *Little* at 948.

> (g) The *Maguire* case demonstrates the even graver dangers courts face when asked to rule on religious discrimination that does not follow clear denominational lines. In that sex discrimination case, a Catholic university claimed that it had refused to hire plaintiff as a theology professor because she held views on abortion that disqualified her from being a Catholic. The court properly decided that any scrutiny of that claim would violate both the free exercise and establishment clauses.

[30] *Kedroff v. St. Nicholas Cathedral of Russian Orthodox Church in North America*, 344 U.S. 94, 97-99 (1952).

[31] *Id.* at 109-110.

[32] *Id.* at 114-115 (quoting *Watson v. Jones*, 13 Wall 728-79 (1871)).

> (h) The right to organize voluntary religious associations to assist in the expression and dissemination of any religious doctrine, and to create tribunals for the decision of controverted questions of faith within the association, and for the ecclesiastical government of all the individual members, congregations, and officers within the general association, is unquestioned. All who unite themselves to such a body do so with an implied consent to this government, and are bound to submit to it. But it would be a vain consent and would lead to the total subversion of such religious bodies, if any one aggrieved by one of their decisions could appeal to the secular courts and have them reversed.

Surrebuttal of Commissioner David Kladney

Commissioners Kirsanow and Heriot object to the idea that LGBT people deserve federal employment protections against employers targeting them for their orientation or gender identity. They claim such protections would be too burdensome for employers and are not needed because discrimination on the basis of sexual orientation or gender identity is not a pervasive problem. Commissioner Heriot has taken my words, that "discrimination [against LGBT persons] is wrong each and every time it happens" to mean I would support laws against any employment decision which is morally wrong but, in her words "idiosyncratic." Commissioner Kirsanow has taken my praise of the business community for voluntarily adopting LGBT protections to argue that no legal protections are needed. Finally, Commissioner Heriot has taken my note that businesses derive many benefits from government (for example, through using the corporate form) and it is therefore proper to hold them to account with nondiscrimination requirements to mean I would think it proper to impose my understanding of American values on every company.

I write simply to state that these arguments are quite obviously not the case. I see discrimination against LGBT persons as a pervasive, destructive problem. I do believe it is wrong in each instance, but we are far from a day when it could be said to be idiosyncratic. I find it impossible that a fair observer of our society could come to the conclusion that LGBT persons are not systematically disadvantaged in ways heterosexual people are not. The report speaks for itself in cataloguing the existing literature on employment discrimination, but should these existing statistics not be sufficient for Commissioners Heriot and Kirsanow, I suggest they indicate their strong support for the Commission's recommendation: "Workplace discrimination data should be collected through the inclusion of sexual orientation and gender identity questions in population-based surveys of the workforce such as the Census, American Community Survey, and surveys fielded by the Bureau of Labor Statistics and other agencies."

In a thought experiment to a world where discrimination against LGBT people were vanishingly rare, Commissioner Heriot proposes that firing someone for their LGBT status would be no more offensive on a societal level than firing someone for an arbitrary reason such as the person's first name or sports team affiliation. That is not our world. In our world, LGBT people face negative employment consequences for their status, as do people of color and people of other protected statuses. In fact, employers use "idiosyncratic" reasons as pretext to hide their discrimination. Such discrimination abrogates our belief in a meritocracy. The only true open question is whether as a society we find it tolerable for LGBT people to suffer because others disapprove of them. I believe it is consistent with American values to protect people on this basis, and while I do not believe every business should be required to adopt my understanding of American values in every respect, I do believe it behooves this country to acknowledge the history of discrimination against LGBT people along with the current realities of employment discrimination and adopt employment protections. Voluntary adoption of employment protections by many companies is insufficient for

the simple reason that these policies are unenforceable, and thus offer cold comfort to those who face discrimination.

Commissioner Kirsanow uses the bulk of his rebuttal to argue for the incompatibility of LBGT employment protections with religious liberty. I disagree with Commissioner Kirsanow on this point, but write simply to say, counter to his assertions, the Commission does strongly support religious freedom and nondiscrimination on the basis of religion. Nothing in this report states otherwise, and the Commission's history demonstrates support for the tenets of religious freedom and nondiscrimination. Disagreement as to the contours of religious protections in particular instances does not indicate an abandonment of Constitutional and statutory religious protections.

RICK SCOTT
GOVERNOR

ELIZABETH DUDEK
SECRETARY

PUBERTY SUPPRESSION THERAPY
GENERALLY ACCEPTED PROFESSIONAL MEDICAL STANDARDS (GAPMS)
DETERMINATION REPORT WITH RECOMMENDATION

Date: September 14, 2016

To: Justin Senior, Deputy Secretary for Medicaid

From: Bureau of Medicaid Policy

Subject: **Puberty Suppression Therapy**

PURPOSE

In order for the use of puberty suppression therapy to be covered under the Florida Medicaid program, it must meet medical necessity criteria as defined in Rule 59G-1.010, Florida Administrative Code (F.A.C.), and be funded through the General Appropriations Act of Chapter 216, Florida Statutes (F.S.).

Pursuant to the criteria set forth in Rule 59G-1.010, F.A.C., the use of puberty suppression therapy must be consistent with generally accepted professional medical standards (GAPMS) as determined by the Medicaid program, and not experimental or investigational.

In accordance with the determination process established in Rule 59G-1.035, F.A.C., the Deputy Secretary for Medicaid will make the final determination as to whether the use of puberty suppression therapy is consistent with generally accepted professional medical standards and not experimental or investigational.

If it is determined that puberty suppression therapy is consistent with generally accepted professional medical standards, this report will be supplemented with an addendum which analyzes additional factors to determine whether this health service should be covered under the Florida Medicaid program.

REPORT WITH RECOMMENDATION

This report with recommendation is presented as the summary assessment considering the factors identified in Rule 59G-1.035, F.A.C., based on the collection of information from credible sources of reliable evidence-based information. The intent is to provide a brief analysis with justification in support of the final recommendation.

The analysis described in this report includes:

- A high level review of relevant disease processes.
- An overview of the health service information.
- Clearance from the government regulatory body (e.g., Food and Drug Administration).

SlideShare.net/AHCAFlorida

Pl. Trial Ex. 240

- Evidence based clinical practice guidelines.
- A review of the literature considered by the relevant medical community or practitioner specialty associations from credible scientific evidence-based literature published in peer reviewed journals and consensus of coverage policy from commercial and other state Medicaid insurers.

HEALTH SERVICE SUMMARY

Hormones

Hormones are important chemical messengers in the body that effectively transfer signals and instructions from one set of cells to another. Hormones are secreted into the bloodstream by a collection of glands inside the body referred to as the endocrine system. A gland is a group of cells that produces and secretes chemicals into the body. The major glands that make up the endocrine system include the hypothalamus, pituitary gland, thyroid and parathyroid, adrenals, pineal body, and the ovaries and testes.

In a laboratory setting, hormones are produced synthetically and are prescribed by physicians to treat disease or hormone deficiencies. An instance where synthetic hormones may be needed is when an individual has their thyroid gland surgically removed; a practitioner may prescribe synthetic thyroid hormones to replace those that their body can no longer produce.

Over 50 different hormones have been identified in the human body, and more are still being discovered. Hormones influence and regulate practically every cell, tissue, organ, and function of the body, including growth, development, metabolism, homeostasis, and sexual and reproductive function.[20]

Reproductive Hormones

The hormones commonly considered as reproductive hormones in the body are testosterone, estrogen, and progesterone. Testosterone is often referred to as a male hormone, and estrogen and progesterone are often referred to as female hormones. However, there are no exclusively male or female hormones that have been identified. The physical manifestations of gender result from differences in the amounts of individual hormones in the body and differences in their patterns of secretion, first in utero and then again during puberty. In other words, testosterone, estrogen, and progesterone are produced by men and women, but in differing amounts and in different patterns.[20]

Reproductive Hormone Suppression Therapy

There are many disease processes in which increased levels of reproductive hormones are released. They include, but are not limited to, prostate cancer, breast cancer, severe endometriosis, and central precocious puberty. To address the over-secretion of reproductive hormones, several drugs have been developed to aid in reducing hormone levels, including those hormones released during puberty.

For the purposes of this report, an analysis is being performed on the use of hormone treatment to suppress puberty. Currently, there are a number of drugs used to suppress puberty, which all use gonadotropin-releasing hormone (GnRH) agonists. Agonists function to stop receptors from connecting with the appropriate transmitter. For a hormone to perform its primary function in the

brain and body it must find the correct receptor to transmit its response; the GnRH agonists prevent this natural cycle.[20]

Government Regulatory Body Approval

The Food and Drug Administration (FDA) has approved three drugs for the use in children for the purpose of puberty suppression therapy, as follows:

- Lupron[44]
  - Indications for use: Palliative treatment of advanced prostatic cancer and central precocious puberty in children of both sexes.
- Synarel[47]
  - Indications for use: Central precocious puberty (gonadotropin-dependent precocious puberty) in children of both sexes and endometriosis.
- Supprelin[46]
  - Indications for use: Central precocious puberty in both sexes.

Each of these drugs has specific indications for use and dosing information. Additionally, these medications have approved off-label uses. This permits usage in other than the approved FDA indications. These approved off-label uses are compiled in three compendia: American Hospital Formulary Service Drug Information (AHFS), United States Pharmacopeia-Drug Information (or its successor publications), and DRUGDEX Information System.[7] The drugs specified above are authorized in the respective compendia to treat the following conditions:

- Lupron:
  - Breast cancer
  - In vitro fertilization
  - Ovarian cancer
  - Premenstrual syndrome
  - Prostate cancer
  - Prostate cancer, Neoadjuvant treatment
  - Uterine leiomyoma
- Synarel:
  - Benign prostatic hyperplasia
  - Contraception, Female; prophylaxis
  - Contraception, Male; prophylaxis
  - Crohn's disease
  - Hirsutism
  - In vitro fertilization
  - Uterine leiomyoma
- Supprelin:
  - Acute intermittent porphyria
  - Endometriosis
  - Female infertility; Adjunct
  - Polycystic ovary syndrome
  - Uterine leiomyoma

While all of these drugs may be utilized to treat other conditions, as indicated above and specified in the compendia, none of them are authorized or specified in the compendia for use in treating individuals diagnosed with gender dysphoria.[7]

LITERATURE REVIEW

This analysis summarizes information obtained from scientific literature published in credible peer-reviewed journals related to the use of puberty suppression therapy. This section also briefly cites the positions from the relevant medical societies, and summarizes the key articles referenced in support of their positions.

Central Precocious Puberty

Central precocious puberty (CPP) develops due to premature pubertal changes and rapid bone development. CPP is associated with lower adult height and increased risk for development of psychological problems.

Reproductive hormone suppression therapy (also referred to as puberty suppression therapy in this document) has been the standard of care for CPP for the last 15-20 years. The standard treatment for CPP is GnRH analogs. Although there are many different analogs with different routes of administration, the primary agent in the United States for many years was depot intramuscular injections administered every four weeks, but in the last ten years, a subdermal or under the skin implant has been developed, which has been shown to be effective for up to two years.[17, 39, 41]

In a recent study, researchers explored the difference in cognitive function, behavior, emotional reactivity, and psychosocial problems between young females treated with GnRH and age-matched controls. They concluded that young females treated with GnRH do not differ in their cognitive functioning, behavioral, and social problems from their same age peers. However, they did find a significant difference in heart rate that increased with treatment duration and suggested a follow-up study with an emphasis on cardiac health.[05]

Gender Dysphoria

Gender dysphoria is an individual's affective or cognitive discontent with their assigned gender (gender at birth).[14] Gender dysphoria refers to the distress that may accompany the incongruence between the individual's experienced or expressed gender and their assigned gender. Evidence of this distress is the hallmark of the disorder. The diagnostic criteria are divided into a category for children and a category for adolescents and adults. The disorder is manifested differently as an individual ages or enters different developmental stages. Both categories require marked incongruence between the individual's experienced or expressed gender and their assigned gender of at least a six months' duration and clinically significant distress or impairment in social, school (occupation for adults), or other important areas of functioning.[14]

Diagnostic criteria in children include: a strong desire to be the other gender or an insistence that they are the other gender; a preference for wearing clothing associated with the other gender; preference for cross gender roles in simulated play; preference for toys games, or activities usually associated with the other gender; preference for playmates of the other gender; and the dislike of their sexual anatomy. The prevalence of this diagnosis among the general population ranges from 0.005% to 0.014% in males and 0.002% to 0.003% in females.[14]

Studies have shown that the majority of children (80%) diagnosed with gender dysphoria will not continue to be gender dysphoric after puberty.[31]

In adolescents and adults, diagnostic criteria include: a strong desire to be and to be treated as the other gender and a strong desire to have the sex characteristics of the other gender (or in the case of adolescents, the wish to prevent the development of their assigned gender's characteristics).[14]

Gender dysphoria is associated with high levels of stigmatization, discrimination, and victimization, leading to negative self-concept, increased rates of mental disorder comorbidity, school dropout, and economic marginalization.[14] Adolescents that do not receive treatment during this already vulnerable period of development might engage in risky or self-harming behaviors , such as self-harm, self-mutilation, suicidal ideation, or suicide.[22]

For the 20% of children who persist in their feelings of gender dysphoria, clinicians may begin to explore alternative treatment approaches beyond psychotherapy after the onset of puberty, including medical interventions such as the use of GnRH analogs to suppress puberty.[38] The use of puberty suppression therapy is used as a diagnostic aid in adolescents contending with gender dysphoria.[6, 10, 11, 24, 31, 50] The use of GnRH analogs is generally prescribed in adolescents ages 12-16. In addition to puberty suppression therapy, a physician may also begin to prescribe cross-sex hormones, though the latter does not generally begin until the ages of 16-18.[10, 11]

The use of GnRH analogs will delay reproductive development in this population. However, there remains a great deal of concern and lack of consensus in the medical community of the potential risks, including: misdiagnosis, sterilization, adverse medical effect on the metabolic and endocrine system, impaired bone mass and brain development, etc.[51, 6] To date, there have been no randomized controlled clinical trials on the use of GnRH analogs in the treatment of gender dysphoria (on large cohorts) that have been shown to be efficacious with tolerable side effects. This is in large part due to the small number of patients diagnosed with gender dysphoria, which makes any statement on the general efficacy of a treatment approach challenging.[31] However, there have been case-studies (qualitative) that have been conducted that review the outcomes on small cohorts. These studies have concluded that there are limited negative side effects from the use of puberty suppression drugs in adolescents contending with gender dysphoria.[54, 55]

Clinicians who support the use of puberty suppression therapy in the treatment of gender dysphoria argue that the risks of misdiagnosis are significantly reduced if the treatment is delayed until the initiation of puberty. They also contend that this treatment may relieve emotional distress in the individual (including reducing suicidal ideation in severe cases) and may "buy time" for the child to explore their feelings of gender dysphoria without contending with physical changes that cannot be undone (e.g., breast development).[22] Most treatment protocols recommend extensive psychological evaluations/assessments and psychotherapy by mental health professionals prior to the initiation of medical interventions. This is especially important given the changing thoughts and feelings of prepubescent children versus adolescents with persistent gender dysphoria and in adolescents presenting with co-morbid conditions.

It is important to note that most of the literature reviewed in development of this analysis concluded that more systematic research is required to determine the long-term efficacy of medical treatment for adolescents with gender dysphoria.[21, 24, 25, 28, 50, 51]

Evidence-Based Clinical Practice Guidelines

The American Academy of Pediatrics published a consensus statement on the use of GnRH analogs in children in March 2009. They concluded that GnRH use was undisputed in the treatment of CPP early-onset (less than six years old). However, the use of GnRH for conditions other than CPP requires additional investigation and cannot be suggested routinely.[3] The consensus statement does not specifically address the use of GnRH in the treatment of gender dysphoria.

The Endocrine Society published guidelines for the endocrine treatment of transsexual persons. The Society concluded that transsexual persons seeking to develop the physical characteristics of the desired gender require safe, effective hormone regimen that will 1) suppress endogenous hormone secretion determined by the person's genetic/biological sex and 2) maintain sex hormone levels within the normal range for the person's desired gender. They recommend that a mental health professional make the referral and participate in ongoing care and an endocrinologist must confirm the diagnostic criteria. They do not recommend endocrine treatment of prepubertal children. The recommendations are as follows:

- Treatment of transsexual adolescents (Tanner stage two, generally achieved around the age of 12 years) by suppressing puberty with GnRH analogues until the age of 16 years.
- Initiation of cross-sex hormones at the age of 16 years with continued suppression of biological sex hormones.
- Maintaining physiologic levels of gender-appropriate sex hormones and monitoring for known risks throughout adulthood.[10, 18, 32]

In making these recommendations, however, the Endocrine Society identified the strength of the evidence used to support its conclusions. For all of the recommendations listed above, the Society acknowledged the strength of the evidence as low or very low.

COVERAGE POLICY

Federal Regulations

Federal regulations for Medicaid specify that a state may limit coverage of a drug with respect to the treatment of a specific disease or condition for an identified population (if any) based on the drug's labeling, if it does not have a significant, clinically meaningful therapeutic advantage in terms of safety, effectiveness, or clinical outcome of such treatment for such population over other drugs included in the formulary. In addition, states may exclude a drug when the prescribed use of the drug is not for a medically accepted indication, either approved by the FDA or supported by information from the appropriate compendia. These guidelines apply to a state's administration of its Medicaid prescribed drug benefit in both managed care and non-managed care delivery systems.

States are also required to implement a drug use review program for covered outpatient drugs in order to assure that prescriptions are appropriate, medically necessary, and are not likely to result in adverse medical results. The program is required to assess data on drug use against predetermined standards, consistent with the following:

1. Compendia, consisting of the following:
   a. American Hospital Formulary Service Drug Information;
   b. United States Pharmacopeia-Drug Information (or its successor publications); and
   c. the DRUGDEX Information System; and
2. The peer-reviewed medical literature.

Federal law requires states to provide services to eligible recipients under the age of 21 years, if such services are medically necessary to correct or ameliorate a defect, a condition, or a physical or mental illness. This is known as the Early and Periodic Screening, Diagnostic, and Treatment (EPSDT) benefit. Included are diagnostic services, treatment, equipment, supplies, and other measures described in section 1905(a) of the Social Security Act, codified in Title 42 of the United States Code 1396d (a). As such, services for recipients under the age of 21 years exceeding any coverage limitations specified within a state's policies maybe approved, if medically necessary.

Florida Medicaid

In order to be reimbursed by Florida Medicaid, a drug must be medically necessary and either (a) prescribed for medically accepted indications and dosages found in the drug labeling or drug compendia in accordance with section 1927(k) (6) of the Social Security Act, or (b) prior authorized by a qualified clinical specialist approved by the Agency for Health Care Administration (Agency).[1]

The criteria that are utilized under the Florida Medicaid program in the authorization of drugs for off-label purposes are as follows:

1. Documentation submitted with trial and failure or intolerance to all FDA- approved medications for the indication **AND**
2. Phase III clinical studies published in peer review journals to support the non-FDA approved use **AND**
3. Usage supported by publications in peer reviewed medical literature **and** one or more citations in at least one of the following compendia:
   a. American Hospital Formulary Service Drug Information (AHFS)
   b. United States Pharmacopeia-Drug Information (or its successor publications)
   c. DRUGDEX Information System[1]

Florida Medicaid covers reproductive hormone suppression therapy (including puberty suppression therapy) for all FDA approved indications/uses or when the information in the appropriate compendium supports the use of the drug in the treatment of the specific disease state or condition. Since the use of GnRH agonists are not FDA approved or listed in the appropriate compendia for the treatment of gender dysphoria, Florida Medicaid does not authorize these drugs for such uses. However, children/adolescents diagnosed with gender dysphoria are eligible to receive an array of other medical and behavioral health interventions (e.g., individual and family therapy, psychological evaluations/assessments, other medical evaluation and management services) necessary to address their presenting signs and symptoms.

Health plans contracted to provide services under the Florida Medicaid Statewide Medicaid Managed Care program are required to cover all prescription drugs listed in the Agency's Medicaid Preferred Drug List (PDL). In addition, the health plan's prior authorization criteria and protocols may not be more restrictive than those used by the Agency as indicated in the Florida Statutes, the Florida Administrative Code, the Medicaid State Plan and those posted on the Agency website.

Florida Medicaid provides services to eligible recipients under the age of 21 years, if such services are medically necessary to correct or ameliorate a defect, a condition, or a physical or mental illness. Medical necessity in the State of Florida must meet the following conditions:

1. Be necessary to protect life, to prevent significant illness or significant disability, or to alleviate severe pain;
2. Be individualized, specific, and consistent with symptoms or confirmed diagnosis of the illness or injury under treatment, and not in excess of the patient's needs;
3. Be consistent with generally accepted professional medical standards as determined by the Medicaid program, and not experimental or investigational;
4. Be reflective of the level of service that can be safely furnished, and for which no equally effective and more conservative or less costly treatment is available statewide; and
5. Be furnished in a manner not primarily intended for the convenience of the recipient, the recipient's caretaker, or the provider.

If a service exceeds the coverage described within a Florida Medicaid policy or the associated fee schedule, a request (along with all supporting documentation) may be submitted to the Agency or its designee for review.

Medicare

Medicare covers reproductive hormone suppression for all FDA approved use. The *Medicare Benefit Policy Manual*, Chapter 15, page 15, subsection 50.4.2, discusses the unlabeled use of a drug. The policy states that "FDA approved drugs used for indications other than what is indicated on the official label may be covered under Medicare if the carrier determines the use to be medically accepted, taking into consideration the major drug compendia, authoritative medical literature and/or accepted standards of medical practice."[5] However, because Medicare covers primarily elderly adults and disabled adults, its coverage policies have little or no application in this analysis.

State Medicaid Programs

All state Medicaid programs cover reproductive hormone suppression therapy for the approved FDA indications and when the criteria for off-label use are met. Some state Medicaid programs are also adopting coverage policies that allow for reimbursements of puberty suppression therapy in adolescents diagnosed with gender dysphoria. It appears at this time as though most states do not cover this service although that may change over time. This report highlights the coverage policies for four Medicaid programs that do cover the service, as follows:

1. Colorado Medicaid covers behavioral health services, GnRH analogs/agonists, cross-sex hormone therapy, gender confirmation surgery, and pre and post-operative care.
2. Maryland Medicaid covers GnRH treatment if the recipient has a diagnosis of gender dysphoria.
3. Rhode Island Medicaid covers behavioral health services, pharmacological and hormonal therapy to delay physical changes of puberty, and pharmacological and hormonal therapy that is non-reversible and produces masculinization or feminization. Some services require prior authorization.
4. Washington State Medicaid covers behavioral health services, puberty suppression therapy, hormonal therapy, and gender reassignment surgery.

GENERALLY ACCEPTED PROFESSIONAL MEDICAL STANDARDS RECOMMENDATION

Puberty suppression therapy is considered a health service that is consistent with generally accepted professional medical standards for the approved FDA indications (i.e., central precocious puberty) and for off-label use when supported by citations in at least one of the compendia. Since Florida Medicaid already provides coverage of puberty suppression therapy in the treatment of central precious puberty and for use in treating the conditions cited in the compendia, no further policy coverage analyses are needed to supplement this report on this point.

Based upon the available published literature, it is inconclusive whether puberty suppression therapy is considered a health service that is consistent with generally accepted professional medical standards in the treatment of gender dysphoria. Most of the studies published thus far on the use of puberty suppression in gender dysphoric children/adolescents have concluded that further systematic research is required to determine the long-term safety and efficacy of this approach and there remains a lack of consensus within the medical community on its appropriateness (both from an ethical and safety perspective). As the research on this topic continues to evolve, more conclusive evidence may emerge that supports the long-term efficacy and effectiveness of this treatment approach. At any time, a follow-up analysis can be performed that could change this recommendation.

EPSDT Considerations:

While the Agency cannot make a blanket determination on puberty suppression therapy for gender dysphoria, we also cannot categorically exclude this treatment for children. Clinical guidelines from the Endocrine Society do recommend this therapy for certain adolescents, albeit based upon a combination of weak and very weak evidence. In certain circumstances, the risks of not treating an adolescent may be worse than the potential long-term consequences of treatment. Moreover, it is noted extensively in the literature that adolescents contending with gender dysphoria often experience a myriad of emotional, physical, and societal challenges. Unresolved, the distress can manifest into a host of behavioral health problems including depression, anxiety, and suicidal ideation and self-mutilation. Florida pays for services for children when they protect life and /or prevent significant disability or harm, in accordance with the state's medical necessity definition.

Given these concerns, while it is not recommended that any further analyses be conducted to expand Florida Medicaid's coverage of puberty suppression therapy beyond those indications/uses approved by the FDA or authorized in the appropriate compendium, it is recommended that any individualized request for such therapy be reviewed as a part of the Agency's special services process. Consistent with EPSDT requirements, the request can be evaluated on an individualized basis to determine if the service is medically necessary (e.g. it is administered to protect life and/or prevent significant disability, such as to prevent suicide or self-mutilation) to ensure that all less invasive interventions have been exhausted, and to ensure that this treatment approach presents as the best alternative given the adolescent's psychological state and presenting signs and symptoms.

Original Development Date: Original Effective Date: Revision Date:	September 20, 2016 September 18, 2017 November 17, 2017

SPECIAL SERVICES CRITERIA
PUBERTAL SUPPRESSION WITH GONADOTROPIN-RELEASING HORMONE ANALOG AGENT FOR GENDER DYSPHORIA

LENGTH OF AUTHORIZATION: THREE MONTHS

CLINICAL CRITERIA:
Gender dysphoria is defined as distress or discomfort caused by a discrepancy between a person's assigned sex at birth and a person's gender identity. Unresolved, the distress or discomfort can manifest into a host of behavioral health problems including depression, anxiety, suicidal ideation and self-mutilation. The purpose of pubertal suppression is to alleviate suffering caused by the development of secondary sex characteristics, in order to provide time to make a balanced decision regarding the actual gender reassignment.[1]

REVIEW CRITERIA:
- A comprehensive mental health evaluation is required and must include the diagnosis of gender dysphoria, using the current Diagnostic and Statistical Manual of Mental Disorders-5 by a mental health professional (MHP) licensed in accordance with s. 490 or s. 491, Florida Statutes (supporting documentation required).[2]
- The diagnosis must be confirmed by an endocrinologist.[2]
- The MHP clinical notes must reflect the MHP's professional judgment that not treating the patient is likely to be worse than the potential long-term consequences of the treatment. The treatment must be medically necessary (e.g. it is administered to protect life and/or prevent significant disability, such as to prevent suicide or self-mutilation), and must ensure that the pubertal suppression treatment approach presents as the best alternative given the patient's psychological state and presenting signs and symptoms (supporting documentation required).
- The patient must have been in psychotherapy for a minimum of six months since diagnosed with gender dysphoria prior to consideration for pubertal suppression therapy.
- Females and males must have reached a Tanner stage 2 or Tanner stage 3 prior to consideration of pubertal suppression therapy and have confirmed pubertal levels of estradiol and testosterone.
- If treatment is being prescribed for adolescents under the age of 12, additional documentation is required to support the request.
- The MHP clinical notes must address the patient's readiness for pubertal suppression treatment and ensure psychotherapy will continue to be offered while on pubertal suppression therapy.[3]
- Parental consent is required during treatment for patients under the age of 18.[4] The patient and the legal guardian/parents must demonstrate knowledge and understanding of the expected

outcomes of suppression of pubertal hormones including the reversible and irreversible effects of pubertal suppression therapy (supporting documentation required).[2]

- Documentation must include evidence that other psychiatric or medical comorbidities that may interfere with the diagnostic work-up or treatment have been ruled out.[3]
- Documentation of treatment adherence is required.

Florida Medicaid

Generally Accepted Professional Medical Standards Determination on the Treatment of Gender Dysphoria

June 2022

Ron DeSantis, Governor
Simone Marstiller, Secretary

Contents

Introductory Remarks and Abstract

Generally Accepted Professional Medical Standards

The Secretary of the Florida Agency for Health Care Administration requested that the Division of Florida Medicaid review the treatment of gender dysphoria for a coverage determination pursuant to Rule 59G-1.035, Florida Administrative Code (F.A.C.) (See Attachment A for the Secretary's Letter to Deputy Secretary Tom Wallace). The treatment reviewed within this report included "sex reassignment treatment," which refers to medical services used to obtain the primary and/or secondary physical sexual characteristics of a male or female. As a condition of coverage, sex reassignment treatment must be "consistent with generally accepted professional medical standards (GAPMS) and not experimental or investigational" (Rule 59G-1.035, F.A.C., see Attachment B for the complete rule text).

The determination process requires that "the Deputy Secretary for Medicaid will make the final determination as to whether the health service is consistent with GAPMS and not experimental or investigational" (Rule 59G-1.035, F.A.C.). In making that determination, Rule 59G-1.035, F.A.C., identifies several factors for consideration. Among other things, the rule contemplates the consideration of "recommendations or assessments by clinical or technical experts on the subject or field" (Rule 59G-1.035(4)(f), F.A.C.). Accordingly, this report attaches five assessments from subject-matter experts:

- **Attachment C:** Romina Brignardello-Petersen, DDS, MSc, PhD and Wojtek Wiercioch, MSc, PhD: *Effects of Gender Affirming Therapies in People with Gender Dysphoria: Evaluation of the Best Available Evidence*. 16 May 2022.
- **Attachment D:** James Cantor, PhD: *Science of Gender Dysphoria and Transsexualism*. 17 May 2022.
- **Attachment E:** Quentin Van Meter, MD: *Concerns about Affirmation of an Incongruent Gender in a Child or Adolescent*. 17 May 2022.
- **Attachment F:** Patrick Lappert, MD: *Surgical Procedures and Gender Dysphoria*. 17 May 2022.
- **Attachment G:** G. Kevin Donovan, MD: *Medical Experimentation without Informed Consent: An Ethicist's View of Transgender Treatment for Children*. 16 May 2022.

Abstract

Available medical literature provides insufficient evidence that sex reassignment through medical intervention is a safe and effective treatment for gender dysphoria. Studies presenting the benefits to mental health, including those claiming that the services prevent suicide, are either low or very low quality and rely on unreliable methods such as surveys and retrospective analyses, both of which are cross-sectional and highly biased. Rather, the available evidence demonstrates that these treatments cause irreversible physical changes and side effects that can affect long-term health.

Five clinical and technical expert assessments attached to this report recommend against the use of such interventions to treat what is categorized as a mental health disorder (See attachments):

- **Health Care Research:** Brignardello-Petersen and Wiercioch performed a systematic review that graded a multitude of studies. They conclude

that evidence supporting sex reassignment treatments is low or very low quality.

- **Clinical Psychology:** Cantor provided a review of literature on all aspects of the subject, covering therapies, lack of research on suicidality, practice guidelines, and Western European coverage requirements.
- **Plastic Surgery:** Lappert provided an evaluation explaining how surgical interventions are cosmetic with little to no supporting evidence to improve mental health, particularly those altering the chest.
- **Pediatric Endocrinology:** Van Meter explains how children and adolescent brains are in continuous phases of development and how puberty suppression and cross-sex hormones can potentially affect appropriate neural maturation.
- **Bioethics:** Donovan provides additional insight on the bioethics of administering these treatments, asserting that children and adolescents cannot provide truly informed consent.

Following a review of available literature, clinical guidelines, and coverage by other insurers and nations, Florida Medicaid has determined that the research supporting sex reassignment treatment is insufficient to demonstrate efficacy and safety. In addition, numerous studies, including the reports provided by the clinical and technical experts listed above, identify poor methods and the certainty of irreversible physical changes. Considering the weak evidence supporting the use of puberty suppression, cross-sex hormones, and surgical procedures when compared to the stronger research demonstrating the permanent effects they cause, these treatments do not conform to GAPMS and are experimental and investigational.

Health Service Summary

Gender Dysphoria

Frequently used to describe individuals whose gender identity conflicts with their natural-born sex, the term gender dysphoria has a history of evolving definitions during the past decades (Note: This report uses the term "gender" in reference to the construct of male and female identities and the term "sex" when regarding biological characteristics). Prior to the publication of the *Fifth Edition of the Diagnostic and Statistical Manual of Mental Disorders* (DSM-V), the American Psychiatric Association (APA) used the diagnosis of gender identity disorder (GID) to describe individuals who sought to transition to the opposite gender. However, behavioral health clinicians sought a revision after determining that using GID created stigma for those who received the diagnosis. This is despite the APA having adopted GID to replace the previous diagnosis of transsexualism for the exact same reason (APA, 2017).[1]

When crafting its new definition and terminology, the APA sought to remove the stigma of classifying as a disorder the questioning of one's gender identity by focusing instead on the psychological distress that such questioning can evoke. This approach argues that individuals seeking behavioral health and transition services are doing so due to experiencing distress and that gender non-conformity by itself is not a mental health issue. This led to the adoption of gender dysphoria in 2013 when the APA released the DSM-V. In addition to using a new term, the APA also differentiated the diagnosis between children and adolescents and adults, listing different characteristics for the two age groups (APA, 2017).

According to the DSM-V, gender dysphoria is defined as "the distress that may accompany the incongruence between one's experienced or expressed gender and one's assigned gender." As for the criteria to receive the diagnosis, the APA issued stricter criteria for children than adolescents and adults. For the former, the APA states that a child must meet six out of eight behavioral characteristics such as having "a strong desire to be of the other gender or an insistence that one is the other gender" or "a strong preference for cross-gender roles in make-believe or fantasy play." The criteria for adults and adolescents are less stringent with individuals only having to meet two out of six characteristics that include "a strong desire to be the other gender" or "a strong desire to be rid of one's primary and/or secondary sexual characteristics." The APA further notes that these criteria can also apply to young adolescents (DSM-V, 2013).

In 2021, the Merck Manual released a slightly different definition for gender dysphoria, citing that the condition "is characterized by a strong, persistent cross-gender identification associated with anxiety, depression, irritability, and often a wish to live as a gender different from the one associated with the

[1] The concept of gender being part of identity and disconnected from biological sex originated during the mid-twentieth century and was publicized by psychologist John W. Money. His research asserted that gender was a complete social construct and separate from biology, meaning that parents and/or caregivers could imprint on a young child (under three years) the identity of a boy or girl. In 1967, Money's theories led to a failed experiment on twin boys where physicians surgically transitioned one to appear as a girl. The twin that underwent sex reassignment never fully identified as a female. However, Money never publicly acknowledged this and reported the experiment as a success. Furthermore, he promoted his conclusions across the scientific community, concealing what actually unfolded. As a result, Money's ideas on gender fluidity served as a basis for performing procedures on children with hermaphroditic features or genital abnormalities. The case reveals how the understanding of a concept (e.g., gender) at any given time can lead to incorrect medical decisions with irreversible consequences (Gaetano, 2015).

sex assigned at birth." Additionally, the Merck Manual further states that "gender dysphoria is a diagnosis requiring specific criteria but is sometimes used more loosely for people in whom symptoms do not reach a clinical threshold" (Merck Manual, 2021). This definition is largely consistent with the DSM-V but does not emphasize the distress component to the same extent.[2]

Like other behavioral health diagnoses classified in the DSM-V, gender dysphoria has the following subtypes:

- **Early-Onset Gender Dysphoria:** This subtype begins during childhood and persists through adolescence into adulthood. It can be interrupted by periods where the individual does not experience gender dysphoria signs and may classify as homosexual (DSM-V, 2013).
- **Late-Onset Gender Dysphoria:** Occurring after puberty or during adulthood, this subtype does not begin until late adolescence and can emerge following no previous signs of gender dysphoria. The APA attributes this partially to individuals who did not want to verbalize their desires to transition (DSM-V, 2013).

Further studies have identified additional subtypes of gender dysphoria. In 2018, Lisa Littman introduced the concept of a rapid-onset subtype. Classified as rapid-onset gender dysphoria (ROGD), it features characteristics such as sudden beginnings during or following puberty. However, it differs from the DSM-V definitions because ROGD is associated with other causes such as social influences (e.g., peer groups, authority figures, and media). In other words, adolescents who had no history of displaying typical gender dysphoria characteristics go through a sudden change in identity following intense exposure to peers and/or media that heavily promotes transgender lifestyles (Littman, 2018). While more long-term studies are needed to confirm whether ROGD is a temporary or long-term condition, Littman's study has initiated discussions regarding potential causes of gender dysphoria as well as introduced a potential subtype.

Additionally, the frequent use of gender dysphoria in clinical and lay discourse has led to a fracturing of the definition. Studies on the topic frequently do not apply the DSM-V's criteria for the diagnosis and overlook certain key features such as distress. In a 2018 review by Zowie Davy and Michael Toze, the authors evaluated 387 articles that examine gender dysphoria and noted stark departures from the APA's definition. They further asserted that the APA intended to "reduce pathologization" by establishing a new definition for gender dysphoria in the DSM-V. This in turn would reduce diagnoses, although as Davy and Toze note, the tendency for the literature to diverge from the APA's definition may result in increased numbers of individuals classified as having gender dysphoria when they do not meet the DSM-V's criteria (Davy and Toze, 2018). This further raises the question of whether individuals are receiving potentially irreversible treatments for the condition when they might not actually have it.

The current usage of gender dysphoria is the result of discussions spanning across decades as demonstrated in the past editions of the DSM. Until 2013, the APA considered having gender identity issues a mental disorder by itself regardless of the presence of psychological distress. That perspective has since shifted to only consider the adverse psychological effects of questioning one's gender as a disorder. In addition, the APA considers gender as part of one's identity, which is not subject to a diagnosis. Whether the APA has shifted its terminology and criteria for gender identity issues due to

[2] Following the release of the Florida Department of Health's guidelines for treating gender dysphoria, Merck removed its definition for "gender dysphoria" from the Merck Manual (Fox News, 2022).

emerging clinical data or cultural changes is another question. In 1994, the APA replaced transsexualism with gender identity disorder as part of the "effort to reduce stigma" (APA, 2017). This raises questions about what influences decisions to revise definitions and criteria; is it social trends or medical evidence?

Behavioral Health Issues Co-Occurring with Gender Dysphoria

Because gender dysphoria pertains directly to the distress experienced by an individual who desires to change gender identities, secondary behavioral health issues can co-occur such as depression and anxiety. If left untreated, these conditions can lead to the inability to function in daily activities, social isolation, and even suicidal ideation. Studies do confirm that adolescents and adults with gender dysphoria report higher levels of anxiety, depression, and poor peer relationships than the general population (Kuper et al, 2019). Other associated conditions include substance abuse, eating disorders, and compulsivity. A significant proportion of individuals with gender dysphoria also have autism spectrum disorder (ASD) (Saleem and Rizvi, 2017). Although the number reporting secondary issues is increased, individuals diagnosed with gender dysphoria do not necessarily constitute the entire population that is gender non-conforming (i.e., does not identify with natal sex), and no information is available breaking down the percentage of those who are non-conforming with gender dysphoria and those who are non-conforming with no distress. Additionally, available research raises questions as to whether the distress is secondary to pre-existing behavioral health disorders and not gender dysphoria. This is evident in the number of adolescents who reported anxiety and depression diagnoses prior to transitioning (Saleem and Rizvi, 2017).

Furthermore, conventional treatments for secondary behavioral health issues are available. These include cognitive behavioral therapy, medication, and inpatient services. The APA reports that treatments for these are highly effective with 80% to 90% of individuals diagnosed with depression responding positively (APA, 2020). In addition, a high percentage of adolescents diagnosed with gender dysphoria had received psychiatric treatment for a prior or co-occurring mental health issue. A 2015 study from Finland by Kaltiala-Heino et al noted that 75% of children seeking sex reassignment services had been treated by a behavioral health professional (Kaltiala-Heino et al, 2015).

Diagnosing Gender Dysphoria

Prior to the publication of the DSM-V, diagnosing individuals experiencing gender identity issues followed a different process. Behavioral health clinicians could assign the diagnosis based on gender non-conformance alone. That has changed since 2013. Today, non-conforming to one's gender is part of personal identity and not a disorder requiring treatment. This change has led professional associations to shift the diagnostic criteria for gender dysphoria to focus on the distress caused by shifting identities (DSM-V, 2013).

For adolescents, the APA identifies "a marked incongruence between one's experienced/expressed gender and natal sex, of at least 6 months' duration" as the core component of gender dysphoria (DSM-V, 2013). What the APA does not elucidate is the threshold for "marked." This raises questions as to whether practitioners exercise uniformity when applying the diagnostic criteria or if they do so subjectively. For example, the WPATH's *Standards of Care for the Health of Transsexual, Transgender, and Gender Non-Conforming People* provides guidance on the processes mental health practitioners should use when assessing for gender dysphoria but offers no benchmarks for meeting diagnostic criteria (WPATH, 2012).

Such processes include evaluating for gender non-conforming behaviors and other co-existing mental disorders like anxiety or depression. This involves not only interviewing the adolescent but also the family in addition to reviewing medical histories. WPATH also asserts that gender dysphoria assessments need to account for peer relationships, academic performance, and provide information of potential treatments. This last component is necessary because it might affect an individual's choices regarding transitioning, particularly if the information does not correspond to the desired outcome (WPATH, 2012).

The diagnosis of gender dysphoria is a relatively recent concept in mental health, being the product of decades of discussion and building upon previous definitions. Instead of treating gender non-conformity as a disorder, behavioral health professionals acknowledge it as part of one's identity and focus on addressing the associated distress. Considering the new criteria, this changes the dynamics of the population who would have qualified for a diagnosis before 2013 and those who would today. Given that desiring to transition into a gender different from natal sex no longer qualifies as a disorder, behavioral health professionals are treating distress and referring adolescents and adults to therapies that are used off-label and pose irreversible effects.

Current Available Treatments for Gender Dysphoria

At present, proposed treatment for gender dysphoria occurs in four stages, beginning with psychological services and ending with sex reassignment surgery. As an individual progresses through each stage, the treatments gradually become more irreversible with surgical changes being permanent. Because of the increasing effects, individuals must have attempted treatment at the previous stage before pursuing the next one (Note: late adolescents and adults have already completed puberty and do not require puberty blockers). Listed in order, the four stages are as follows:

- **Behavioral Health Services:** Psychologists and other mental health professionals are likely the first practitioners individuals with gender dysphoria will encounter. In accordance with clinical guidelines established by the World Professional Association for Transgender Health (WPATH)[3], behavioral health professionals are supposed to "find ways to maximize a person's overall psychological well-being, quality of life, and self-fulfillment." WPATH further discourages services for attempting to change someone's gender identity. Instead, it instructs practitioners to assess for the condition and readiness for puberty blockers or cross-sex hormones while offering guidance to function in a chosen gender. WPATH does assert that the clinicians do need to treat any other underlying mental health issues secondary or co-occurring with gender dysphoria (WPATH, 2012). However, the organization provides conflicting guidance because it also advises practitioners to prescribe cross-sex hormones on demand (Levine, 2018).
- **Puberty Suppression:** Used only on individuals in the earliest stages of puberty (Tanner stage 2), preventing pubertal onset provides additional time to explore gender identities before the physical characteristics of biological sex develop. This treatment is intended to reduce distress and anxiety related to the appearance of adult sexual physical features. To suppress puberty, pediatric endocrinologists inject gonadotropin releasing hormone (Gn-RH) at specific intervals (e.g., 4 weeks or 12 weeks). The Gn-RH suppresses gonadotropin receptors that allow for the

[3] The World Professional Association for Transgender Health asserts that it is a professional organization. However, it functions like an advocacy group by allowing open membership to non-clinicians (WPATH, 2022).

development of primary and secondary adult sexual characteristics. Prior to receiving puberty suppression therapy, individuals must have received a diagnosis of gender dysphoria and have undergone a mental health evaluation (Kyriakou et al, 2020).

- **Cross-Sex Hormones:** For adults and late adolescents (16 years or older), the next treatment phase recommended is taking cross-sex hormones (e.g., testosterone or estrogen) to create secondary sex characteristics. In men transitioning into women, these include breast development and widening around the pelvis. Women who transition into men experience deeper voices, redistribution of fat deposits, and growing facial hair. According to the Endocrine Society, late adolescents who qualify for cross-sex hormones must have a confirmed diagnosis of gender dysphoria from a mental health practitioner with experience treating that population. Some physical changes induced by these hormones are irreversible (Endocrine Society, 2017).
- **Sex Reassignment Surgery:** Sometimes referred to as "gender affirming" surgery, this treatment does not consist of just one procedure but several, depending on the desires of the transitioning individual. Primarily, sex reassignment procedures alter the primary and secondary sexual characteristics. Men transitioning into women (trans-females) undergo a penectomy (removal of the penis), orchiectomy (removal of the testes), and vulvoplasty (creation of female genitals). Other procedures trans-females may undergo include breast augmentation and facial feminization. For women that transition into men (trans-males), procedures include mastectomy (removal of the breasts), hysterectomy (removal of the uterus), oophorectomy (removal of the ovaries), and phalloplasty (creation of male genitals). Because of the complexities involved in phalloplasty, many trans-males do not opt for this procedure and limit themselves to mastectomies. Additionally, the effects of sex reassignment surgery, such as infertility, are permanent (WPATH, 2012).

While some clinical organizations assert that they are the standard of care for gender dysphoria, the U.S. Food and Drug Administration (FDA) currently has not approved any medication as clinically indicated for this condition (Unger, 2018). Although puberty blockers and cross-sex hormones are FDA approved, the FDA did not approve them for treating gender dysphoria, meaning that their use for anything other than the clinical indications listed is off-label (American Academy of Pediatrics, 2014). As for surgical procedures, the FDA does not evaluate or approve them, but it does review all surgical devices (FDA, 2021). In addition, the Endocrine Society concedes that its practice guidelines for sex reassignment treatment does *not* constitute a "standard of care" and that its grades for available services are low or very low (Endocrine Society, 2017).[4]

[4] Disagreement over how to treat gender dysphoria, gender identity disorder, and transsexualism has persisted since sex reassignment surgery first became available in the 1960s. In a 2006 counterargument, Paul McHugh highlights how individuals seeking surgery had other reasons that extended beyond gender identity, including sexual arousal and guilt over homosexuality. In addition, he asserts that undergoing sex reassignment procedures did not improve a patient's overall behavioral health and that providing a "surgical alteration to the body of these unfortunate people was to collaborate with a mental disorder rather than to treat it" (McHugh, 2006).

Literature Review: Introduction

Currently, an abundance of literature and studies on gender dysphoria is available through academic journals, clinical guidelines, and news articles. Similar to other mental health issues, the material addresses a broad range of topics consisting of available treatments, etiology (i.e., causes), risks, benefits, and side effects. Although most stories reported by the media indicate that treatments such as cross-sex hormones and sex reassignment surgery are the most effective, research reveals that numerous questions still exist. These include what are the long-term health effects of taking cross-sex hormones, what are the real causes of gender dysphoria, and how many individuals that transition will eventually want to revert to their natal sex. Additionally, much of the available research is inconclusive regarding the effectiveness of sex reassignment treatments with multiple studies lacking adequate sample sizes and relying on subjective questionnaires. While much of the scientific literature leans in favor of cross-sex hormones and surgery as options for improving the mental health of individuals with gender dysphoria, it does not conclusively demonstrate that the benefits outweigh the risks involved, either short or long-term. What studies do reveal with certainty is that sex reassignment surgery and cross-sex hormones pose permanent effects that can result in infertility, cardiovascular disease, and disfigurement. All of this indicates that further research is necessary to validate available treatments for gender dysphoria. Thus, physicians, who recommend sex reassignment treatment, are not adhering to an evidence-based medicine approach and are following an eminence-based model.

The following literature review addresses the multiple facets of this condition and presents areas of ongoing debate and persisting questions. Beginning with the condition's etiology and continuing with evaluations of puberty blockers, cross-sex hormones, and surgery, the review explains each area separately and in context of gender dysphoria at large. Additionally, the review provides an analysis on available research on mental health outcomes as well as the condition's persistence into adulthood. Taken as a whole, the available studies demonstrate that existing gender dysphoria research is inconclusive and that current treatments are used to achieve cosmetic benefits while posing risky side effects as well as irreversible changes.

Literature Review: Etiology of Gender Dysphoria

What causes gender dysphoria is an ongoing debate among experts in the scientific and behavioral health fields. Currently, the research indicates that diagnosed individuals have higher proportions of autism spectrum disorder (ASD), history of trauma or abuse, fetal hormone imbalances, and co-existing mental illnesses. Also, experts acknowledge that genetics may factor into gender dysphoria. Another potential cause is social factors such as peer and online media influence. At the moment, none of the studies provides a definite cause and offer only correlations and weakly supported hypotheses. In addition, evidence favoring a biological explanation is highly speculative. However, the research does raise questions about whether treatments with permanent effects are warranted in a population with disproportionately high percentages of ASD, behavioral health problems, and trauma.

In a 2017 literature review by Fatima Saleem and Syed Rizvi, the authors examine gender dysphoria's numerous potential causes and the remaining questions requiring further research. In conclusion, the pair indicate that associations exist between the condition and ASD, schizophrenia, childhood abuse, genetics, and endocrine disruption chemicals but that more research is needed to improve understanding of how these underlying issues factor into a diagnosis. Throughout the review, Saleem and Rizvi identify the following as potential contributing elements to the etiology of gender dysphoria:

- **Neuroanatomical Etiology:** During fetal development, the genitals and brain develop during different periods of a pregnancy, the first and second trimesters respectively. Because the processes are separate, misaligned development is possible where the brain may have features belonging to the opposite sex. The authors identify one study where trans-females presented with a "female-like putamen" (structure at the base of the brain) when undergoing magnetic resonance imaging (MRI) scans.[5]
- **Psychiatric Associations:** Saleem and Rizvi identify multiple studies reporting that individuals with gender dysphoria have high rates of anxiety and depressive disorders with results ranging as high as 70% having a mental health diagnosis. In addition, the pair note that schizophrenia may also influence desires to transition. However, the review does not assess whether the mental health conditions are secondary to gender dysphoria.
- **Autism Spectrum Disorder:** Evidence suggests a significant percentage of individuals diagnosed with gender dysphoria also have ASD. The authors note that the available studies only establish a correlation and do not identify mechanisms for causation.
- **Childhood Abuse:** Like the above causes, Saleem and Rizvi note that those with gender dysphoria tended to experience higher rates of child abuse across all categories, including neglect, emotional, physical, and sexual.
- **Endocrine Disruptors:** Although this cause still requires substantial research, it is a valid hypothesis regarding how phthalates found in plastics can create an imbalance of testosterone in fetuses during gestation, which can potentially lead to gender dysphoria. The authors point to one study that makes this suggestion.

[5] Research on neuroanatomical etiology for gender dysphoria remains highly speculative due to limitations of brain imaging (Mayer and McHugh, 2016). In addition, neuroscience demonstrates that exposures to certain environments and stimuli as well as behaviors can affect brain changes (Gu, 2014). Furthermore, available research indicates that male and female brains have different physical characteristics but cannot be placed in separate categories due to extensive overlap of white/grey matter and neural connections (Joel et al, 2015).

Saleem and Rizvi's review reveal that gender dysphoria's etiology can have multiple factors, most of which require treatments and therapies not consisting of cross-sex hormones or surgery. (Saleem and Rizvi, 2017).

Out of the research on the condition's etiology, a large portion focuses on the correlation with ASD. One of the more substantial studies by Van der Miesen et al published in 2018 evaluates 573 adolescents and 807 adults diagnosed with ASD and compares them to 1016 adolescents and 846 adults from the general population. The authors' findings note that adolescents and adults with ASD were approximately 2.5 times more likely to indicate a desire of becoming the opposite sex. Although the methodology used to reach this conclusion consisted of surveys where respondents had a choice of answering "never," "sometimes," or "often," the results correspond with those of similar studies. Van der Miesen et al also indicate that most responses favoring a change in gender responded with "sometimes." Additionally, the authors do not state how many in their sample group actually had a gender dysphoria diagnosis. (Van der Miesen et al, 2018).

Another study by Shumer et al from 2016 utilizes a smaller sample size (39 adolescents) referred to an American hospital's gender clinic. Unlike Van der Miesen et al's research, Shumer et al evaluate subjects with a diagnosis of gender dysphoria for possible signs of ASD or Asperger's syndrome. Their findings revealed that 23% of patients presenting at the clinic would likely have one of the two conditions. Possible explanations for the high percentage are the methods used to gather the data. Shumer et al requested a clinical psychologist to administer the Asperger Syndrome Diagnostic Scale to the parents of the sample patients, four of whom already had an ASD diagnosis. The authors conclude that the evidence to support high incidence of gender dysphoria in individuals with ASD is growing and that further research is needed to determine the specific cause (Shumer et al, 2016).

Research indicating a strong correlation between ASD and gender dysphoria is not the only area where new studies are emerging. Discussions about the effects of prenatal testosterone levels are also becoming more prevalent. One such example is Sadr et al's 2020 study that looks at the lengths of the index and ring fingers (2D:4D) of both left and right hands of 203 individuals diagnosed with gender dysphoria. The authors used this method because prenatal testosterone levels can affect the length ratios of 2D:4D. By comparing the ratios of a group with gender dysphoria to a cohort from the general population, Sadr et al could assess for any significant difference. Their results indicated a difference in trans-females who presented with more feminized hands. For trans-males, the difference was less pronounced. The results for both groups were slight, and the meta-analysis that accompanies the study notes no statistically significant differences in multiple groups from across cultures. However, Sadr et al further assert that the evidence strongly suggests elevated prenatal testosterone levels in girls and reduced amounts in boys may contribute to gender dysphoria, requiring additional research (Sadr et al, 2020).

In addition to biological factors and correlations with ASD, researchers are exploring psychological and social factors to assess their role in gender dysphoria etiology. This literature examines a range of potential causative agents, including child abuse, trauma, and peer group influences. One such study by Kozlowska et al from 2021 explores patterns in children with high-risk attachment issues who also had gender dysphoria. The authors wanted to assess whether past incidents of abuse, loss, or trauma are associated with higher rates of persons desiring to transition. As a basis, Kozlowska et al cite John Bowlby's research on childhood brain development, noting that the process is not linear and depends

heavily on lived experiences. The study further acknowledges that biological factors combined with life events serve as the foundation for the next developmental phase and that early poor-quality attachment issues increase the risk for psychological disorders in adolescence and adulthood. Such disorders include mood and affective disorders, suicidal ideations, and self-harm. Kozlowska et al also cite other studies that indicate a high correlation between gender dysphoria and "adverse childhood events" and further assert that the condition "needs to be conceptualized in the context of the child's lived experience, and the many different ways in which lived experience is biologically embedded to shape the developing brain and to steer each child along their developmental pathway" (Kozlowska et al, 2021).

For their study, Kozlowska et al recruited 70 children diagnosed with gender dysphoria and completed family assessments going back three generations. This in-depth level was necessary to ascertain any and all events that could affect a child's developmental phases. Additionally, the researchers individually assessed the diagnosed children. To establish comparisons, Kozlowska et al performed assessments on a non-clinical group and a mixed-psychiatric group. Their results demonstrate that children with gender dysphoria have significantly higher rates of attachment issues as well as increased reports of "adverse childhood events" such as trauma (e.g., domestic violence and physical abuse). Furthermore, the authors indicate that a high proportion of families reported "instability, conflict, parental psychiatric disorder, financial stress, maltreatment events, and relational ruptures." These results led Kozlowska et al to conclude that gender dysphoria can be "associated with developmental pathways – reflected in at-risk patterns of attachment and high rates of unresolved loss and trauma – that are shaped by disruptions to family stability and cohesion." The study also cites that treatment requires "a comprehensive biopsychosocial assessment with the child and family, followed by therapeutic interventions that address, insofar as possible, the breadth of factors that are interconnected with each particular child's presentation" (Kozlowska et al, 2021).

This recent study raises questions regarding the medical necessity of gender dysphoria treatments such as puberty blockers and cross-sex hormones for adolescents. If high percentages of children diagnosed with gender dysphoria also have histories of trauma and attachment issues, should conventional behavioral health services be utilized without proposing treatments that pose irreversible effects? Would that approach not provide additional time to address underlying issues before introducing therapies that pose permanent effects (i.e., the watchful waiting approach)?

Aside from the notion that childhood abuse and adversity can potentially cause gender dysphoria, other possible explanations such as social factors (e.g., peer influences and media) may be contributing factors. Research on rapid onset gender dysphoria (ROGD) links this phenomenon to peer and social elements. In an analysis utilizing parent surveys, Lisa Littman asserts that the rapid rise of ROGD is not associated with the traditional patterns of gender dysphoria onset (i.e., evidence of an individual's gravitation to the opposite sex documented over multiple years) but rather exposure to "social and peer contagion." Littman uses this term in the context of definitions cited in academic literature, stating that "social contagion is the spread of affect or behaviors through a population" and that "peer contagion is the process where an individual and peer mutually influence each other in a way that promotes emotions and behaviors that can potentially undermine their own development or harm others." Examples of the latter's negative effects include depression, eating disorders, and substance abuse. What prompted this study is a sudden increase of parents reporting their daughters declaring themselves to be transgender without any previous signs of gender dysphoria. Littman also indicates

that these parents cite that their daughters became immersed in peer groups and social media that emphasized transgender lifestyles (Littman, 2018).

In addition to identifying characteristics of ROGD, the study examines social media content that provides information to adolescents regarding how to obtain cross-sex hormones through deception of physicians, parents, and behavioral health professionals. Such guidance includes coaching on how to fit a description to correspond to the DSM-V and pressures to implement treatment during youth to avoid a potential lifetime of unhappiness in an undesirable body. Littman further states that "online content may encourage vulnerable individuals to believe that non-specific symptoms and vague feelings should be interpreted as gender dysphoria." The study also notes that none of the individuals assessed using the parental surveys qualified for a formal diagnosis using the DSM-V criteria (Littman, 2018).

The survey responses revealed similar data to Kozlowska et al's study with 62.5% of the adolescents having a mental health or neurodevelopmental disorder. Furthermore, the responses indicate a rapid desire to bypass behavioral health options and pursue cross-sex hormones. 28.1% of parents surveyed stated that their adolescents did not want psychiatric treatments. One parent even reported that their daughter stopped taking prescribed anti-depressants and sought advice only from a gender therapist. Littman's research further reveals that 21.2% of parents responded that their adolescent received a prescription for puberty blockers or cross-sex hormones at their first visit (Littman, 2018). These responses indicate that practitioners do not uniformly follow clinical guidelines when making diagnoses or prescribing treatment.

In the discussion, Littman proposes two hypotheses for the appearance of ROGD. The first states that social and peer contagion is one of the primary causes, and the second asserts that ROGD is a "maladaptive coping mechanism" for adolescents dealing with emotional and social issues. While the surveyed parents did not report early signs of gender dysphoria, a majority noted that their daughters had difficulty in handling negative emotions. Littman concludes that ROGD is distinct from gender dysphoria as described in the DSM-V and that further research is needed to assess whether the condition is short or long-term (Littman, 2018). What the study does not explore, but raises the question, is what proportion of those being treated for gender dysphoria are adolescents with ROGD.

Littman's study along with the others reveal that the causes of gender dysphoria are still a mystery and could have multiple biological and social elements. Because of this ongoing uncertainty, treatments that pose irreversible effects should not be utilized to address what is still categorized as a mental health issue. That allows adequate opportunity for individuals to receive treatment for co-existing mental disorders, establish their gender dysphoria diagnoses, and understand how cross-sex hormones and surgery will alter the appearance of their bodies as well as long-term health.

Literature Review: Desistance of Gender Dysphoria and Puberty Suppression

The World Professional Association for Transgender Health (WPATH) and the Endocrine Society both endorse the use of gonadotropin releasing hormones (Gn-RH) to suppress puberty in young adolescents who have gender dysphoria. Both organizations state that the treatment is safe and fully reversible. In addition, they state that delaying pubertal onset can provide extra time for adolescents to explore the gender in which they choose to live. The associations further state that puberty suppression is necessary to prevent the development of primary and secondary sexual characteristics that can inhibit successful transitions into adulthood (WPATH, 2012; Endocrine Society, 2017). Of the two groups, WPATH offers clinical criteria an individual should meet to qualify for puberty suppression such as addressing psychological co-morbidities and assessing whether gender dysphoria has intensified (WPATH, 2012).

Neither organization explains that the majority of young adolescents who exhibit signs of gender dysphoria eventually desist and conform to their natal sex and that the puberty suppression can have side effects. Both organizations neglect to mention that using Gn-RH for gender dysphoria by altering the appearance is not an FDA-approved clinical indication. Furthermore, the research used to justify puberty suppression is low or very-low quality and little information is available on long-term effects (Hruz, 2019). Additionally, in his assessment, Quentin Van Meter explained that physical differences between central precocious puberty and natural onset puberty demonstrate that Gn-RH does not have permanent adverse effects for those treated for the former but can for the latter such as insufficient bone-mineral density and neural development (Van Meter, 2022). Also, as recently as May 17, 2022, during a U.S. Senate Committee on Appropriations hearing, Lawrence Tabak, acting director of the National Institutes of Health, responded to Senator Marco Rubio, acknowledging that no long-term studies are available evaluating the effects of puberty blockers when used for gender dysphoria (U.S. Senate Committee on Appropriations, 2022).

Currently, some studies provide weak support for this treatment but leave too many questions as to its effectiveness and medical necessity, especially considering how many children decide against transitioning. In addition, puberty blockers halt development of primary and secondary sexual characteristics and deny opportunities for adolescents to adapt and become comfortable with their natal sex. Instead, puberty blockers can serve as a potential "gateway drug" for cross-sex hormones by denying them the experience of physically maturing (Laidlaw et al, 2018).

A 2013 study by Steensma et al offers data on the percentage of children who opt not to transition after experiencing gender dysphoria. The authors follow 127 adolescents (mean age of 15 during the evaluation period) for four years who had been referred to a Dutch gender dysphoria clinic. Out of this cohort, 47 (37%; 23 boys and 24 girls) continued experiencing the condition and applied for sex reassignment treatment. The other 80 adolescents never returned to the clinic. Because this clinic was the only one that treated gender dysphoria in the Netherlands, Steensma et al assumed that those who did not return no longer desired transitioning. The study indicates one of the key predictors for persisting gender dysphoria was the age of first presentation. Older adolescents that started going to the clinic were more likely to persist, while younger adolescents tended not to follow through. Steensma et al provide further insight into other predicting factors, particularly on how each individual views his or her gender identity. The authors note that adolescents who "wished they were the other sex" were more likely to become desisters and that those who "believed that they were the other sex" persisted

and later sought sex reassignment treatment (Steensma et al, 2013). While the study focuses on factors that contribute to the condition's persistence or desistance, it raises the question as to whether puberty suppression is necessary when age plays such an important role regarding the decision to transition.

WPATH and the Endocrine Society state that the primary reason for initiating pubertal suppression is not to treat a physical condition but to improve the mental health of adolescents with gender dysphoria. However, available research does not yield definitive results that this method is effective at addressing a mental health issue. The "gold standard" for medical studies is the randomized-controlled trial (RCT). Because RCTs utilize large sample sizes, have blind testing groups (i.e, placebos), and use objective controls, they can offer concrete conclusions and shape the array of established treatments. In addition, RCTs require comparisons between cohort outcomes and ensure that participants are randomly assigned to each group. These measures further reduce the potential for bias and subjectivity (Hariton and Locascio, 2018).

Presently, no RCTs that evaluate puberty suppression as a method to treat gender dysphoria are available. Instead, the limited number of published studies on the topic utilize small sample sizes and subjective methods (Hruz, 2019). A 2015 article by Costa et al is one such example. The study asserts that "psychological support and puberty suppression were both associated with an improved global psychological functioning in gender dysphoric adolescents." To reach this conclusion, the authors selected 201 children diagnosed with the condition and divided them into two groups, one to receive psychological support only and the other to get puberty blockers in addition to psychological support. Costa et al did not create a third group that lacked a gender dysphoria diagnosis to serve as a control. To assess whether puberty suppression is an effective treatment, the authors administered two self-assessments (Utrect Gender Dysphoria Scale and Children's Global Assessment Scale)[6] to the groups at 6-month intervals during a 12-month period. Because the study relies heavily on self-assessments, the conclusions are likely biased and invalid. Another problem that is also present and common throughout articles supporting puberty suppression is the short-term period of the study. Costa et al's conclusions may not be the same if additional follow-ups occurred three or five years later (Costa et al, 2015). This further raises the question whether low-quality studies like Costa et al's should serve as the basis for clinical guidelines advising clinicians to prescribe drugs for off-label purposes.

Aside from questionable research, information regarding the full physical effects of puberty suppression is incomplete. In a 2020 consensus parameter prepared by Chen et al, 44 experts in neurodevelopment, gender development, and puberty/adolescence reached a conclusion stating that "the effects of pubertal suppression warrant further study." The basis for this was that the "full consequences (both beneficial and adverse) of suppressing endogenous puberty are not yet understood." The participating experts emphasized that the treatment's impact on neurodevelopment in adolescents remains unknown. Chen et al explain that puberty-related hormones play a role in brain development as documented in animal studies and that stopping these hormones also prevents neurodevelopment in addition to sexual maturation. The authors further raise the question whether normal brain development resumes as if it had not been interrupted when puberty suppression ceases. Because this

[6] Behavioral health practitioners use the Children's Global Assessment Scale (CGAS) to measure child functioning during the evaluation process to determine diagnoses. Available evidence indicates that the CGAS is not effective for evaluating children who experienced trauma and presented with mental health symptoms (Blake et al, 2006).

question remains unanswered, it casts doubt on the veracity of organizations' assertions that puberty suppression is "fully reversible" (Chen et al, 2020).

In addition to the unanswered questions and low-quality research, puberty suppression causes side effects, some of which have the potential to be permanent. According to a 2019 literature review by De Sanctis et al, most side effects associated with Gn-RH are mild, consisting mostly of irritation around injection sites. However, clinicians have linked the drug to long-term conditions such as polycystic ovarian syndrome, obesity, hypertension, and reduced bone mineral density. While reports of these events are low and the authors indicate that Gn-RH is safe for treating central precocious puberty (Note: De Sanctis et al do not consider gender dysphoria in their analysis), the review raises questions about whether off-label use to treat a psychological condition is worth the risks (De Sanctis et al, 2019).

Furthermore, De Sanctis et al cite studies noting increased obesity rates in girls who take Gn-RH but that more research is needed to gauge the consistency. Additionally, the authors note that evidence is strong regarding reduced bone mineral density during puberty suppression but indicate that the literature suggests it is reversible following treatment (De Sanctis et al, 2019). While research leans toward the reversibility of effects on bone mineral density, the quantity of studies available on this subject are limited. Also, no long-term research has been completed on how puberty suppression affects bone growth. This is significant because puberty is when bone mass accumulates the most (Kyriakou et al, 2020). One example of a complication involving bone growth and Gn-RH is slipped capital femoral epiphysis. This condition occurs when the head of the femur (i.e., thighbone) can slip out of the pelvis, which can eventually lead to osteonecrosis (i.e., bone death) of the femoral head. Although the complication is rare, its link to puberty suppression indicates that the "lack of adequate sex hormone exposure" could be a cause (De Sanctis et al, 2019).

The current literature on puberty suppression indicates that using it to treat gender dysphoria is off-label, poses potentially permanent side effects, and has questionable mental health benefits. The limited research and lack of FDA approval for that clinical indication prompt questions about whether medications with physically altering effects should be used to treat a problem that most adolescents who experience it will later overcome by conforming to their natal sex. Additional evidence is required to establish puberty suppression as a standard treatment for gender dysphoria.

Literature Review: Cross-Sex Hormones as a Treatment for Gender Dysphoria

Currently, the debate surrounding the use of cross-sex hormones to treat gender dysphoria revolves around their ability to improve mental health without causing irreversible effects. It is not about whether taking cross-sex hormones can alter someone's appearance. The evidence demonstrating the effectiveness of cross-sex hormones in achieving the secondary sexual characteristics of the opposite sex is abundant. Also, the overall scientific consensus concludes that individuals who take cross-sex hormones will reduce the primary sexual function of his or her natal sex organs. What researchers continue evaluating are the short and long-term effects on mental health, impacts on overall physical health, and how the changes affect the ability to detransition. Of these, benefits to mental health overshadow the other discussions. Prescribers of cross-sex hormones focus so heavily on behavioral health outcomes that they de-emphasize that these drugs cause permanent physical changes and side effects that can lead to premature death (Hruz, 2020). Some clinical guidelines such as WPATH's do not even indicate that some of the changes are irreversible.

Like puberty suppression, the Endocrine Society and WPATH provide guidance on administering cross-sex hormones to individuals with gender dysphoria. Both organizations state that this treatment should not be administered without a confirmed diagnosis of gender dysphoria and only after a full psychosocial assessment. In addition, behavioral health practitioners must ensure that any mental comorbidities are not affecting the individual's desire to transition. WPATH and the Endocrine Society further state that clinicians should administer hormone replacements such as testosterone and Estradiol (estrogen) in gradual phases, where the dose increases over several months. For trans-females, the organizations state that progesterone (anti-androgen) is also necessary to block the effects of naturally produced testosterone (WPATH, 2012; Endocrine Society, 2017). When taking cross-sex hormones, trans-males need increased doses for the first six months. After that, the testosterone's effects are the same on lower doses. Once started, individuals cannot stop taking hormones unless they desire to detransition (Unger, 2016).

Although the two groups provide similar guidance, they vary on statements that can have significant impact on long-term outcomes, particularly regarding age. According to WPATH's standards, 16 years is the general age for initiating cross-sex hormones, but the organization acknowledges that the treatment can occur for younger individuals depending on circumstances (WPATH, 2012). This differs from the Endocrine Society, which states no specific age for appropriateness and explains the disagreements in assigning a number. The group highlights that most adolescents have attained sufficient competence by age 16 but may not have developed adequate abilities to assess risk (Endocrine Society, 2017). This raises the question whether adolescents can make sound decisions regarding their long-term health. Additionally, the varying guidance raises an issue with WPATH not only using age 16 as a standard but also indicating that younger adolescents are capable of making that choice.

WPATH's guidance also does not stress the irreversible nature of cross-sex hormones, citing the treatment as "partially reversible" and not indicating which changes are permanent. Furthermore, parts of WPATH's information are misleading and directly conflict with guidance issued by clinics and other sources. One such example consists of WPATH stating that "hormone therapy *may* (emphasis added) lead to irreversible changes." This statement is misleading in light of existing research, which indicates that multiple physical changes are permanent. In addition, WPATH claims that certain effects of cross-

sex hormones such as clitoral enlargement can last one to two years when it is actually irreversible (UCSF, 2020). WPATH also does not explain the risks to male fertility, noting that lowered sperm count or sterility is "variable." The University of California at San Francisco (UCSF) provides starkly different information by stating that trans-females should expect to become sterile within a few months of starting cross-sex hormones. UCSF also advises trans-females to consult a sperm bank if they may want to father children after transitioning (WPATH, 2012; UCSF, 2020). Below is a chart that outlines the effects of cross-sex hormones and identifies which ones are reversible or permanent.

Physical Changes Effectuated by Cross-Sex Hormones	
Physical Changes in Trans-Males (Female-to-Male Transitions)	
Physical Change	**Reversible or Irreversible**
Oily Skin or Acne	Reversible
Facial and Body Hair Growth	Irreversible
Male-Pattern Baldness	Irreversible
Increased Muscle Mass	Reversible
Body Fat Redistribution	Reversible
Ceasing of Menstruation	Reversible
Enlarged Clitoris	Irreversible
Vaginal Atrophy	Reversible
Deepening of Voice	Irreversible
Physical Changes in Trans-Females (Male-to-Female Transitions)	
Body Fat Redistribution	Reversible
Decreased Muscle Mass	Reversible
Skin Softening or Decrease in Oiliness	Reversible
Lower Libido	Reversible
Fewer Spontaneous Erections	Reversible
Male Sexual Dysfunction	Possibly Irreversible
Breast Growth	Irreversible
Decrease in Testicular Size	Reversible
Decrease in Sperm Production or Infertility	Likely Irreversible
Slower Facial and Body Hair Growth	Reversible

Sources: UCSF, 2020; WPATH, 2012; Endocrine Society, 2017[7]

The above chart demonstrates that trans-males and trans-females experience different effects from cross-sex hormones that can cause myriad issues in later life. For example, trans-males who opt to detransition may face challenges related to permanent disfigurement (e.g., facial hair and deepened voices). Trans-females, on the other hand, may not endure the same issues pertaining to visible physical changes but might become despondent over being unable to reproduce. This can occur regardless of whether the transitioning individual is satisfied with sex reassignment. Given that the clinical guidelines do not provide uniform information on the permanent effects of cross-sex hormones, clinicians are unable to make sound recommendations to patients. This treatment can supposedly alleviate symptoms

[7] This chart consists of conclusions regarding physical changes made by three different clinical organizations. If one organization determined that a physical change was irreversible, that was sufficient to meet the criteria to be listed as "irreversible" in the chart.

of distress. However, cross-sex hormones' permanent effects also have the potential to cause psychological issues.

Arguments favoring cross-sex hormones assert that the desired physical changes can alleviate mental health issues in individuals with gender dysphoria but do not consider that hormones used in this manner, like puberty blockers, are off-label. While the FDA has approved estrogen and testosterone for specific clinical indications (e.g., hypogonadism), it has not cleared these drugs for treating gender dysphoria. Additionally, these arguments do not acknowledge that the U.S. Drug Enforcement Administration (DEA) lists testosterone as a Schedule III controlled substance, meaning that it has a high probability of abuse (DEA, 2022). Furthermore, evidence of psychological benefit from cross-sex hormones is low-quality and relies heavily on self-assessments taken from small sample groups (Hruz, 2020).

A 2019 study by Kuper et al seeks to demonstrate that adolescents desiring cross-sex hormones have elevated rates of depression, anxiety, and challenges with peer relationships. To make their findings, the authors provided questionnaires to 149 adolescents who presented at a gender clinic in Dallas, Texas and concluded that half of the sample group experienced increased psychological issues. One problem with the study is that it relies on parent or self-assessments such as the Youth-Self Report, Body-Image Scale, and the Child Behavior Checklist. While these assessments have strong reliability, the sample is cross-sectional, consisting of gender dysphoric individuals who presented for an initial visit at the clinic. Also, Kuper et al do not directly link these psychological symptoms to gender dysphoria but rather insinuate a strong connection. Without an analysis of the longitudinal histories of the participants, the study cannot demonstrate whether gender dysphoria was a direct cause of the psychological issues, which could possibly result from trauma, abuse, or family dysfunction. Kuper et al's study only presents weak correlation between adolescents who report symptoms of distress and gender dysphoria. While the authors do not claim that the participants' psychological problems caused the condition, they fail to explicitly state that no demonstrable relationship exists and explain that their findings are "broadly consistent with the previous literature" (Kuper et al, 2019).

Additionally, a more comprehensive literature review from 2019 by Nguyen et al evaluates the effect of cross-sex hormones on mental health outcomes. Although the authors argue that the evidence supports the treatment, they do note that available studies use "uncontrolled observational methods" and "rely on self-report." The review also asserts that "future research should focus on applying more robust study designs with large sample sizes, such as controlled prospective cohort studies using clinician-administered ratings and longitudinal designs with appropriately matched control groups." All of these are characteristics of RCTs. While Nguyen et al highlight flaws in the studies in their conclusion, they do not emphasize them in their analysis, opting to focus primarily on results. Another problem with the studies selected for the review is the short-term periods for evaluation. Out of 11 studies Nguyen et al discuss, only one tracks its participants for 24 months. The others only follow their cohorts for 6 or 12 months (Nguyen et al, 2019). Without long-term data to support assertions that cross-sex hormones substantially improve the mental health of individuals with gender dysphoria, the review cannot make definitive conclusions on the treatment's benefits.

Basing their stances on this low-quality evidence, clinical associations such as the American Academy of Pediatrics (AAP) and the American Psychology Association endorse the use of cross-sex hormones as treatments for gender dysphoria. In particular, the AAP discourages use of the term "transition" and

asserts that medical treatments used to obtain secondary characteristics of the opposite sex are "gender affirming." This decision mirrors the DSM-V's interpretation of gender being part of identity. The AAP further states that taking cross-sex hormones is an "affirmation and acceptance of who they (i.e., patient) have always been" (AAP, 2018). The American Psychological Association also takes a similar stance in its *Resolution on Gender Identity Change Efforts* by asserting that medical treatments such as puberty suppression, cross-sex hormones, and surgery improve mental health and quality of life and reinforce the notion that transitioning and seeking sex reassignment therapies do not constitute a psychological disorder (American Psychological Association, 2021). Stances like these can substantially influence practitioners and their treatment recommendations. Given that low-quality evidence serves as the basis for supportive positions, this raises questions about whether clinicians can make informed decisions for their patients that will promote the best outcomes.

James Cantor published a critique in 2020 of the AAP's endorsement of "gender affirming" treatments, arguing that the organization did not base its recommendations on established medical evidence. He asserts that the AAP's position is based on research that does not support intervention but rather supports "watchful waiting" because most transgender youths desist and identify as their natal sex during puberty. Cantor further argues that the AAP not only disregards evidence but also cites "gender affirming" interventions as the only effective method. To conclude, he states the organization is "advocating for something far in excess of mainstream practice and medical consensus" (Cantor, 2020).

Given those evidentiary problems, those who rely on the AAP's endorsement as a basis for "gender affirming" treatments are practicing eminence-based medicine as opposed to evidence-based medicine. Eminence-based medicine refers to clinical decisions made by relying on the opinions of prominent health organizations rather than relying on critical appraisals of scientific evidence (Nhi Le, 2016). While it is true that the AAP has more knowledge than a lay person and a degree of credibility in the medical community, the opinions of such organizations are not valid unless they are based on quality evidence.

Research on sex reassignment also does not adequately address the reasons for and prevalence of detransitioning. Although no definite numbers are available regarding the percentage of transgender people who decide to detransition, research indicates that roughly 8% decide to return to their natal sex. The reasons range from treatment side effects to more self-exploration that provided insight on individuals' gender dysphoria. In a 2020 study by Lisa Littman, 101 people who had detransitioned provided their basis for doing so. Out of the sample group, 96% had taken cross-sex hormones and 33% had sex reassignment surgery. The average age for transitioning was 22 years, and the mean duration for the transition was 4 years. This indicates that even allowing additional time beyond the recommended age of 16 years can still lead to regrets. The study also raises the question as to whether individuals who transitioned at 16 or younger wanted to detransition in greater numbers. The author further offers reasons why these individuals sought cross-sex hormones and surgery, which include having endured trauma (mental or sexual), homophobia (challenged to accept oneself as a homosexual), peer and media influences, and misogyny (applicable only to trans-males). To obtain the results, the participants responded to a survey that asked about their backgrounds (e.g., reasons for transitioning, mental health comorbidities), and motivations for detransitioning. Littman noted that half of the women (former trans-males) had a mental health disorder and/or had experienced trauma within a year of deciding to transition. Men (former trans-females) reported much lower numbers of behavioral health issues and trauma after de-transitioning. Additionally, 77% of men surveyed identified as the opposite gender prior to transition, whereas just 58% of women had (Littman, 2020).

Of the reasons cited for detransitioning, the majority (60%) noted that they became more comfortable with their natal sex. Other reasons included concerns over complications from the treatments, primarily cross-sex hormones, and lack of improved mental health. Other less-cited explanations include concerns about workplace discrimination and worsening physical health. The study also notes that approximately 36% of participants experienced worse mental health symptoms. Based on the findings, Littman concludes that more research is needed in tracking the transgender population to obtain accurate percentages of those who decide to detransition and that men and women reported varying reasons for deciding to transition and later return to their natal sex. The author notes that higher rates of trauma and peer group influences might have contributed to women's decisions, which Littman attributes partially to rapid onset gender dysphoria (Littman, 2020). What the study also indicates is that cross-sex hormones are not a validated treatment for gender dysphoria. Nearly all of the participants had taken them and decided against maintaining the physical changes. Given that the majority of surveyed detransitioners cited that they were comfortable with their biological sex, the study indicates that gender dysphoria is not necessarily a lifelong issue. This necessarily raises doubts about whether cross-hormones, which cause permanent physical damage, is justified.

In addition to the psychological factors, cross-sex hormones pose significant long-term health risks to transitioning individuals. Currently, little information is available given that researchers have not had adequate time to study the effects in this population. However, use of hormones for other conditions has yielded data on how these drugs can affect the body and the cardiovascular system in particular. Because of the high dosages required to achieve physical change and the need to continuously take the drugs, cross-sex hormones can potentially harm quality of life and reduce life expectancy for transitioning individuals. According to Dutra et al, trans-females are three times more likely to die from a cardiovascular event than the general population. In their 2019 literature review, Dutra et al examined the results of over 50 studies evaluating the effects of cross-sex hormones on not only transgender individuals but those with menopause and other endocrine disorders, all of which indicate that use of estrogen or testosterone can increase risks for cardiovascular disease. Throughout their review, Dutra et al cite examples of trans-females having higher triglyceride levels after 24 months of cross-sex hormones and how researchers halted a study on estrogen due to an increase in heart attacks among participants. Another article the authors reference indicates a higher risk for thromboembolisms (i.e., blood clots) in trans-females. For trans-males, Dutra et al explain that research shows significant increased risk for hypertension, high cholesterol, obesity, and heart attacks. One study noted that trans-males have a four times greater risk of heart attack compared to women identifying as their natal sex. Dutra et al conclude that most transgender individuals are younger than 50 and that more studies are needed as this population ages. They do note that available studies indicate that cross-sex hormones pose dangers to long-term cardiovascular health (Dutra et al, 2019).

In sum, the literature reveals that the evidence for cross-sex hormones as a treatment for gender dysphoria is weak and insufficient. Between the permanent effects, off-label use, and consequences to long-term health, cross-sex hormones are a risky option that does not promise a cure but does guarantee irreversible changes to both male and female bodies. Additionally, the inadequate studies serving as the basis for recommendations by clinical associations can lead to providers making poorly informed decisions for their patients. Research asserting that taking cross-sex hormones improves mental health is subjective and short-term. More studies that utilize large sample sizes and appropriate

methods is required before the medical profession should consider cross-sex hormones as one of gender dysphoria's standard treatments.

Literature Review: Sex Reassignment Surgery

The final phase of treatment for gender dysphoria is sex reassignment surgery. This method consists of multiple procedures to alter the appearance of the body to resemble an individual's desired gender. Some procedures apply to the genitals (genital procedures) while others affect facial features and vocal cords (non-genital procedures). While the surgery creates aesthetical aspects, it does not fully transform someone into the opposite biological sex. Transgender persons who undergo the procedures must continue taking cross-sex hormones to maintain secondary sexual characteristics. Additionally, all physical changes are irreversible, and the success rate of a surgery varies depending on the procedure and the population. For example, surgeries for trans-females have much better results than those for trans-males. Complications such as post-operative infections can also arise with the urinary tract system. However, sex reassignment surgery supposedly can provide drastic, if not complete, relief from gender dysphoria (Endocrine Society, 2017). The following is a list of procedures (both genital and non-genital) for trans-females and trans-males that create physical features of the desired sex.

Procedures for Trans-Females

- **Genital Surgeries:** These consist of penectomy (removal of the penis), orchiectomy (removal of the testicles), vaginoplasty (construction of a neo-vagina), clitoroplasty (construction of a clitoris), and vulvoplasty (construction of a vulva and labia). To perform, a surgeon begins by deconstructing the penis and removing the testicles. The penile shaft and glans are repurposed to serve as a neo-vagina and artificial clitoris (Note: These are not actual female genitalia but tissue constructed to resemble female anatomy). If the shaft tissue is insufficient, the surgeon may opt to use a portion of intestine to build a neo-vagina. The scrotum serves as material for fashioning a vulva and labia. In addition to constructing female genitalia, the surgeon reroutes the urethra to align with the neo-vagina. Genital surgeries for trans-females result in permanent sterility (Bizic et al, 2014).
- **Chest Surgery:** To attain full breasts, trans-females can undergo enlargement. The procedure is similar to breast augmentation for women where a surgeon places implants underneath breast tissue. Prior to surgery, trans-females need to take cross-sex hormones for roughly 24 months to increase breast size to get maximum benefit from the procedure (Endocrine Society, 2017).
- **Cosmetic and Voice Surgeries:** Designed to create feminine facial features, fat deposits, and vocal sounds, these procedures are secondary to genital procedures and intended to alter trans-females' appearances to better integrate into society as a member of the desired gender (WPATH, 2012).

Procedures for Trans-Males

- **Mastectomy:** This is the most performed sex reassignment surgery on trans-males because cross-sex hormones and chest-binding garments are often insufficient at diminishing breasts. To remove this secondary sexual characteristic, trans-males can undergo a mastectomy where a surgeon removes breast tissue subcutaneously (i.e., under the skin) and reconstructs the nipples to appear masculine. The procedure can result in significant scarring (Monstrey et al, 2011).
- **Genital Surgeries:** Unlike the procedures for trans-females, genital surgeries for trans-males are more complex and have lower success rates. Consisting of hysterectomy, oophorectomy

(removal of the ovaries), vaginectomy (removal of the vagina), phalloplasty (construction of a penis), and scrotoplasty (construction of prosthetic testicles), a team of surgeons must manufacture a penis using skin from the patient (taken from an appendage) while removing the vagina and creating an extended urethra. The functionality of the artificial penis can vary based on how extensive the construction was. Attaining erections requires additional surgery to implant a prosthesis, and the ability to urinate while standing is often not achieved. Genital procedures for trans-males result in irreversible sterility (Monstrey et al, 2011).

- **Cosmetic Surgeries:** Similar to trans-females, these procedures create masculine facial features, fat deposits, and artificial pectoral muscles. They aid trans-males with socially integrating as their desired gender. Surgery to deepen voices is also available but rarely performed (WPATH, 2012).

Because sex reassignment surgery is irreversible, the criteria for receiving these procedures is the strictest of all gender dysphoria treatments. WPATH and the Endocrine Society suggest rigorous reviews of patient history and prior use of other therapies before approving. Furthermore, the two organizations recommend that only adults (18 years old) undergo sex reassignment surgery.[8] WPATH and the Endocrine Society also recommend ensuring a strongly documented diagnosis of gender dysphoria, addressing all medical and mental health issues, and at least 12 months of cross-sex hormones for genital surgeries. Although the organizations agree on most criteria, they differ on whether hormones should be taken prior to mastectomies. WPATH asserts that hormones should not be a requirement, whereas the Endocrine Society advises up to 2 years of cross-sex hormones before undergoing the procedure (WPATH, 2012; Endocrine Society, 2017). What this indicates is that trans-males might undergo breast removal without having first pursued all options if their clinician adheres to WPATH's guidelines, which can lead to possible regret over irreversible effects.

As with cross-sex hormones, sex reassignment surgery's irreversible physical changes can potentially show marked mental health improvements and prevent suicidality in people diagnosed with gender dysphoria. In April 2022, the chair of the University of Florida's pediatric endocrinology department, Dr. Michael Haller, advocated for the benefits of "gender affirming" treatments (WUSF, 2020). However, the available evidence calls such statements into question. Recent research assessing both cross-sex hormones and sex reassignment surgery indicate that the effects on "long-term mental health are largely unknown." In studies regarding the benefits of surgery, the results have the same weaknesses as the research for the effectiveness of cross-sex hormones. These include small sample sizes, self-report surveys, and short evaluation periods, all of which are insufficient to justify recommendations for irreversible treatments (Bränström et al, 2020).

Two studies conducted in Sweden provide insight on the effectiveness of sex reassignment surgery in improving the behavioral health of transgender persons. Because Sweden has a nationalized health system that collects data on all residents, this country can serve as a resource to assess service utilization and inpatient admissions. Both studies, one by Dhejne et al from 2011 and another by Bränström et al published in 2020, assessed individuals who had received sex reassignment surgery and examined outcomes over several decades. Dhejne et al's findings indicate that sex reassignment

[8] Although practice guidelines indicate the minimum age to undergo sex reassignment surgery is 18, available evidence demonstrates that mastectomies have been performed on adolescent girls as young as 13 who experience "chest dysphoria" (Olson-Kennedy et al, 2018).

procedures do not reduce suicidality. The authors explained that individuals who underwent sex reassignment surgery were still more likely to attempt or commit suicide than those in the general population. This study is unique because it monitored the subjects over a long period of time. Dhejne et al note that the transgender persons tracked for the study did not show an elevated suicide risk until ten years after surgery (Dhejne et al, 2011). Given that a high proportion of research follows sex reassignment patients for much shorter timeframes, this evidence indicates that surgery might have little to no effect in preventing suicides in gender dysphoric individuals over the long run.

In addition to having an increased suicide risk, Dhejne et al discuss how individuals who underwent sex reassignment procedures also had higher mortality due to cardiovascular disease. The authors do not list the specific causes but establish the correlation. Given that cross-sex hormones can damage the heart, the increased risk could be related to the drugs and not the surgery. Furthermore, the study explains that the tracked population had higher rates of psychiatric inpatient admissions following sex reassignment. Dhejne et al established this by examining the rates of psychiatric hospitalizations in these individuals prior to surgery and noted higher utilization in the years following the procedures. These results are in comparison to the Swedish population at large. While the study contradicts other research emphasizing improvements in mental health issues, it has its limitations. For example, the sample size is small. Dhejne et al identified only 324 individuals who had undergone sex reassignment surgery between 1973 and 2003. In addition, the authors noted that while the tracked population had increased suicide risks when compared to individuals identifying as their natal sex, the rates could have been much higher if the procedures were not available (Dhejne et al 2011). What this study postulates is that sex reassignment surgery does not necessarily serve as a "cure" to the distress resulting from gender dysphoria and that ongoing behavioral health care may still be required even after a complete transition.

Bränström et al's study evaluating the Swedish population used a larger sample (1,018 individuals who had received sex reassignment surgery) but tracked them for just a ten-year period (2005 to 2015).[9] Unlike Dhejne et al, the authors did not track suicides and focused primarily on mood or anxiety disorder treatment utilization. Their results indicate that transgender persons who had undergone surgery utilized psychiatric outpatient services at lower rates and were prescribed medications for behavioral health issues at an annual decrease rate of 8%. Bränström et al also did not limit comparisons to Sweden's overall population and factored in transgender persons who take cross-sex hormones but have not elected to have surgery. Those results still presented a decrease in outpatient mental health services. However, Bränström et al note that individuals only on cross-sex hormones showed no significant reduction in that category, which calls into question claims regarding effectiveness of cross-sex hormones in ameliorating behavioral issues.

The Bränström et al study prompted numerous responses questioning its methodology. The study lacked a prospective cohort or RCT design, and it did not track all participants for a full ten-year period (Van Mol et al, 2020). These criticisms resulted in a retraction, asserting that Bränström et al's conclusions were "too strong" and that further analysis by the authors revealed that the new "results demonstrated no advantage of surgery in relation to subsequent mood or anxiety disorder-related

[9] Although Bränström et al claim to follow individuals for a ten-year period, peer reviews of the research revealed that this was not the case, noting the authors had varying periods of tracking, ranging from one to ten years (Van Mol et al, 2020).

health care visits or prescriptions or hospitalizations following suicide attempts in that comparison" (Kalin, 2020).

There are multiple explanations for why the Bränström et al study reached different results than the Dhejne et al study. For starters, Bränström et al tracked a larger sample group over a later period (2005 to 2015 as opposed to 1973 to 2003) during which gender dysphoria underwent a dramatic shift in definition. Also, Dhejne et al did not see elevated suicides until after ten years, raising the question as to whether sex reassignment surgery has temporary benefits on mental health rather than long-term or permanent benefits. Like the other Swedish study, Bränström et al's findings are a correlation and do not specifically state that the procedures cause reduced psychiatric service utilization (Bränström et al, 2020).

A 2014 study by Hess et al in Germany evaluated satisfaction with sex reassignment procedures by attempting to survey 254 trans-females on their quality of life, appearance, and functionality as women. Out of the participants selected, only 119 (47%) returned completed questionnaires, which Hess et al indicate is problematic because dissatisfied trans-females might not have wanted to provide input. The results from the collected responses noted that 65.7% of participants reported satisfaction with their lives following surgery and that 90.2% indicated that the procedures fulfilled their expectations for life as women. While these results led Hess et al to conclude that sex reassignment surgery generally benefits individuals with gender dysphoria, the information is limited and raises questions (Hess et al, 2014). Such questions include whether the participants had mental health issues before or after surgery and did their satisfaction wane over time. Hess et al only sent out one questionnaire and not several to ascertain consistency over multiple years. Questions like these raise doubts about the validity of the study. Although Hess et al's research is just one study, numerous others utilize the same subjective methods to reach their conclusions (Hruz, 2018).

In his assessment, Patrick Lappert contributes additional insight on the appropriate clinical indications for mastectomies, noting that removal of breast tissue is necessary following the diagnosis of breast cancer or as a prophylactic against that disease. He cites that this basis is verifiable through definitive laboratory testing and imaging, making it an objective diagnosis, whereas gender dysphoria has no such empirical methods to assess and depends heavily on the patient's perspective. Also, Lappert notes that trans-males who make such decisions are doing so on the idea that the procedure will reduce their dysphoria and suicide risk. However, they are making an irreversible choice based on anticipated outcomes supported only by weak evidence, and thus cannot provide informed consent (Lappert, 2022).

The literature is inconclusive on whether sex reassignment surgery can improve mental health for gender dysphoric individuals. Higher quality research is needed to validate this method as an effective treatment. This includes studies that obtain detailed participant histories (e.g., behavioral diagnoses) and track participants for longer periods of time. These are necessary to evaluate the full effects of treatments that cause irreversible physical changes. In addition, sex reassignment procedures can result in severe complications such as infections in trans-females and urethral blockage in trans-males. Health issues related to natal sex can also persist. For example, trans-males who undergo mastectomy can still develop breast cancer and should receive the same recommended screenings (Trum et al, 2015). Until more definitive evidence becomes available, sex reassignment surgery should not qualify as a standard treatment for gender dysphoria.

Literature Review: Quality of Available Evidence and Bioethical Questions

Quality of Available Evidence

Clinical organizations that have endorsed puberty suppression, cross-sex hormones, and sex reassignment surgery frequently state that these treatments have the potential to save lives by preventing suicide and suicidal ideation. The evidence, however, does not support these conclusions. James Cantor notes that actual suicides (defined as killing oneself) are low, occur at higher rates for men, and that interpretations of available research indicate a blurring of numbers between those with gender dysphoria and homosexuals (Cantor, 2022). Although information exists that contradicts certain arguments, media outlets continue to report stories emphasizing the "lifesaving" potential of sex reassignment treatment. A May 2022 story by NBC announced survey results under the headline "Almost half of LGBTQ youths 'seriously considered suicide in the past year'" (NBC, 2022). This is a significant claim that can have a sensational effect on patients and providers alike, but how strong is the evidence supporting it? Almost all of the data backing this assertion are based on surveys and cross-studies, which tend to yield low-quality results (Hruz, 2018). In addition, how many gender dysphoric individuals are seeing stories in the media and not questioning the narrative? Because research on the effectiveness of treatments is ongoing, a debate persists regarding their use in the adolescent and young-adult populations, and much of it is due to the low-quality studies serving as evidence.

In their assessment, Romina Brignardello-Petersen and Wojtek Wiercioch examined the quality of 61 articles published between 2020 and 2022 (Note: See Attachment A for the full study). They identified research on the effectiveness of puberty blockers, cross-sex hormones, and sex reassignment surgery and assigned a grade (high, moderate, low, or very low) in accordance with the Grading of Recommendations Assessment, Development, and Evaluation (GRADE) approach. Out of the articles reviewed, all with a few exceptions received grades of low or very low quality when demonstrating outcomes regarding improvements in mental health and overall satisfaction with transitioning. For puberty blockers, Brignardello-Petersen and Wiercioch identified low quality evidence for alleviating gender dysphoria and very low quality for reducing suicidal ideation. The authors also had nearly identical findings for cross-sex hormones. However, they noted moderate quality evidence for the likelihood of cardiovascular side effects. Regarding surgery, Brignardello-Petersen and Wiercioch graded articles that examined overall satisfaction and complication rates. None of the studies received grades higher than low quality. These findings led the authors to conclude that "there is great uncertainty about the effects" of sex reassignment treatments and that the "evidence alone is not sufficient to support" using such treatments. Among the studies graded was one the U.S. Department of Health and Human Services cited in its information on "gender affirming" treatments. The authors noted this research had a "critical risk of bias" and was of low quality (Brignardello-Petersen and Wiercioch, 2022).

For his part, James Cantor provided a review of available literature, which addresses studies on etiology, desistance, effectiveness of puberty blockers and cross-sex hormones, suicidal behaviors, and clinical association and international guidelines. Throughout his analysis, Cantor cites weak evidence, poor methodologies (e.g., retrospective versus prospective studies), and lack of professional endorsements in research that indicates the benefits of sex reassignment treatment. Additionally, he notes that improvements in the behavioral health of adolescents who take cross-sex hormones can be attributed to the counseling they receive concurrently and that suicidality is not likely to result from gender

dysphoria but from co-occurring mental disorders. The reasoning behind the third point is based on the blending of suicide and suicidality, which are two distinct concepts. The former refers specifically to killing oneself, and the second regards ideation and threats in attempts to receive help. Cantor specifically notes that actual suicides are highly unlikely among gender dysphoric individuals, particularly trans-males. His other conclusions indicate that young children who experience gender identity issues will most likely desist by puberty, that multiple phenomena can cause the condition, and that Western European health services are not recommending medical intervention for minors. The basis for these statements is the paucity of high to moderate quality evidence on the effectiveness of sex reassignment treatments and numerous studies demonstrating desistance (Cantor, 2022).

Despite the need for stronger studies that provide definitive conclusions, many practitioners stand by the recommendations of the AAP, Endocrine Society, and WPATH. This is evident in a letter submitted to the *Tampa Bay Times*, which was a rebuttal to the Florida Department of Health's (DOH) guidance on treatment for gender dysphoria (Note: The guidance recommends against using puberty blockers, cross-sex hormones, or surgery for minors) (DOH, 2022). The authors, led by six professors at the University of Florida's College of Medicine, state that recommendations by clinical organizations are based on "careful deliberation and examination of the evidence by experts." However, evaluations of these studies show otherwise. Not only does the available research use cross-sectional methods such as surveys, but it provides insufficient evidence based on momentary snapshots regarding mental health benefits. These weak studies are the foundation for the clinical organizations' guidelines that the University of Florida professors tout as a gold standard. In addition, the letter's authors state that DOH's guidance is based on a "non-representative sample of small studies and reviews, editorials, opinion pieces, and commentary" (Tampa Bay Times, 2022). That statement misses the point when it comes to evidence demonstrating whether treatments with irreversible effects are beneficial because the burden of proof is on those advocating for this treatment, not on those acknowledging the need for further research. This raises the question concerning how much academic rigor these professors are applying to practice guidelines released by clinical organizations and whether they also apply the same level of rigor to novel treatments for other conditions (e.g., drugs, medical devices).

Another example of a lack of rigor is a 2019 article by Herman et al from the University of California at Los Angeles (UCLA) that evaluated responses to a 2015 national survey on transgender individuals and suicide. Unlike other studies, this one utilized a large cohort with 28,000 participants from across the U.S. responding. However, the researchers used no screening criteria and did not randomly select individuals. In addition, responses consisted entirely of self-reports with no supporting evidence to even prove a diagnosis of gender dysphoria. Although Herman et al conclude that the U.S. transgender population is at higher risk for suicidal behaviors, the authors' supporting evidence is subjective and serves as a weak basis. Additionally, the survey results do not establish gender dysphoria as a direct cause of suicide or suicidal ideation. The questions required participants to respond about their overall physical and mental health. Out of those that indicated "poor" health, 77.7% reported suicidal thoughts or attempts during the previous year, whereas just 29.1% of participants in "excellent" health had. These percentages indicate that causes beyond gender dysphoria could be affecting suicidal behaviors. Other reasons cited include rejection by family or religious organizations and discrimination. The authors also acknowledge that their findings are broad, not nationally representative, and should serve as a basis for pursuing future research (Herman et al, 2019).

Yet another example is a study published in 2022 by Olson et al tracks 300 young children that identify as transgender over a 5-year period, and asserts low probabilities for detransitioning, while supporting interventions such as puberty blockers. The authors found that children (median age of 8 years) who identified as a gender that differed from their natal sex were unlikely to desist at a rate of 94% and conclude that "transgender youth who socially transitioned at early ages" will continue "to identify that way." While this appears to contradict earlier studies that demonstrate most young adolescents who change gender identities return to their "assigned gender at birth," the authors note differences and limitations with the results. For example, Olson et al notes that they did not verify whether the participants met the DSM-V's diagnostic criteria for gender dysphoria and that the children's families supported the decisions to transition. Instead, the authors relied on a child's chosen pronouns to classify as transgender. Also, Olson et al acknowledged that roughly 66% of the sample was biologically male. This is particularly significant considering that the majority of transitioning adolescents in recent years were natal females. Another issue with the study includes the median age at the end of follow-up (13 years), which is when boys begin puberty. Furthermore, the authors cite that the participants received strong parental support regarding the transitions, which constitutes positive reinforcement (Olson et al, 2022). Other research demonstrates that such feedback on social transitioning from parents and peers can prevent desistance following pubertal onset (Zucker, 2019). Despite these limitations, the New York Times announced the study's publication under the headline "Few Transgender Children Change Their Minds After 5 Years" (New York Times, 2022). Such a title can add to the public's perception that gender dysphoria requires early medical intervention to address.

Bioethical Questions

The irreversible physical changes and potential side effects of sex reassignment treatment raise significant ethical questions. These questions concern multiple bioethical principles including patient autonomy, informed consent, and beneficence. In a 2019 article, Michael Laidlaw, Michelle Cretella, and Kevin Donovan argue that prescribing puberty blockers or cross-sex hormones on the basis that they will alleviate psychological symptoms should not be the standard of care for children with gender dysphoria. Additionally, the three authors assert that such treatments "constitute an unmonitored, experimental intervention in children without sufficient evidence of efficacy or safety." The primary ethical question Laidlaw, Cretella, and Donovan pose is whether pushing physical transitioning, particularly without parental consent, violates fully informed consent (Laidlaw et al, 2019).

In accordance with principles of bioethics, several factors must be present to obtain informed consent from a patient. These consist of being able to understand and comprehend the service and potential risks, receiving complete disclosure from the physician, and voluntarily providing consent. Bioethicists generally do not afford the ability of giving informed consent to children who lack the competence to make decisions that pose permanent consequences (Varkey, 2021). Laidlaw, Cretella, and Donovan reinforce this point regarding sex reassignment treatment when they state that "children and adolescents have neither the cognitive nor the emotional maturity to comprehend the consequences of receiving a treatment for which the end result is sterility and organs devoid of sexual function" (Laidlaw et al, 2019). This further raises the question whether clinicians who make such treatment recommendations are providing full disclosure about the irreversible effects and truly obtaining informed consent.

Another issue is the conflict between consumerism and the practitioner's ability to provide appropriate care. Consumerism refers to patients learning about treatments through media/marketing and requesting their health care provider to prescribe it, regardless of medical necessity. Considering that social media is rife with individuals promoting "gender affirmative" drugs and surgeries, children are making self-assessments based on feelings they may not understand and that can lead to deep regret in the future (Littman, 2018). This can contribute to patients applying pressure on their doctors to prescribe medications not proven safe or effective for the condition. Consumerism can also affect bioethical compliance because it constrains clinicians from using their full "knowledge and skills to benefit the patient," which is "tantamount to a form of patient abandonment and therefore is ethically indefensible" (Varkey, 2021).

In his assessment, G. Kevin Donovan explains the bioethical challenges related to sex reassignment treatment, emphasizing the lack of informed consent when administering these services. He asserts that gender dysphoria is largely a self-diagnosis practitioners cannot verify with empirical tests (e.g., labs and imaging) and that providing such treatments is experimental. Because of the lack of consent and off-label use of puberty blockers and cross-sex hormones, Donovan raises the question as to how "experienced and ethical physicians so mislead others or be so misled themselves?" He further attributes this phenomenon to societal and peer pressures that influence self-diagnosis and confirm decisions to transition. As a result, these pressures lead to individuals wanting puberty blockers, cross-sex hormones, and surgery. Donovan goes on to identify several news stories where embracing sex reassignment treatment is a "cult-like" behavior. To conclude, he links these factors back to the failure to obtain informed consent from transgender patients and how that violates basic bioethical principles (Donovan, 2022).

Coverage Policies of the U.S. and Western Europe

U.S. Federal Level Coverage Policies

Medicare: In 2016, the Centers for Medicare and Medicaid Services (CMS) published a decision memo announcing that Medicare Administrative Contractors (MACs) can evaluate sex reassignment surgery coverage on a "case-by-case" basis.[10] CMS specifically noted that the decision memo is not a National Coverage Determination and that "no national policy will be put in place for the Medicare program" (CMS, 2016). This memo was the result of CMS reviewing over 500 studies, reports, and articles to the validity of the procedures. Following its evaluation, CMS determined that "the quality and strength of evidence were low due to mostly observational study designs with no comparison groups, subjective endpoints, potential confounding . . . small sample sizes, lack of validated assessment tools, and considerable (number of participants in the studies) lost to follow up." In 2017, CMS reinforced this position with a policy transmittal that repeated the 2016 memo's criteria (CMS, 2017).

The basis for Medicare's decision is that the "clinical evidence is inconclusive" and that "robust" studies are "needed to ensure that patients achieve improved health outcomes." In its review of available literature, CMS sought to answer whether there is "sufficient evidence to conclude that gender reassignment surgery improves health outcomes for Medicare beneficiaries with gender dysphoria." After evaluating 33 studies that met inclusion criteria, CMS's review concludes that "not enough high-quality evidence" is available "to determine whether gender reassignment surgery improves health outcomes for Medicare beneficiaries with gender dysphoria and whether patients most likely to benefit from these types of surgical intervention can be identified prospectively." Additionally, out of the 33 studies, just 6 provided "useful information" on the procedures' effectiveness, revealing that their authors "assessed quality of life before and after surgery using validated (albeit non-specific) psychometric studies" that "did not demonstrate clinically significant changes or differences in psychometric test results" following sex reassignment surgery (CMS, 2016).

U.S. Department of Defense – Tricare: Tricare does not cover sex reassignment surgery, but it will cover psychological services such as counseling for individuals diagnosed with gender dysphoria and cross-sex hormones when medically necessary (Tricare, 2022).[11]

U.S. Department of Veterans Affairs: The U.S. Department of Veterans Affairs (VA) does not cover sex reassignment surgery, although it will reimburse for cross-sex hormones and pre- and post-operative care related to transitioning. Because the VA only provides services to veterans of the U.S. armed forces, it cannot offer sex reassignment treatment to children (VA, 2020).[12]

---

[10] The Centers for Medicare and Medicaid Services is part of the U.S. Department of Health and Human Services. Its primary functions are to administer the entire Medicare system and oversee federal compliance of state Medicaid programs. In addition, CMS sets reimbursement rates and coverage criteria for the Medicare program.
[11] Tricare is the insurance program that covers members of the U.S. armed forces and their families. This includes children of all ages.
[12] The U.S. Department of Veterans Affairs oversees the Veterans Health Administration (VHA), which consists of over 1,000 hospitals, clinics, and long-term care facilities. As the largest health care network in the U.S., the VHA provides services to veterans of the U.S. armed forces.

State-Level Coverage Policies

Florida: In April 2022, DOH issued guidance for the treatment of gender dysphoria, recommending that minors not receive puberty blockers, cross-sex hormones, or sex reassignment surgery.[13] The justification offered for recommending against these treatments is that available evidence is low-quality and that European countries also have similar guidelines. Accordingly, DOH provided the following guidelines:

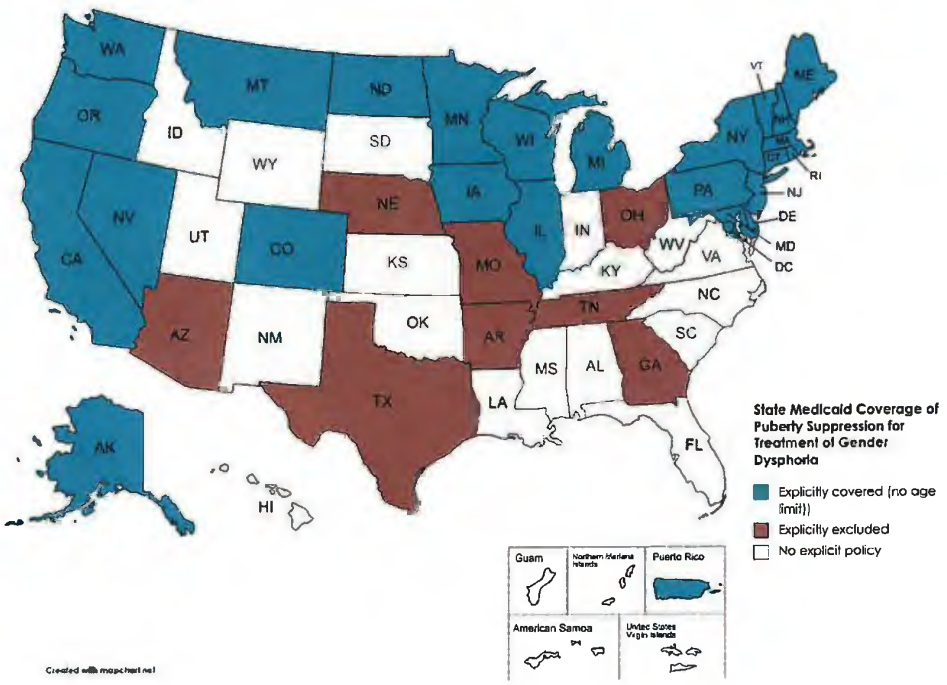
- "Social gender transition should not be a treatment option for children or adolescents."
- "Anyone under 18 should not be prescribed puberty blockers or hormone therapy."
- "Gender reassignment surgery should not be a treatment option for children or adolescents."
- "Children and adolescents should be provided social support by peers and family and seek counseling from a licensed provider."

In a separate fact sheet released simultaneously with the guidance, DOH further asserts that the evidence cited by the federal government cannot establish sex reassignment treatment's ability to improve mental health (DOH, 2022).

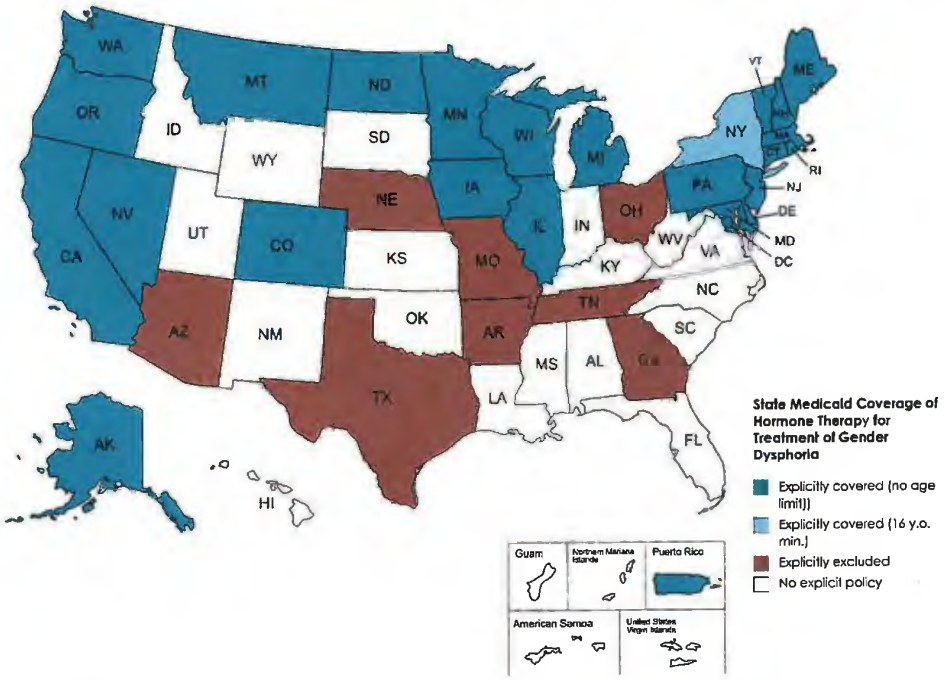
State Medicaid Programs: Because individual states differ in health services offered, Medicaid programs vary in their coverage of sex reassignment treatments. The following maps identify states that cover sex reassignment treatments, states that have no policy, and states that do not cover such treatments.

[13] Unlike the federal government, the State of Florida delegates responsibilities for Medicaid and health care services to five separate agencies (Agency for Health Care Administration, Department of Health, Department of Children and Families, Department of Elder Affairs, and Agency for Persons with Disabilities). Each agency has its own separate head (secretary or surgeon general), which reports directly to the Executive Office of the Governor. As Florida's public health agency, DOH oversees all county health departments, medical professional boards, and numerous health and welfare programs (e.g., Early Steps and Women, Infants, and Children). Because it oversees the boards, DOH has authority to release practice guidelines.

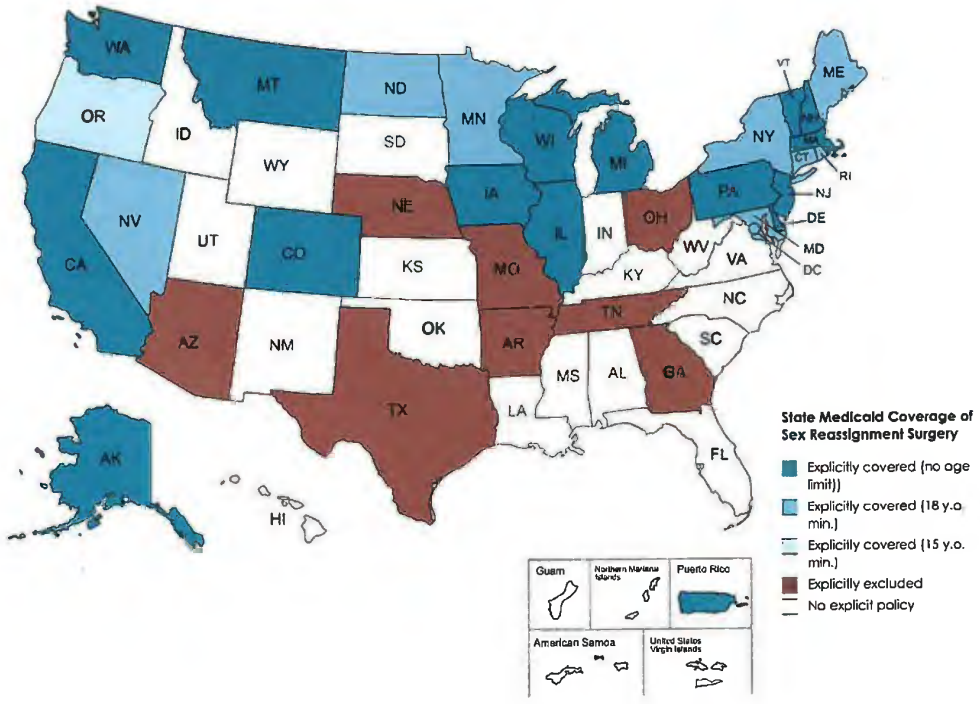
State Medicaid programs with coverage decisions regarding puberty blockers:



State Medicaid programs with coverage decisions regarding cross-sex hormones:



State Medicaid programs with coverage decisions regarding sex reassignment surgery:



Western Europe

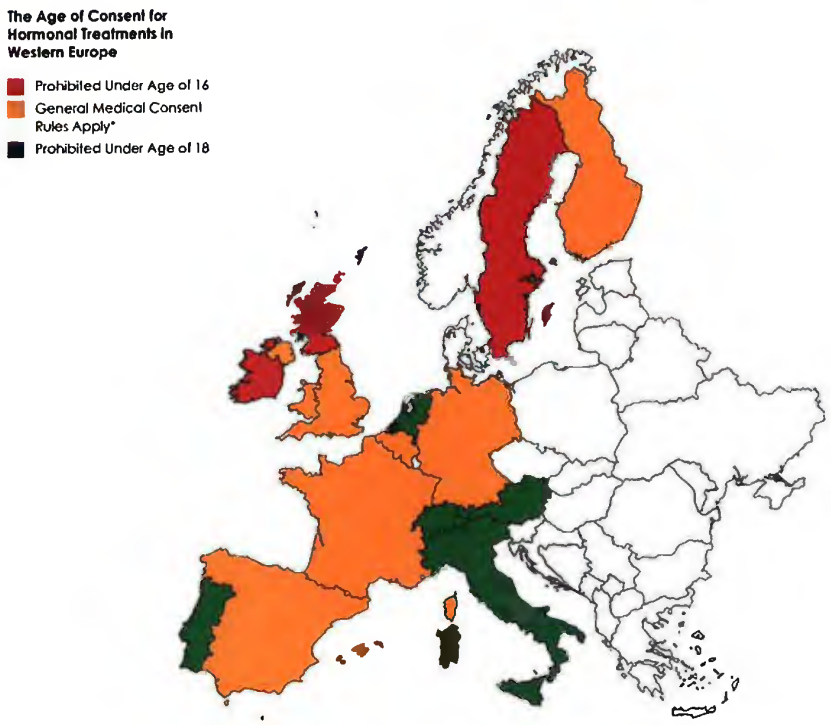
Scandinavian countries such as Sweden and Finland have released new guidelines on sex reassignment treatment for children. In 2022, the Swedish National Board of Health stated that "the risks of hormonal interventions for gender dysphoric youth outweigh the potential benefits." With the exception of youths who exhibited "classic" signs of gender identity issues, adolescents who present with the condition will receive behavioral health services and gender-exploratory therapy (Society for Evidence Based Gender Medicine, 2022).

In Finland, the Palveluvalikoima issued guidelines in 2020 stating that sex reassignment in minors "is an experimental practice" and that "no irreversible treatment should be initiated." The guidelines further assert that youths diagnosed with gender dysphoria often have co-occurring psychiatric disorders that must be stabilized prior to prescribing any cross-sex hormones or undergoing sex reassignment surgery (Palveluvalikoima, 2020).

The United Kingdom (U.K.) is also reassessing the use of irreversible treatments for gender dysphoria due the long-term effects on mental and physical health. In 2022, an independent interim report commissioned by the U.K.'s National Health Service (NHS) indicates that additional research and systematic changes are necessary to ensure the safe treatment of gender dysphoric youths. These include reinforcing the diagnosis process to assess all areas of physical and behavioral health, additional training for pediatric endocrinologists, and informing parents about the uncertainties regarding puberty blockers. The interim report is serving as a benchmark until the research is completed for final guidelines (The Cass Report, 2022).

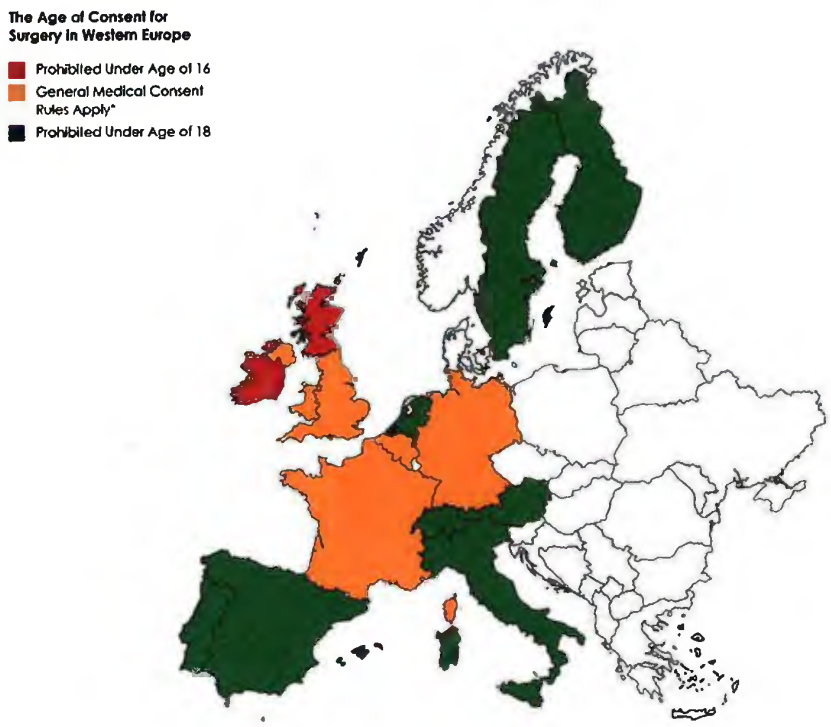
Like state Medicaid programs, health systems across Western Europe also vary in their coverage of sex reassignment treatment.

Western European nations' requirements for cross-sex hormones:



In this context, the age requirement for access to any medical treatment without consent of parents or of a public authority. This age may range from 16 to 18 years depending on each country's laws.

Western European nations' requirements for sex reassignment surgery:



In this context, the age requirement for access to any medical treatment without consent of parents or of a public authority. This age may range from 16 to 18 years depending on each country's laws.

Generally Accepted Professional Medical Standards Recommendation

This report does not recommend sex reassignment treatment as a health service that is consistent with generally accepted professional medical standards. Available evidence indicates that the services are not proven safe or effective treatments for gender dysphoria.

Rationale

The available medical literature provides insufficient evidence that sex reassignment through medical intervention is a safe and effective treatment for gender dysphoria. As this report demonstrates, the evidence favoring "gender affirming" treatments, including evidence regarding suicidality, is either low or very low quality:

- **Puberty Blockers:** Evidence does not prove that puberty blockers are safe for treatment of gender dysphoria. Evidence that they improve mental health and reduce suicidality is low or very low quality.
- **Cross-Sex Hormones:** Evidence suggesting that cross-sex hormones provide benefits to mental health and prevents suicidality is low or very low quality. Rather, evidence shows that cross-sex hormones cause multiple irreversible physical consequences as well as infertility.
- **Sex Reassignment Surgery:** Evidence of improvement in mental health and reduction in suicidality is low or very low quality. Sex reassignment surgery results in irreversible physical changes, including sterility.

While clinical organizations like the AAP endorse the above treatments, none of those organizations relies on high quality evidence. Their eminence in the medical community alone does not validate their views in the absence of quality, supporting evidence. To the contrary, the evidence shows that the above treatments pose irreversible consequences, exacerbate or fail to alleviate existing mental health conditions, and cause infertility or sterility. Given the current state of the evidence, the above treatments do not conform to GAPMS and are experimental and investigational.

Thank you.

And thank you for standing up for the true credibility of the GAPMS process.

I will read the SOP attachment you sent and think about it more.

Your dedication and work are appreciated.

Chris

Subject: RE: GAPMS process

Good afternoon, Dr. Cogle,

There is a SOP for GAPMS.

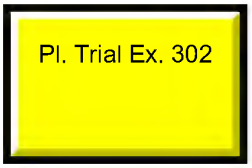
Typically, the requests for consideration of coverage come in either through a health service research email address or from leadership (less often).

The GAPMS process exists to determine whether the service/device requested for coverage is "experimental/investigational" or "medically necessary".

The request gets run through the attached checklist, and once it is determined to be an actual GAPMS (rather than a decision point or "simple" coverage determination) I reach out to the requestor and schedule a time to gently walk them thru the process.

We ask that the requestor(s) send us a host of information, much of which is included on the checklist. They often send us published research about the service/device under consideration, relevant national or local coverage determination information, and as many examples as they have of coverage by other states or major insurers. The amount of information provided by the requestors can vary quite a bit in quality and completeness.

Their request is added to our GAPMS queue to be worked on, typically in the order in which they have been received. We do tend to reward requestors who maintain contact, provide updates, and respond in a timely manner to any inquiries we might have.



Assuming they check off all the boxes on the checklist, so to speak, we begin the process.

- I determine what similar services or alternative treatments we already cover. I verify that the service/device requested has FDA approval and a dedicated billing code.
- I utilize Policy Reporter to determine which states currently include the service/device on their respective fee schedules. I also research and verify any existing coverage among the major insurance companies. I look for any existing national or local coverage determinations.
- The greatest amount of time is spent researching the existing professional literature on the subject, ideally well designed, non-industry sponsored studies, in peer-reviewed journals. Systematic reviews and meta-analyses, when existing, play a big role and can often provide a heads up regarding the quality of the literature as well as any gaps that may exist. The quality can of course vary considerably depending on the item in question and how long it has existed as a treatment option. I also look for any existing clinical guidelines that might exist related to the request, as well as consulting various sites like AHRQ, Cochrane, NICE, etc. What do they have to say about it? Also, are their any ongoing trials identifiable through clinicatrials.gov that might shed more substantial light on the matter at a future date?
- I also pull any relevant articles pertaining to cost analyses that might indicate potential for cost saving for Florida Medicaid.
- Assuming (and for some of these that is a big "If") they check all the right boxes on all of the above, I will submit a request to MPF, along with a minimum of three price examples from other states that currently provide coverage, for a cost analysis. Anything added (with some exceptions) to the fee schedule must be budget neutral. So, we ask, what do we already pay for, can this new service/device offset any existing coverage, and does it lead to healthier outcomes at similar or less cost?

Once everything has been received, researched, and reviewed, I prepare a report that is roughly a template insofar as it is divided into sections ranging from "literature" to "existing coverage among other states" etc. Once the report has been completed, it goes to my immediate supervisor who reviews it for content and then forwards it to the Bureau Chief. Usually there would be a meeting with her, questions asked and answered, and then the report moves on to Tom for his signature, yay or nay, as final approval. Then the requestor is contacted and given a final copy of the report. If it is determined medically necessary and budget neutral, the code is then added to the fee schedule based on the normal fee schedule update timeline.

All of that is the ideal. The reality is that the reviews get done, the reports get written, and then they all bottleneck with leadership because GAPMS are fairly low on the totem pole of priorities, particularly since the pandemic began. It is also extremely common for a request to come in (most of them, really) that are asking for coverage long before the necessary information exists to justify coverage. Manufacturers will have a newfangled device with a tiny evidence base or will make the request before their most significant and enlightening trials/studies have even been completed. I have often said that a lot of what I am asked to look at will likely eventually gain coverage. But it is common for the request to outpace the evidence, and they are often several years away from finalizing their best case.

I believe there are currently about seven completed that are still awaiting review and approval from leadership. Some of them have been written for over two years. I have re-reviewed them and made any necessary updates concerning coverage, research, etc. I typically do that twice a year.

Of course, the requestors are always free to resubmit after a denial, so some of these never really die. But the resubmissions go to the back of the queue and are taken in the order they arrive.

If you will excuse me, I feel obligated to include this information: I was not informed or consulted, did not in any way participate, and did not write the GAPMS concerning gender dysphoria treatment. That particular GAPMS did not come through the traditional channels and was not handled through the traditional GAPMS process. Every report I have written represents my best effort at determining the most timely and accurate information available on the subject under consideration. I do not cherry pick data or studies and would never agree to if I were so asked. All I can say about that report, as I have read it, is that it does not present an honest and accurate assessment of the status of the current evidence and practice guidelines as I understand them to be in the existing literature. I sincerely apologize if I come across as a bit agitated about it, but as the "GAPMS guy" around here, lots of assumptions have been made by those

who do not know me well. I'm a different sort of person than the author of that report. I can't speak for them. I conduct myself and my work with integrity and I do not play favorites, yay or nay. Full stop, period.

Thanks so much for your help Friday. That shaved a few minutes off a tight deadline for me. Please let me know if you have any additional or questions or would like any additional information or clarification.

Take care.

Jeff

Subject: GAPMS process

Hello, Jeff. Good talking with you this past Friday.

Are there standard operating procedures for GAPMS?

If so, can I review them?

If no SOPs, then can I help you develop a SOP for GAPMS?

Thank you,

Chris

TAB 183-7

HCA Hearing on General Medicaid Policy Rule

July 2022

The purpose of the amendment to Rule 59G-1.050 – General Medicaid Policy – is to update covered Medicaid services for gender dysphoria. The rule specifies covered services and clarifies definitions.

Cabinet

- Cole Gearing – Program Administrator in AHCA Medicaid Policy Bureau
- Jason Weida – Asst. Deputy Secretary for Medicaid Policy Bureau
- Matt Brackett – Program Consultant in AHCA Medicaid Policy Bureau
- Sheena Grant – Chief Counsel and Rules Coordinator in AHCA General Counsel Office
- Mohammad Jazil and Gary Perko of Holtzman and Vogel Law Firm – AHCA Outside Counsel
- Dr. Andre Van Mol – Board-certified family physician
- Dr. Quentin Van Meter – Board-certified pediatric endocrinologist
- Dr. Miriam Grossman – Board-certified child, adolescent, and adult psychiatrist

Key Points:

- April 20, 2022 – FDOH issued guidance on the treatment of gender dysphoria in children and adolescents
- Secretary Simone Marstiller requested the division of Medicaid to determine what treatments are consistent with the process described in Florida Administrative Code 59G-1.035 with generally accepted professional medical standards
- As a result, Subsection 7 would be added to Rule 59G-1.050 to AHCA's general Medicaid policy
    - Subsection 7a provides that the Florida Medicaid program does not cover, and therefore, will not reimburse for the following services for the treatment of gender dysphoria:
        1. Puberty Blockers
        2. Hormones and Hormone Antagonists
        3. Sex Assignment Surgeries
        4. Any other procedures that alter primary or secondary sexual characteristics
    - Subsection 7b provides that for the purposes of determining medical necessity, including the early public screening of diagnosis of treatment, the services listed in Subsection 7a do not meet the definition of medical necessity I accordance with Rule 59G-1.104 Florida Administrative Code
- Rule 59G-1.035 identifies specific factors for determining guidelines that are covered by the Florida Medicaid program including:
    - Evidence-based clinical practice guidelines
    - Published reports and articles in the authoritative medical and scientific literature related to health services

Pl. Trial Ex. 305

Updated July 26, 2022

- Effectiveness of the health service in improving the individual's prognosis or health outcomes
- Utilization trends
- Coverage policies by other credible insurance payor services
- Recommendations or assessments by clinical or technical experts on the subject or field

- Cabinet's determination in the case and its report were published on AHCA's website on June 2, 2022
  - Document explains that the Florida Medicaid program determines that the effectiveness of the services listed above are "low to very low quality" and insufficient to demonstrate that such treatments conform with the guidelines set forth with Rule 59G-1.035
  - Florida Medicaid program determined that the specific services will not be covered

Comments:

Each speaker was allotted two minutes of speaking time. The speakers are listed below in the order in which they spoke. Those individuals whose names were inaudible are represented by "NAME." Those in favor of Rule 59G-1.050 are highlighted in blue while those opposed are highlighted in violet.

- Chloe Cole
  - 17-year-old detransitioner from California
  - Medically transitioned from ages 13-16
  - Was taken to therapist to affirm "male identity"
  - Took puberty blockers and injections
  - Had a double mastectomy at age 14
  - Experiencing many health complications

- Sophia Galvin
  - 22-year-old detransitioner
  - Began transitioning at 18
  - History of mental health
  - Had a double mastectomy at age 19

- NAME
  - Without her consent:
    - 16-year-old daughter was injected with hormones
    - At 17, Medicaid paid surgeons to perform double mastectomy and hysterectomy as an outpatient
    - At 19, Medicaid paid for her to undergo a vaginoplasty
  - Private insurance was bypassed

- Janette Cooper – Partners of Ethical Care
- Hannah Lambert

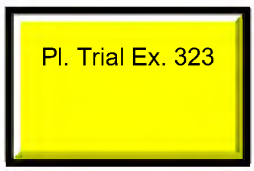
FLRules.com one-time comment:

Name: Ms.Mila Becker
Email: mbecker@endocrine.org
Title: 59G-1.050 General Medicaid
Comment: To Whom It May Concern:
The Endocrine Society strongly opposes the proposed rule, which would deny access to gender affirming care to the Florida Medicaid population. The Endocrine Society is the world's oldest and largest organization of scientists devoted to hormone research and physicians who care for people with hormone-related conditions. Many of our 18,000 members are recognized for their expertise in transgender medicine and research.

Our comments below are focused on responding to inaccurate and misleading statements about the Endocrine Society's clinical practice guidelines made in the report Generally Accepted Professional Medical Standards Determination on the Treatment of Gender Dysphoria (GAPMS) developed by Florida Medicaid in June 2022, which is used to justify the proposed rule.

Quality of Endocrine Society Clinical Practice Guidelines on Endocrine Treatment of Gender Dysphoric/Gender Incongruent Persons and the GRADE System
The Institute of Medicine (IOM) (now known as the National Academy of Medicine) defined clinical practice guidelines as "recommendations intended to optimize patient care that are informed by a systematic review of evidence and an assessment of the benefits and harms of alternative care options." While guidelines are not standards of care that clinicians are legally bound to follow, they provide a framework for best practices, and deviations must be justified.
Endocrine Society guidelines are developed using a robust and rigorous process that adheres to the highest standards of trustworthiness and transparency as defined by the IOM. The Endocrine Society follows the Grading of Recommendations, Assessment, Development and Evaluation (GRADE) methodology to develop its recommendations. GRADE is the most accepted and internationally recognized standard for guideline development. Of the over 100 international groups that endorse GRADE, other prominent organizations using this methodology include the U.S. Agency for Healthcare Research and Quality, the U.S. Centers for Disease Control and Prevention, England's National Institute for Health and Care Excellence, and the World Health Organization. GRADE is a transparent framework for summarizing evidence and provides a systematic approach for making clinical practice recommendations.
GRADE begins with the formulation of clinical questions followed by a systematic review of the evidence that supports those questions. This evidence is used to develop and support the clinical recommendations that form the basis of the guideline. A certainty of evidence assessment is made for the overall body of evidence for a particular question on a scale from very low, low, moderate, to high. While some of the recommendations in the Endocrine Society's guideline are based on low or very low certainty evidence, strong recommendations can be made for low and very low certainty evidence in the GRADE system in some circumstances (Life threatening situation; uncertain benefit, certain harm; potential equivalence, one option clearly less risky or less costly, high certainty in similar benefits, one option potentially more risky or costly; potential catastrophic harm.) Additionally, the GRADE methodology does not account only for the certainty of the evidence when developing recommendations.
Systematic reviews of the effects of an intervention provide essential, but not sufficient information for making informed decisions. There are other factors that GRADE methodology requires guideline authors to account for including, most importantly, patient values and preferences, in making trade-offs between alternative courses of action.
Additionally, Endocrine Society guidelines are not developed in a vacuum. Guidelines take an average of 2-3 years to be developed through a multi-step drafting, comment, review, and approval process. This includes a public comment period and expert review period, and all comments are addressed by the guideline development panel prior to publication. Expert reviewers are subject to the same conflict of interest rules as panel members. There is ample opportunity for feedback and debate through this years-long development process.



Consequently, the Endocrine Society's guidelines represent a high-quality resource to be used for patient care based on medical evidence, author expertise, rigorous scientific review, and a transparent process. In contrast, GAPMS did not include endocrinologists with expertise in transgender medicine, misunderstands the use of the GRADE methodology and the notion of standard of care, and makes sweeping statements against gender affirming medical care that are not supported by evidence or references provided. Most disturbing, GAPMS does not acknowledge the data showing harm reduction and improvements in behavioral health issues, such as depression and anxiety, with gender affirming care.

Sufficiency of Evidence and Bar for Gender Affirming Care

The Endocrine Society and other medical and mental health organizations representing professionals who treat gender dysphoria/gender incongruence firmly believe there is sufficient evidence to support gender affirming care and to support that harm can occur if these people are not treated. The statement in GAPMS that "low quality" studies provide insufficient evidence for gender affirming care demonstrates a failure to understand medical literature. The medical literature terminology is appropriately conservative. But "low-quality" studies are typical for much of medical care and much better than "expert opinion," also common for medical care.

The Endocrine Society believes Florida is imposing a bar for care that is too high, will result in harm to people with gender dysphoria/incongruence, and is not used for other patients. GAPMS suggests that because puberty blockers are used off-label they are experimental and not safe. The fact is many treatments used in medicine are used off-label. That just means that medication is used for a purpose other than that for which the pharmaceutical company did the paperwork. Such prescribing is common. That is part of the reason states license physicians, to make those prescribing decisions. FDA approval and randomized controlled trials are simply too stringent. Most medical care occurs appropriately without those in place.

Scientific Evidence Indicates the Effectiveness of Treating Gender Dysphoria According to the Guidelines

The results of multiple studies indicate that adolescents suffering from gender dysphoria who receive medical interventions as part of their gender-affirming care experience improvements in their overall well-being. Eight studies have been published that investigated the use of puberty blockers in the care of adolescents suffering from gender dysphoria and six studies have been published that investigated the use of hormone therapy to treat adolescents suffering from gender dysphoria. These studies find positive mental health outcomes for those adolescents who received puberty blockers or hormone therapy, including statistically significant reductions in anxiety, depression, and suicidal ideation.

For example, a 2020 study analyzed survey data from 89 transgender adults who had access to puberty blockers while adolescents and from more than 3,400 transgender adults who did not. The study found that those who received puberty blocking hormone treatment had lower likelihood of lifetime suicidal ideation than those who wanted puberty blocking treatment but did not receive it, even after adjusting for demographic variables and level of family support. Approximately nine in ten transgender adults who wanted puberty blocking treatment but did not receive it reported lifetime suicidal ideation. Additionally, a longitudinal study of nearly 50 transgender adolescents found that suicidality was decreased by a statistically significant degree after receiving gender-affirming hormone treatment. As another example, a prospective two-year follow-up study of adolescents with gender dysphoria published in 2011 found that treatment with puberty blockers was associated with decreased depression and improved overall functioning. A six-year follow-up study of 55 individuals from the 2011 study found that subsequent treatment with hormone therapy followed by surgery in adulthood was associated with a statistically significant decrease in depression and anxiety. "Remarkably, this study demonstrated that these transgender adolescents and young adults had a sense of well-being that was equivalent or superior to that seen in age matched controls from the general population." As scientists and researchers, the Endocrine Society always welcomes more research, including on this crucial topic. However, the available data indicate that the gender-affirming treatments that would be denied by the proposed rule are effective for the treatment of gender dysphoria. For these reasons, the use of the gender-affirming medical interventions specified in the Endocrine Society's guidelines is supported by all mainstream pediatric organizations, representing thousands of physicians across multiple disciplines.

Statements in GAPMS are Factually Inaccurate and Ignore the Recommendations of the Medical Community

GAPMS asserts that most adolescents who experience gender dysphoria will later overcome it by confirming to their natal sex. This assertion lacks scientific support. While some prepubertal children who experience gender dysphoria may go on to identify with their sex assigned at birth by the time they reach puberty, there are no studies to support the proposition that adolescents with gender dysphoria will come to identify with their sex assigned at birth, whether they receive treatment or not. On the contrary, "[l]ongitudinal studies have indicated that the emergence or

worsening of gender dysphoria with pubertal onset is associated with a very high likelihood of being a transgender adult."
Further, GAPMS relies upon controversial research not recognized in the mainstream transgender medicine community. For example, it refers to a paper by Lisa Littman on Rapid Onset Gender Dysphoria (ROGD) – a condition that does not exist -- to justify not supporting gender affirming medical care for adolescents with gender dysphoria without noting the methodological concerns that have been raised regarding this paper, including the fact that only parents (recruited from anti-transgender websites) and none of the youth with gender dysphoria participated in the study, and that parents were not recruited from websites supportive of transgender youth. These methodological concerns prompted publication of a correction by the original author.

The Proposed Rule Would Irreparably Harm Many Adolescents with Gender Dysphoria by Denying Access to the Treatment They Need
The proposed rule would deny Medicaid beneficiaries with gender dysphoria access to medical interventions that alleviate suffering, are grounded in science, and are endorsed by the medical community. The medical treatments prohibited by the proposed rule can be a crucial part of treatment for people with gender dysphoria and necessary to preserve their health. As discussed above, research shows that people with gender dysphoria who receive puberty blockers and/or hormone therapy experience less depression, anxiety, and suicidal ideation. Several studies have found that hormone therapy is associated with reductions in the rate of suicide attempts and significant improvement in quality of life. In light of this evidence supporting the connection between lack of access to gender-affirming care and lifetime suicide risk, banning such care can put patients' lives at risk.
The Endocrine Society is eager to work with Florida to address these concerns and would be happy to connect Florida Medicaid with our transgender medicine experts. If we can be of assistance or provide any additional information, please contact our Chief Policy Officer at mbecker@endocrine.org.

Sincerely,

Ursula Kaiser, MD
President, Endocrine Society

Simone Marstiller, Secretary
Tom Wallace, Deputy Secretary for Medicaid
Florida Agency for Health Care Administration
2727 Mahan Drive
Tallahassee, FL 32308
MedicaidRuleComments@ahca.myflorida.com

Re: Rule No. 59G-1.050: General Medicaid Policy

Dear Secretary Marstiller and Deputy Secretary Wallace:

We are writing to submit a public comment on a proposed amendment to Section 59G-1.050 of the Florida Administrative Code (the "Proposed Rule"), which, if adopted, would deny medical treatment to transgender individuals.[1] The Proposed Rule would apply to Medicaid members of any age and would deny coverage for puberty blockers, hormones, "sex reassignment surgeries," and "any other procedures that alter primary or secondary sexual characteristics."[2]

We are a group of seven scientists and a law professor, and we are deeply dismayed by the content of the Proposed Rule, which will deny long-established, effective, and evidence-based medical care to thousands of Florida Medicaid patients.[3] We are also distressed as scientists and stewards of public health by the shoddy quality of the purported scientific report offered to justify the Proposed Rule. The report, issued by the Florida Agency for Health Care Administration ("AHCA") on June 2, 2022 (hereinafter, "June 2 Report"), disregards well-established clinical practice guidelines and scientific research showing that standard medical treatments for gender dysphoria are "consistent with generally accepted professional medical standards" and are not "experimental or investigational."[4]

As discussed in depth below, we strongly oppose the adoption of the Proposed Rule. The Proposed Rule would violate the sex discrimination protections provided by the U.S. and Florida Constitutions and the federal statute that governs Medicaid by discriminating against transgender people on the basis of their sex, transgender status, and gender identity.[5] We are confident that other comments will focus in depth on the legal authorities that pre-empt the Proposed Rule.

---

[1] 48 Fl. Admin. Reg. 2461 (June 17, 2022). The Notice of Development of Rulemaking was published in 48 Fl. Admin. Reg. 2270 (June 3, 2022) without any specification of the subject of the rulemaking.
[2] The Proposed Rule would add new subsection (7) to Fl. A dmin. Code Section 59G-1.050. See 48 Fl. Admin. Reg. 2461 (June 17, 2022).
[3] Our comments reflect our views and not those of the University of Alabama, the University of Texas, or Yale University.
[4] Division of Florida Medicaid, Agency for Health Care Adm inistration, Generally Accepted Professional Medical Standards Determination on the Treatment of Gender Dysphoria, June 2022, at https://www.ahca.myflorida.com/letkidsbekids/docs/AHCA_GAPMS_June_2022_Report.pdf ("June 2 Report").
[5] See Bostock v. Clayton County, 590 U.S. __ (2020); Kadel v. Folwell, M.D. N.C., Mem. Op. 6-10-22 (applying Bostock to public health plan coverage); 42 U.S.C. 18116 (requiring nondiscrimination in Medicaid plans).

Pl. Trial Ex. 324

Our comments focus instead on the absence of any persuasive scientific or medical justification for the Proposed Rule. The June 2 Report purports to be a review of the scientific and medical evidence but is, in fact, fundamentally unsound from a scientific perspective. The June 2 Report disregards established scientific knowledge, ignores longstanding clinical practice recommendations developed by authoritative bodies of medical experts, and unaccountably dismisses the medical recommendations of more than 20 medical societies.

As scientists, we are alarmed that Florida's health care agency has adopted a purportedly scientific report that so blatantly violates the basic tenets of scientific inquiry. The report contains glaring errors regarding science, statistical methods, and medicine. Ignoring established science, the report instead relies on biased and discredited sources, stereotyping, and purported "expert" reports that carry no scientific weight.

These fundamental flaws thoroughly discredit the conclusions of the June 2 Report, with two legal consequences. First, the complete absence of scientific foundation for the Proposed Rule renders it an arbitrary and capricious use of rulemaking power. Second, the Florida AHCA cannot characterize the Proposed Rule as a valid interpretation of the existing Florida regulations on generally accepted professional medical standards, because the June 2 Report fails to satisfy Florida's own regulatory requirements for scientific review.[6]

The seven scientists in our group hold academic appointments at the University of Alabama, the University of Texas Southwestern, and Yale University. (The law professor is a tenured professor at the Yale Law School.) We include three Ph.D child and adolescent psychologists and four M.D. physicians with specialties in pediatric endocrinology, child and adolescent psychiatry, and adolescent medicine. All seven are also clinicians who treat transgender youth on a daily basis. Among us, we have accumulated more than 57 years of clinical practice and have treated more than 2,100 transgender youth. We received no funding for our work and have no conflicts of interest to declare.

We are writing to comment on the Proposed Rule because we are concerned that it will harm transgender people in Florida and set a misleading and dangerous national precedent. We are committed to the integrity of science and law, and we strongly oppose legal actions that, like the Proposed Rule and the June 2 Report, claim the authority of science but provide only biased and misleading information. Youth, families, and medical providers in Florida deserve a higher standard of protection and service from their government.

In this comment letter, we focus on the science governing the treatment of gender dysphoria. Our observations are relevant to the treatment of both youth and adults. For example, we show that the June 2 Report falsely claims that the evidence for medical treatment for gender dysphoria does not meet generally accepted professional medical standards and is experimental. We also show that the June 2 report relies on purported "expert" reports that appear to be highly biased and with undisclosed conflicts of interest. To keep our comments focused and manageable in length, the one issue that we do not address is the science of genital surgery used to treat gender dysphoria, which is typically not performed before the age of majority. We are confident that the

[6] See Fl. Admin. Code Section 59G-1.035(1) and (4).

evidence base for surgical procedures is sound, and we are confident that others will address the June 2 Report's erroneous claims regarding surgery.

Throughout our comments, we refer to our companion report, *A Critical Review of the June 2022 Florida Medicaid Report on the Medical Treatment of Gender Dysphoria*, which is attached as Appendix A. The report goes into greater detail on many of the points we raise here.

Background

The AHCA appears to have taken a belt-and-suspenders approach to denying Medicaid coverage for standard medical treatment for gender dysphoria: the agency appears to be pursuing two legal strategies simultaneously. The June 2 Report reflects the first strategy, which frames the denial of care as an interpretation of the existing Florida Medicaid coverage regulations.[7] The Florida Medicaid program covers only health services that are "medically necessary" and excludes services that do not meet "generally accepted professional medical standards or are "experimental or investigational." The existing regulations permit the AHCA to determine when health services are consistent with generally accepted professional medical standards (GAPMS).

Specifically, the existing regulations authorize the Florida Deputy Secretary for Medicaid to make a final coverage determination; however, the Deputy Secretary does not have unfettered interpretive authority. The Florida Administrative Code sets out a detailed process, which requires the AHCA to prepare a report that considers scientific evidence including "evidence-based clinical practice guidelines" and "published reports and articles in the authoritative medical and scientific literature related to the health service (published in peer-reviewed scientific literature generally recognized by the relevant medical community or practitioner specialty associations)."[8] The June 2 Report purports to be such a report. It is titled a "Generally Accepted Professional Medical Standards Determination" and concludes that standard medical treatments for gender dysphoria "do not conform to GAPMS and are experimental and investigational."[9]

The AHCA has also pursued, simultaneously, a second legal strategy by publishing the Proposed Rule on June 17. The Proposed Rule makes no reference to the June 2 Report and contains no independent justification for the rule. The Proposed Rule would add a new subsection to Section 59G-1.050 of the Florida Administrative Code, Section (7), which would deny Medicaid coverage in Florida for medical care for gender dysphoria. The Proposed Rule would apply to Medicaid members of any age and would deny coverage for puberty blockers, hormones, "sex reassignment surgeries," and "any other procedures that alter primary or secondary sexual characteristics.[10] According to the Notice of Proposed Rule published in the Florida Administrative Register, a public hearing will be held on July 8, 2022, and public comments on the Proposed Rule may be submitted through that date.[11]

Analysis

In our comments below, we show that there is no scientific justification for the Proposed Rule and no scientific justification for the conclusions drawn in the June 2 Report.

1. The Proposed Rule would deny Florida Medicaid coverage for standard medical care for gender dysphoria, which is supported by a robust scientific consensus, meets generally accepted professional medical standards, and is neither experimental nor investigational.

The conclusion of the June 2 report – that medical treatments for gender dysphoria "do not conform to [generally accepted professional medical standards] and are experimental and investigational" -- is demonstrably false.

Medical care for the treatment of gender dysphoria, which for youth under the age of majority can include gonadotropin releasing hormone agonists ("GnRHa" or puberty blockers) and hormone therapy, has been vetted and approved by international bodies of experts based on the scientific evidence. Two authoritative bodies of scientists, the World Professional Association for Transgender Health (WPATH) and The Endocrine Society, have published extensive clinical practice guidelines for treating gender dysphoria.[13] These clinical guidelines are based on rigorous, structured processes. Each involves the work of a committee of scientific experts and peer review by additional experts. The guidelines are based on careful reviews of the scientific literature and are revised periodically to reflect scientific developments.

These longstanding clinical practice guidelines have been used by clinicians for decades. WPATH issued its initial guidelines in 1979 and updated them in 1980, 1981, 1990, 1998, 2001, and 2012. The eighth version remains in process, and it incorporates systematic literature reviews and ample opportunities for peer review and revision.[14] The original Endocrine Society guidelines were published in 2009 and updated in 2017.[15]

Reflecting this scientific and medical consensus, medical care for gender dysphoria has been confirmed as standard care by every relevant medical organization in the United States, including the American Academy of Pediatrics, the American Psychological Association, and the American Academy of Child and Adolescent Psychiatry.[16] In 2022, these organizations united

Adelson, Practice Parameter on

with the American Medical Association, the American Academy of Family Physicians, the American College of Obstetricians and Gynecologists, and other groups to file an amicus brief representing a total of 20 major medical societies. The brief reaffirms that puberty blockers and hormone treatments for gender dysphoria are standard medical care and opposes legal measures that would limit patient access to this standard care.[17]

The weight and volume of these endorsements, across diverse medical specialties, sharply contradicts the June 2 Report's conclusion and undermines any purported scientific justification for the Proposed Regulation.

As further evidence, it is critical to note that the medications used to treat gender dysphoria are used commonly and safely in cisgender patients. Puberty blockers are the main treatment for central precocious puberty. Estrogen is prescribed for patients of all ages to manage fertility and reduce heavy menstrual bleeding (to give just two examples of its many uses). Testosterone is prescribed to address hypogonadism, and spironolactone (androgen blockade) is used to treat hirsutism and acne.

The Florida Medicaid program covers all these uses without question. The program authorizes physicians to tailor treatments to cisgender patients' needs and trusts patients (and, in the case of children, their parents) to make informed decisions. The Proposed Rule would deny coverage only for gender dysphoria, discriminating against transgender patients.

2. The June 2 Report appears to be a scientific report, but its veneer hides a flawed analysis that ignores the scientific evidence and relies on pseudo-science that does not meet Florida's own standards for review. The June 2 Report provides no scientific foundation for the Proposed Rule and fails to meet Florida's own regulatory requirements for Medicaid coverage determinations.

The Florida report dismisses or ignores the WPATH and Endocrine Society clinical practice guidelines and the science that underlies them and instead relies on five attached documents that, the report claims, constitute "clinical and technical expert assessments."[18]

Despite their billing as "expert" reports, the attachments to the June 2 report are unpublished, non-peer-reviewed documents written by authors with questionable claims to expertise and with red flags for undisclosed author bias. These documents should be given no weight in a serious scientific process.

The June 2 Report purports to be a coverage determination pursuant to Fl. Admin. Code Section 59G-1.035, but its reliance on these five documents constitutes a gross violation of the process set out in that regulation. The regulation requires that the AHCA consult actual scientific evidence, including "evidence-based clinical practice guidelines" and "*published* reports and

[18] June 2 Report, p. 2.

articles in the authoritative medical and scientific literature related to the health service (published in *peer-reviewed* scientific literature generally recognized by the relevant medical community or practitioner specialty associations)."[19]

The June 2 Report reads like a roadmap for how to violate these rules. The report disregards the evidence-based clinical practice guidelines published by WPATH and The Endocrine Society and relies entirely on the five attachments, which are not published, are not peer-reviewed, and are written by inexpert and biased authors.

A. The purported "expert" documents attached to the June 2 Report are unpublished and not peer-reviewed, and they are written by authors whose expertise has been successfully challenged in legal proceedings and whose professional histories raise red flags for bias.

None of the documents attached to the June 2 Report meet standard criteria for expert scientific investigations, because none is published or peer reviewed. Publication and peer review are fundamental to science, as they ensure that a scientist's data and conclusions are open to scrutiny from scientific experts.

Florida's own standards for the determination of medical necessity recognize this point when they state that determinations of Medicaid coverage must consult "*published* reports and articles in the authoritative medical and scientific literature related to the health service (*published in peer-reviewed scientific literature* generally recognized by the relevant medical community or practitioner specialty associations)."[20] It is thus both unscientific and a violation of the regulations for the June 2 Report to rely on unpublished documents as its principal evidence base.

Further, the attachments raise red flags for author bias. The June 2 Report does not disclose how these "experts" were identified or by what criteria their expertise was assessed. The opacity of the Florida AHCA process for identifying experts is particularly troubling because at least four of the five experts have strong indications of bias. Further, the qualifications and credibility of two of the experts have been successfully challenged in litigation.[21] The endorsement of these individuals as Florida's banner "experts" raises the appearance of bias – that the AHCA sought a pre-ordained outcome, not a true scientific perspective.

Adding to these red flags for bias, none of the authors of the attachments provide a statement of funding and conflicts of interest. This omission violates a strong norm in scientific writing, which requires authors to declare any professional or financial arrangements that could call into question their independence of judgment.[22] That strong norm also requires authors to disclose

[19] Fl. Admin. Code Section 59G-1.035(4).
[20] Fl. Admin. Code Section 59G-1.035(4).
[21] See Stephen Caruso, A Texas Judge Ruled That This Doctor Was Not an Expert, Pennsylvania Capital-Star, Sept. 15, 2020 (reporting that van Meter was disqualified as an expert in a Texas divorce case, now sealed).
[22] For example, the conflict of interest rules for JAMA, one of the premier medical journals in the United States and the world state that "[a]uthors are expected to provide detailed information about all relevant financial interests, activities, relationships, and affiliations (other than those affiliations listed in the title page of the manuscript) including, but not limited to, employment, affiliation, funding and grants received or pending, consultancies, honoraria or payment, speakers' bureaus, stock ownership or options, expert testimony, royalties, donation of

whether projects have been funded and if so, by whom and whether the authors have engaged in expert testimony. Without these statements, the Florida AHCA and the public cannot detect biases that could affect the integrity of these written products.

These are more than theoretical concerns: *four of the attachments have notable indicators of conflicts of interest and bias*. (Note that these are the only four we examined in detail, and so we do not imply that the other one is free from such bias.)

The author of the document provided as Attachment E is Quentin van Meter, whose history indicates bias and lack of expertise. Although the AHCA presents van Meter as an expert in medical treatment for gender dysphoria, at least one court barred him from providing expert testimony on the issue.[23] Van Meter is the president of the American College of Pediatricians (the "ACP"), which presents itself as a scientific group (and might be confused, by a non-expert, with the authoritative American Academy of Pediatrics). The ACP is, in fact, a political group that opposes same-sex marriage,[24] supports mental health providers practicing conversion therapy,[25] and describes gender dysphoria as "confusion."[26] Troublingly, the van Meter attachment, proffered by the AHCA as a scientific report, contains several passages of uncredited, verbatim language that appears in a "position statement" published by the ACP.[27] The van Meter attachment appears to be a re-use of paid testimony rather than an original product.[28]

James Cantor's document, presented as Attachment D to the June 2 Report, also faces serious questions about bias and lack of expertise. In a 2022 case, a federal court took a skeptical view of Cantor's purported expertise, giving his testimony little weight because Cantor has "no clinical experience in treating gender dysphoria in minors and no experience monitoring patients receiving drug treatments for gender dysphoria.[29] Cantor's document is nearly identical to what

appears to be paid testimony in another case, where Cantor's declaration was used to support legislation barring transgender athletes from sports teams,[30] Troublingly, Cantor's appearance in that case seems to have been funded by the Alliance Defending Freedom ("ADF"), [31] a religious and political organization that opposes legal protections for transgender people and same-sex marriage[32] and defends the criminalization of gay sex.[33]

Romina Brignardello-Petersen is one of two authors of the document provided as Attachment C to the June 2 Report. Although Brignardello-Petersen claims to have no research interests in medical care for transgender youth,[34] she has conducted research for the Society for Evidence-Based Gender Medicine ("SEGM").[35] Although SEGM claims to be an international medical society, it is, in fact, an advocacy group that opposes standard medical care for gender dysphoria. The SEGM has no publications or conferences and seems to consist solely of a website. The group appears to be run by a small group of people with limited or no scientific credentials and the website presents a cherry-picked collection of studies and narrative content that is full of scientific errors.[36]

Patrick Lappert, whose document is attached to the June 2 Report as Attachment F, has been disqualified as an expert in a recent federal court decision in North Carolina. [37] The judge found that the evidence "calls Lappert's bias and reliability into serious question" and noted that Lappert has worked closely with ADF and has actively lobbied for legal bans on medical care for

[34] Like the van Meter and Cantor attachments, the BPW document provides no express statement of conflicts of interest. The BPW document does offer a statement of "credentials and expertise," in which she declares that "her research interests are not in this area," meaning apparently research on medical care for gender dysphoria. BPW Document, p. 1.

[35] BPW document, p. 1. For one example of the purported research that Brignardello-Petersen apparently assisted in, see Alison Clayton et al., Commentary: the Signal and the Noise– Questioning the Benefits of Puberty Blockers for Youth with Gender Dysphoria – A Commentary on Rew et al. (2021), Child and Adolescent Mental Health, Dec. 22, 2021, at https://acamh.onlinelibrary.wiley.com/doi/10.1111/camh.12533 In the "Acknowledgements" section, the authors state, "We would also like to thank the Society for Evidence-based Gender Medicine (SEGM) for providing access to several experts who helped shape this commentary and ensure its accuracy. Specifically, we would like to thank Dr. Romina Brignardello Petersen [sic] for contributing her methodological expertise."

[36] Susan Boulware et al., Biased Science: The Texas and Alabama Measures Criminalizing Medical Treatment for Transgender Children and Adolescents Rely on Inaccurate and Misleading Scientific Claims (April 28, 2022), at 28-29 (Appendix A) available at https://medicine.yale.edu/childstudy/policy-and-social-innovation/lgbtq-youth/.

[37] Kadel v. Folwell, 1:19CV272, M.D. N.C. June 10, 2022. The judge ruled that Lappert was not qualified to "render opinions about the diagnosis of gender dysphoria, its possible causes, the efficacy of the DSM, the efficacy of puberty blocking medication or hormone treatments, the appropriate standard of informed consent for mental health professionals or endocrinologists, or any opinion on the non-surgical treatments." Lappert was also disqualified from opining on "the efficacy of randomized clinical trials, cohort studies, or other longitudinal, epidemiological, or statistical studies of gender dysphoria." Id.

transgender youth.[38] The judge gave no weight to Lappert's testimony about informed consent, finding that it was unsupported by scientific evidence.[39] The judge also found that "Lappert has provided the Court with no data or methodology used to draw his conclusion that surgical treatment for gender dysphoria has "never been generally accepted by the relevant scientific community."[40]

B. The linchpin of the June 2 Report is the analysis by Brignardello-Petersen and Wiercioch (the "BPW document"), provided as Attachment C, which purports to be a comprehensive review of the scientific literature but, in fact, is extremely narrow in scope and so flawed in its analysis that it merits no scientific weight at all.

The BPW document, like the other attachments to the June 2 Report, is an unpublished, non-peer-reviewed document. It is written by inexpert authors who construct an arbitrarily truncated sample and adopt a method that violates scientific guidelines and produces a biased result. The authors describe their findings in deceptive language and jargon predictably mislead the reader. Our review shows that *nothing in the BPW document calls into question the scientific foundations of the WPATH and the Endocrine Society clinical practice guidelines.*

The BPW document seems scientific on its face, because it uses technical jargon and includes numerous tables and charts. But a closer examination shows that it violates established standards for medical research and shows signs of being engineered to produce a pre-ordained and inaccurate result.

The bottom line is that, contrary to the BPW document's claims, there is a large body of reliable scientific literature that supports standard medical treatment for gender dysphoria.

(1) The BPW document lacks scientific credibility due to the authors' lack of relevant qualifications and their ties to an activist group.

The BPW document purports to be a systematic review of the scientific literature on medical treatment for gender dysphoria, but it is full of errors and omissions, resulting in a biased and misleading result. Here, we describe just three of the notable defects that undercut entirely the document's claim to objectivity and sound method. We provide additional detail on these errors in the Appendix to these comments.

First, *neither of the BPW authors are experts* in medical care for gender dysphoria, either as researchers or clinicians. One author (Brignardello-Petersen) has not previously studied the subject, except in her work for the ideological organization SEGM.org, noted just above. Her only clinical experience appears to be in dentistry.[41] The other author (Wiercioch) is a junior researcher (a postdoctoral fellow) with no prior research or clinical experience in this field.[42]

---

[38] Id.
[39] Id., pp. 29-30.
[40] Id., p. 31.
[41] Romina Brignardello bio, at https://experts.mcmaster.ca/display/brignarr[visited July 2, 2022]
[42] Google Scholar, Wojtek Wiercioch, visited June 22, 2022, https://scholar.google.com/citations?user=vdi3r_AAAAAJ&hl=en

The authors' lack of interest and experience renders the BPW work inexpert rather than objective, and it violates the National Academy of Medicine standards for systematic reviews.[43] By analogy, one would not rely on, say, two dermatologists to conduct a review of the scientific literature on neurosurgery and to make recommendations for clinical practice.

Second, not only is the study not formally peer-reviewed, the BPW authors violate scientific norms and standards by *failing to engage at all with their peers or with actual experts* in the subject matter.[44] The BPW authors appear not to have published their protocol in advance or otherwise to have submitted their protocol for peer review.

Third, the BPW document raises red flags for opinion bias. Buried in the methodology pages of the BPW document is the fact that the authors include the fringe website SEGM.org.[45] As noted above, the group's website posts are not peer-reviewed or published, and its cherry-picked content is assembled by activists and is often full of errors.[46] Troublingly, this is the group to which one of the authors, Brignardello-Petersen, has ties, as noted above.

(2) The BPW document violates scientific standards for evaluating medical evidence. The picture that emerges is of a rushed and inexpert report with indications of bias.

The BPW document has a patina of scientific expertise. It invokes the respected GRADE standards for rating the quality of studies, and it occupies many pages with tables and technical specifications. When a reader looks past the jargon, however, the BPW authors adopt a method that violates scientific standards and appears to be jury-rigged to reach a foregone conclusion. The authors convey their conclusions in misleading language. *Contrary to the BPW authors' claims, their study does not call into question the scientific and clinical importance of the established science that supports medical care for gender dysphoria.*

The BPW analysis incorporates numerous decisions that bias the results, and the authors describe their findings in grossly misleading terms. To begin, the BPW document reviewed only a small sample of the relevant scientific literature. In the introduction, the BPW authors initially claim to have reviewed 61 systematic reviews of medical treatment for gender dysphoria.[47] But buried in

---

[43] Committee on Standards for Systematic Reviews of Comparati ve Effectiveness Research, Institute of Medicine, Finding What Works in Health Care: Standards for Systematic Reviews, National Academies (Jill Eden et al., eds 2011), p. 48 (Standard 2.1.1 states that teams for systematic reviews should include expertise in pertinent clinical content areas). Background: The Institute of Medicine, now called the National Academy of Medicine, is one of three branches of the National Academies of Science, Engineering, and Medicine. The National Academy of Science dates to 1963 and was established by Congress; the Institute of Medicine was established as a separate entity in 1970 and serves as the nation's leading authority on scientific research and knowledge. National Academy of Medicine, About the National Academy of Medicine, website visited June 22, 2022, https://nam.edu/about-the-nam/ The standards for systematic reviews were published in 2011, responding to a Congressional request to set benchmarks for high-quality systematic reviews that could reliably guide physicians and healthcare providers in making informed, scientific judgments about health care.

[44] For additional detail, see the Appendix.

[45] BPW document, Methods section, p. 2.

[46] See Boulware et al., supra note 36, pp. 28-29 (Appendix A).

[47] BPW document, Introduction Section, p. 2.

the middle of the document is the admission that the analysis is based on a sample of 27 systematic reviews, not 61 as claimed.[48]

Troublingly, the authors also embed in the middle of their technical document an unjustified decision to limit their analysis to studies published from 2020 to the present. The authors disclose that they "prioritized" studies from the last 30 months (two full years plus four months in 2022), but they do not defend that priority. The reader is left to wonder whether this truncation served only to help the authors produce their analysis in a very short time frame.

Further, the BPW authors mechanically apply a series of rating systems (AMSTAR and GRADE) for assessing the quality of scientific evidence, but their use violates key principles for using these systems. Based on this mechanical review of truncated sources, the BPW analysis reaches the conclusion that there is little or no evidence for the benefits of medical care for gender dysphoria.[49]

But the BPW analysis is deceptive, because it dismisses nearly all existing studies of medical treatment for gender dysphoria as "low quality," without explaining that this is a highly technical term and not a natural-language condemnation of the studies. By contrast, the GRADE system, which the authors purport to use, is quite clear about its quality rating systems and its limitations.[50] We provide additional detail on the authors' misuse and deceptive statements in the Appendix.

The key point is that "low quality" in this context is a technical term and not a condemnation of the evidence, because "low quality" studies regularly guide important aspects of clinical practice. Indeed, the GRADE system, which the BPW document claims to use, specifically notes that GRADE should *not* be used to dismiss observational studies or to give absolute priority to RCTs:

> Although higher quality evidence is more likely to be associated with strong recommendations than lower quality evidence, a particular level of quality does not imply a particular strength of recommendation. *Sometimes, low or very low quality evidence can lead to a strong recommendation*.[51]

The methodology adopted by the BPW document will thus, predictably, conclude that any body of scientific literature that does not contain RCTs is "low" in quality. The 30 pages that it takes the authors to lay out their methodology is thus extremely misleading: a knowledgeable reader

---

[48] BPW document, Results Section, p. 1.

[49] For example, the BPW document states that there is *evidence* about the effect of puberty blockers compared to not using puberty blockers. In other words, no studies compared the outcomes between a group of people with gender dysphoria using puberty blockers and another group of people with gender dysphoria not using them. Therefore, it is unknown whether people with gender dysphoria who use puberty blockers experience more improvement in gender dysphoria, depression, anxiety, and quality of life than those with gender dysphoria who do not use them. BPW document, Results section, p. 4.

[50] See Howard Balshem et al., GRADE Guideline: 3. Rating the Quality, 64 J. Clinical Epidemiology P401-406 (2011), Table 3, p. 404

[51] Balshem et al., supra note 50, at 402 (emphasis added).

would know that if there are few or no RCTs in the literature, then the BPW technical conclusion is foregone, and, as importantly, is not a sound guide for clinical recommendations.

Put in simpler terms, if we coded apples as "high quality fruit" and bananas as "low quality fruit," then any fruit bowl that has only bananas would predictably be technically coded as "low quality." But that technical conclusion conveys very little information without context. For example, if no apples exist, then bananas may be a nutritious choice.

The drafters of the GRADE system emphasize that technically "low quality" evidence can support a strong clinical treatment recommendation. For example, pediatricians now agree – and every parent has been told -- that children should not be given aspirin for fevers. This recommendation is based on observational studies that showed an association between aspirin treatment during viral illnesses and the development of Reyes syndrome (a rapid and progressive disease of neurological dysfunction that can be fatal). Based on those studies, it would be unethical to conduct an RCT giving some children aspirin, and so the strong, consensus treatment recommendation is based entirely on "low quality" studies.[52]

The critical fact is that RCTs are not, and cannot be, the gold standard for medical research on gender dysphoria, due to strong ethical constraints. Medical care has long been shown, by reliable scientific methods, to address gender dysphoria and improve mental health: as we have repeatedly noted, these treatments have been recommended by rigorous clinical practice guidelines issued by WPATH and the Endocrine Society and endorsed by every major medical organization. Given this medical consensus, which is based on solid scientific evidence, it would be unethical to conduct an RCT that involved denying standard medical care to a control group of individuals.

It is thus simply a mistake – and a mischaracterization of medical research – to conclude that the absence of RCTs means that there is "no evidence" for the efficacy of medical treatment for gender dysphoria.

3. The June 2 Report reflects a faulty understanding of statistics, medical regulation, and scientific research, and it repeats discredited claims and engages in speculation and stereotyping without scientific evidence. The report therefore provides no scientific support for the Proposed Rule or for an interpretation of existing Florida Medicaid standards.

The June 2 Report provides no credible scientific support for the Proposed Rule, because its analysis is full of errors and misstatements. In this section, we offer seven examples, all of which are documented in more detail in the Appendix to these comments.

> A. The June 2 Report repeatedly and erroneously dismisses solid studies as "low quality." If Florida's Medicaid program applied the June 2 Report's approach to all medical procedures equally, it would have to deny coverage for widely-used medications like statins (cholesterol-lowering drugs taken by millions of older Americans) and common medical procedures like mammograms and routine surgeries.

[52] Balshem et al., supra note 50, at 402.

In its opening words, the June 2 Report makes an error that is repeated throughout the document: "Studies presenting the benefits to mental health, including those claiming that the services prevent suicide, are either low or very low quality and rely on unreliable methods such as surveys and retrospective analyses, both of which are cross-sectional and highly biased."

As we document in Section 2.B., above, it is an outright mistake to conclude that a study in the technical category of "low quality" is unreliable or poor evidence for clinical practice.[53] We provide additional analysis of the misuse of this language in the June 2 Report in the Appendix.

It is quite common for consensus medical practices to be supported only by technically "low quality" but respected observational studies – without RCTs. For example, the famous Framingham Heart Study provided the framework for clinical practice guidelines that support the use of statins, a cholesterol-lowering drug that is effective in preventing cardiovascular death.[54]

The statins example shows that the June 2 Report rests on a fundamental misunderstanding of medical research and clinical practice. If the Florida Medicaid program actually adopted the standard of evidence urged by the June 2 report, the program would not cover statins, which are prescribed to 28% of adults over the age of 40.[55] Other common practices that would have to be reconsidered under this logic include post-menopausal hormone replacement therapy (which reduces lifetime risk of heart attacks and stroke) and mammography screening for breast cancer.

The same point is true of the technically "low quality" evidence base for many surgical procedures, including minimally invasive gall bladder surgery, which has a solid evidence base in observational studies. We think it unlikely that Florida's Medicaid program will begin to refuse to pay for statins, mammograms, and routine surgeries. If not, then the June 2 Report and the Proposed Rule reflect an untenable and discriminatory double standard.

> B. The June 2 Report disregards robust clinical research studies and instead relies on sources with no scientific credibility. The report's analysis fails to satisfy Florida's own regulatory standards for Medicaid coverage decisions and provides no scientific foundation for the Proposed Rule.

The June 2 Report repeatedly cites sources with little or no scientific credibility – including journalism, a student blog, a website, and letters to the editor – rather than peer-reviewed empirical research, in violation of Florida's own regulatory standards.[56] At the same time, the

report makes baseless or exaggerated criticisms of solid studies. Here, we offer only brief examples, with additional illustrations in the Appendix showing how selective and ungrounded criticism permeates the June 2 Report and further undermines its scientific credibility.

For example, the June 2 report attacks a 2015 study by Costa et al., claiming that the study design is flawed because it did not include a control group of adolescents without gender dysphoria.[57] This point is incorrect: as the Appendix to this report explains, the Costa et al. study did include an appropriate control group.

In addition to glaring technical errors, the June 2 Report's criticism of Costa makes an even more fundamental error: the June 2 report levels baseless criticisms at a single study *and fails to acknowledge that the weight of the literature as a whole strongly supports the same results Costa et al. report*. Scientific knowledge is, importantly, cumulative. It is thus entirely misleading – and unscientific – to dismiss the effectiveness of puberty blockers by criticizing studies in isolation. Put simply, the June 2 Report fails to acknowledge the number of solid studies that all find that puberty blockers are effective.[58] Indeed, at least 16 studies show that puberty blockers and hormones benefit patients with gender dysphoria, and the benefits have been documented across study designs, including retrospective report, cross sectional, longitudinal, and qualitative.[59]

The June 2 Report also grossly misleads the reader in its discussion of a study by Chen et al. in 2020[60] and a study by DeSanctis et al. in 2019.[61] The Appendix discusses these examples at

length. As a final example, the June 2 Report criticizes a 2019 preliminary study by Kuper et al. without acknowledging the existence of a more extensive 2020 study by Kuper et al.[62] The earlier study presented data on the mental health of adolescents when initially presenting for care; only the later study presented full data that demonstrated the benefit of treatment.

> C. The June 2 Report mistakenly claims that puberty blockers and hormones are experimental because they are used "off-label" and not approved by the FDA. In fact, off-label use, when supported by scientific evidence, as here, is extremely common in medical practice and especially in pediatrics.

The June 2 Report repeatedly notes that the FDA has not approved the use of puberty blockers and hormones for the treatment of gender dysphoria in minors.[63] The report infers that lack of FDA approval renders a treatment unauthorized and experimental, but this is false. Once again, the June 2 Report (mis)uses technical language to confuse readers.

The term "off-label" has a very specific meaning: a drug is off-label if the FDA has not approved a particular medication for a particular use in a specific population. The off-label use of medications for children is common and often necessary, because an "overwhelming number of drugs" have no FDA-approved instructions for use in pediatric patients.[64]

The lack of FDA approval does not imply that the use of medications should be restricted. There is a consensus in the medical community that off-label use is necessary because of limits imposed by burdensome and expensive regulatory processes. Pharmaceutical companies often lack financial incentives to support research required for FDA approval for specific use in children.[65]

The American Academy of Pediatrics, recognizing these facts, specifically authorizes the off-label use of drugs:

> The purpose of off-label use is to benefit the individual patient. Practitioners use their professional judgment to determine these uses. As such, *the term "off-label" does not imply an improper, illegal, contraindicated, or investigational use.* Therapeutic decision-making must always rely on the best available evidence and the importance of the benefit for the individual patient.[66]

[64] Boulware et al, supra note 36, quoting Kathleen A. Neville, et al., American Academy of Pediatrics Committee on Drugs, Off-label use of drugs in children, 133(3) Pediatrics 563-7 (2014) ("AAP Committee on Drugs")

[65] AAP Committee on Drugs (2014), supra note 64.

[66] AAP Committee on Drugs (2014), supra note 64 (emphasis added). See also Lenneke Schrier, et al., Off-label Use of Medicines in Neonates, Infants, Children, and Adolescents: a Joint Policy Statement by the European Academy of Paediatrics and the European Society for Developmental Perinatal and Pediatric Pharmacology, 179(5) Eur. J. Pediatr 839-845 (2020).

Off-label use is so common in pediatrics that off-label drugs are prescribed in 20% of patient visits.[67] We discuss numerous examples in the Appendix, but a few familiar examples provide illustrations of day-to-day, off-label use in pediatrics.[68]

As many parents know, the use of steroids for croup is a life-saving treatment that is off-label. The medication helps toddlers get through severe, potentially airway-obstructing illnesses safely. Ondansetron (Zofran) is used off-label for nausea and vomiting to prevent dehydration.

In psychiatry, some of the most commonly-prescribed medications for youth are off label. For example, selective serotonin reuptake inhibitors (SSRIs) are used to treat major depressive disorder in adolescents and have been shown to be effective, even though several are off-label.[69] Another common example is clonidine, which is FDA-approved for attention deficit hyperactivity disorder (ADHD) but is used off-label for anxiety, insomnia, and post-traumatic stress disorder (PTSD).[70]

Finally, the June 2 Report notes that testosterone is a controlled substance and is subject to risk of abuse, but, once again, this is misleading. The inclusion of testosterone on the schedule of controlled substances reflects the misuse of the drug by some individuals and communities (e.g., weightlifters and athletes who may use the drug to build muscle). The classification does not in any way imply that physicians should not dispense the drug if medically necessary. No special license is necessary for prescribing the medication, which is routinely prescribed to cisgender men with testosterone deficiency.

> D. The June 2 Report falsely claims that medical care for gender dysphoria is provided to a large percentage of children who will come to regret their treatment. In fact, patients with gender dysphoria have vanishingly low rates of regret regarding their medical treatment.

The June 2 Report attempts to cast doubt on medical treatment for gender dysphoria by repeating the debunked claim that most transgender teens ultimately reject their transgender identity. Below, we analyze two related claims made in the report and show why both are refuted by sound evidence. We provide additional detail in the Appendix.

First, the report claims that "the majority of young adolescents who exhibit signs of gender dysphoria eventually desist and conform to their natal sex."[71] This is false. We have refuted this claim in detail in prior work. The key point is that *adolescents with gender dysphoria rarely find*

[71] June 2 Report, p. 14.

that their dysphoria resolves without treatment.[72] Because medical treatment for gender dysphoria begins only in adolescence, and only if medically necessary, medical treatment is thus provided only to a group known to be quite stable in their gender identity.

Second, the June 2 report claims that many transgender people regret their medical treatment. This is false. We provide a detailed discussion in the Appendix, but the scientific evidence is clear: solid studies show very low percentages of regret (typically under 1%) among transgender people who receive medical treatment for gender dysphoria. For example, Bustos et al. (2021) found regret expressed by one percent or fewer of transgender patients who underwent gender-affirming surgery, and Danker et al. (2018) report a rate of far less than 1%, as do Wiepjes et al. (2015).[73]

> E. The June 2 Report repeats discredited claims that "social contagion" is leading teens to become transgender. Scientific evidence refutes this claim, which is based on a single, discredited study whose results have not been replicated by more rigorous studies.

The June 2 Report claims that "social factors (e.g., peer influences and media) may be contributing factors to gender dysphoria,"[74] citing as evidence a single, discredited study by Littman. We have addressed this claim at length in other work and note that the study incorporated such serious methodological errors that the journal of publication required an extensive correction because of the article's misstatements. [75]

Littman's sensationalist hypothesis has been widely covered in the press, but no clinical studies have found that rapid-onset gender dysphoria exists. Further, no professional organization has recognized "rapid-onset gender dysphoria" as a distinct clinical condition or diagnosis.

Most recently, an April 2022 study of 173 youth presenting at Canadian gender clinics *found no evidence of rapid-onset dysphoria or social contagion.* The researchers posited that if "rapid onset" gender dysphoria were a real phenomenon, then teens who had more recently begun identifying as transgender would (per the Littman hypothesis) also be more likely to report online support and engagement in their gender identity. They might also (per Littman's hypothesis) be more likely to struggle with mental health concerns.

An April 2022 study of 173 youth found no such correlations, strongly undercutting the "rapid-onset" hypothesis endorsed by the June 2 report. The researchers controlled for age and sex assigned at birth and looked for correlations with recent gender knowledge (defined as less than one to two years having passed since "you realized your gender was different from what other people called you"). Recent gender knowledge was *not* significantly associated with depressive symptoms, psychological distress, past diagnoses with comorbid mental health issues or neurodevelopmental disorders, or self-harm. Nor was it associated with having gender-

[75] Boulware et al., supra note 36, at 20-21 (internal citations omitted).

supportive online friends, general support from online friends or transgender friends, or gender support from parents.[76]

Data do substantiate that younger people today are more likely to identify as transgender than are older people, but this does not substantiate the idea of social contagion. The increase may be due to a cohort effect associated with the increasing social acceptance of gender diversity (i.e., older people grew up in a much more restrictive and transphobic social environment). In fact, adolescent presentation of transgender identity is often observed and should not be pathologized.[77]

Further, the data do not show a massive wave of transgender identity even among teens. A 2022 study by the Williams Institute found that, using an expansive definition of "transgender," about 0.5% of adults now identify as transgender, while 1.4% of youth aged 13-17 do, or about 300,000 young people.[78] This is not a large percentage or a large absolute number.

The June 2 Report's social contagion claim also disregards the enormous social pressure on teenagers to adopt a cisgender identity; transgender teens face significant discrimination and violence by asserting their gender identity and report very high rates of bullying at school.[79] Further, the evidence shows that teens (like adults) tend to use social media for emotional support and to access a helpful peer group that may not be available in person.[80]

Ultimately, however, the social contagion hypothesis is irrelevant to the question whether medical care for gender dysphoria is effective. As we have noted, medical treatments are not offered to all gender-questioning youth. Instead, the WPATH and Endocrine Society standards recommend drug therapies for transgender adolescents whose interdisciplinary medical team has determined that they have lasting and intense gender dysphoria and that treatment is medically necessary.

> F. The June 2 Report claims that inappropriate medical care is provided to adolescents with gender dysphoria who also have anxiety, depression, and other mental health conditions. These assertions are unsupported by evidence and disregard evidence-based clinical practice guidelines that provide sound guidance for treating complex cases.

The June 2 Report speculates that because "a high proportion" of youth receiving medical care for gender dysphoria also have a behavioral health disorder, "available research raises

questions as to whether the [individuals'] distress is secondary to pre-existing behavioral health disorders and not gender dysphoria."[81] In simpler terms, the June 2 Report speculates that perhaps gender dysphoria is not real but is, rather, an imagined by-product of underlying mental illness.

A close examination shows that this claim has no foundation in science; it rests on unexamined and harmful stereotypes and unaccountably dismisses the scientific knowledge and clinical skill of child and adolescent psychologists and psychiatrists. Here, we briefly explain why the June 2 Report's speculations are scientifically unfounded. We provide further detail on these points in the Appendix.

The June 2 Report implicitly posits that behavioral health disorders cause gender dysphoria, but this hypothesis is completely unsupported by scientific evidence, which strongly suggests that the direction of causation runs the other way. It is well-established that being transgender leads to mental health concerns because of the social stress and discrimination of being transgender in our society.[82] Although the effects of gender minority stress are well-known, the June 2 Report makes no mention of the literature.

Further, the co-occurrence of psychological distress among individuals with gender dysphoria provides no reason for denying care. Any population of individuals – cisgender or transgender -- will include some with mental health concerns. In response, the WPATH and Endocrine Society guidelines include a careful psychological assessment of each adolescent as part of the process for determining whether medical treatment for gender dysphoria is appropriate.

Importantly, experts in child and adolescent psychiatry, child psychology, and adolescent medicine have established that youth – including youth with mental health conditions -- can make complex medical decisions. The scientific literature specifically demonstrates that transgender youth with co-occurring mental health conditions can competently participate in medical decision-making.[83]

> G. The June 2 Report speculates, without evidence, that psychotherapy alone is as effective as medical treatment for gender dysphoria. This claim contradicts the findings of solid scientific studies.

The June 2 Report argues, without scientific evidence, that youth with gender dysphoria should not be offered medical treatment but instead should only receive psychotherapy, an approach that

it mistakenly terms "watchful waiting."[84] This statement is false. Here we provide an overview of the actual science, with more detail in the Appendix.

Several solid, recent studies have demonstrated that medical care for gender dysphoria has positive effects on mental health that are not associated with psychotherapy alone. Costa et al. in 2015 found that puberty blockers improve psychosocial functioning in teens with gender dysphoria, compared to teens who receive psychotherapy but not blockers.[85] In a 2022 study, Tordoff et al. clearly found that youth with gender dysphoria reported better outcomes if they received puberty blockers, even after controlling for the effects of psychotherapy.[86] A 2020 study by Laura Kuper et al. also shows that hormone treatment for gender dysphoria is effective above and beyond the benefits of psychotherapy and psychiatric medications. [87]

Conclusion

Our analysis demonstrates that the June 2 Report carries no scientific weight. The report disregards established clinical guidelines and peer-reviewed studies and instead relies on purported "expert" reports that raise major red flags for lack of expertise, close ties to advocacy groups, and financial conflicts of interest. The report makes repeated errors about scientific research and medical regulation, and it engages in ungrounded speculation and stereotyping.

Accordingly, the Proposed Rule is ungrounded in scientific research and is arbitrary and capricious. Further, because the June 2 report violates Florida's own standards for scientific review, it cannot support the Proposed Rule as an interpretation of the existing Florida regulatory scheme.

We respectfully submit this letter of comment for your consideration.

Very truly yours,

Anne L. Alstott

---

[84] For example, at p. 12, the June 2 Report asks, "[S] hould conventional behavioral health services be utilized without proposing treatments that pose irreversible effects [i.e., drug therapies]? Would that approach not provide additional time to address underlying issues before introducing therapies that pose permanent effects {i.e., the watchful waiting approach)?" At p. 20, t he June 2 Report misuses the term "watchful waiting" to describe the denial of medical care to adolescents with gender dysphoria, and the report miscites its own purported expert report. The Cantor document discusses "watchful waiting" meaning the denial of social transition to prepubertal children, not the denial of medical treatment to adolescents. Cantor document, p. 10-11.

Introduction

On June 2, 2022, the Florida Agency for Health Care Administration ("AHCA") issued a purported scientific report (hereinafter, "June 2 Report") concluding that standard medical care

* The authors have received no funding for this report or for our public comments on Florida's proposed Medicaid rule. We have no conflicts of interest to declare. Dr. Olezeski prepared paid expert testimony in a case for the Federal Public Defender for the District of Connecticut. We thank Melisa Olgun for excellent research assistance.

for gender dysphoria does not meet generally accepted medical standards and is experimental and investigational.[88]

We are a group of seven scientists and a law professor, and we have concluded, after a careful examination of the June 2 Report, that its conclusions are incorrect and scientifically unfounded. The June 2 Report purports to be a review of the scientific and medical evidence but is, in fact, fundamentally unscientific.

We are alarmed that Florida's health care agency has adopted a purportedly scientific report that so blatantly violates the basic tenets of scientific inquiry. The report makes false statements and contains glaring errors regarding science, statistical methods, and medicine. Ignoring established science and longstanding, authoritative clinical guidance, the report instead relies on biased and discredited sources, including purported "expert" reports that carry no scientific weight due to lack of expertise and bias.

So repeated and fundamental are the errors in the June 2 Report that it seems clear that the report is not a serious scientific analysis but, rather, a document crafted to serve a political agenda.

The AHCA has offered the June 2 Report as justification for a proposed rule that would deny Florida Medicaid coverage for gender dysphoria to people of all ages (the "Proposed Rule").[89] We strongly oppose the Proposed Rule and have documented our reasons in public comments submitted to the AHCA on July 8, 2022. This report provides our detailed reasons for concluding that the June 2 Report provides no scientific support for Florida's proposed action.

Executive Summary

As we note in our comments on the Proposed Rule, we strongly oppose Florida's proposal to deny Medicaid coverage to standard medical care for gender dysphoria. In this report, we show that the June 2 Report is so thoroughly flawed and biased that it deserves no scientific weight. Although our focus is on the science, we also note that the Proposed Rule would violate the sex discrimination protections provided by the U.S. and Florida Constitutions and the federal statute that governs Medicaid by discriminating against transgender people on the basis of their sex, transgender status, and gender identity.[90]

In this report, we examine closely the "scientific" claims made in the June 2 Report, and we show that its basic conclusion is incorrect. Medical treatment for gender dysphoria does meet generally accepted professional medical standards and is not experimental or investigational. We also show that the June 2 report reflects a faulty understanding of statistics, medical regulation, and scientific research. The report ignores solid scientific evidence and instead

[90] See Bostock v. Clayton County, 590 U.S. __ (2020); Kadel v. Folwell, M.D. N.C., Mem. Op. 6-10-22 (applying Bostock to public health plan coverage); 42 U.S.C. 18116 (requiring nondiscrimination in Medicaid plans).

repeats discredited claims, cites to sources with no scientific merit, and engages in unfounded speculation based on stereotypes rather than science.

Specifically, we show that:

- Contrary to the June 2 Report's repeated claims, medical care for gender dysphoria is supported by a robust scientific consensus, meets generally accepted professional medical standards, and is neither experimental nor investigational.
- The June 2 Report appears to be a scientific report, but its veneer hides a flawed analysis that ignores the scientific evidence and relies instead on pseudo-science, particularly purported "expert" reports that are biased, inexpert, and full of errors. The claimed "expert" reports are written by authors whose testimony has been disqualified in court and who have known ties to anti-LGBTQ advocacy groups.
- Nothing in the June 2 Report calls into question the scientific foundations of standard medical care for gender dysphoria. The June 2 Report makes unfounded criticisms of robust and well-regarded clinical research and instead cites sources with little or no scientific merit, including journalism, a blog entry, letters to the editor, and opinion pieces.
- The linchpin of the June 2 Report is an analysis by two epidemiologists that claims to undermine the scientific evidence supporting medical care for gender dysphoria. Their analysis is extremely narrow in scope, inexpert, and so flawed that it merits no scientific weight at all.
- The June 2 Report repeatedly and erroneously dismisses solid studies as "low quality." If Florida's Medicaid program applied the June 2 Report's approach to all medical procedures equally, it would have to deny coverage for widely-used medications like statins (cardioprotective cholesterol-lowering drugs taken by millions of older Americans) and common medical procedures like mammograms and routine surgeries.

I. Contrary to the June 2 Report's repeated claims, medical care for gender dysphoria is supported by a robust scientific consensus, meets generally accepted professional medical standards, and is neither experimental nor investigational.

The conclusion of the June 2 report – that medical treatments for gender dysphoria "do not conform to [generally accepted professional medical standards] and are experimental and investigational"[91] – is demonstrably false.

Medical care for the treatment of gender dysphoria, which for youth under the age of majority can include gonadotropin releasing hormone agonists ("GnRHa" or puberty blockers) and hormone therapy, has been vetted and approved by international bodies of experts based on the scientific evidence. Two authoritative bodies of scientists, the World Professional Association for Transgender Health (WPATH) and The Endocrine Society, have published extensive clinical practice guidelines for treating gender dysphoria.[92] These clinical guidelines are based on

[91] June 2 Report, p. 2.

[92] See Standards of Care for the Health of Transsexual, Transgender, and Gender Nonconforming People, World Professional Association for Transgender Health (7th version, 2012), at https://www.wpath.org/publications/soc ("WPATH (2012)"); Wylie C. Hembree, et al., Endocrine Treatment of Gender-Dysphoric/Gender-Incongruent

rigorous, structured processes that include a committee of scientific experts and peer review by additional experts. The guidelines are based on careful reviews of the scientific literature and are revised periodically to reflect scientific developments.

These longstanding clinical practice guidelines have been used by clinicians for decades. WPATH issued its initial guidelines in 1979 and updated them in 1980, 1981, 1990, 1998, 2001, and 2012. The eighth version remains in process, and it incorporates systematic literature reviews and ample opportunities for peer review and revision.[93] The original Endocrine Society guidelines were published in 2009 and updated in 2017.[94]

Reflecting this scientific and medical consensus, medical care for gender dysphoria has been confirmed as standard care by every relevant medical organization in the United States, including the American Academy of Pediatrics, the American Psychological Association, and the American Academy of Child and Adolescent Psychiatry.[95] In 2022, these organizations united with the American Medical Association, the American College of Obstetricians and Gynecologists, and other groups to file an amicus brief representing a total of 20 major medical societies. The brief reaffirms that puberty blockers and hormone treatments for gender dysphoria are standard medical care and opposes legal measures that would limit patient access to this standard care.[96]

The weight and volume of these endorsements, across diverse medical specialties, sharply contradicts the June 2 Report's conclusions.

II. The June 2 Report appears to be a scientific report, but its veneer hides a flawed analysis that ignores the scientific evidence and relies instead on pseudo-science. The report heavily relies on five purported "expert" documents that are biased, inexpert, and full of errors.

The Florida report dismisses or ignores the WPATH and Endocrine Society clinical practice guidelines and the science that underlies them and instead relies on five attached documents that, the report claims, constitute "clinical and technical expert assessments."[97]

[97] June 2 Report, p. 2.

Despite their billing as "expert" reports, the attachments to the June 2 report are unpublished, non-peer-reviewed documents written by authors with questionable claims to expertise and with red flags for undisclosed author bias. These documents should be given no weight in a serious scientific process.

> A. The purported "expert" documents attached to the June 2 Report carry no scientific weight. They are unpublished and not peer-reviewed, and they are written by authors whose expertise has been successfully challenged in legal proceedings and whose backgrounds raise red flags for bias.

None of the documents attached to the June 2 Report meet standard criteria for expert scientific investigations, because none is published or peer reviewed. Publication and peer review are fundamental to science, as they ensure that a scientist's data and conclusions are open to scrutiny from scientific experts.

Florida's own standards for the determination of medical necessity recognize this point when they state that determinations of Medicaid coverage must consult "*published* reports and articles in the authoritative medical and scientific literature related to the health service (*published in peer-reviewed scientific literature* generally recognized by the relevant medical community or practitioner specialty associations)."[98] It is thus both unscientific and a violation of the regulations for the June 2 Report to rely on the unpublished documents as its principal evidence base.

Further, the attachments all raise red flags for author bias. The June 2 Report does not disclose how these "experts" were identified or by what criteria their expertise was assessed. The opacity of the Florida AHCA process for identifying experts is particularly troubling because at least four of the experts have strong indications of bias. Further, the qualifications and credibility of two of the experts have been successfully challenged in litigation.[99] Two of the expert reports duplicate, word-for-word (or with very slight edits) testimony that was offered, apparently for pay, in litigation. Both have connections to advocacy organizations that oppose LGBTQ rights across the board. The endorsement of these individuals as Florida's banner "experts" raises the appearance of bias – that the AHCA sought a pre-ordained outcome, not a true scientific perspective.

Adding to these red flags for bias, none of the authors of the attachments provide a statement of funding and conflicts of interest. This omission violates a strong norm in scientific writing, which requires authors to declare any conflicts of interest; these include any professional or financial arrangements that could call into question their independence of judgment.[100] That

[98] Fl. Admin. Code Section 59G-1.035(4).

[99] See Stephen Caruso, A Texas Judge Ruled That This Doctor Was Not an Expert, Pennsylvania Capital-Star, Sept. 15, 2020 (reporting that van Meter was disqualified as an expert in a Texas divorce case, now sealed).

[100] For example, the conflict of interest rules for JAMA, one of the premier medical journals in the United States and the world state that "[a]uthors are expected to provide detailed information about all relevant financial interests, activities, relationships, and affiliations (other than those affiliations listed in the title page of the manuscript) including, but not limited to, employment, affiliation, funding and grants received or pending, consultancies, honoraria or payment, speakers' bureaus, stock ownership or options, expert testimony, royalties, donation of medical equipment, or patents planned, pending, or issued." JAMA Network, Instructions for Authors, visited June

strong norm also requires authors to disclose whether projects have been funded and if so, by whom and whether the authors have engaged in expert testimony. Without these statements, the Florida AHCA and the public cannot detect biases that could affect the integrity of these written products.

These are more than theoretical concerns: at least four of the attachments have notable indicators of conflicts of interest and bias. (Note that these are the only four we examined in detail, and so we do not imply that the other one is free from such bias.)

The author of the document provided as Attachment E is Quentin van Meter, whose history indicates bias and lack of expertise. Although the AHCA presents van Meter as an expert in medical treatment for gender dysphoria, at least one court barred him from providing expert testimony on the issue.[101] Van Meter is the president of the American College of Pediatricians (the "ACP"), which presents itself as a scientific group (and might be confused, by a non-expert, with the authoritative American Academy of Pediatrics). The ACP is, in fact, a political group that opposes same-sex marriage,[102] supports mental health providers practicing conversion therapy,[103] and describes childhood gender dysphoria as "confusion."[104] Troublingly, the van Meter attachment, proffered by the AHCA as a scientific report, contains several passages of uncredited, verbatim language that appears in a "position statement" published by the ACP.[105] The van Meter attachment appears to be a re-use of paid testimony rather than an original product.[106]

James Cantor's document, presented as Attachment D to the June 2 Report, also faces serious questions about bias and lack of expertise. In a 2022 case, a federal court took a skeptical view of Cantor's purported expertise, noting that "the Court gave [Cantor's] testimony little weight because he admitted, inter alia, to having no clinical experience in treating gender dysphoria in minors and no experience monitoring patients receiving drug treatments for gender dysphoria.[107]

[104] Michelle Cretella, Gender Dysphoria in Children, American College of Pediatricians (2018), https://acpeds.org/position-statements/gender-dysphoria-in-children (site visited June 22, 2022). The author of the ACP position paper is Michelle Cretella, who was publicly rebuked by the Society for Adolescent Health and Medicine, the leading society for adolescent medicine in the United States, for "pushing political and ideological agendas not based on science and facts." https://www.adolescenthealth.org/Advocacy/Advocacy-Activities/2017-Activity/Senate-Bill-439-(2).aspx

[105] The similarity was shown by a Word comparison of the van Meter report provided as Attachment E to the June 2 Report with a "position statement" published on the ACP website, with authorship credit given on the website to Michelle Cretella. See Michelle Cretella, Gender Dysphoria in Children, supra note 17.

[106] The van Meter document attached to the June 2 Report is substantially identical to his expert declaration in Adams v. School Board of St. Johns County, Florida. https://files.eqcf.org/wp-content/uploads/2017/12/41-D-AMENDED-Notice-Documents-iso-Response-to-PI.pdf.

[107] Opinion and Order, Eknes-Tucker v. Marshall, 2:22-CV-184-LCB, M.D. Alabama, May 13, 2022.

Cantor's document is nearly identical to what appears to be paid testimony in another case, where Cantor's declaration was used to support legislation barring transgender athletes from sports teams,[108] Troublingly, Cantor's appearance in that case seems to have been funded by the Alliance Defending Freedom ("ADF"), [109] a religious and political organization that opposes legal protections for transgender people and same-sex marriage[110] and defends the criminalization of sexual activity between partners of the same sex.[111] Because Cantor provides no conflicts of interest disclosure, readers cannot ascertain whether Florida AHCA also paid for Cantor's report and whether Florida officials were aware that the Cantor report reused his work for (apparently) the ADF.

Romina Brignardello-Petersen is one of two authors of the document provided as Attachment C to the June 2 Report. Although Brignardello-Petersen claims to have no research interests in medical care for transgender youth,[112] she has conducted research for the Society for Evidence-Based Gender Medicine ("SEGM").[113] Although SEGM claims to be an international medical society, it is actually an activist group that opposes standard medical care for gender dysphoria. The SEGM has no publications or conferences and seems to consist solely of a website created by a small group of people with limited or no scientific credentials or clinical experience. The site presents a cherry-picked collection of studies and narrative content that is full of scientific errors.[114]

Patrick Lappert, whose document is attached to the June 2 Report as Attachment F, has been disqualified as an expert in a recent federal court decision in North Carolina. [115] The judge found

[112] Like the van Meter and Cantor attachments, the BPW document provides no express statement of conflicts of interest. The BPW document does offer a statement of "credentials and expertise," in which she declares that "her research interests are not in this area," meaning apparently research on medical care for gender dysphoria. BPW Document, p. 1.

[113] BPW document, p. 1. For one example of the purported research that Brignardello -Petersen apparently assisted in, see Alison Clayton et al., Commentary: the Signal and the Noise– Questioning the Benefits of Puberty Blockers for Youth with Gender Dysphoria– A Commentary on Rew et al. (2021), Child and Adolescent Mental Health, Dec. 22, 2021, at https://acamh.onlinelibrary.wiley.com/doi/10.1111/camh.12533 In the "Acknowledgements" section, the authors state, "We would also like to thank the Society for Evidence -based Gender Medicine (SEGM) for providing access to several experts who helped shape this commentary and ensure its accuracy. Specifically, we would like to thank Dr. Romina Brignardello Petersen [sic] for contributing her methodological expertise."

[114] Susan Boulware et al., Biased Science: The Texas and Alabama Measures Criminalizing Medical Treatment for Transgender Children and Adolescents Rely on Inaccurate and Misleading Scientific Claims (April 28, 2022), at 28-29 (Appendix A) available at https://medicine.yale.edu/childstudy/policy-and-social-innovation/lgbtq-youth/.

[115] Kadel v. Folwell, 1:19CV272, M.D. N.C. June 10, 2022. The judge ruled that Lappert was not qualified to "render opinions about the diagnosis of gender dysphoria, its possible causes, the efficacy of the DSM, the efficacy of puberty blocking medication or hormone treatments, the appropriate standard of informed consent for mental health professionals or endocrinologists, or any opinion on the non-surgical treatments." Lappert was also

that evidence "calls Lappert's bias and reliability into serious question" and noted that Lappert has worked closely with ADF and has actively lobbied for legal bans on medical care for transgender youth.[116] The judge gave no weight to Lappert's testimony about informed consent in that case, finding that it was unsupported by scientific evidence.[117] The judge also found that "Lappert has provided the Court with no data or methodology used to draw his conclusion that surgical treatment for gender dysphoria has "never been generally accepted by the relevant scientific community."[118]

B. The linchpin of the June 2 Report is the analysis by Brignardello-Petersen and Wiercioch (the "BPW document"), provided as Attachment C, which purports to be a comprehensive review of the scientific literature on medical treatment for gender dysphoria but, in fact, is extremely narrow in scope and so flawed in its analysis that it merits no scientific weight.

The BPW document, like the other attachments to the June 2 Report, is an unpublished, non-peer-reviewed document. It claims to conduct a systematic review of the relevant scientific literature, but in fact, it is written by inexpert authors who construct an arbitrarily truncated sample and adopt a method that violates scientific guidelines and produces a biased result. The authors describe their findings in deceptive language and jargon predictably mislead the reader. Our review shows that *nothing in the BPW document calls into question the scientific foundations of the WPATH and the Endocrine Society clinical practice guidelines.*

The BPW document seems scientific on its face, and it may be impressive to non-experts, because it uses technical jargon and includes numerous tables and charts. But a closer examination shows that it violates established standards for medical research and shows signs of being engineered to produce a pre-ordained and inaccurate result: the false claim that there is no scientific evidence base for medical treatment for gender dysphoria. Contrary to the authors' claims, there is a large body of reliable scientific literature that supports standard medical treatment for gender dysphoria and spans decades.

The bottom line is that, contrary to the BPW document's claims, there is a large body of reliable scientific literature that supports standard medical treatment for gender dysphoria.

(1) The BPW document lacks scientific credibility due to the authors' lack of relevant qualifications and their ties to an activist group.

The BPW document purports to be a systematic review of the scientific literature on medical treatment for gender dysphoria. But the document, like the other attachments to the June 2 Report, is not published or peer-reviewed, and its design and execution raise numerous red flags for bias. Here, we describe just four of the notable defects that undercut entirely the document's claim to objectivity and sound method.

---

disqualified from opining on "the efficacy of randomized clinical trials, cohort studies, or other longitudinal, epidemiological, or statistical studies of gender dysphoria." Id.

[116] Id.

[117] Id., pp. 29-30.

[118] Id., p. 31.

First, neither of the BPW authors are experts in medical care for gender dysphoria, either as researchers or clinicians. One author (Brignardello-Petersen) has not previously studied the subject, except in her work for the ideological organization SEGM.org, noted just above. Her only clinical experience appears to be in dentistry.[119] The other author (Wiercioch) is a junior researcher (a postdoctoral fellow) with no prior research or clinical experience in this field.

The authors' lack of interest and experience renders the BPW work inexpert rather than objective, and it violates the National Academy of Medicine (formerly, Institute of Medicine) standards for systematic reviews. By analogy, one would not rely on, say, two dermatologists to conduct a review of the scientific literature on neurosurgery and to make recommendations for clinical practice.

Second, not only is the study not formally peer-reviewed, the BPW authors violate scientific norms and standards by *failing to engage at all with their peers or with actual experts in the subject matter*. As experts in research methodology should know, any sound systematic review should propose explicit and reproducible methods to methodically summarize the existing literature; the protocol (i.e., the research design) is then published to solicit input and criticisms from potential users of the review and experts in the field. Peer review of the literature review and publication of the protocol are not optional or merely window-dressing; they reflect bedrock commitments of the scientific method. These processes help ensure that the authors of any review understand the existing research and craft a research design that will usefully build on and add to prior work.

The BPW document violates these standards, raising questions about whether this was a rushed study designed to serve a political agenda – rather than a considered, comprehensive, scientific enterprise. The BPW document does not contain a review of the existing literature, and it does not acknowledge the WPATH and Endocrine clinical practice guidelines, which are themselves based on careful systematic reviews. The BPW authors appear not to have published their protocol in advance or otherwise to have submitted their protocol for peer review. That is, there is no indication that they vetted their research design in consultation with subject-matter experts.

Committee on Standards for Systematic Reviews of Comparative Effectiveness Research, Institute of Medicine, Finding What Works in Health Care: Standards for Systematic Reviews, National Academies (Jill Eden et al., eds 2011), p. 48 (Standard 2.1.1 states that teams for systematic reviews should include expertise in pertinent clinical content areas). Background: The Institute of Medicine, now called the National Academy of Medicine, is one of three branches of the National Academies of Science, Engineering, and Medicine. The National Academy of Science dates to 1963 and was established by Congress; the Institute of Medicine was established as a separate entity in 1970 and serves as the nation's leading authority on scientific research and knowledge. National Academy of Medicine, About the National Academy of Medicine, website visited June 22, 2022 https://nam.edu/about-the-nam/ The standards for systematic reviews were published in 2011, responding to a Congressional request to set benchmarks for high-quality systematic reviews that could reliably guide physicians and healthcare providers in making informed, scientific judgments about health care.
Committee on Standards for Systematic Reviews of Comparative Effectiveness Research, Institute of Medicine, supra note 34, at pp. 72-75.

Third, the BPW document raises red flags for opinion bias. Buried in the methodology pages of the BPW document is the fact that the authors uncritically include politically biased "grey literature" sources, giving them equal weight to peer-reviewed, published literature. Specifically, the authors include in their search the fringe website SEGM.org. As noted above, the group's website posts are not peer-reviewed or published, and its content is assembled by a small group of activists with few or no expert credentials and is often full of errors. Troublingly, this is the group to which one of the authors, Brignardello-Petersen, has ties, as noted above.

> *(2) The BPW document examines a truncated sample of the literature and adopts a methodology that violates scientific standards for evaluating medical evidence. The authors compound this bias by describing their results using overstated and deceptive language. The picture that emerges is of a rushed and inexpert report with indications of bias.*

The BPW document has a patina of scientific expertise. It invokes the respected GRADE standards for rating the quality of studies, and it occupies many pages with tables and technical specifications. When a reader looks past the jargon, however, the BPW authors adopt a method that actually violates GRADE standards and appears to be jury-rigged to reach a foregone conclusion. The authors then convey their conclusions in misleading language. *Contrary to the BPW authors' claims, their study does not call into question the scientific and clinical importance of the established science that supports medical care for gender dysphoria.*

The BPW analysis incorporates numerous decisions that bias their results, and they make numerous misleading statements. First, the BPW document reviewed only a small sample of the relevant scientific literature. In the introduction, the BPW authors initially claim to have reviewed 61 systematic reviews of medical treatment for gender dysphoria. But buried in the middle of the document is the admission that the analysis is based on a sample of 27 systematic reviews, not 61 as claimed. The result is that the BPW analysis excludes a great deal of relevant evidence, and the authors provide no rationale for this "prioritization," as they call it. Troublingly, although the BPW document claims to be conducting a review of the literature that analyzes existing systematic reviews, the 27 studies they analyze are not all systematic reviews. Three of the 27 are mislabeled as systematic reviews but are actually practice bulletins, unpublished protocols or unlocatable.

Troublingly, the authors also embed in the middle of their document a*n unjustified decision to limit their analysis to studies published from 2020 to the present, and their project has strong indications that it was rushed work.* The authors disclose that they "prioritized" studies from the last 30 months (two full years plus four months in 2022), but they do not defend that priority.

BPW document, Methods section, p. 2.
See Boulware et al., supra note 27 pp. 28-29 (Appendix A).
BPW document, Introduction Section, p. 2.
BPW document, Results Section, p. 1.

The reader is left to wonder whether this truncation served only to help the authors produce their analysis in what was apparently a very short time frame.

The truncation of the literature sample to the period from 2020 to early 2022 is worrisome because that period coincides with the worst global public health emergency in generations. The pandemic disrupted many institutions, straining the health care system and putting immense pressure on clinicians. It is likely that the pandemic stalled the production and publication of non-COVID research during this period, calling into sharp question the BPW authors' sampling strategy.

The BPW sample is also questionable because the authors choose, without justification, a small subsection of databases to search and have likely missed important literature as a result. Specifically, they chose not to source from other important databases such as Embase, PsycInfo, Web of Science, Scopus, or Cochrane. They also limited their scope to works published in English only, an exclusion that can introduce bias.

Second, the BPW authors misused and mechanically applied a well-regarded rating system known as AMSTAR, which is intended to evaluate the methodological strength of systematic reviews. They misused this rating system because their so-called group of systematic reviews included documents that cannot correctly be included (practice bulletins, unpublished protocols, and unlocatable documents) and thus led to a negative bias. The BPW error is further amplified because the authors used the flawed results of the AMSTAR phase to inform their next level of analysis, the GRADE system (which assesses the quality of medical evidence of pooled systematic reviews). Based on this flawed and purely mechanical review of truncated sources, the BPW analysis reaches the conclusion that there is little or no evidence for the benefits of medical care for gender dysphoria.

The BPW analysis is highly deceptive, because it dismisses nearly all existing studies of medical treatment for gender dysphoria as "low quality," without explaining that this is a highly technical term and not a natural-language condemnation of the studies. By contrast, the GRADE system, which the authors purport to use, is quite clear about its quality rating systems and its limitations. In general, only randomized controlled trials (RCTs) are coded as "high" quality evidence in the GRADE system. A randomized controlled trial is a study that divides patients randomly into a control group (no treatment) and a treatment group. In contrast, an observational study records information about patients in a real-world setting that is more reliably generalizable, e.g., a cohort of patients seen at a clinic. Under the GRADE guidelines, observational studies are coded as "low" in quality.

The authors disclose that they conducted their initial literature searches– the first step in the review process – at the end of April 2022. BPW document, Methods section, p. 2.

For example, the BPW document states that there is *evidence* about the effect of puberty blockers compared to not using puberty blockers. In other words, no studies compared the outcomes between a group of people with gender dysphoria using puberty blockers and another group of people with gender dysphoria not using them. Therefore, it is unknown whether people with gender dysphoria who use puberty blockers experience more improvement in gender dysphoria, depression, anxiety, and quality of life than those with gender dysphoria who do not use them. BPW document, Results section, p. 4.

See Howard Balshem et al., GRADE Guideline: 3. Rating the Quality, 64 J. Clinical Epidemiology P401 -406 (2011), Table 3, p. 404

The key point is that "low quality" in this context is a technical term and not a condemnation of the evidence, because "low quality" studies regularly guide important aspects of clinical practice. Indeed, the GRADE system, which the BPW document claims to use, specifically notes that GRADE should *not* be used to dismiss observational studies or to give absolute priority to RCTs:

> Although higher quality evidence is more likely to be associated with strong recommendations than lower quality evidence, a particular level of quality does not imply a particular strength of recommendation. *Sometimes, low or very low quality evidence can lead to a strong recommendation.*[130]

The methodology adopted by the BPW document will thus, predictably, conclude that any body of scientific literature that does not contain RCTs is "low" in quality. Had BPW begun, as they should have, with a literature review of the evidence on puberty blockers and hormones, they would have seen that the evidence consists primarily of observational studies (for the good reasons discussed below). Thus, the 30 pages that it takes the authors to lay out their methodology is misleading: a knowledgeable reader would know that if there are few or no RCTs in the literature, then the BPW technical conclusion is foregone and, as importantly, is not a sound guide for clinical recommendations.

Put in simpler terms, if we coded apples as "high quality fruit" and bananas as "low quality fruit," then any fruit bowl that has only bananas would predictably be technically coded as "low quality." But that technical conclusion conveys very little information without context. For example, if no apples exist, then bananas may be a nutritious choice.

The drafters of the GRADE system emphasize that technically "low quality" evidence can support a strong clinical treatment recommendation. For example, pediatricians now agree that children should not be given aspirin for fevers. This recommendation is based on observational studies that showed an association between aspirin treatment during viral illnesses and the development of Reyes syndrome (a rapid and progressive disease of neurological dysfunction that can be fatal). Based on those studies, it would be unethical to conduct an RCT giving some children aspirin, and so the strong, consensus treatment recommendation is based entirely on "low quality" studies.[131]

The critical fact is that RCTs are not, and cannot be, the gold standard for medical research on gender dysphoria. In the context of treatments for gender dysphoria, randomized controlled trials would often be inappropriate for ethical reasons. Medical care has long been shown, by reliable scientific methods, to address gender dysphoria and improve mental health: as we have repeatedly noted, these treatments have been recommended by rigorous clinical practice guidelines issued by WPATH and the Endocrine Society and endorsed by every major medical organization. Given this medical consensus, which is based on solid scientific evidence, it would be unethical to conduct an RCT that involved denying standard medical care to a control group of individuals.

Similar ethical issues, along with practical barriers, leave many areas of consensus medicine supported by observational studies and not RCTs. Many surgical procedures, for example, are not supported by RCTs.[132] Nor are standard protocols for lowering cholesterol using statins, one of the most widely-prescribed drugs in the United States. (See Section III.A of this report.)

It is thus simply a mistake – and a mischaracterization of medical research across fields of medicine – to conclude that the absence of RCTs means that there is "no evidence" for the efficacy of medical treatment for gender dysphoria. Medical research requires, instead, that researchers evaluate the design and conduct of specific observational studies and do so with an awareness of clinical context.[133]

In sharp contrast to BPW, this is precisely what the authors of the Endocrine Society did in their 2017 clinical guidelines, which use the GRADE system but, in addition, carefully discuss the characteristics of the studies supporting each treatment guideline.[134] The Endocrine Society discloses the GRADE rankings for each treatment recommendation in order to be transparent about the evidence base for each of its recommendations. Then, following National Academy of Medicine (formerly, Institute of Medicine) standards for clinical practice guidelines, they proceed to a qualitative review of the evidence, place the evidence in clinical context, and discuss openly the values at stake in making a clinical practice recommendation.[135]

III. The June 2 Report reflects a faulty understanding of statistics, medical regulation, and scientific research, and it repeats discredited claims and engages in speculation and stereotyping without scientific evidence.

The June 2 Report is full of errors and misstatements. Disregarding solid scientific evidence, the report relies on debunked studies and sheer speculation, and it levels criticisms at solid evidence that betray a poor understanding of medical research and statistics.

A. The June 2 Report repeatedly and erroneously dismisses solid studies as "low quality." If Florida's Medicaid program applied the June 2 Report's approach to all medical procedures equally, it would have to deny coverage for widely-used medications like statins (cholesterol-lowering drugs taken by millions of older Americans) and common medical procedures like mammograms and routine surgeries.

[132] See, e.g., Peter McCulloch, et al., Randomised Trials in Surgery: Problems and Possible Solutions, 324 (7351) BMJ 1448-1451 (2002).

[133] See Balshem et al., supra note 42 at 405 ("[W] e caution against a mechanistic approach toward the application of the criteria for rating the quality of the evidence up or down…. Fundamentally, the assessment of evidence quality is a subjective process, and GRADE should not be seen as obviating the need for or minimizing the importance of judgment or as suggesting that quality can be objectively determined"). See also the National Institute of Medicine (Institute of Medicine) Standards, supra note 34, at 176: ("We are disappointed when a systematic review simply lists the characteristics and findings of a series of singlestudies without attempting, in a sophisticated and clinically meaningful manner, to discover the pattern in a body of evidence. Although we greatly value meta -analyses, we look askance if they seem to be mechanistically produced without careful consideration of the appropriateness of pooling results or little attempt to integrate the finds into the contextual background.")

[135] Id.

In its opening words, the June 2 Report makes an error that is repeated throughout the document: "Studies presenting the benefits to mental health, including those claiming that the services prevent suicide, are either low or very low quality and rely on unreliable methods such as surveys and retrospective analyses, both of which are cross-sectional and highly biased."
